How well do we know the gluon polarization in the proton?

Y. Zhou, N. Sato, and W. Melnitchouk (Jefferson Lab Angular Momentum (JAM) Collaboration)
Phys. Rev. D **105**, 074022 – Published 25 April 2022

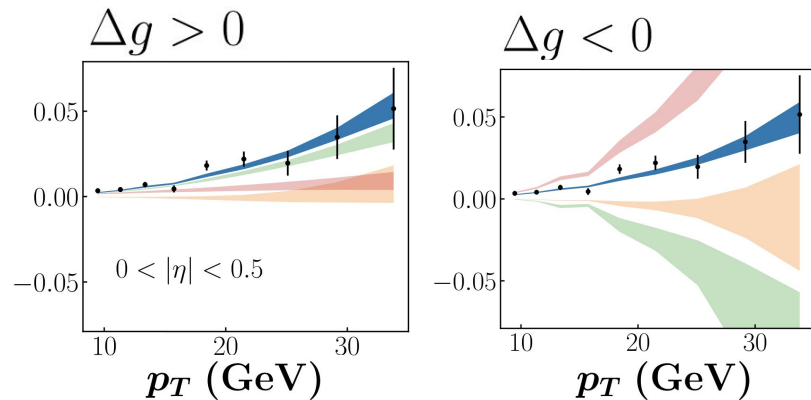

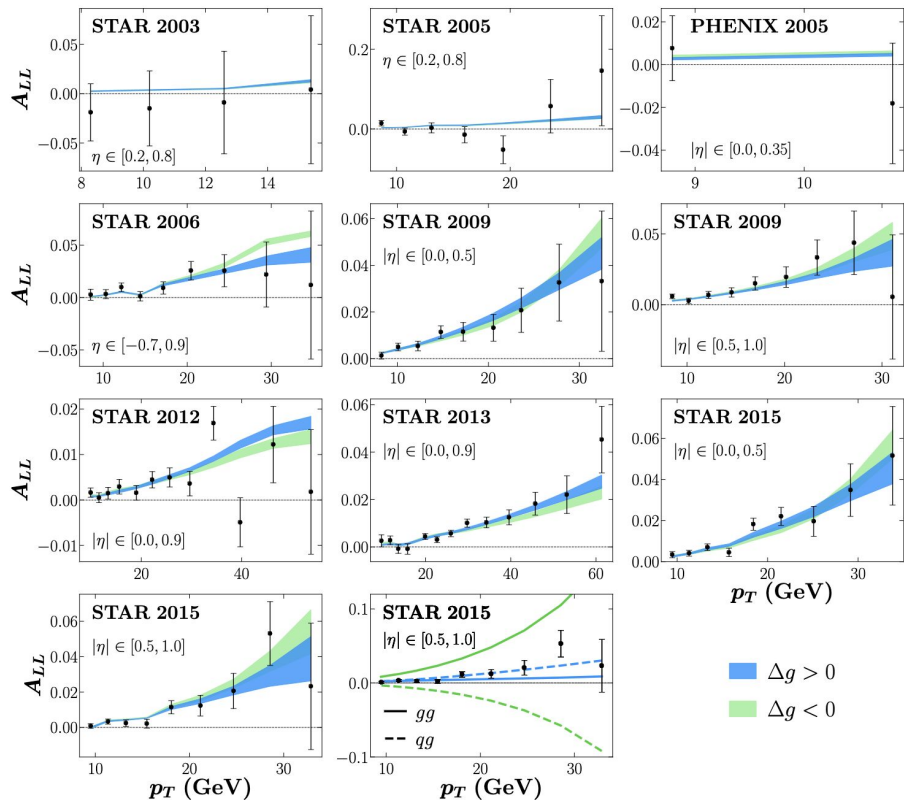

$$|\Delta g| \leq g$$

PDF positivity constraint

- Sign of Δg is not uniquely determined by existing experimental data (DIS $W^2 > 10 \text{ GeV}^2$)
- PDF positivity constraints + data strongly disfavors the negative Δg
- Negative Δg violates significantly PDF positivity constraint
- PDF positivity is not a strict requirement in QCD

$$A_{LL}^{\text{jet}}(p_T, y) \propto a_{gg}[\Delta g \otimes \Delta g] + \sum_q a_{qq}[\Delta q \otimes \Delta g] + \sum_{q, q'} a_{qq'}[\Delta q \otimes \Delta q'] + \mathcal{O}(\alpha_s),$$

$$|A_{LL}| < 1 \quad \checkmark$$

Δg enters quadratically, and different channels contribute with different signs and magnitudes

Charged-pion cross sections and double-helicity asymmetries in polarized $p + p$ collisions at $\sqrt{s} = 200$ GeV

A. Adare *et al.* (PHENIX Collaboration)
Phys. Rev. D **91**, 032001 – Published 2 February 2015

Measurement of charged pion double spin asymmetries at midrapidity in longitudinally polarized $p + p$ collisions at $\sqrt{s} = 510$ GeV

U. Acharya *et al.* (PHENIX Collaboration)
Phys. Rev. D **102**, 032001 – Published 5 August 2020

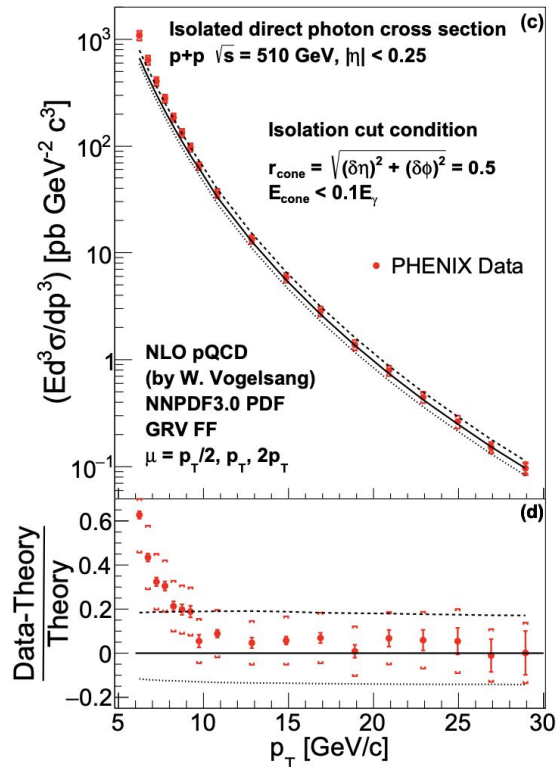

- PHENIX collaboration stated that the ordering of π^+ , π^0 and π^- asymmetries can help discriminate Δg solutions
- The two solutions for Δg found by JAM describe the data equally well

Measurement of Direct-Photon Cross Section and Double-Helicity Asymmetry at $\sqrt{s} = 510$ GeV in $\vec{p} + \vec{p}$ Collisions

N. J. Abdulameer *et al.* (PHENIX Collaboration)
 Phys. Rev. Lett. **130**, 251901 – Published 21 June 2023

- PHENIX collaboration stated that negative Δg is disfavored by more than 2.8σ
- However, only last 3 high- $p_T A_{LL}$ points are well described in pQCD (see denominator of A_{LL})

Accessing gluon polarization with high- P_T hadrons in SIDIS

R. M. Whitehill, Yiyu Zhou, N. Sato, and W. Melnitchouk (Jefferson Lab Angular Momentum (JAM) Collaboration)
Phys. Rev. D **107**, 034033 – Published 27 February 2023

SIDIS with large $p_{h,T}$: $e(\ell) + N(P) \rightarrow e(\ell') + h(P_h) + X$

(a)

(b)

(c)

(d)

- q_T is required to be comparable to photon virtuality Q
- Δg starts to contribute at LO
- The cross section depends on Δg linearly

$$q_T \equiv \frac{p_{h,T}}{z} \gtrsim Q$$

SIDIS with large $p_{h,T}$: $e(\ell) + N(P) \rightarrow e(\ell') + h(P_h) + X$

$$A_{LL}^{\text{jet}}(p_T, y) \propto a_{gg}[\Delta g \otimes \Delta g] + \sum_q a_{qg}[\Delta q \otimes \Delta g] + \sum_{q,q'} a_{qq'}[\Delta q \otimes \Delta q'] + \mathcal{O}(\alpha_s),$$

$$A_{LL}^{\text{SIDIS}} \sim \Delta g + \Delta q + \dots$$

New Data-Driven Constraints on the Sign of Gluon Polarization in the Proton

N. T. Hunt-Smith, C. Cocuzza, W. Melnitchouk, N. Sato, A. W. Thomas, and M. J. White (JAM Collaboration-Spin PDF Analysis Group)

Phys. Rev. Lett. **133**, 161901 – Published 16 October 2024

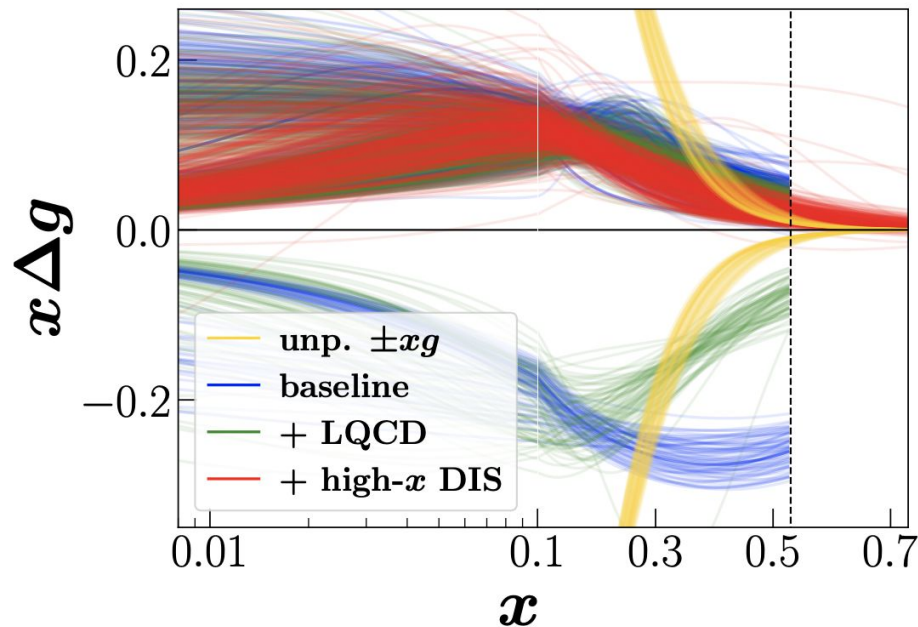

- With inclusion of high- x DIS DSAs (SLAC, HERMES & **JLab**), LQCD data strongly disfavor negative Δg solution
- Combined DSA from jet and high- x DIS with LQCD allows us to discriminate the sign of Δg for the first time!

Summary & outlook

- For the first time, we were able to discriminate the sign of Δg using data-driven approach
- Constraints from LQCD along with DSAs from jets and DIS at large- x were crucial to achieve the resolution of Δg sign
- Inclusion of LQCD is becoming increasingly important in global analysis
- Experimental constraints at large x on Δg are still scarce, and more data are needed to reach precision similar to unpolarized gluon density (RHIC: dijet, EIC: small x , **JLab-12/22**: SIDIS & high x)

Gluon helicity from global analysis of experimental data and lattice QCD Ioffe time distributions

J. Karpie, R. M. Whitehill, W. Melnitchouk, C. Monahan, K. Orginos, J.-W. Qiu, D. G. Richards, N. Sato, and S. Zafeiropoulos (Jefferson Lab Angular Momentum and HadStruc Collaborations)
Phys. Rev. D **109**, 036031 – Published 27 February 2024

Toward the determination of the gluon helicity distribution in the nucleon from lattice quantum chromodynamics

Colin Egerer, Bálint Joó, Joseph Karpie, Nikhil Karthik, Tanjib Khan, Christopher J. Monahan, Wayne Morris, Kostas Orginos, Anatoly Radyushkin, David G. Richards, Eloy Romero, Raza Sabbir Sufian, and Savvas Zafeiropoulos (HadStruc Collaboration)
 Phys. Rev. D **106**, 094511 – Published 28 November 2022

$$\widetilde{M}^{\mu\nu;\alpha\beta}(p, z) = \langle p | F^{\mu\nu}(0) W(0; z) \widetilde{F}^{\alpha\beta}(z) | p \rangle$$

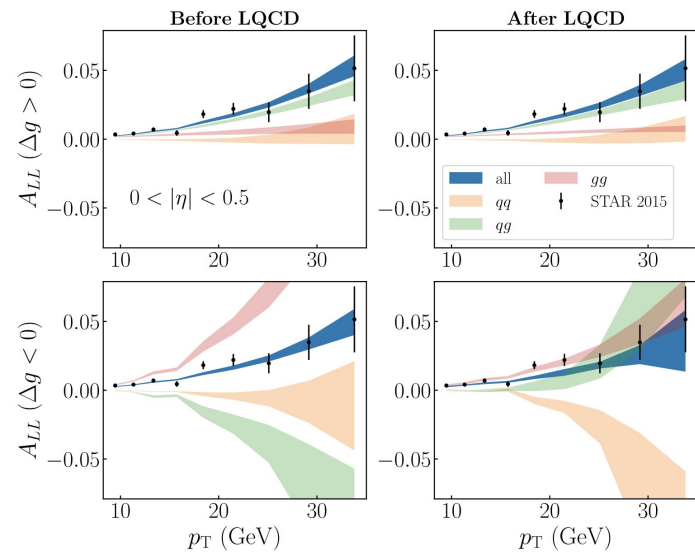

$$\widetilde{\mathfrak{M}}(\nu, z^2) = \frac{\widetilde{M}_{00}(p, z) / p_0 p_3 Z_L(z_3/a)}{M_{00}(p=0, z) / m^2}$$

$$\begin{aligned} \widetilde{\mathfrak{M}}(\nu, z^2) \langle x_g \rangle_{\mu^2} = & \boxed{\tilde{\mathcal{I}}_p(\nu, \mu^2)} - \frac{\alpha_s N_c}{2\pi} \int_0^1 du \tilde{\mathcal{I}}_p(u\nu, \mu^2) \left\{ \ln \left(z^2 \mu^2 \frac{e^{2\gamma_E}}{4} \right) \right. \\ & \left(\left[\frac{2u^2}{\bar{u}} + 4u\bar{u} \right]_+ - \left(\frac{1}{2} + \frac{4 \langle x_S \rangle_{\mu^2}}{3 \langle x_g \rangle_{\mu^2}} \right) \delta(\bar{u}) \right) \\ & + 4 \left[\frac{u + \ln(1-u)}{\bar{u}} \right]_+ - \left(\frac{1}{\bar{u}} - \bar{u} \right)_+ - \frac{1}{2} \delta(\bar{u}) + 2\bar{u}u \left. \right\} \\ & - \frac{\alpha_s C_F}{2\pi} \int_0^1 du \tilde{\mathcal{I}}_S(u\nu, \mu^2) \left\{ \ln \left(z^2 \mu^2 \frac{e^{2\gamma_E}}{4} \right) \tilde{\mathcal{B}}_{gq}(u) + 2\bar{u}u \right\} + \mathcal{O}(\Lambda_{\text{QCD}}^2 z^2), \end{aligned}$$

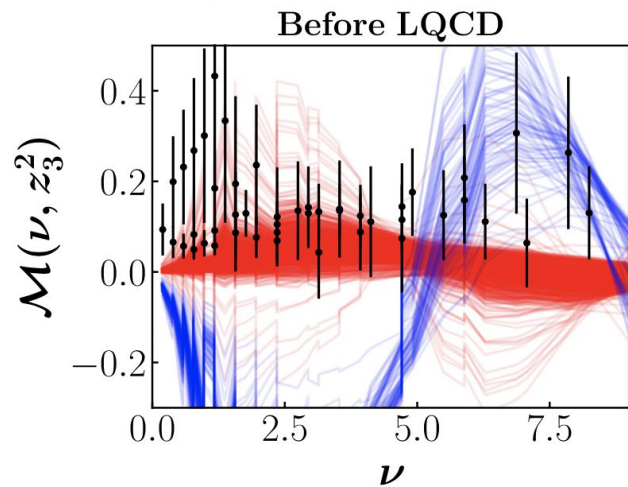

$$\boxed{\mathcal{I}_{\Delta g}(\nu, \mu^2) = \int_0^1 dx x \sin(x\nu) \Delta g(x, \mu^2)}$$

DIS $W^2 > 10 \text{ GeV}^2$

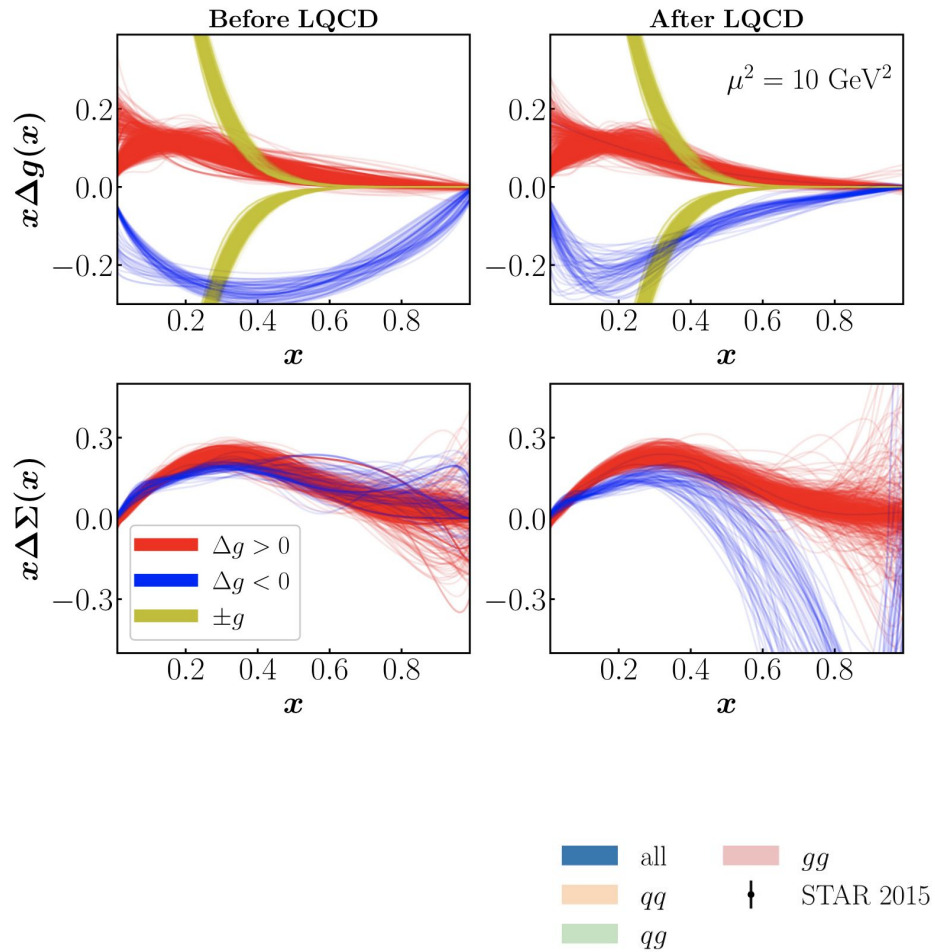

- Good description of global data after inclusion of LQCD for both solutions for Δg
- On the basis of χ^2 , LQCD cannot discriminate fully the sign of Δg

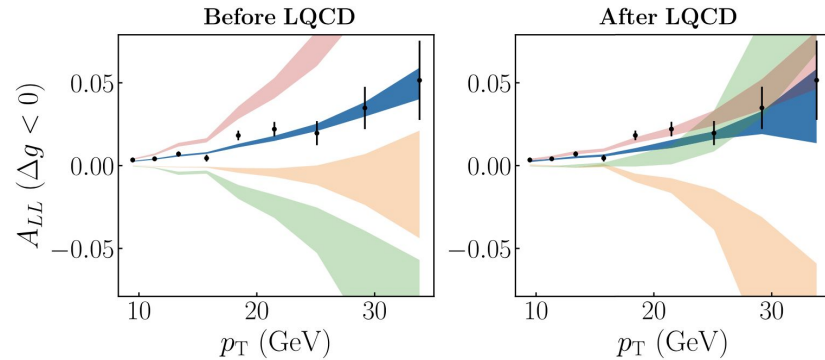

$$\begin{aligned}\chi^2 &= (\mathbf{d} - \mathbf{t})^T \boldsymbol{\Sigma}^{-1} (\mathbf{d} - \mathbf{t}) \\ &= (\mathbf{d} - \mathbf{t})^T \mathbf{U} \mathbf{D}^{-1} \mathbf{U}^T (\mathbf{d} - \mathbf{t}) \\ &= \sum_i \text{res}_i^{*2}.\end{aligned}$$

- Projections of residuals reveal strong correlations between LQCD data points
- The correlations prevent determination of sign of Δg

- LQCD distorts significantly the negative Δg at $x > 0.3$
- Note that both solutions violate PDF positivity bounds in $x > 0.3$
- Before inclusion of LQCD data, $\Delta\Sigma$ were stable for both solutions
- Inclusion of LQCD data forces the $\Delta\Sigma$ to become negative at $x > 0.4$ for the negative gluon solution

New Data-Driven Constraints on the Sign of Gluon Polarization in the Proton

Phys. Rev. Lett. **133**, 161901 – Published 16 October 2024

Higgs production at RHIC and the positivity of the gluon helicity distribution

Daniel de Florian, Stefano Forte, and Werner Vogelsang
Phys. Rev. D **109**, 074007 – Published 10 April 2024

- Higgs A_{LL} is directly sensitive to Δg squared at LO
- Calculations of A_{LL} (Higgs) with negative Δg can lead to unphysical results (**using non-LQCD based analysis**)

$$A_{LL}^H(\tau) = \frac{[\Delta g \otimes \Delta g]}{[g \otimes g]} + \mathcal{O}(\alpha_s),$$

Can Higgs A_{LL} fully discriminate negative Δg ?

Negative Δg with LQCD constraints still admits a physical Higgs A_{LL}
