Intense laser pulses propagation in overdense plasmas

giovedì 12 settembre 2024 11:45 (20 minuti)

The propagation of electromagnetic waves in plasmas is allowed up to a maximum density (critical density) at which the pulsation of the wave ω equals the plasma frequency ω_p . However, at high intensities some phenomena arise which allow electromagnetic radiation to penetrate regions of the plasma at density higher than the critical one. Some of these phenomena will be presented here.
