Summary

Scope of the MPGD endcaps in ePIC detector tracking

In May 2023, MC simulations showed that the tracking configuration in the endcap regions of the ePIC detector, which will experience the highest backgrounds in the experiment, would not provide enough hit points in the |η| > 2 region for good pattern recognition.

ePIC giornate nazionali - June 28 2024 - Annalisa D'Angelo

Scope of the MPGD endcaps in ePIC detector tracking

• Adding two MPGD Endcap Tracking (ECT) disks both in the hadronic and in the leptonic regions increased the number of hits in the $|\eta| > 2$ region to improve pattern recognition.

ePIC giornate nazionali - June 28 2024 - Annalisa D'Angelo

Technical Performance Requirements

Time resolution 10 ns or less to provide tracking timing

- Fast rise time ~ 20 ÷ 50 ns
- Peaking time 50 ns
- Sampling faster than 50 MHz

Low material budget

- 1-2 % X₀ - it will be the minimum compatible with the chosen technology

Spatial resolution: 150 μ m or better

- <150 μ m intrinsic spatial resolution for perpendicular tracks
- Technological optimizations to retain 150 μ m resolution for inclined/curved tracks

High Efficiency

- Single detector efficiency ~ 96 –97 % → 92 –94 % combined efficiency for two disks

Detector Geometry: Envelope and Active Regions

MPGD Disk	Max Z Pos (cm)	Disk Outer Radius (cm)	Outer Active Reg. radius (cm)	Calculated Beam pipes radii (mm)	Offset (mm)	Disk Inner Radius (cm)	Inner Active Reg. radius (cm)
HD MPGD 2	163.5	50	45	55.8	22.5	9	10.5
HD MPGD 1	150.5	50	45	53.1	19.9	9	1.5
LD MPGD 1	-112.5	50	45	37.7	-3.1	4.5	6.0
LD MPGD 2	-122.5	50	45	39.2	-3.4	4.5	6.0

- Two couples of disks: Lepton/Hadron Disks
 The geometric envelope should include the electronics front-end boards
- 50 cm external radius/45 cm active region radius – including 5cm outer ring for services.
- Different internal hole dimensions due to divergent beam pipes: 4.5 cm (LD)/9 cm(HD)

Endcap Detectors Integration in ePIC

The assigned envelope will include the detectors and the FEB electronics.

The disks will be attached together and to the support frame under design.

Detector Technology Choices

μ-RWELL

The **µ-RWELL** is a Resistive MPGD detector (Micro Pattern Gas Detector)

Standard Gas mixture: $Ar:CO_2:CF_4$ 45:15:40 mixture (it also works with $Ar:CO_2$ «green» mixture) The device is composed of two elements:

• drift/cathode PCB defining the gas gap (5 μm Cu layer on the bottom side)

• μ -RWELL_PCB (detector core) Multilayer circuit: *Well Pattered Polyimide* \oplus resistive film \oplus readout PCB The "WELL" acts as a multiplication channel for the ionization produced in the gas of the drift gap The resistive stage ensures the quenching of the spark amplitude

Detector Technology Choices µ-RWELL

The **µ-RWELL** is a Resistive MPGD detector (Micro Pattern Gas Detector)

The device is composed of two elements:

- drift/cathode PCB defining the gas gap ($5\mu m Cu$ layer on the bottom side)
- μ -RWELL_PCB (detector core) Multilayer circuit: *Well Pattered Polyimide* \oplus resistive film \oplus readout PCB

Standard Gas mixture: Ar:CO₂:CF₄ 45:15:40 mixture (it also works with Ar:CO₂ «green» mixture)

Development of μ -RWELL detectors for the upgrade of the tracking system of CMD-3 detector

L. Shekhtman*, G. Fedotovich, A. Kozyrev, V. Kudryavtsev, T. Maltsev, A. Ruban Budker Institute of Nuclear Physics, 630090, Novosibirsk, Russia Novosibirsk State University, 630090, Novosibirsk, Russia

ARTICLE INFO

ABSTRACT

Keywords: Tracking detectors Micro-RWELL Micro-pattern gas detectors

An upgrade of tracking system of Cryogenic Magnetic Detector (CMD-3) is proposed using microresistive WELL technology. CMD-3 is a general purpose detector operating at the VEPP-2000 collider at Budker Institute of Nuclear Physics and intended for studies of light vector mesons in the energy range between 0.3 GeV and 2 GeV. The new subsystem consists of double-layer cylindrical detector and the end-cap discs. Two prototypes, micro-RWELL and micro-RWELL-GEM were built and tested. Gas amplification of micro-RWELL detector was measured with several gas mixtures and maximum gain between 20000 and 30000 was observed. However, maximum gain is fluctuating from measurement to measurement by a factor of 2 and thus a safety margin of 2-3 is needed to provide reliable operation of the device. In order to increase the signal GEM was added to micro-RWELL, new prototype was tested with the same gas mixtures and gains above 105 have been demonstrated. Time resolution achieved for both prototypes are 7 ns for micro-RWELL and 4 ns for micro-RWELL-GEM.

L. Shekhtman, Nuclear Inst. and Methods in Physics Research, A 936 (2019) 401-404

Drift Gap: Shekhtman 3mm – LNF+Roma2 6mm

L6=25,17µm

Transfer Gap: Shekhtman 3mm – LNF+Roma2 3mm

Developed for CMD3 upgrade disks (4 sectors 50×50cm²)

The GEM **must be** stretched: sizes larger than 50×50cm² could be critical (depending on the gas gaps size).

µ-RWELL + GEM – Gain

L. Shekhtman, Nuclear Inst. and Methods in Physics Research, A 936 (2019) 401–404

Fig. 4. Gain as a function of voltage on the top electrode of μ -RWELL for different gas mixtures. Voltage across the drift gap is 500 V.

Fig. 5. Gain as a function of voltage on the top electrode of μ -RWELL for GEM voltages providing additional gain of 50–100 and for different gas mixtures. Voltage across the drift gap is 500 V.

Detector Technology Choices: GEM+*µ***Rwell**

- 2D CS readout reduces the gain from 10^4 to $3-4 \ 10^3 \rightarrow$ the detector stability is put at risk
- GEM- μ Rwell hybrid configuration has been chosen to increase the gain in the 10 000 \div 20 000 range
- 2D strip read-out using a "COMPASS-like" scheme
- 500 μm pitch guarantees a spatial resolution better than 150 μm (no need of capacitive sharing))
- A gas gap lager than 3 mm is compatible with single detector efficiency larger than 96%

GEM - μ Rwell Technology Combining the CC and µTPC reconstruction (through wheighted average) a a 3 mm honeycomb resolution well below 100 µm could be reached over a wide incidence angle range. 3/6 mm gas gap 2/3 mm transfer gap Space Resolution (µm) 1D Strip R/O: 400um pitch, gain 4000, $80\Omega/\Box$ 10³ = cathode μ – Rwell GEM PCB read-out CC= Charge Centroid θ 10^{2} - ← CC CC 🕂 μ-TPC uTPC ∔ Combined 10 20 30 50 10 40 0 Angle (°) Next test beam Oct/Nov 2024

ePIC giornate nazionali - June 28 2024 - Annalisa D'Angelo

Detector Technology Choices: (X,Y) vs (R, φ) read-out

(X, Y) read-out geometry

PROs	CONs
The strip length does not vary much along the active area	Alignment is critical
All readout FE hybrids may be located outside the active area	Routes to read-out connectors must be accurately studied

- (X, Y) readout is preferred vs (R, φ) no FEB on the active area
- 500 μm pitch \rightarrow better than 150 μm intrinsic position resolution

• Strips routing details is being studied

Detector Technology Choices: Detector sectors overlap

ePIC giornate nazionali - June 28 2024 – Annalisa D'Angelo

ePIC Endcaps – open options

FEB – RDO – DAQ electronics

Preliminary design of SALSA

- FEB is based on new
 SALSA chip designed and produced by the
 Saclay/San Paulo group for all MPGD detectors
- Specific FEB form factor must be designed to fit each detector requirements

See Roberto's talk

More on Technical Performance Requirements

ePIC

Not critical ~ 1 kHz/cm² or less

Temperature Stability

Rate Capability

- Not critical for the detector performances
- Detector calibration should consider gas pressure variations
- Electronics power consumption and cooling
 - − SALSA ASIC consumption ~ 15 mW/channel at $1.2V \rightarrow 60$ W/disk
 - Air vs liquid cooling is under study at Saclay

2 configuration

By Mariangela Bondi'

- Pairs of disk in electron and hadron endcaps based on uRWell technology
- 2 configuration under development:
 - 0 1 configuration : 4 quarters
 - 2 configuration: 2 semi-ellipses
- Currently disk made of subtracted solid
 - No overlaps
 - DD4hep-ACTS conversions fail X
 - Disk approximation with trapezoid: working in progress

August 2023: Interest of INFN groups to contribute to the MPGD trackers

- 1 year time to make the final decision about the INFN responsibility of the endcap construction
- Joined DRD-1 and eRD108 communities
- **December 2023: Direct contact with ePIC management (Rolf Ent)**
- ePIC/DOE management agreed that INFN takes the leadership of MPGD ECT
- eRD108 \rightarrow PED project: 30 k\$ from DOE to provide a design by the end of 2024.

March 2024: Incremental Design and Safety Review (PDR)

- Detector technical choices and project design communicated to the management
- Very positive feedback

May 2024: MPGD ECT working group reinforced

- Interest expressed by Paolo Musico (INFN GE) and local RM TV digital electronic group to contribute to the FEB design
- Interest expressed by Temple University to contribute to the Lepton Disks construction
- Support from the local INFN Director: electronics workshop and clean room

Involved Institutions & Workforce

INFN Workforce:

Roma Tor Vergata

Coordinator: A. D'Angelo,

Detector Hardware and QA: E. Sidoretti (PhD) A. Fantini, L. Lanza, Post Doc Simulation & Reconstruction: L. Lanza, A. Fantini, R. Di Salvo FEB Electronics: R. Ammendola

Genova

FEB Electronics: Paolo Musico, M. Battaglieri (streaming ro)

Catania

Simulation & Reconstruction: Mariagela Bondi'

The work will be performed in close connection with:

the group of Gianni Bencivenni @ INFN LNF and with the JLab detector group (Kondo Gnanvo, Seung Joon Lee)

INFN coordinates the GEM- μ Rwell MPGD ECT – for both the Hadron and Lepton Disks

- INFN will provide the Hadron Disks and related electronics as In-kind contributions
- **Temple U.** (Bernd Surrow , Matt Posik,) have expressed interest for the Lepton Disks.

The µ-RWELL (Micro Resistive Well Detector)

- The **µ-RWELL** is a Resistive MPGD detector (Micro Pattern Gas Detector)
- Used Gas : $Ar:CO_2:CF_4$ 45:15:40 mixture (it also works with $Ar:CO_2$ «green» mixture) The device is composed of two elements:
 - drift/cathode PCB defining the gas gap ($5\mu m Cu$ layer on the bottom side)
 - µ-RWELL_PCB (detector core)
 - Multilayer circuit: Well Pattered Polyimide \oplus resistive film \oplus readout PCB
 - Amplification stage: \rightarrow 50 µm thick Kapton (Apical®) foil With a 5 µm Cu layer on the top side
 - **Resistive stage:** \rightarrow DLC (*Diamond-Like-Carbon*) film sputtered on the bottom side of the polyimide foil _____
 - Surface resistivity: $\rho = 10 \div 100 \ M\Omega/\Box$

the resistivity is function of DLC thickness

The resistive layer strongly suppresses the transition from streamer to spark

=> Allows to achieve **large gains** (> 10⁴), without affecting the capability to operate under high particle fluxes

G. Bencivenni et al.; 2015_JINST_10_P02008

The µ-RWELL principle of operation

The "WELL" acts as a multiplication channel for the ionization produced in the gas of the drift gap

The charge induced on the resistive layer is spread with a time constant:

τ ~ <mark>ρ</mark> x c [M.S. Dixit et al., NIMA 566 (2006) 281]:

 $\rho \rightarrow {\rm ~the~DLC~surface~resistivity~}\cdot$

 $c \rightarrow$ the capacitance (per unit area), depending on the distance between the DLC and the readout plane

 $C = \varepsilon_0 \times \varepsilon_r \times \frac{s}{t} = 120 \ pF \times L(m) - w = 0.2 \ mm, \ p = 0.4 \ mm \text{ strip read-out}$

- The resistive stage ensures the quenching of the spark amplitude
- As a *drawback, t*he capability to stand high particle fluxes is reduced, but appropriate grounding schemes of the resistive layer solves this problem

The µ-RWELL Technology

Studies have been focused on the DLC grounding layout to increase the rate capability while maintaining a safe resistivity => The solution is to reduce as much as possible the current path towards the ground connection introducing a high density "grounding network" on the resistive stage of the detector

PEP – Patterning-Etching-plating

The active area is discontinued by grooves that uncover the DLC; then a copper plating, carefully separated from the copper in the active sectors, is disposed to connect the DLC to the ground.

A small dead zone on the amplification stage must be introduced for high stability operation

The **µ-RWELL** Technology

The spatial resolution is strongly dependent on the impinging angle of the track \rightarrow A non-uniform resolution in the solid angle covered by the apparatus \rightarrow Large systematical errors.

2D – readout: step by step approach

- 1. The first prototype was a set of 2x1D detectors each having the following specs, rotated by 90 degrees: 5 – 19 October 2022
- 780 µm pitch
- $300 \,\mu\text{m}$ width
- 10 x 10 cm² active surfa
- 128 channels

Test Beam: SPS North Area H8

2D – readout: 780 µm pitch-300 µm width - 10 x 10 cm² active surface

Increasing the pitch read-out the resolution is strongly affected by the number of strips among which the charge is distributed

ePIC giornate nazionali - June 28 2024 - Annalisa D'Angelo

2D – readout: step by step approach

1. 2x1D detectors.

The 2022/2023 tests show that the optimal pitch to obtain 100 μm resolution is the following:

- 400 μm pitch

- **300** μm width

Al – Faraday Cage glue

Honevcomb/millifoam

FR4 glue

glue FR4 glue

Kapton Copper

Copper Kapton DLC prepreg

Copper Kapton Glue

FR4 glue

glue FR4 glue Al – Faraday Cage

Honevcomb/millifoam

2D – readout: step by step approach

2. The second prototype reads the 2-nd coordinate on the "top" copper layer

Same readout geometry as in the bottom:

- 780 µm pitch
- 300 µm width
- $10 \times 10 \text{ cm}^2$ active surface
- 128 channels

The effect charge collection on the «top» RWELL layer is the object of investigation.

cathode

Gas gap

- 2D readout: step by step approach
- 3. The third prototype reads both coordinates on the bottom in "COMPASS-like" strips configuration with capacity sharing read-out:
- 1200 μm pitch
- 300 μm vs 1000 μm strips width
- 10 x 10 cm² active surface
- 83 channels

First Large Area Detector prototype

A first large area 40 x 46 cm² detector has been delivered to Roma Tor Vergata and is being characterized **in collaboration with the LNF group lead by Gianni Bencivenni**

1200 μm pitch 300 μm vs 1000μm strips

On-going Activities

TEST BEAM at CERN SPS North Area H8: 16 - 30 October 2024

Photo taken during 5 – 19 October 2022 test beam

Preliminary results from June test beam

Efficiency

- CS readout reaches a plateau at higher HV values than standard readout scheme.
- TOP readout is not yet at plateau at 600 V
 (HV was chosen not to to be raised to higher values)

Preliminary results from June test beam

Resolution

- CS readout reaches 100 μm resolution at highest HV values (starting from 1200 μm pitch)
- TOP readout resolution is fixed at 250-300 μm (pitch is 780 μm)

Preliminary results from June test beam

Cluster Size

- CS readout Cluster Size is not lower than 2.5 strips and increases to 4 at higher HV.
- higher cluster size → better resolution
- TOP readout cluster size is fixed at 1.3
- Bottom readout cluster size increases from 1.5 to 2.3 with HV

Summary of results from June test beam

TOP read-out

- The Top-readout efficiency is 80-82% (compatible with the geometrical acceptance of 87%).
- The efficiency does not show the plateau below 600V HV. The signal produced does not suffer from sharing between the 2 readout views.
- Spatial resolution is 250-350 μ m, compatible with pitch/v12

Capacity Sharing read-out

- The CS shows an efficiency plateau at 92-93% as a function of HV from 600 to 660V (too high!)
- The charge spread allows a very good spatial resolution, <100 μ m (at high HV).
- The average cluster size increases with HV.

FUTURE ACIVITIES

2D read-out optimization:

• The CS readout could be improved by eliminating one layer of sharing, going from the actual 3 capacitive ones (0.3 - 0.6 - 1.2 mm) down to 2 (0.4 - 0.8 mm).

INFN Manpower:

- Roma Tor Vergata: A. D'Angelo (PO), R. Di Salvo (I ric), A. Fantini (RU), L. Lanza (RTDa), E. Sidoretti (PhD)
- **Genova:** M. Battaglieri (DR), Paolo Musico (INFN) -> Readout electronics (SALSA)
- Roma 1: Evaristo Cisbani (GEM expert) Catania: Mariagela Bondi'
- The work would be performed in close connection with the group of Gianni Bencivenni @ LNF and with the JLab detector group (Kondo Gnanvo) EIC Detector R&D Proprosal

Strategy towards the integration in the MPDG Community

- We have explored the space for INFN in the EIC MPGD working group:
 - We joined the eRD108 call for 2024 FY for the R&D on endcap disks
 - We participate to the EIC MPGD weekly meetings
- We have explored the space for the INFN Roma TV group to DRD-1
 - We have submitted the request to join the DRD-1 gaseous detectors WP1 – T2
 - We are in contact with the INFN reference persons ٠

time

the grounding grid of the DLC is patterned by etching a groove in the base material from the top

 $\frac{G}{G_0}$ > 0.90 up to 20MHz/ cm²

The CLAS12 DC TRACKING UPGRADE

Two MPGD detector technologies have been discussed, triple-GEM and μ -RWELL

Large area triple-GEM detectors have been used in experiments (PRad, SBS, ...).

- μ-RWELL technology is new, only small prototypes have been tested:
 - \rightarrow will require extensive R&D.
- \blacktriangleright µ-RWELL detector is best suited for CLAS12:
 - low material budget, easy to build, less support structures in the active volume of the detector.

The High-Rate solution: PEP

Rate capability measured with 5.9 keV X-rays with Double Layer μ -RWELL (DRL) and with PEP

NB: a photon flux around 1 MHz/cm², which corresponds to a m.i.p. rate of 3 MHz/cm².

The μ -RWELL Development for Large Area Detectors : Spatial resolution $\rightarrow \mu$ TPC reconstruction ρ

A possible solution : *µTPC reconstruction*

- > The electrons created by the ionizing particle drift towards the amplification region
- In the μTPC mode from the knowledge of the drift time and the measurement of the arrival time of electrons, the track segment in the gas gap is reconstructed
- > The fit of the analog signal gives the arrival time of drifting electrons.
- > By the knowledge of **the drift velocity**, the 3D trajectory of th ionizing particle in the **drift gap** is reconstructed. drift field $E_p = 1 \frac{kV}{cm}$
