

Toward a stand alone distributed management system

Enrico Vianello, Matteo Manzali, Bruno Santeramo, Luca Tomassetti

Generalization of SuperB distributed production system as stand alone, general purpose infrastructure to accomplish small and medium VO requirements

let's talk about:

- WebUI development :
 - user ldap groups vs. webui permissions :
 - how could ldap groups be changed to reach a better generalization
 - bug-fixing on several pages
 - Full Simulation :
 - *FullSim* “draft” version
 - how show a large number of job parameters
 - introducing sub-parameters
- TIMELINE

Now there are the following LDAP groups:

- webui
- webuiFastProdMgr
- webuiFullProdMgr
- webuiShift
- WebUiDeveloper

which assign different privileges on webui users, this privileges are:

- init_full
- init_fast
- init_shift
- shift_monitor
- view_monitor
- create_production
- create_request

WebUI devel
works with these

In a generic <session oriented> project these groups and privileges are not enough
the proposal is to introduce following LDAP groups and privileges:

Idap groups:

webui_SessionMgr
webui_%SESSIONNAME%_ProductionMgr
webui_%SESSIONNAME%_ExpertUser
webui_%SESSIONNAME%_ShifterUser
webui_%SESSIONNAME%_User

privileges:

create session
create production
delete production
create request
validate request
delete request
view monitor
shift init
expert init

WebUI Smarty
now works with
these

meeting 22 Settembre 2011

groups	privileges	create session	create production	delete production	create request	validate request	delete request	view monitor	shift init	expert init
webui_SessionMgr										
webui...ProductionMgr										
webui...ExpertUser										
webui...ShifterUser										
webui...User										

...how about this solution?

giovedì 22 settembre 2011

- **When a user creates a new production, an associated test production is created**
- **User can delete a production (main + test) when both main and test production has no jobs**
- **It's possible to re-open a close production**

- **When a user creates a new production request, an associated test request is created**
- **It's possible to delete only production requests that have no jobs**
- **If a user deletes a production request, the test request associated is cleared only if has no jobs, otherwise the test request “survives” while main request is cleared**
- **..so it's possible to have on db a test request and not the main request (in fact, by Expert-Init it's possible to create a new test request through a job submission)**
- **target-sites specified on creating a production requests are virtually “shared” with the associated test request: the changements on main target sites are copied to the test request**
 - **there is the possibility that test request has some jobs while main request is still open: it means that jobs already submitted had, as target site, the site specified in the main request; also, if there is a changement on target sites (because status is still open!), from that moment on all test jobs will be move output files to the new target sites**

TO DO

- **on expert init interface, if the user defines a new test request, not only minrunnum has to be asked but also one or more target-sites**

meeting 22 Settembre 2011

- **SBK4 FullSim tables created!**
- **FullSim Job Parameters:**

Generator, Geometry, Symtype, PL, Geant4 Version, Min. Delta E, PDG Code, Theta min, Theta max, Phi min, Phi max, Energy min, Energy max. (**any other?**)

example of viewing all job parameters in FullSim request creation form: (OLD VERSION)

- **problems:**
 - **how to hide/show sub-parameters (like in webui devel) when selecting the generator and how to show in a better way some job parameters (ranges for example..)**
solution #1- SuperBVO members has a custom view of job parameters (simple but not generic)
 - ☒ solution #2- Elaborate a valid and not too much complex way to implement subparameter or dependencies (complex but generic)
- **large number of parameters = large number of columns on monitors**
 - solution: adding a new field on *_Parameter table: *hide_on_monitor* , so session manager can hide column/s by default on monitors and then, through the datatables col-vis plugin, show hidden columns if necessary

Generator	Geometry	Type	PL	Geant4 version	Min. Delta E	PDG Code	Theta min.	Theta max.	Phi min.	Phi max.	Energy (GeV) min.	Energy (GeV) max.	req.events	evt/job	#jobs	minrunnum	status
No data available in table

Parameters and Sub-Parameters

- there was a not used “[session_name]_Enable” on db, designed to obtain a “tree” of dependencies for Job Parameters = DELETED
- new “[session_name]_SubParameter” designed as follow: (case FullSim_SubParameter)

PK

↑

0 : is not a subparam
1 : is a subparam and it is shown if the parameter in *fname* is *fvalue*

↑

name	subparam	fname	fvalue
DG	0	DG	Geometry_CIPE
PL	0	PL	QGSP
G4EVER	0	G4EVER	9.2
SIMTYPE	0	SIMTYPE	bgframes
GENERATOR	0	GENERATOR	RadBhaBha
BRUNOPDG	1	GENERATOR	singleparticle
BRUNOEMAX	1	GENERATOR	singleparticle
BRUNOEMIN	1	GENERATOR	singleparticle
BRUNOPHIMAX	1	GENERATOR	singleparticle
BRUNOPHIMIN	1	GENERATOR	singleparticle
BRUNOBBBMINDE	1	GENERATOR	RadBhaBha
BRUNOTHETAMAX	1	GENERATOR	singleparticle
BRUNOTHETAMIN	1	GENERATOR	singleparticle

not relevant - initialized with default value for the parameter - used to maintain the referential integrity

→

it means that the parameter *name* has to be shown on the interface only if *fname* parameter has the value in *fvalue*

→

FK

↓

..._Parameter(name)

FK

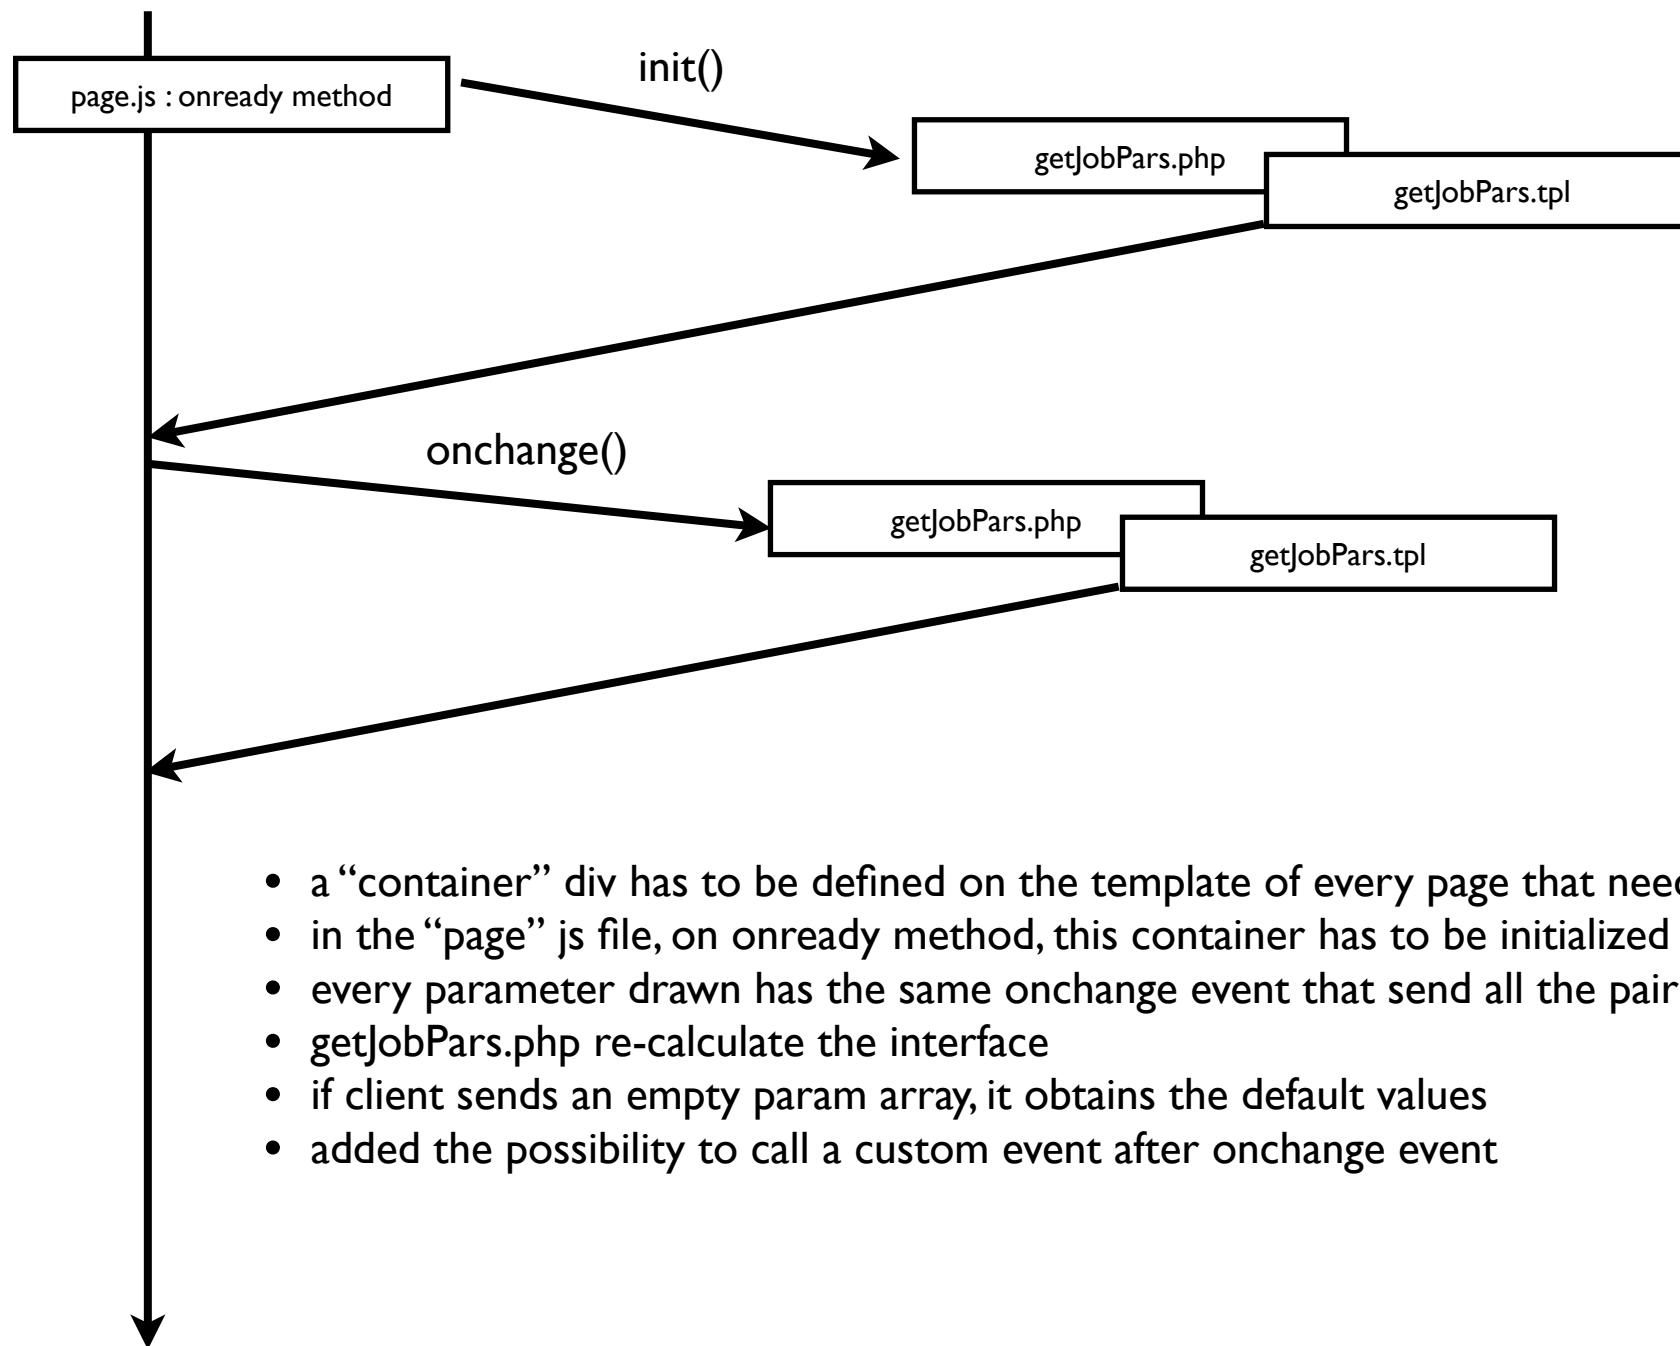

↓

..._Parameter_Values
(name, value)

With a list of pairs like (parameter.name, parameter.value), we can obtain a list of the parameters that have to be shown with a query similar to:

```
SELECT DISTINCT(name)
FROM FullSim_SubParameter
WHERE (subparam = 0)
      OR ( (subparam = 1) AND (
          (fname = parameter[1].name AND fvalue = parameter[1].value)
          OR
          ...
          OR
          (fname = parameter[n].name AND fvalue = parameter[n].value) ) )
```

Parameters and Sub-Parameters

- a “container” div has to be defined on the template of every page that needs to show the session job parameters
- in the “page” js file, on onready method, this container has to be initialized with an ajax call to `getJobPars.php`
- every parameter drawn has the same onchange event that send all the pairs (parname - parvalue) to the `getJobPars.php`
- `getJobPars.php` re-calculate the interface
- if client sends an empty param array, it obtains the default values
- added the possibility to call a custom event after onchange event

Parameters and Sub-Parameters

after init :

Job Parameters (new version beta):

Generator: RadBhaBha	Geometry: Geometry_CIPE	Type: fullsim	PL: QGSP_BERT	Geant4 version: 9.2	Min. Delta E: 0.1
-------------------------	----------------------------	------------------	------------------	------------------------	----------------------

A Production Request with the selected parameters already exists

on change "Generator" :

Generator:
RadBhaBha
RadBhaBha
SingleParticle

Generator: SingleParticle	Geometry: Geometry_CIPE	Type: fullsim	PL: QGSP_BERT	Geant4 version: 9.2	PDG Code: 999
Theta min.: -1	Theta max.: 1	Phi min.: 0	Phi max.: 1	Energy (GeV) min.: 2	Energy (GeV) max.: 2

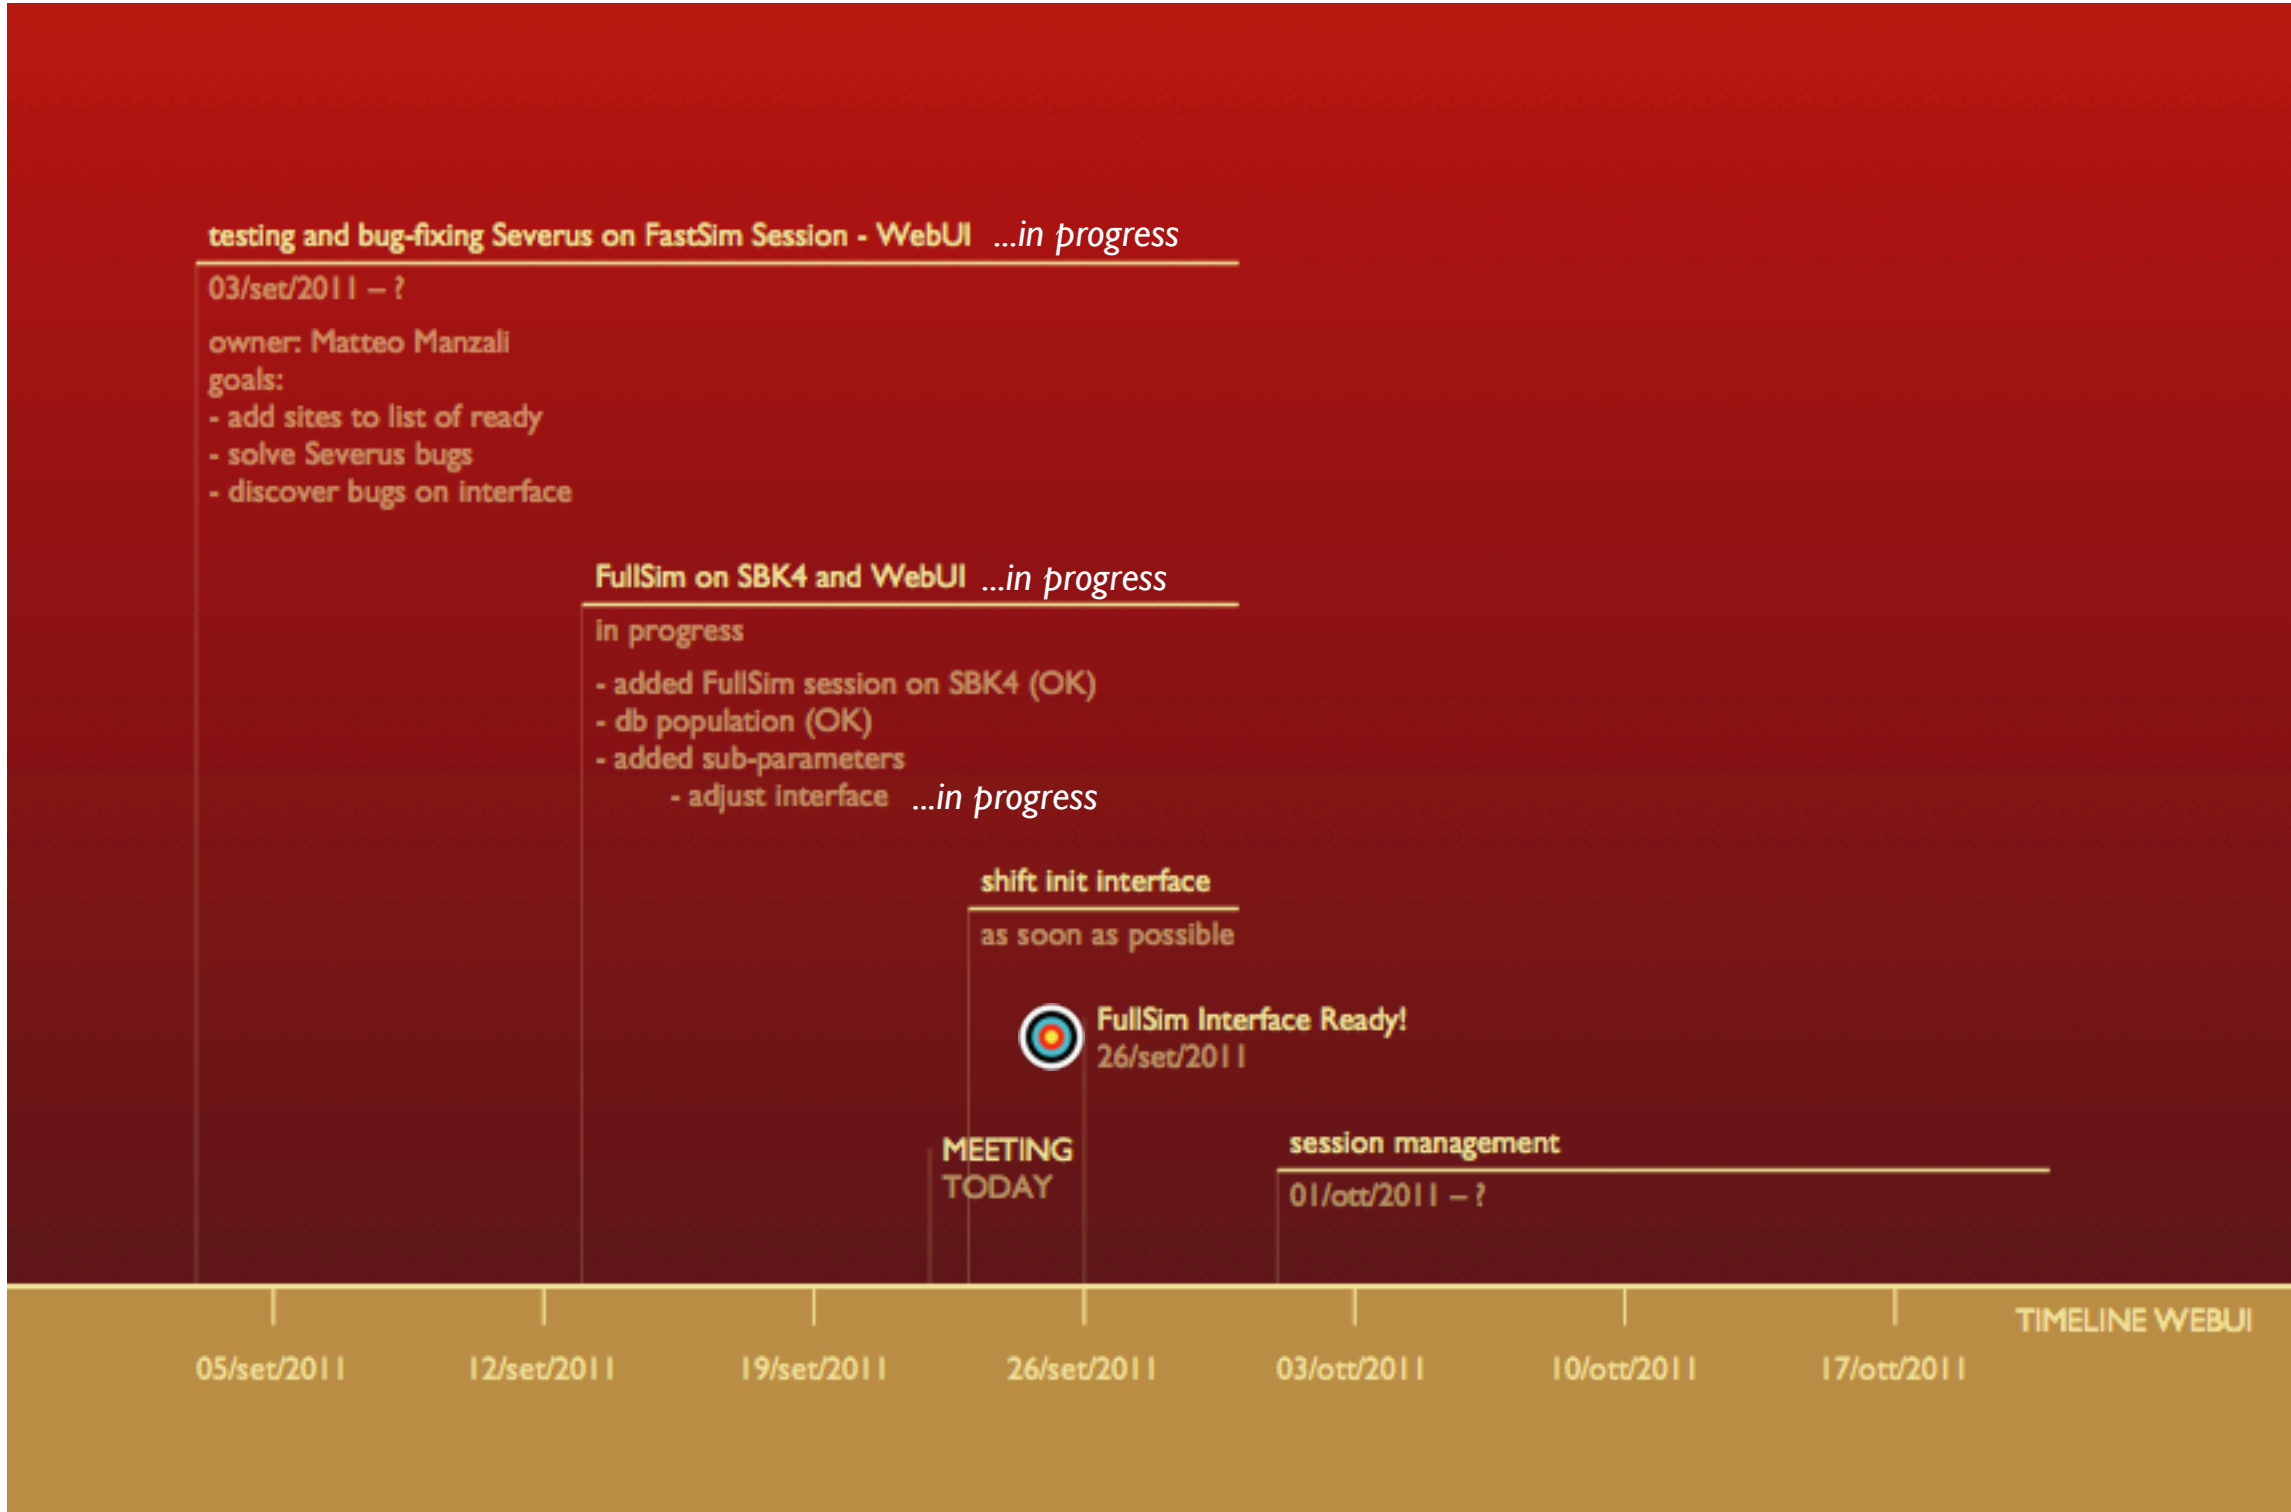

A Production Request with the selected parameters doesn't exists and will be created

check if that request exists - a method appended to the onchange event check this!

>> now REQUEST_NAME has to be created with the MD5 of the enabled job parameters!
