First Results from the Daya Bay Reactor Neutrino Experiment

Deb Mohapatra (Virginia Tech)
on behalf of the Daya Bay Collaboration

Outline

- Introduction
- Daya Bay experimental setup
- Preliminary detector performance
- Side by side comparison of first two detectors
- Sensitivity and systematics
- Summary

The Neutrino Mixing Matrix

- The MNS matrix relates the mass eigenstates (ν_1, ν_2, ν_3) to the flavor eigenstates (ν_e, ν_μ, ν_τ)

$$\begin{pmatrix} \nu_e \\ \nu_\mu \\ \nu_\tau \end{pmatrix} = \begin{pmatrix} U_{e1} & U_{e2} & U_{e3} \\ U_{\mu 1} & U_{\mu 2} & U_{\mu 3} \\ U_{\tau 1} & U_{\tau 2} & U_{\tau 3} \end{pmatrix} \begin{pmatrix} \nu_1 \\ \nu_2 \\ \nu_3 \end{pmatrix}$$

Last unknown
matrix element

- It can be described by three 2D rotations

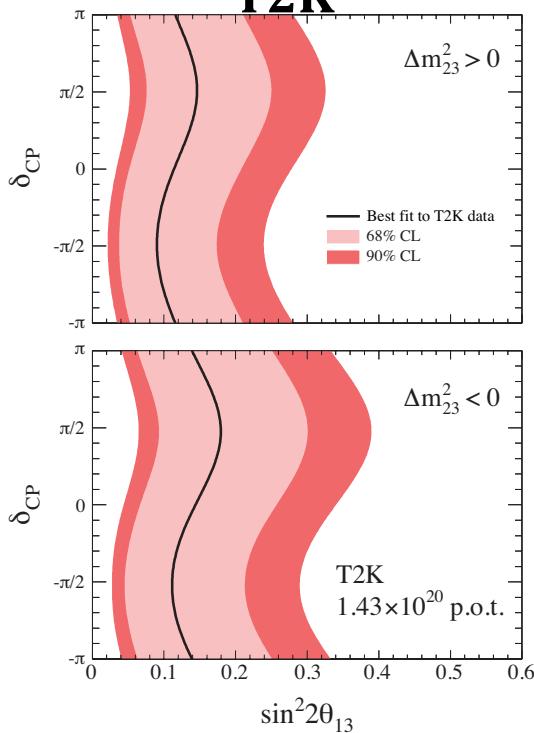

$$U_{\text{MNS}} = \underbrace{\begin{pmatrix} 1 & 0 & 0 \\ 0 & \cos\theta_{23} & \sin\theta_{23} \\ 0 & -\sin\theta_{23} & \cos\theta_{23} \end{pmatrix}}_{\text{Atmospheric}} \underbrace{\begin{pmatrix} \cos\theta_{13} & 0 & e^{-i\delta} \sin\theta_{13} \\ 0 & 1 & 0 \\ -e^{i\delta} \sin\theta_{13} & 0 & \cos\theta_{13} \end{pmatrix}}_{\text{Reactor}} \underbrace{\begin{pmatrix} \cos\theta_{12} & \sin\theta_{12} & 0 \\ -\sin\theta_{12} & \cos\theta_{12} & 0 \\ 0 & 0 & 1 \end{pmatrix}}_{\text{Solar}} \underbrace{\begin{pmatrix} 1 & 0 & 0 \\ 0 & e^{i\alpha} & 0 \\ 0 & 0 & e^{i\beta} \end{pmatrix}}_{\text{Majorana Phases}}$$

Measurement of the last unknown mixing angle is going to have a substantial impact on the future of neutrino physics.

Recent Experimental Results (2011): θ_{13} may be large

Accelerator based appearance expts

T2K

PRL 107, 041801 (2011)

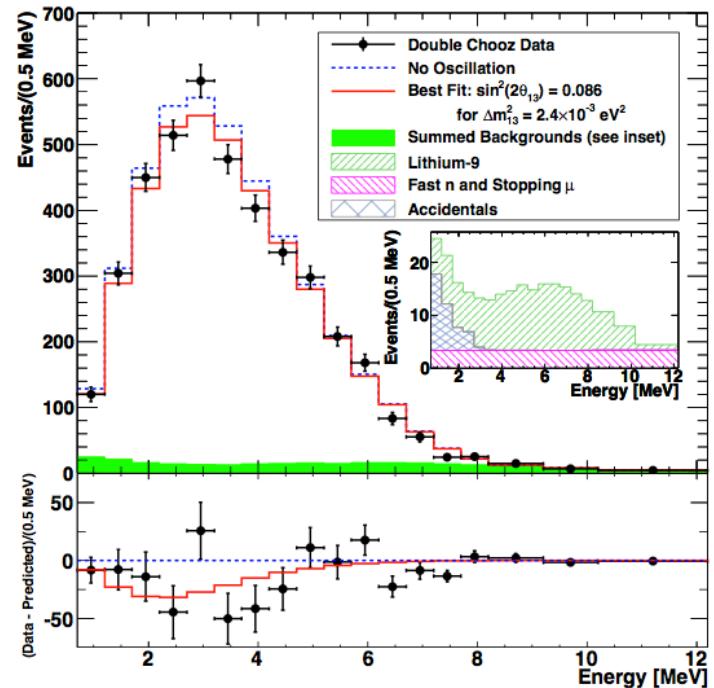

$0.03(0.04) < \sin^2 2\theta_{13} < 0.28(0.34)$ at 90% CL

PRL 107, 181802 (2011)

$0.03(0.04) < \sin^2 2\theta_{13} < 0.28(0.34)$ at 90% CL

Reactor based disappearance expt

Double Chooz

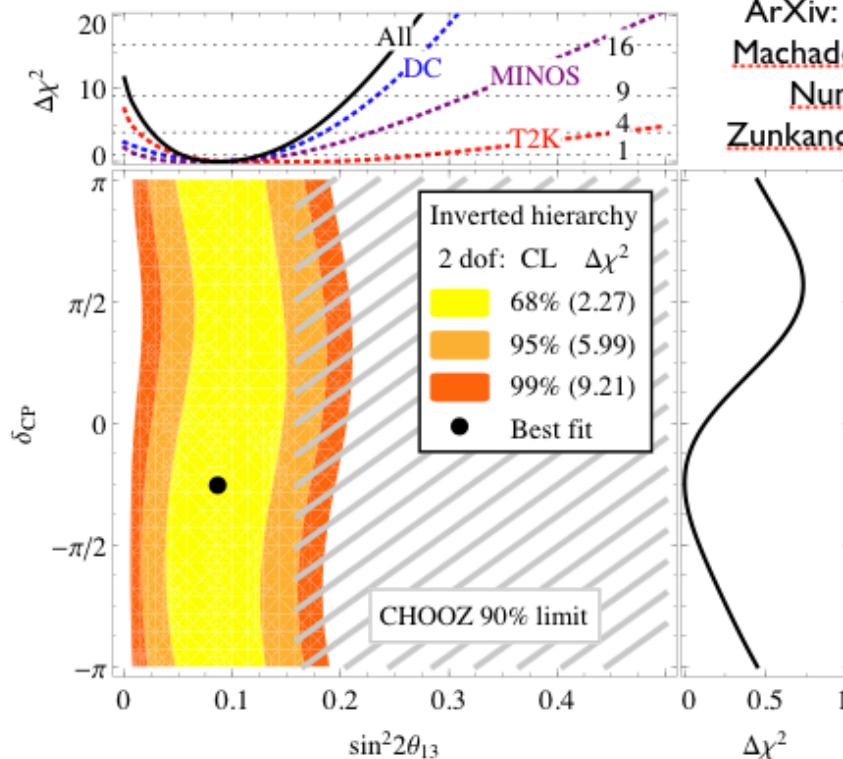

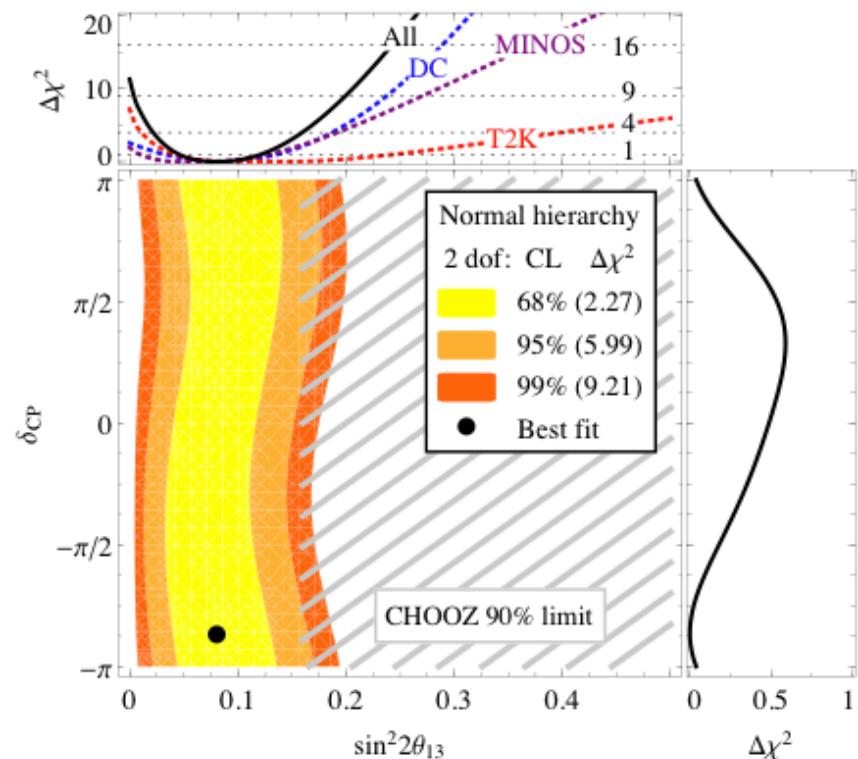

arXiv:1112.6353v2

$\sin^2 2\theta_{13} = 0.086 \pm 0.041(\text{stat}) \pm 0.030(\text{sys})$
 $(0.015 < \sin^2 2\theta_{13} < 0.16 \text{ at 90\% CL})$

Combined Analysis

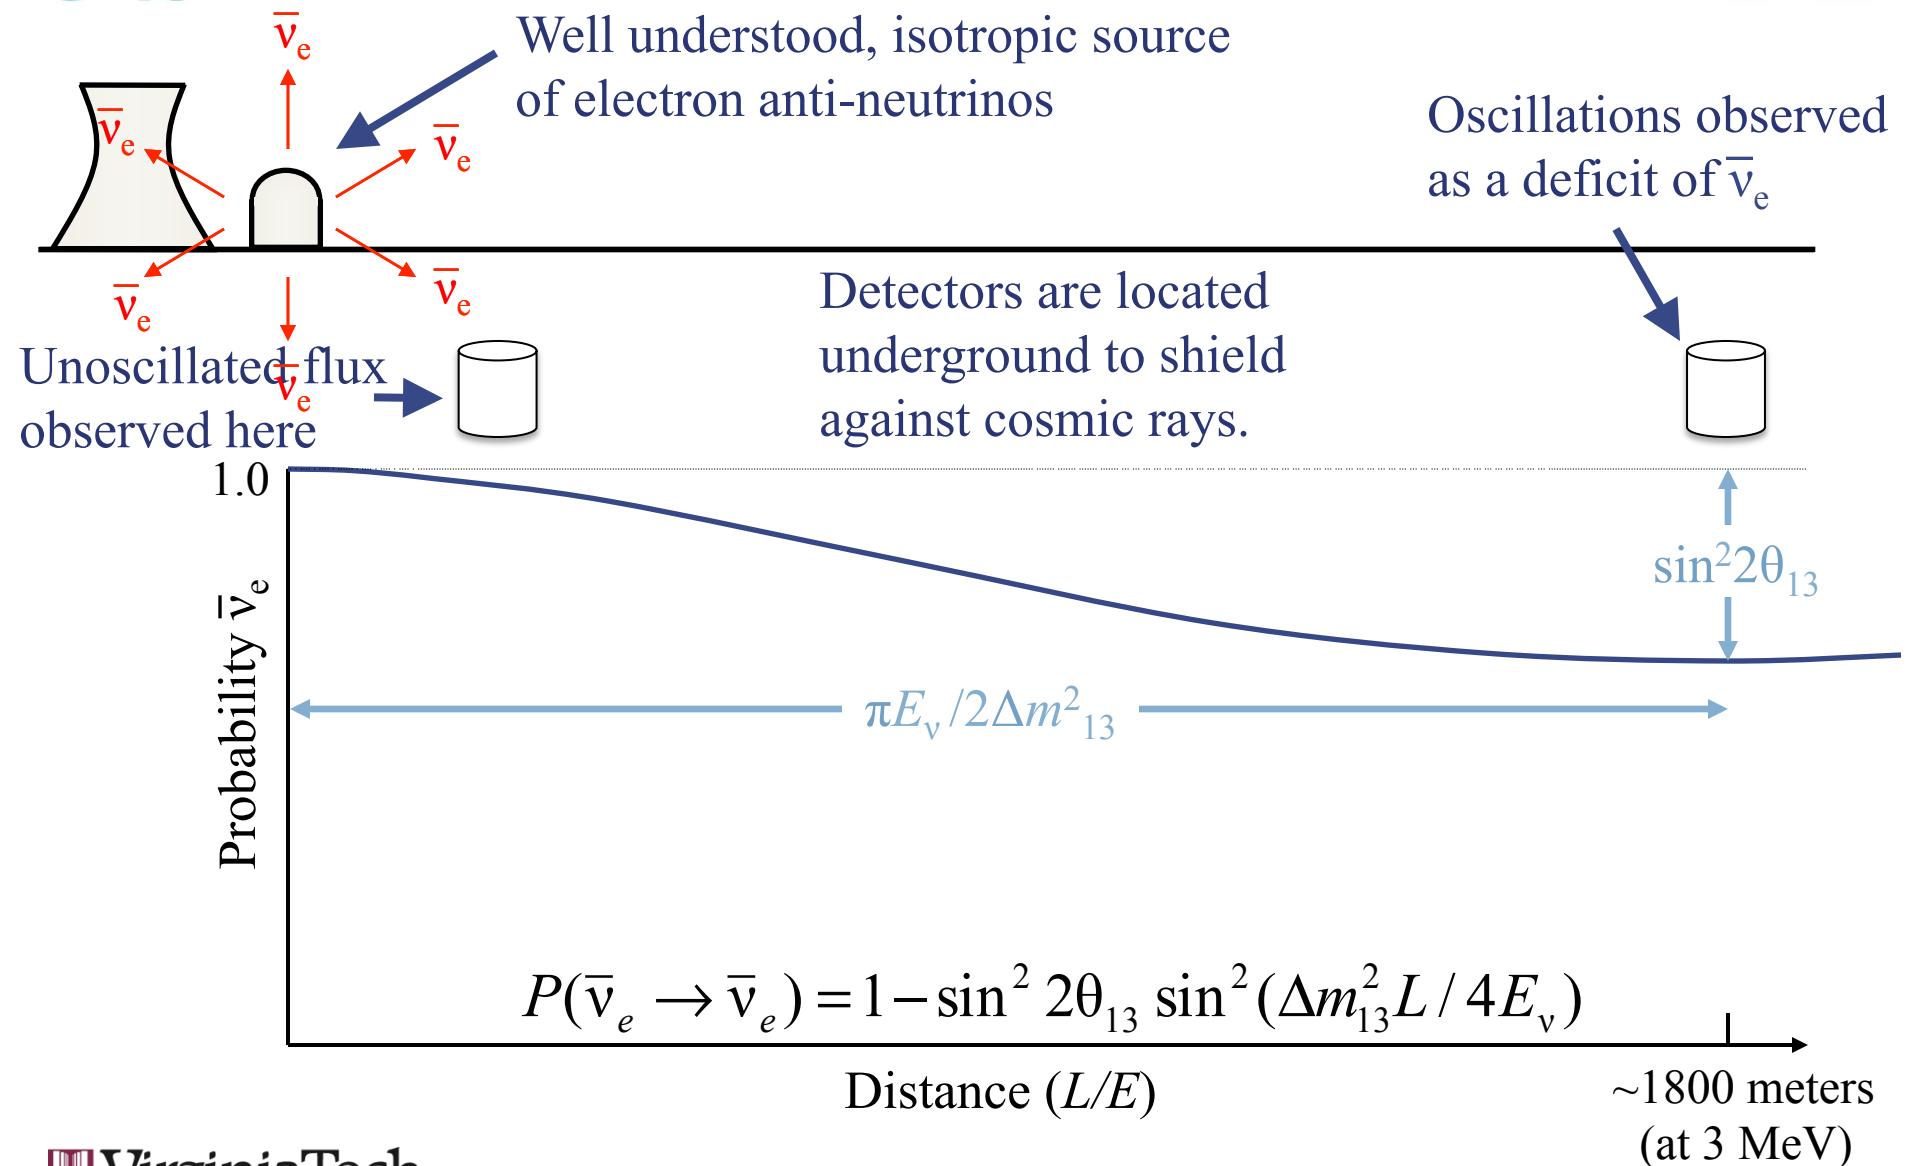

ArXiv:1111.3330,
 Machado, Minakata,
 Nunokawa,
 Zukanovich Funchal

$\sin^2 2\theta_{13}$	Best Fit	95% C.L.	$\sin^2 2\theta_{13} = 0$
Normal Hierarchy	0.081	0.023-0.16	3.36σ
Inverted Hierarchy	0.087	0.027-0.17	3.36σ

Daya Bay Design Principle

- Identical near and far detectors cancel many systematic errors
- Multiple modules boost statistics while reducing systematic errors with multiple independent measurements
- Three zone detector design eliminates the need for spatial cuts which can introduce systematic uncertainties
- Shielding from cosmic rays and natural radioactivity reduces background rates
- Movable detectors allow possible cross calibration between near and far detectors to further reduce systematic errors.

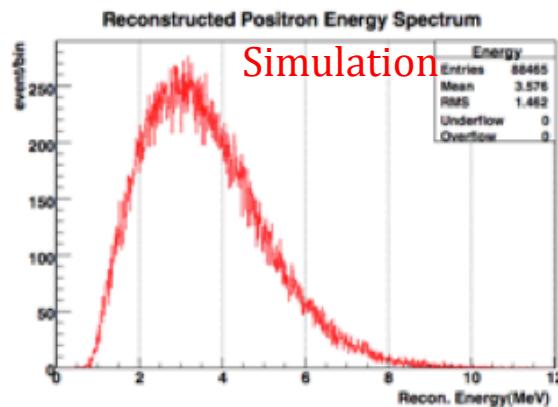

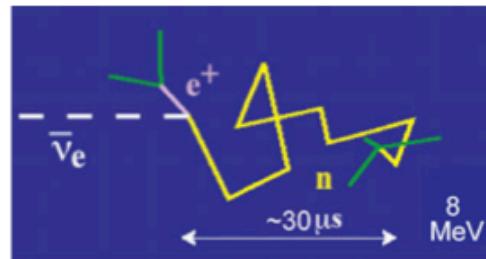

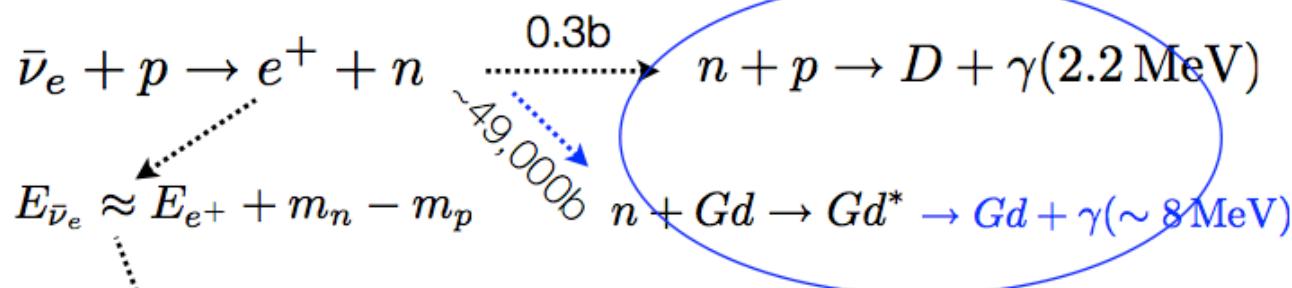

Experimental Layout

	Overburden	D. B.	L. A.	L. A. II
	mwe	m	m	m
EH1	280	360	860	1310
EH2	300	1350	480	530
EH3	880	1910	1540	1550

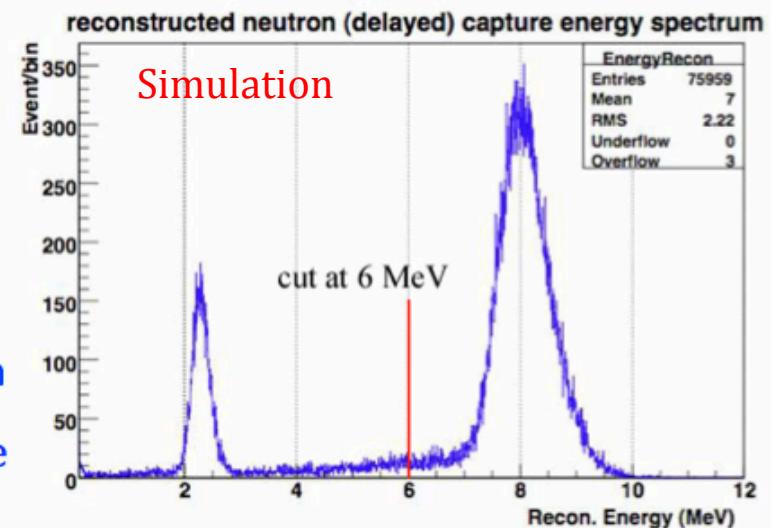

Antineutrino Detection

Daya Bay: 0.1% Gd doped liquid scintillator as target

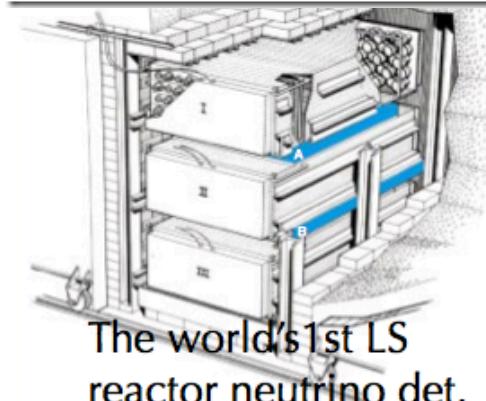

Correlated Signals

- background suppression
- well-defined target zone

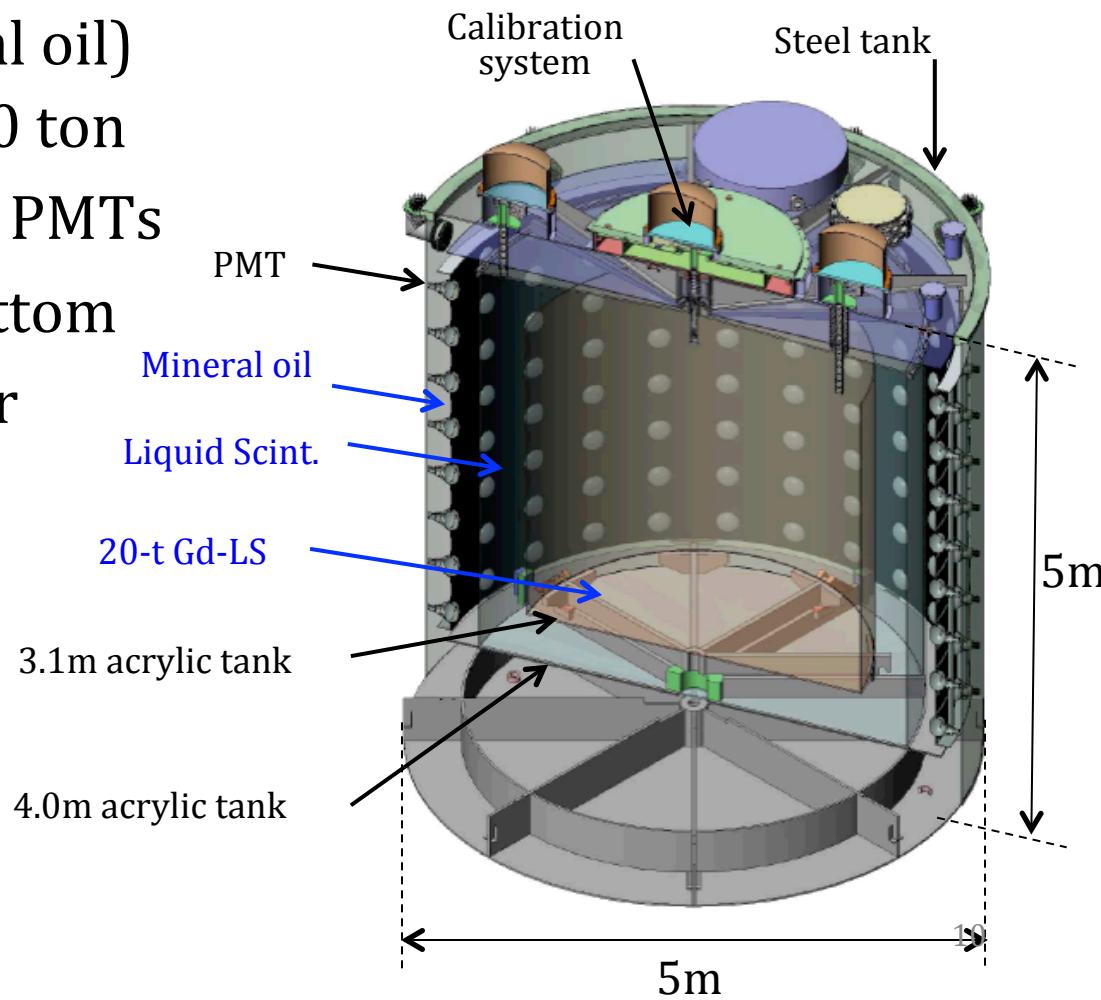

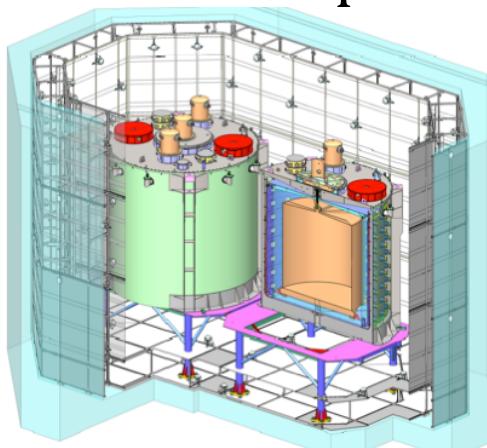

Savannah River Experiment
Reines *et al.*, Phys. Rev. **117**, 159 (1960)

8 Identical Antineutrino Detectors

- Three-zone cylindrical design
 - ✓ Target: 20 t (0.1% Gd based Liquid Scintillator)
 - ✓ Gamma catcher: 20 t LS
 - ✓ Buffer : 40 t (mineral oil)
 - ✓ Detector Mass ~ 110 ton
- 192 low-background 8" PMTs
- Reflectors at top and bottom
- ADs sit in a pool of water

AD Calibration System

Automated calibration system

→ routine weekly deployment of sources

LED light sources

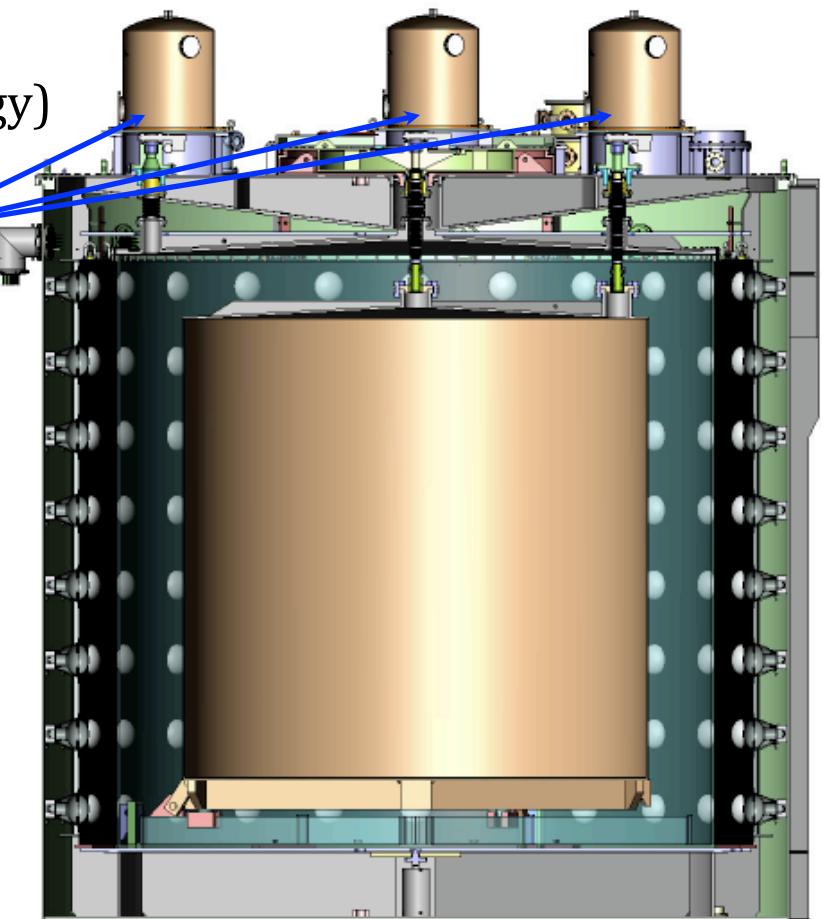

→ monitoring optical properties

e^+ and n radioactive sources (=fixed energy)

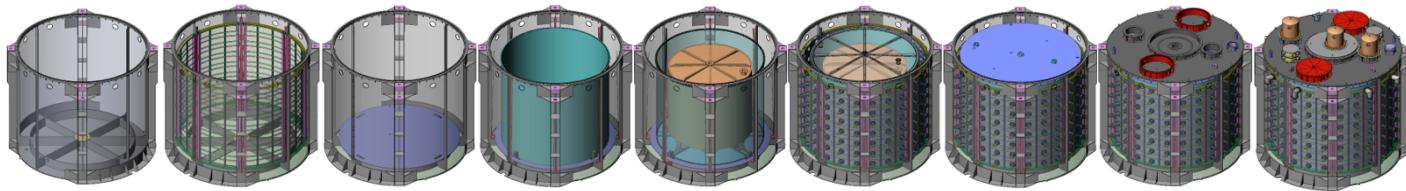

→ energy calibration

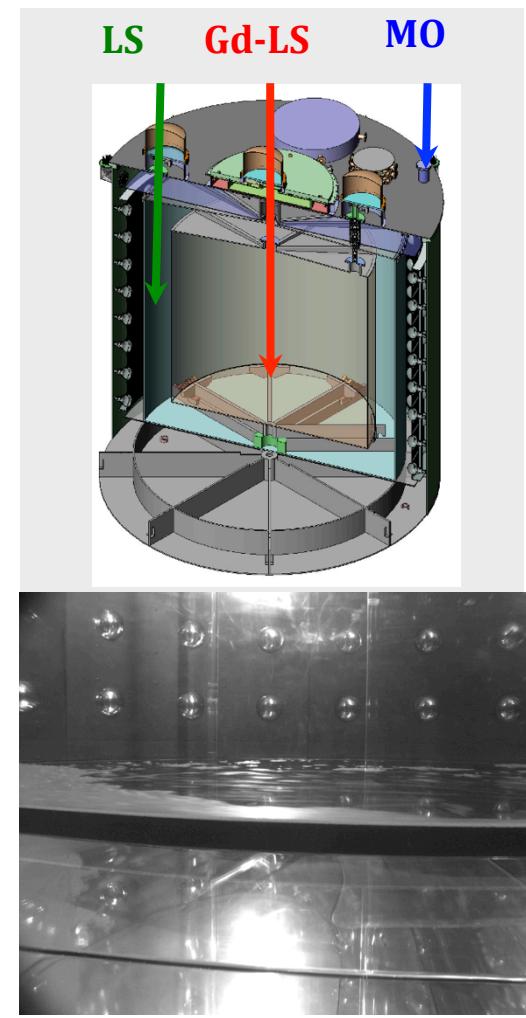

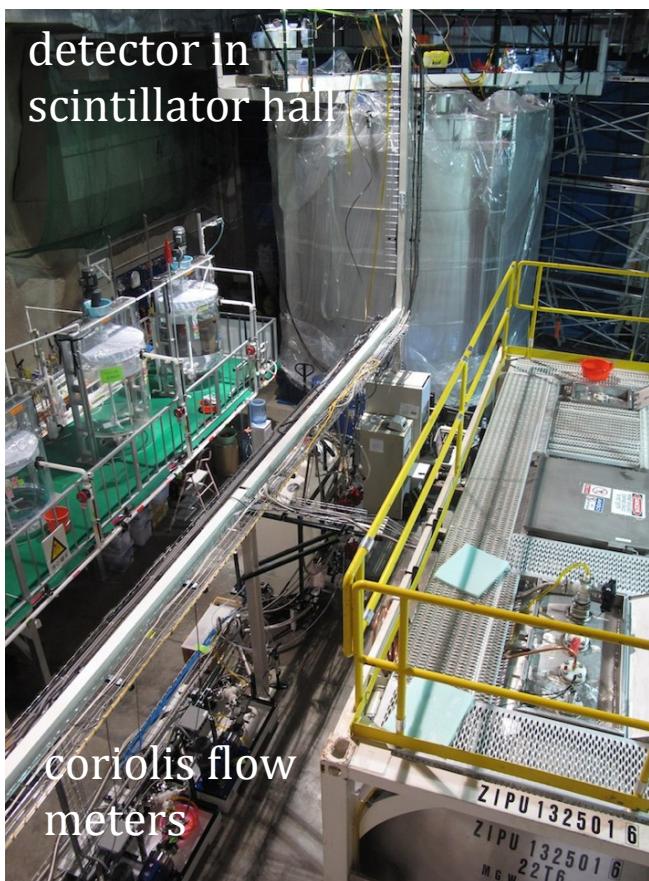

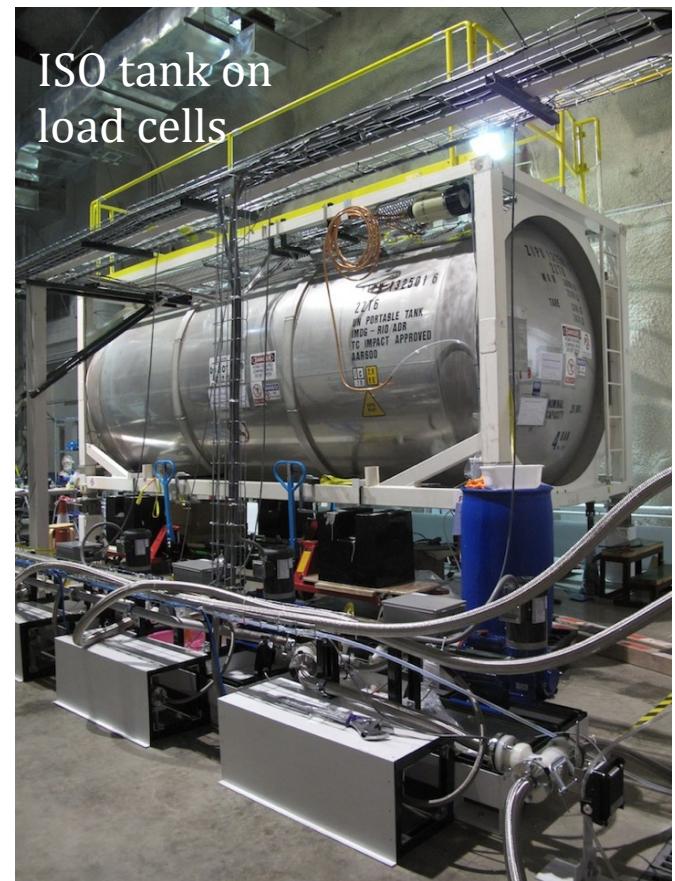

- ^{68}Ge source
- Am- ^{13}C + ^{60}Co source
- LED diffuser ball

Anti Detector Assembly

Detector Filling and Target Mass Measurement

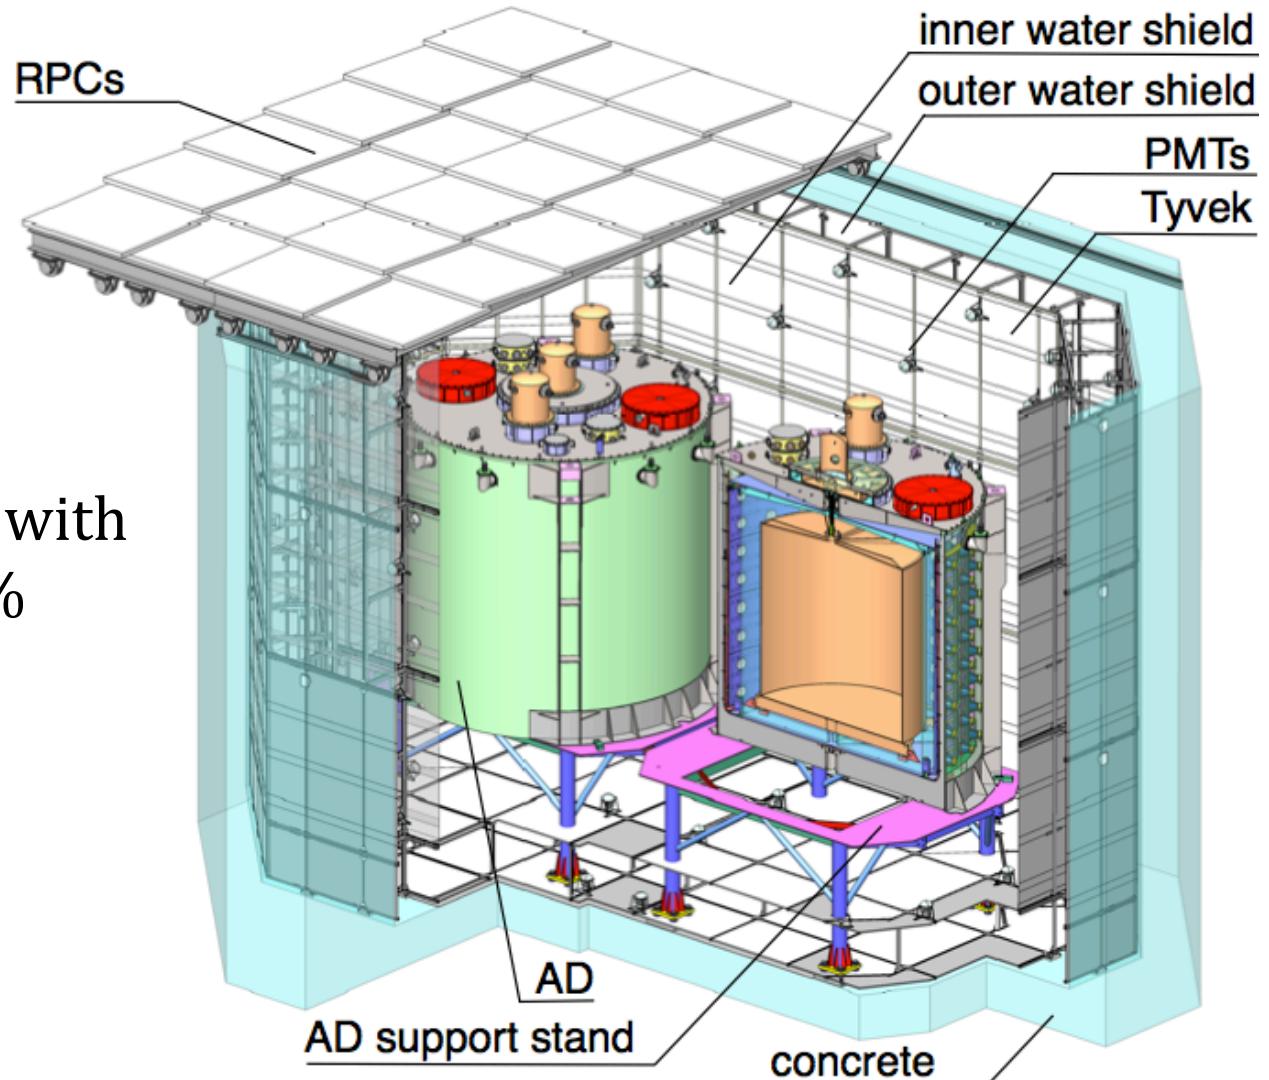

Target mass determination error
 $\pm 3\text{kg}$ out of 20,000 or <0.02%.

Detectors are filled from same reservoirs “*in-pairs*” within < 2 weeks.

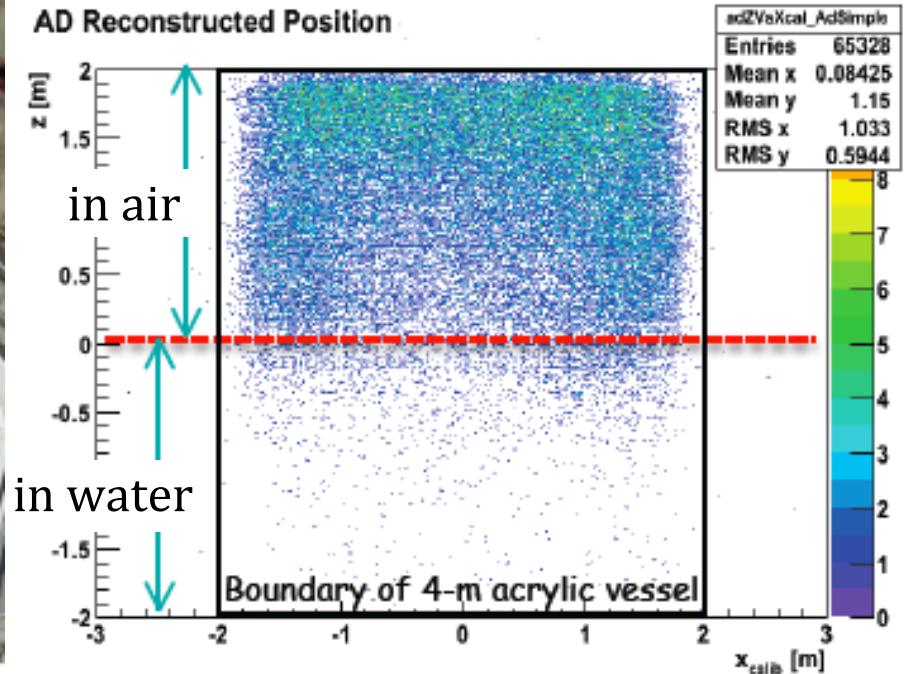

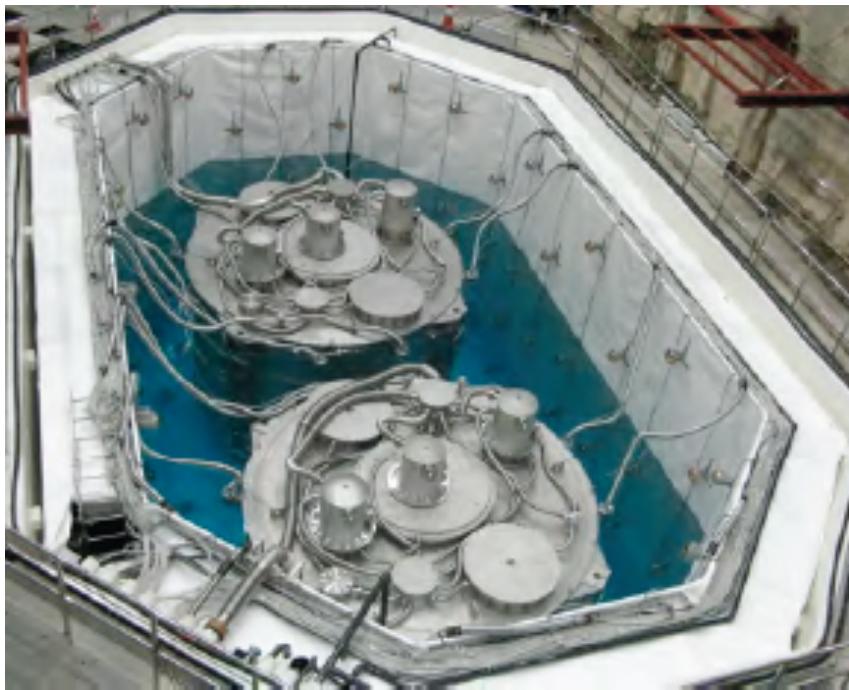

The Muon Tagging System

Dual tagging systems: 2.5 meter thick two-section water shield and RPCs

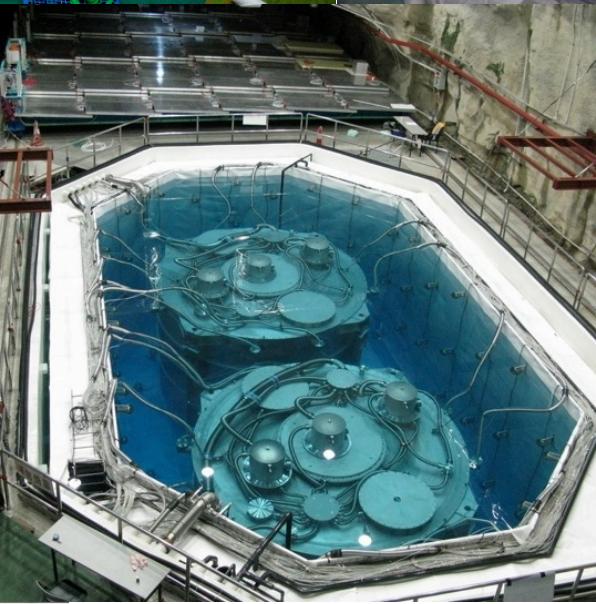

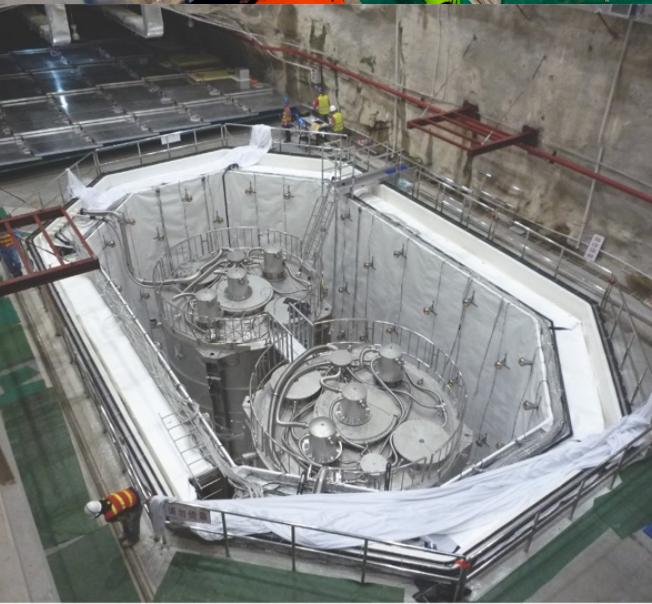

- Efficiency > 99.5% with uncertainty <0.25%

Water Shield Suppresses the Radioactive background

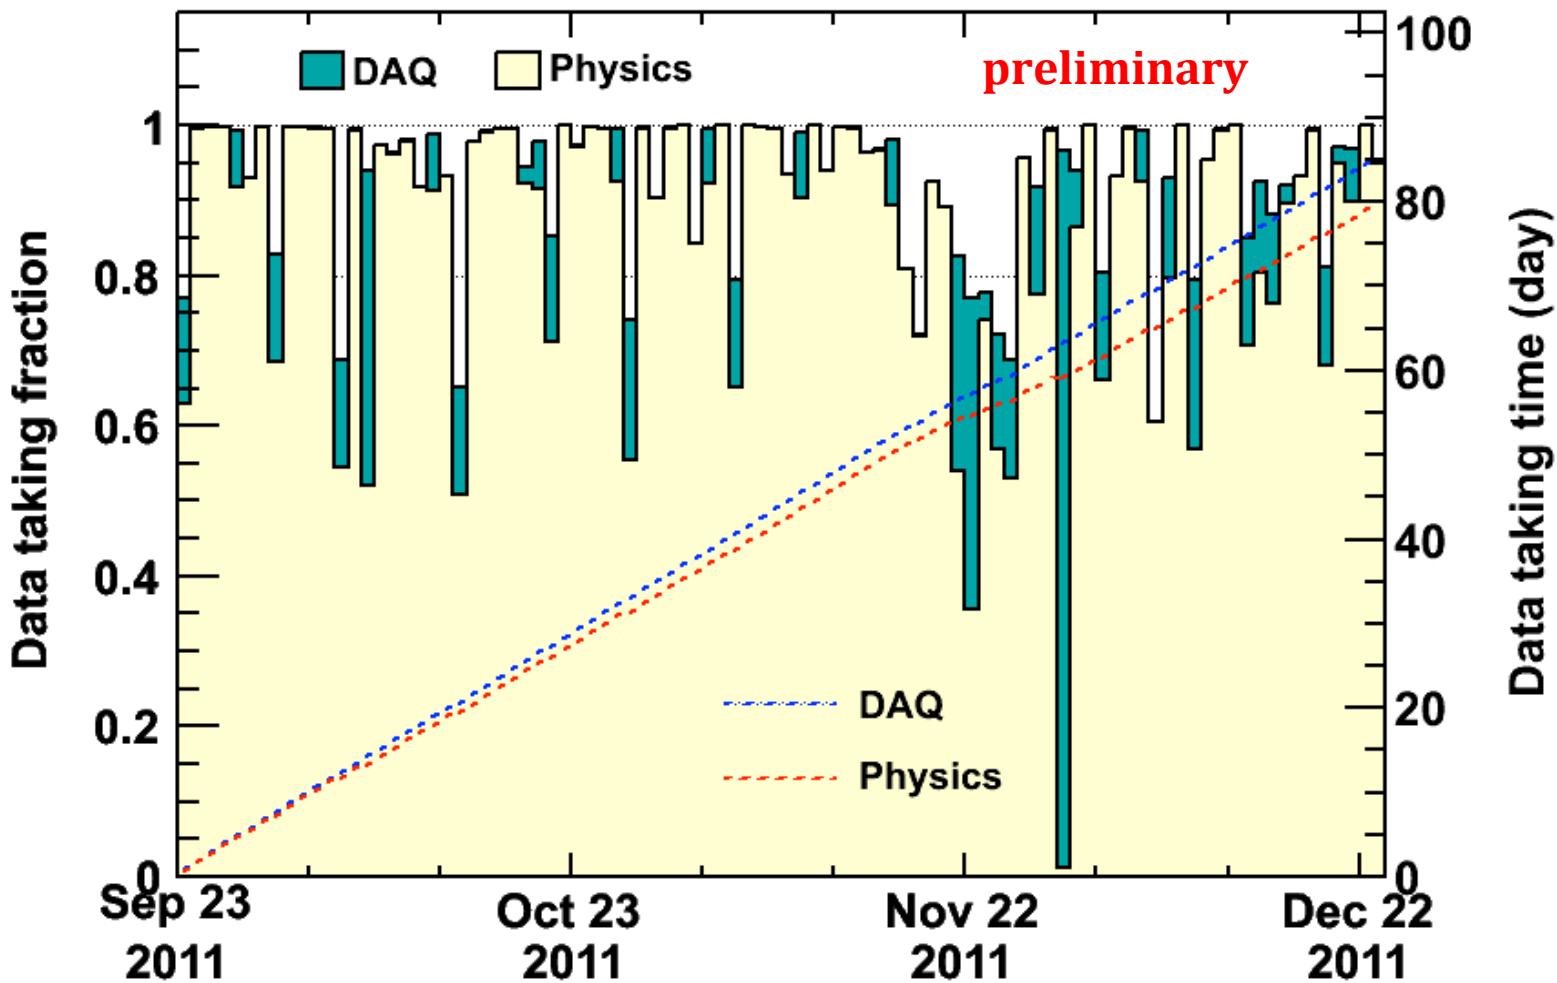

Singles events versus height in the partially filled pool show the suppression of radioactive backgrounds by water.

Near Site Data Taking since August 2011

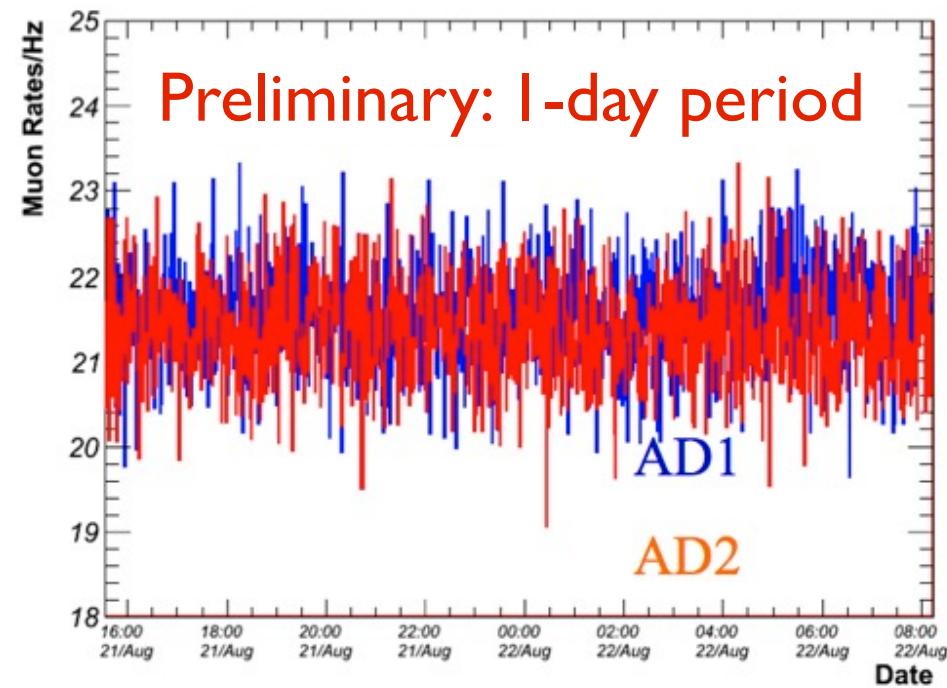

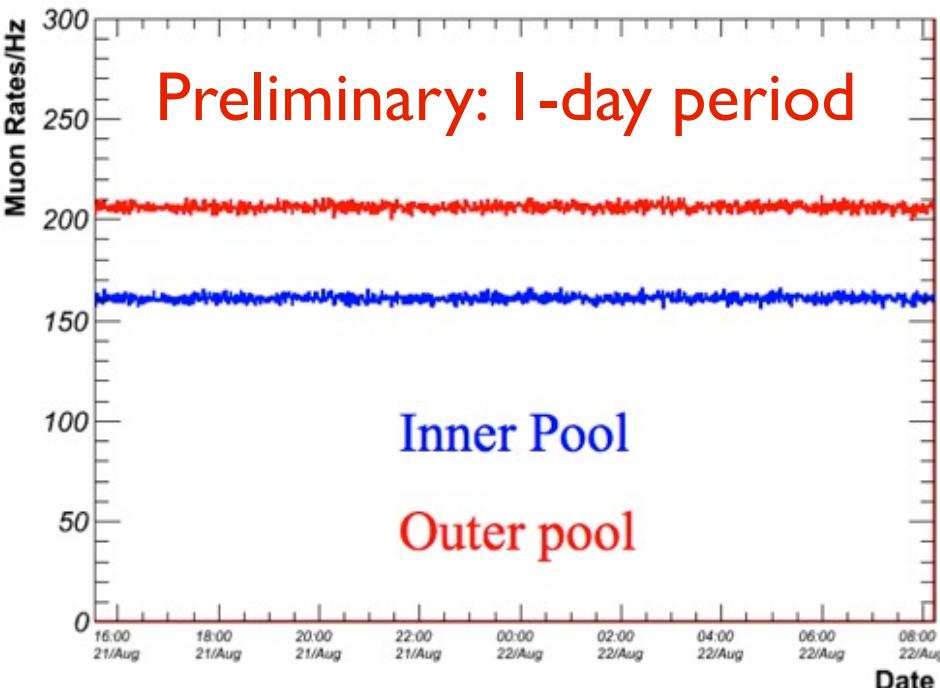

Daya Bay $\bar{\nu}_e$ Experiment

Live Time of First Two Detectors

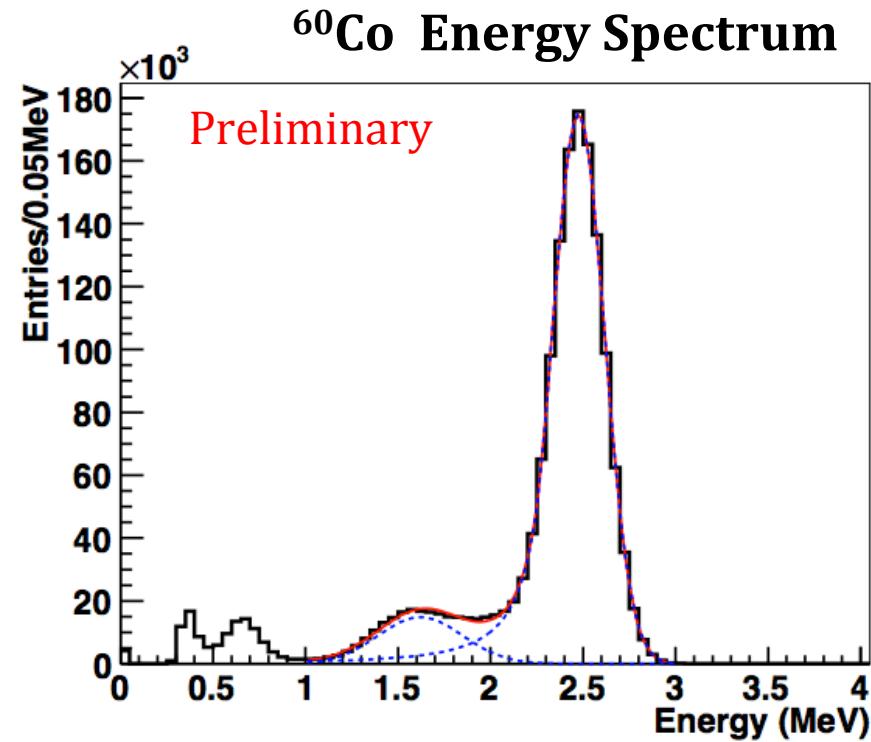

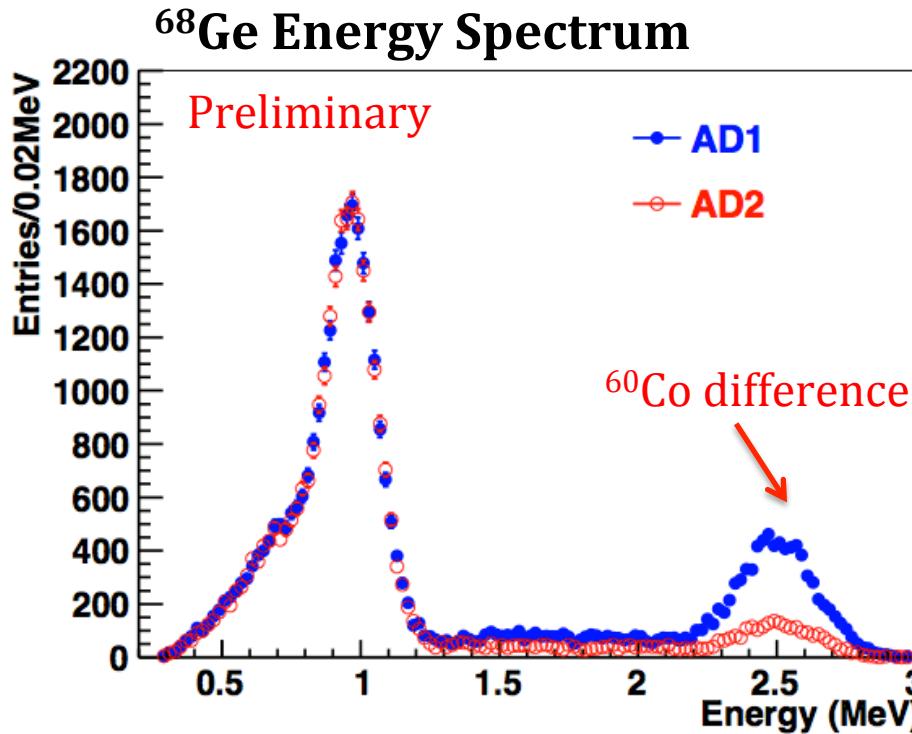

We have used this 3 months of data for side-by-side comparison of first two detectors.

Muon Rates at the Daya Bay Near Site

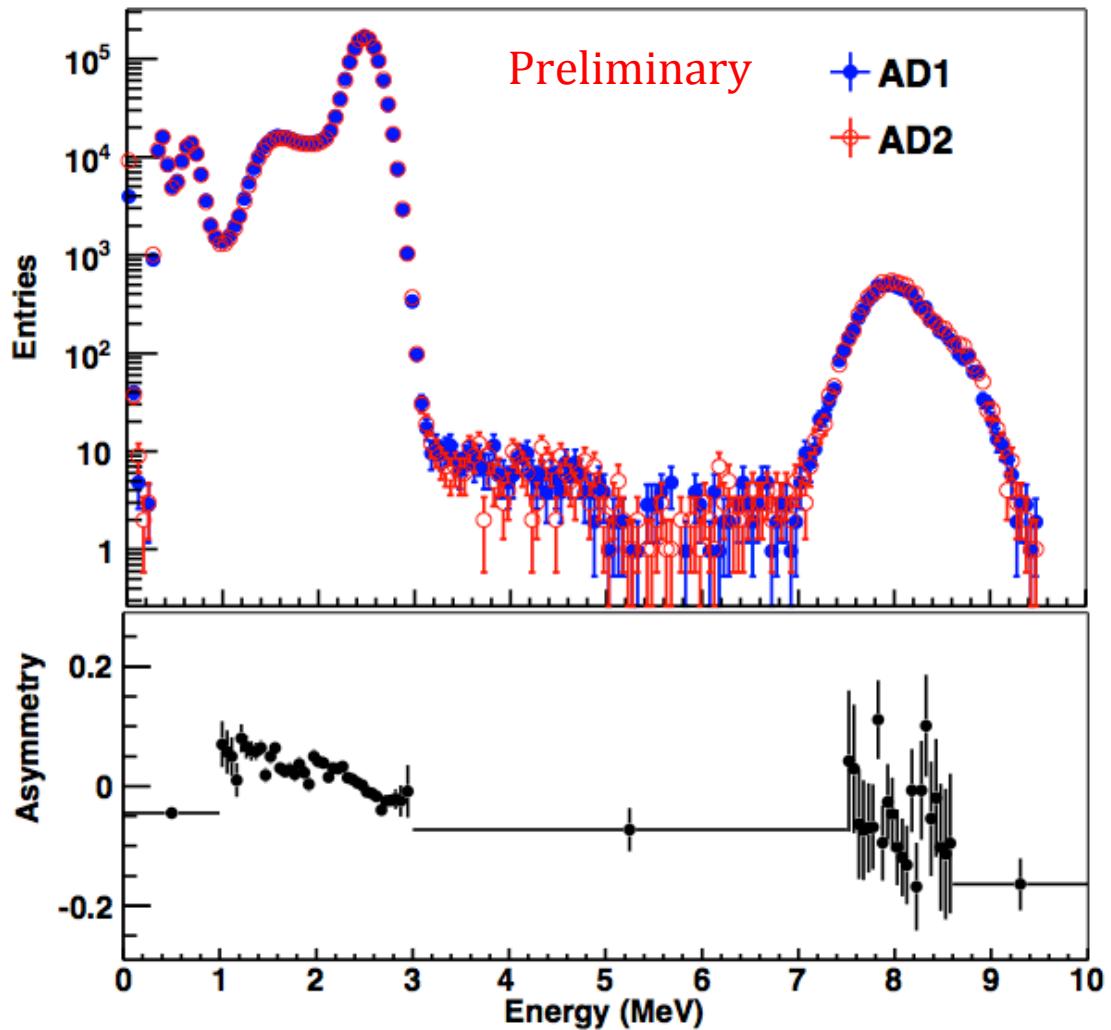

- Measured rates are consistent with expected ~20hz for each AD at the Daya Bay near site

Energy Response with Calibration Sources: ^{68}Ge and ^{60}Co

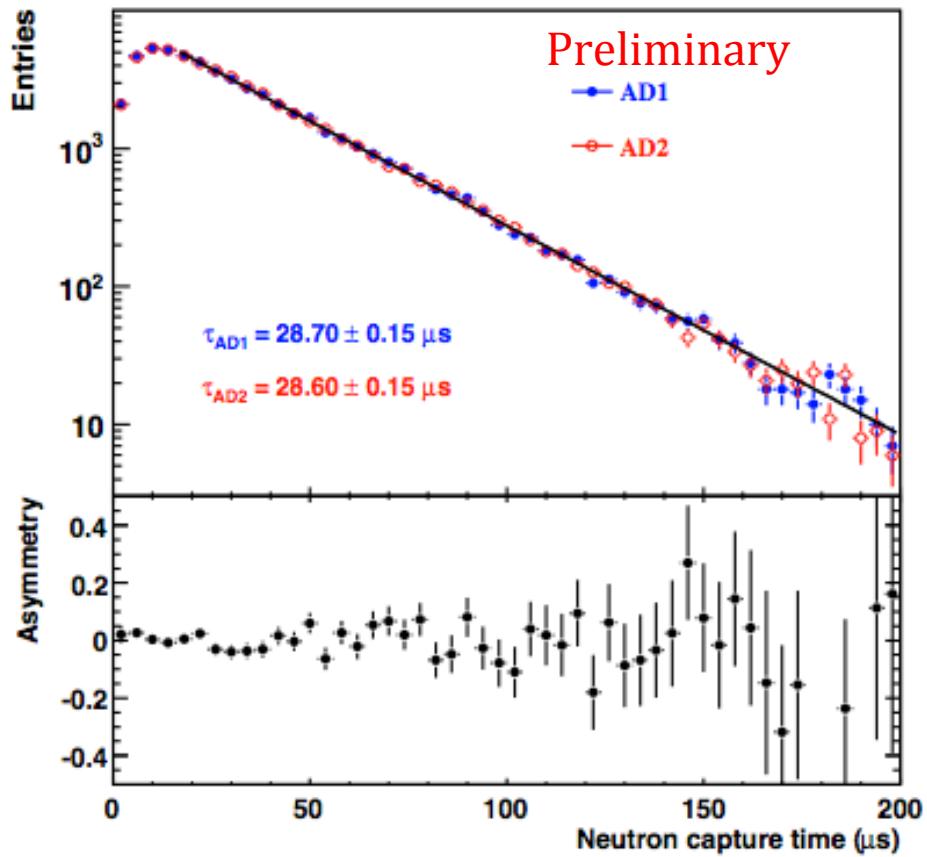

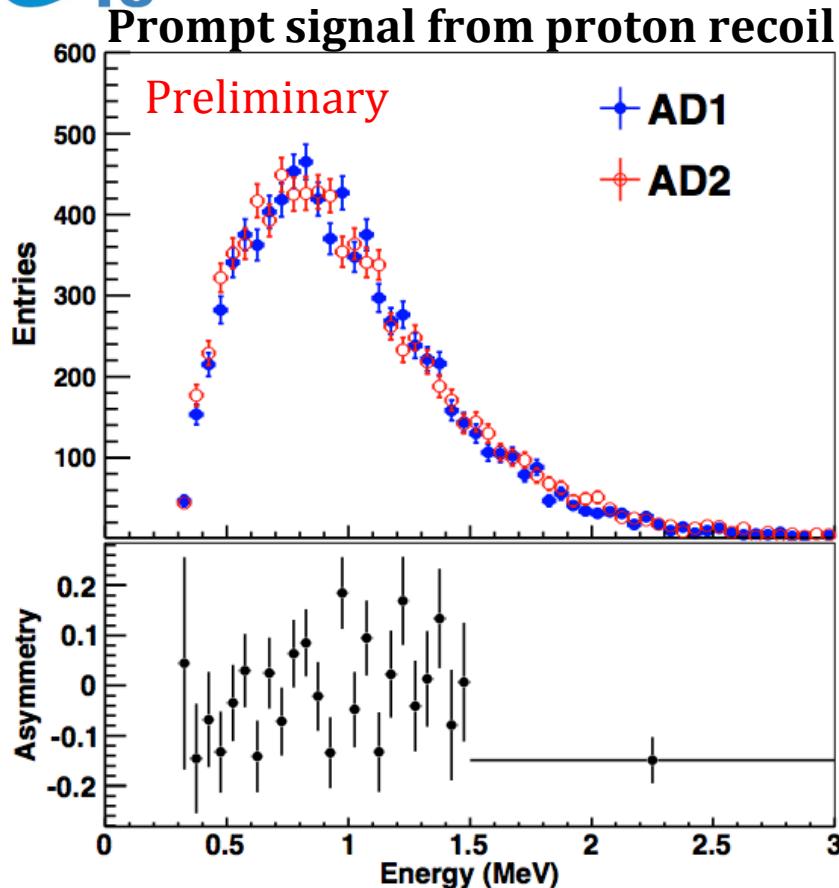

- Weekly automatic detector calibration
- Energy responses of the detectors are studied with ^{68}Ge , ^{60}Co and Am- ^{13}C

Energy Spectrum with Am-¹³C/ ⁶⁰Co Source

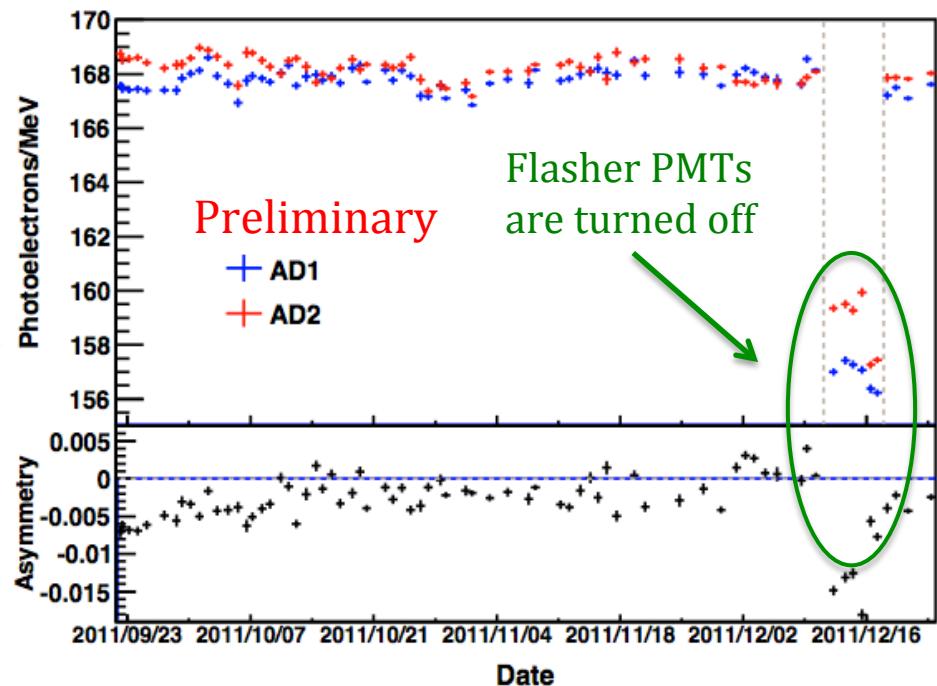

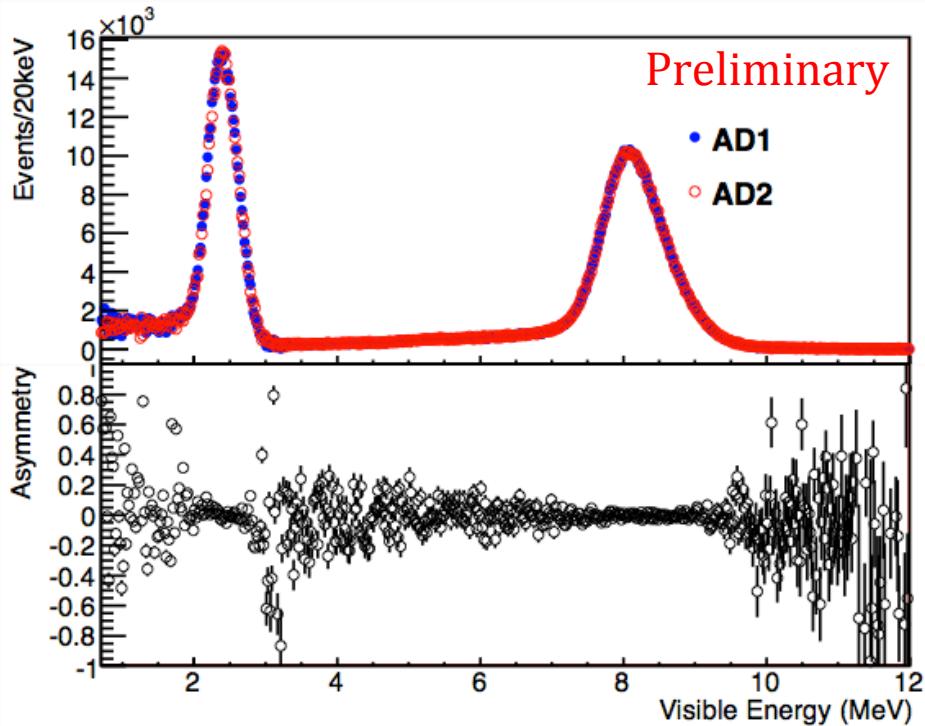

$$\text{Asymmetry} = \frac{N_{\text{AD1}} - N_{\text{AD2}}}{(N_{\text{AD1}} + N_{\text{AD2}})/2}$$

$N_{\text{AD1,2}}$ is the bin content
for AD1 or 2

- Two ADs with similar energy responses ($\sim 0.5\%$)
- Consistent response in capture time measurements

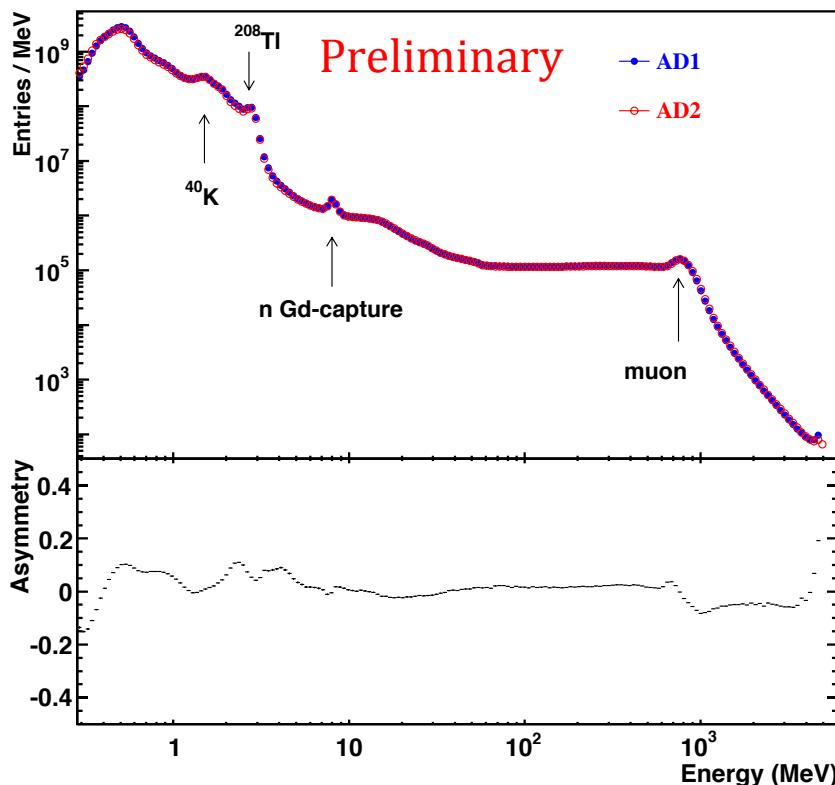

Spallation Neutron Energy Spectrum

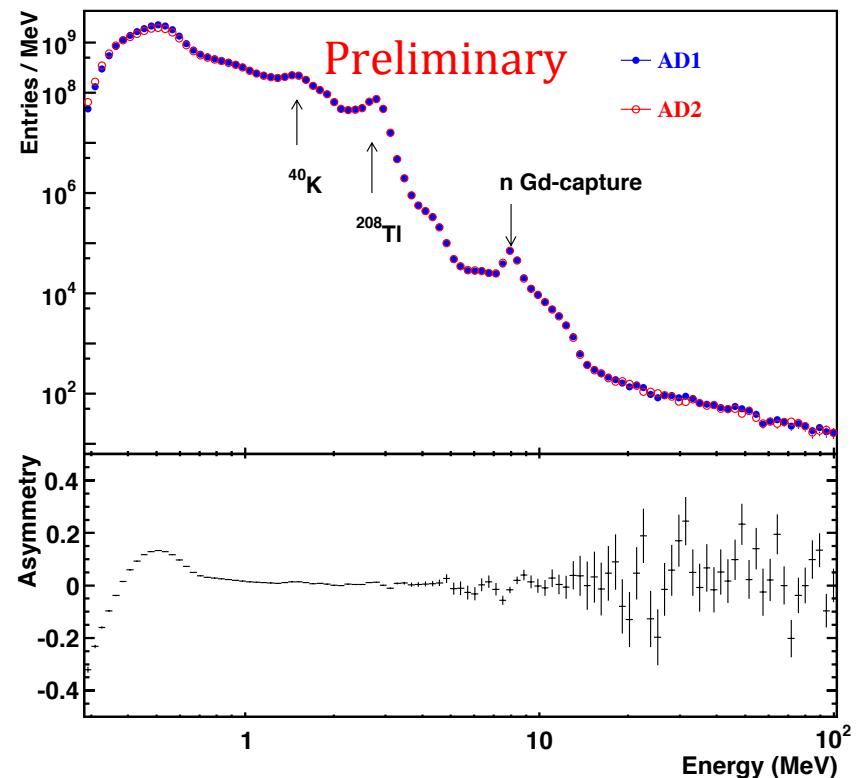

- Run-by-run calibration of detectors using spallation neutrons
 - ~ 168 p.e/MeV for AD1
 - ~ 169 p.e/MeV for AD2

Energy Spectrum of AD Triggers

Before Muon Veto

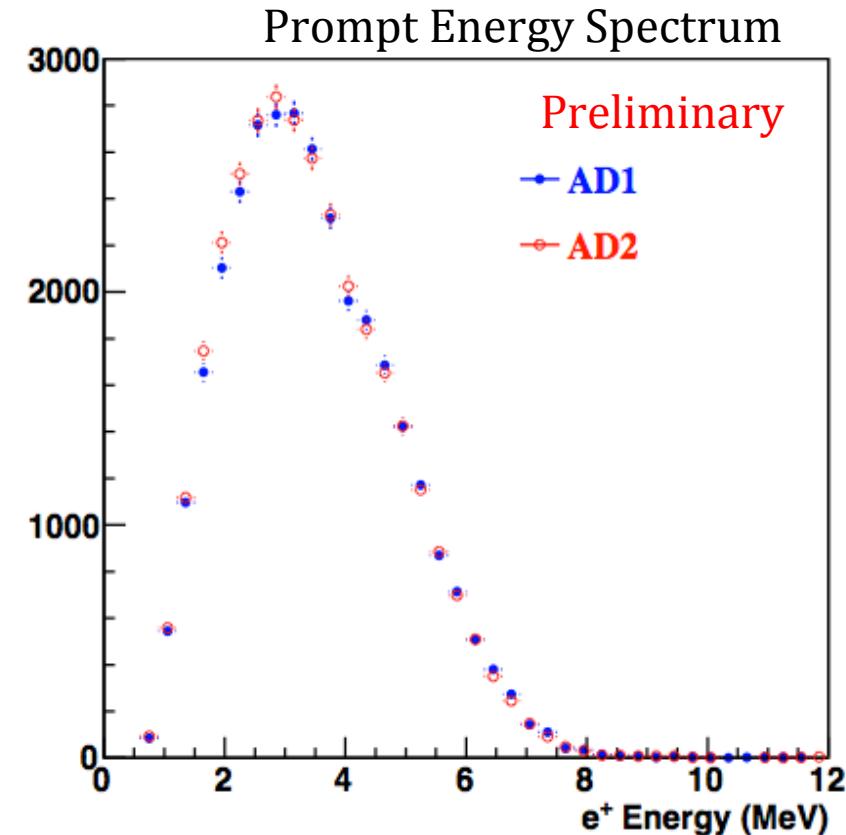

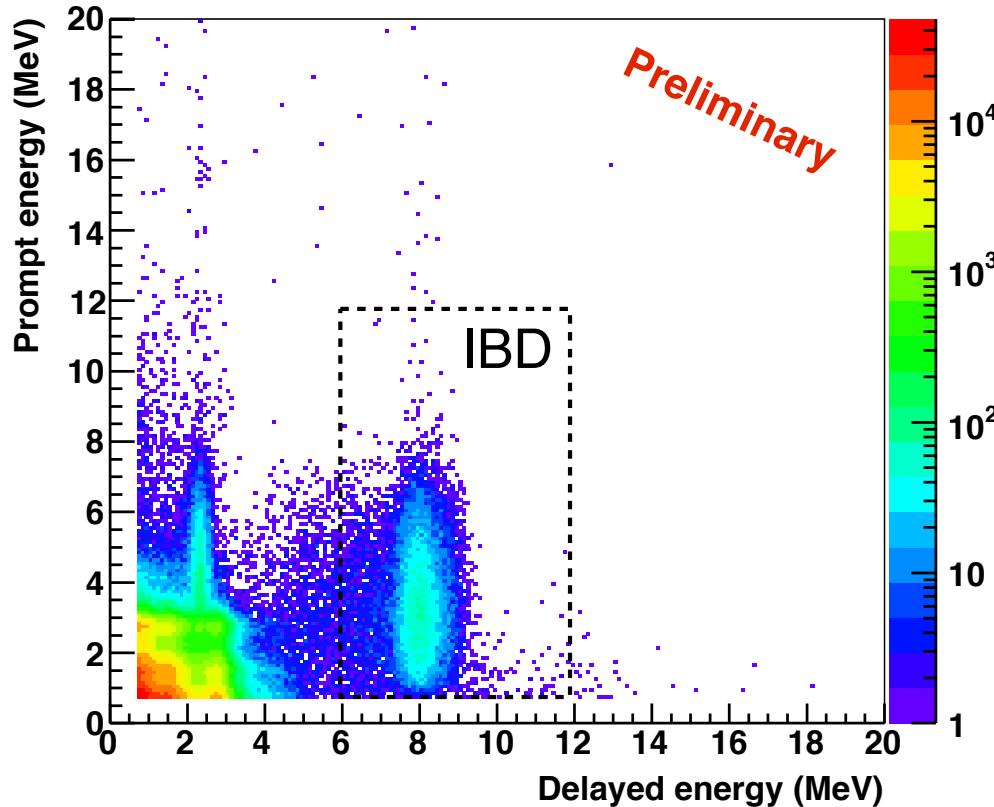

After Muon Veto

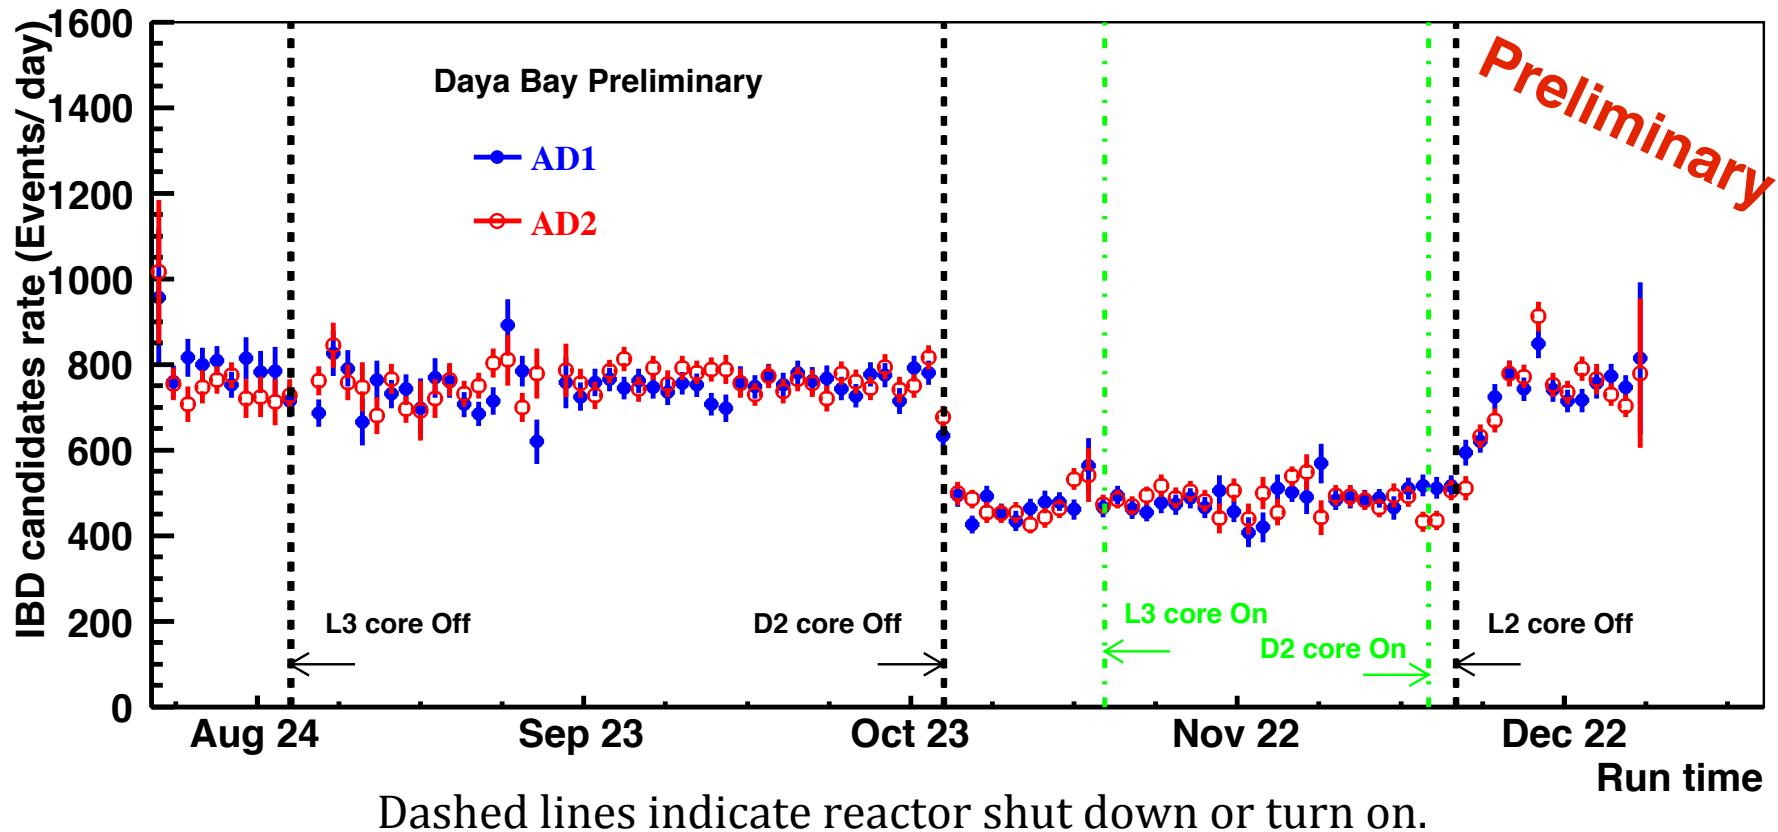

- The difference in AD1 and AD2 triggers is mostly due to nuisance triggers immediately following a Muon event.

Selection of IBD Candidates

With Flasher cut, Muon veto, **Prompt Energy**, **Delayed Energy**, **Time correlation** and **Multiplicity cut**

IBD Candidate Rate

Expected events (/day/detector)

	DYB Site	LA Site	Far Site
IBD Evts	840	760	90
BKG Evts	<0.6%	<0.5%	<0.4%

Expected events with all cores ON

Systematics

Detector Uncertainty Sources		Baseline	Design Goal	Preliminary Results
Number of protons		0.3%	0.1%	(relative) 0.02% <i>Preliminary</i>
Detector Efficiency	Energy cut	0.2%	0.1%	Understanding the 1st two
	H/Gd ratio	0.1%	0.1%	Understanding the 1st two
	Time cut	0.1%	0.03%	Understanding the 1st two
	Neutron Multiplicity	0.05%	0.05%	Understanding the 1st two
	Trigger	0.01%	0.01%	Understanding the 1st two
	Live time	<0.01%	<0.01%	Understanding the 1st two
Total uncertainty		0.38%	0.18%	Stay Tuned!

Summary

- We have demonstrated the identicalness of the first two detectors at Daya Bay near site
- With all 8 detectors running by summer 2012, Daya Bay is going to provide the most precise measurement of θ_{13} .

Backup Slides

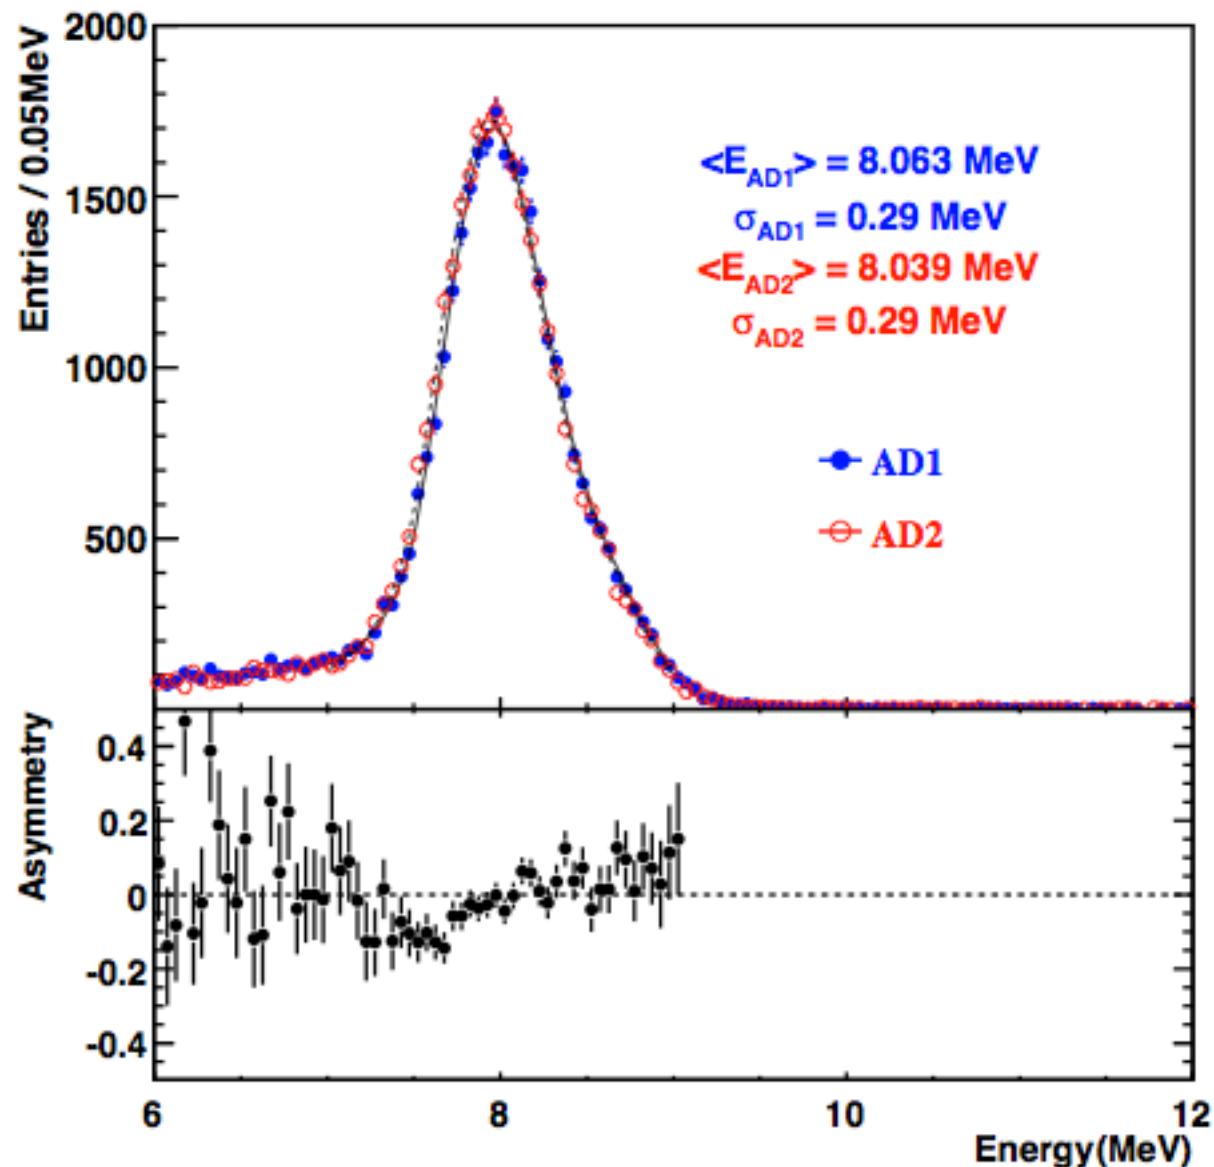

IBD Selection Cut Details

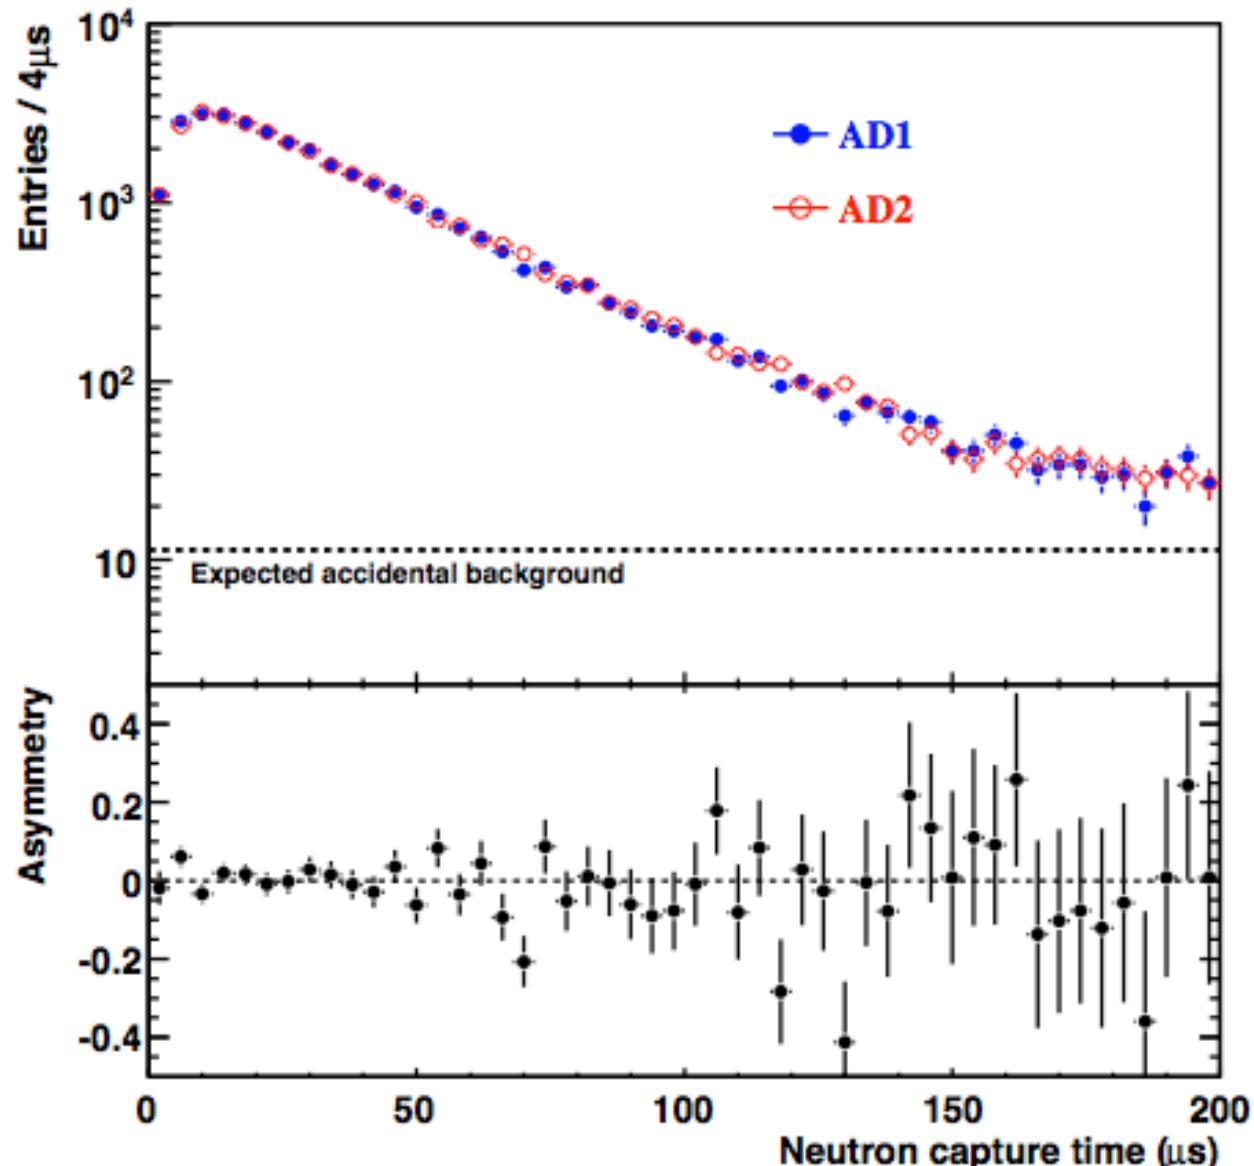

- Flasher rejection: based on geometrical charge pattern
- Positron energy: $0.7 \text{ MeV} < E_{prompt} < 12.0 \text{ MeV}$
- Neutron energy: $6.0 \text{ MeV} < E_{delay} < 12.0 \text{ MeV}$
- Time coincidence: $1 \mu\text{s} < \Delta t_{prompt,delayed} < 200 \mu\text{s}$
- Muon veto:
 - Delayed signal is within $600 \mu\text{s}$ after water pool muon trigger
 - Delayed signal is within $1000 \mu\text{s}$ after AD muon trigger (AD energy deposit $> 20 \text{ MeV}$)
 - Delayed signal is within 1 sec after AD muon with AD energy deposit $> 2.5 \text{ GeV}$
- Multiplicity cut: No other $>0.7 \text{ MeV}$ trigger $200 \mu\text{s}$ before the prompt signal and $200 \mu\text{s}$ after the delayed signal

Delayed Energy of IBD Candidates

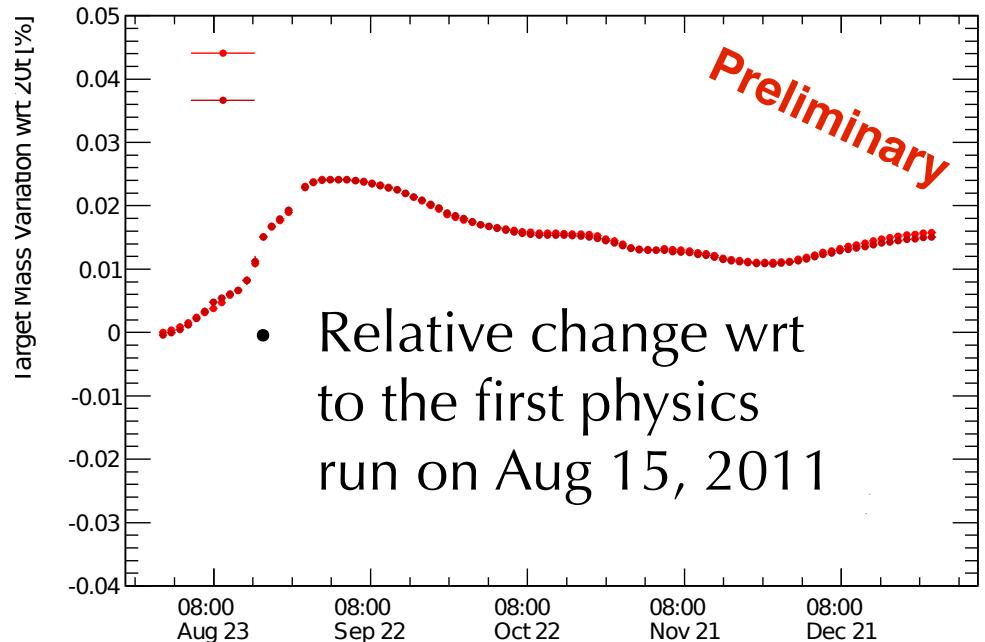

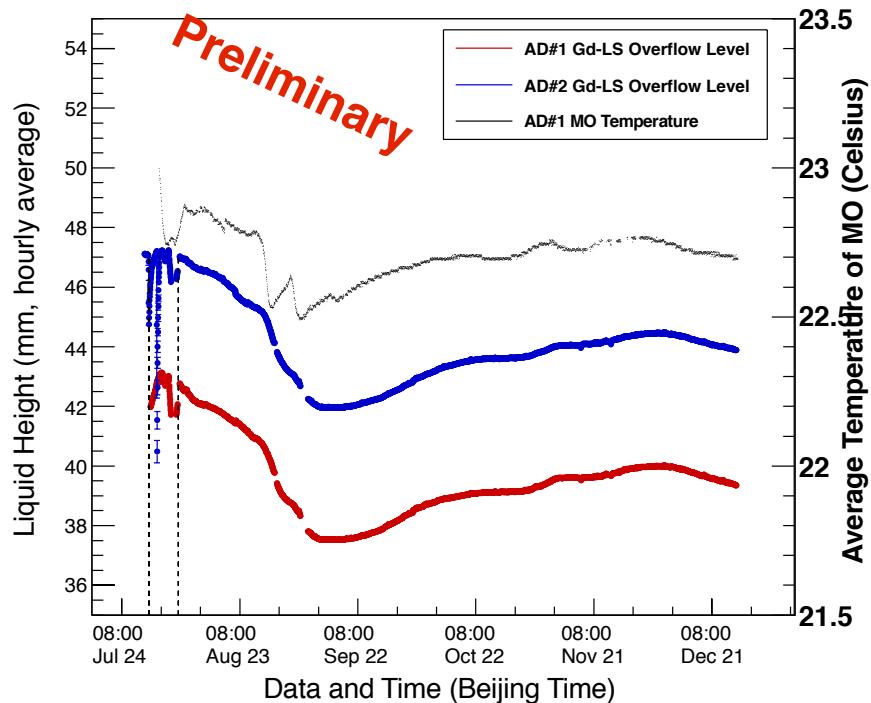

IBD Neutron Capture Time

Detector Related Uncertainty

Source of uncertainty	Quantity
Mass measurement relative precision	0.02%
Flasher cut	0.01%
Efficiency of neutron energy cut	0.11%
Efficiency of e^+ threshold cut	0.01%
Efficiency of multiplicity cut	< 0.01%
Efficiency of capture time cuts	0.01%
Relative precision on H/Gd ratio	<0.1%
Relative uncertainty of spill-in/out	0.02%
Livetime precision	< 0.01%
Total detector-related uncertainty	0.2%

Target Mass Variation

- Nominal target mass: 20 ton
- Target mass determination error $\pm 3\text{kg}$ out of 20,000 or $<0.02\%$.
