

INAF

Astrophysics

Our activities

- Promote astronomical research activities at the frontier
- Contribute to the development of new instrumentation for first-class ground-based telescopes (LBT, VLT, EELT)
- Together with Universities training the new generations of astronomers (courses, tutors, access to telescopes, research grants)
- Promote the dissemination of Astronomy (Museums, education and outreach activities)

INAF Strategic Vision

June 2019

INAF Strategic Vision

Introduction

Astronomy is arguably the oldest of the natural sciences.

Over the course of human civilization, the sky has provided the means to measure time and the succession of the seasons, to guide the traveler, to understand our place in the Universe.

Astronomical knowledge was remarkably advanced in Babylon, Egypt and China thousands of years ago and developed through the centuries with Aristarcos and Tolomeus in Greece and Copernicus, Kepler and Galileo in Europe. It was in Italy with Galileo Galilei at the beginning of the 17th century that Astronomy and Physics were united, deriving mathematical predictions of celestial motions from assumed physical causes.

Astronomy led the scientific revolution, which continues to this day and has revealed that the sky visible to the naked eye is really just a hint of a vast and complex cosmos, within which

Basic Priorities

- ❖ Exploration of the solar system
- ❖ Planets and life around other stars
- ❖ Multi-messenger astrophysics
- ❖ Origin and evolution of the Universe
- ❖ Life cycle of stars
- ❖ Black holes and the violent Universe
- ❖ *Participation in the major international infrastructures of the future*

Exploration of the solar system

- ❖ Sun and heliosphere
 - ❖ Magnetic fields and solar flares
 - ❖ Solar wind and connection with the Sun
 - ❖ Effects on the Earth ("space-weather")
- ❖ Mercury and Sun-Planet Interaction
- ❖ Exploration of Mars
- ❖ Jupiter and its satellites

Rosetta mission 2004-2016

Exploration of the solar system

- ❖ Sun and heliosphere
- ❖ Mercury and Sun-Planet Interaction
 - ❖ BepiColombo Mission (2026)
- ❖ Exploration of Mars
- ❖ Jupiter and its satellites

Bepicolombo Mission

Exploration of the solar system

- ❖ Sun and heliosphere
- ❖ Mercury and Sun-planet interaction
- ❖ Exploration of Mars
 - ❖ ExoMars: INAF-guided instruments
 - ❖ Political problems
 - ❖ Mars Sample Return (2031)
- ❖ Jupiter and its satellites

Exploration of the solar system

- ❖ Sun and heliosphere
- ❖ Mercury and Sun-planet interaction
- ❖ Exploration of Mars
- ❖ **Jupiter and its satellites**
 - ❖ **Icy moons and the presence of water / life**
 - ❖ **JUICE mission**
 - ❖ **Italian and INAF participation**

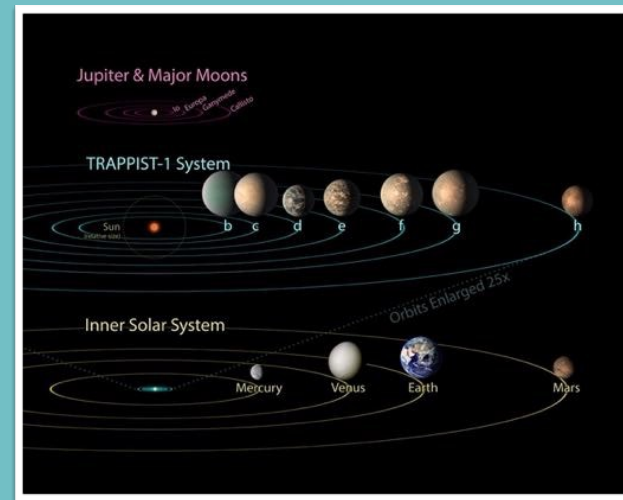

Planets and life around other stars

- ❖ Study of planetary systems
 - ❖ Exoplanets
 - ❖ Multiple exoplanet systems

- ❖ Atmospheres of exoplanets

- ❖ Processes that can give rise to life

Hunting for extrasolar planets

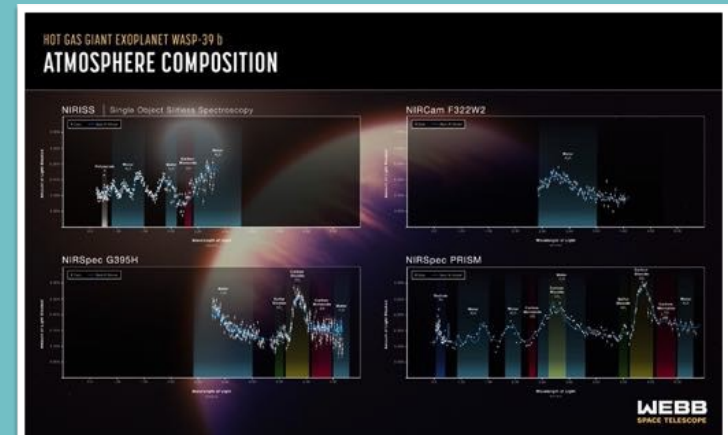

CHEOPS
(2018)

PLATO
(2026)

Planets and life around other stars

- ❖ Study of planetary systems
- ❖ Atmospheres of exoplanets
 - ❖ JWST to ELT
- ❖ Processes that can give rise to life

SPHERE instrument @ VLT

Planets and life around other stars

- ❖ Study of planetary systems
- ❖ Atmospheres of exoplanets
- ❖ Processes that can give rise to life
 - ❖ Organic molecules in space
 - ❖ Chemistry of planetary atmospheres
 - ❖ Laboratory studies

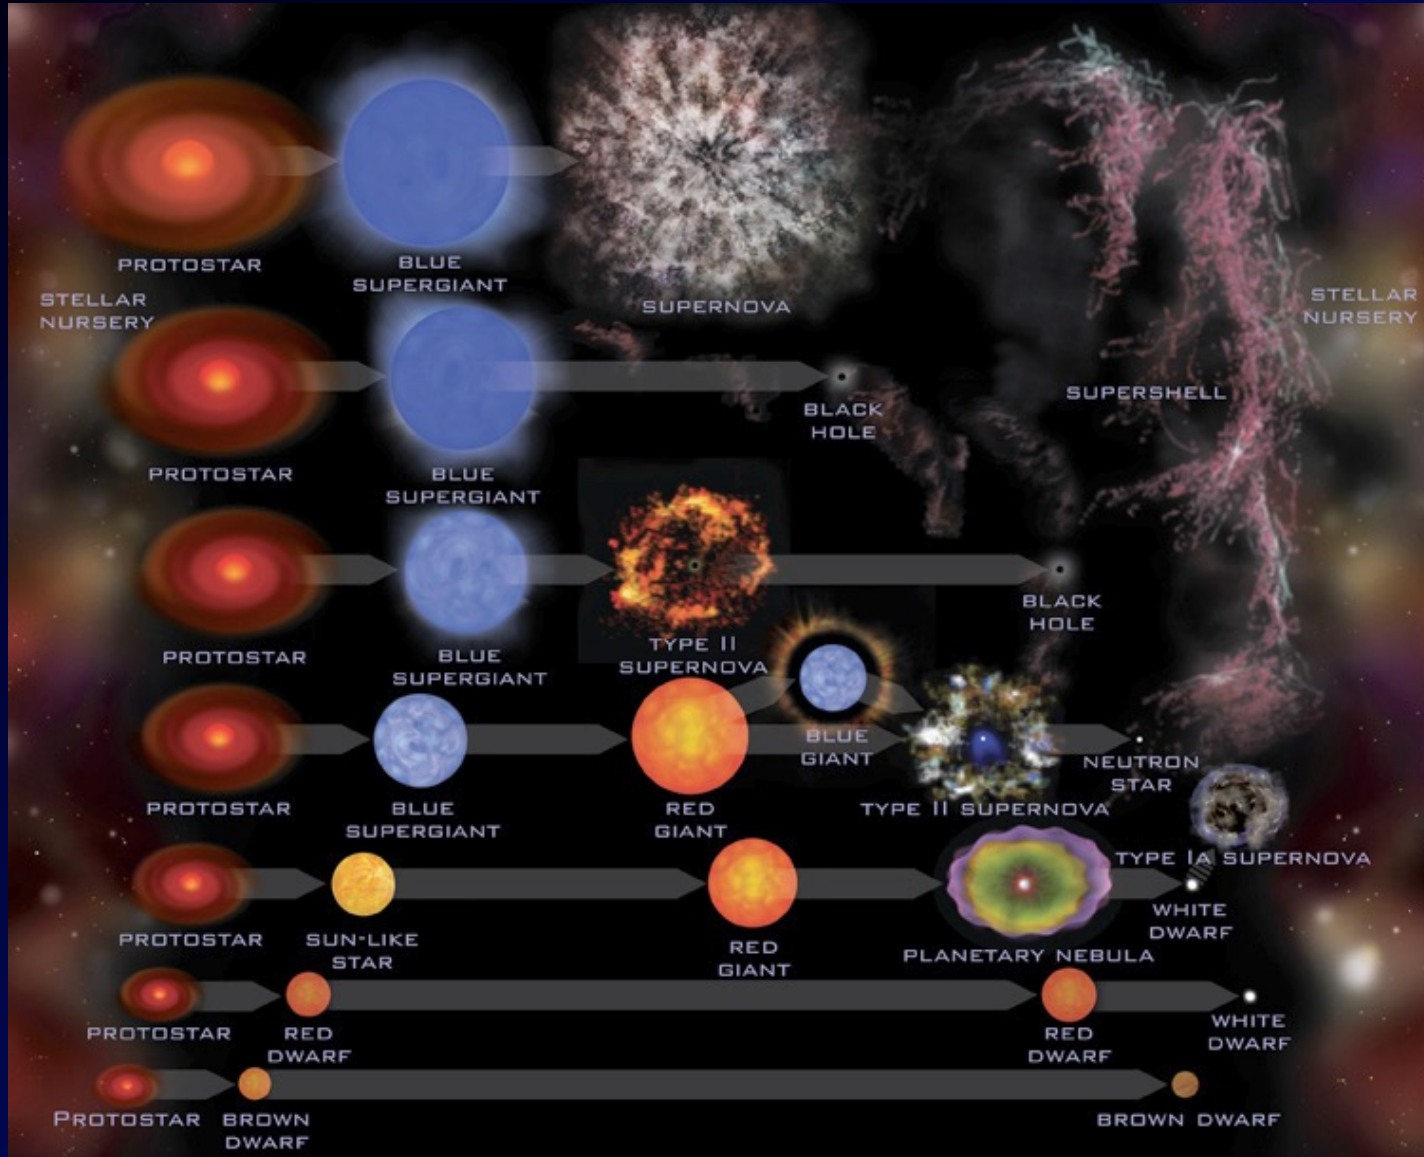

Life cycle of stars

- ❖ Mechanisms of star formation
- ❖ From gas clouds to stars
- ❖ Conditions for the formation of planets
- ❖ Fundamental physical processes in stars
- ❖ Explosions and compact remains

The evolution of stars

The Milky Way

GAIA

10 kpc

1000 million objects
measured to $l = 20$

>20 globular clusters
Many thousands of Cepheids and RR Lyrae

Horizon for proper motions
accurate to 1 km/s

Mass of galaxy from
rotation curve at 15 kpc

Sun

30 open clusters
within 500 pc

Dark matter in disc measured
from distances/motions of K giants

Horizon for detection of
Jupiter mass planets (200 pc)

Dynamics of disc,
spiral arms, and bulge

Proper motions in LMC/SMC
individually to 2-3 km/s

Horizon for distances
accurate to 10 per cent

General relativistic light-bending determined to 1 part in 10^6

1 microarcsec/yr = 300 km/s at $z = 0.03$
(direct connection to inertial)

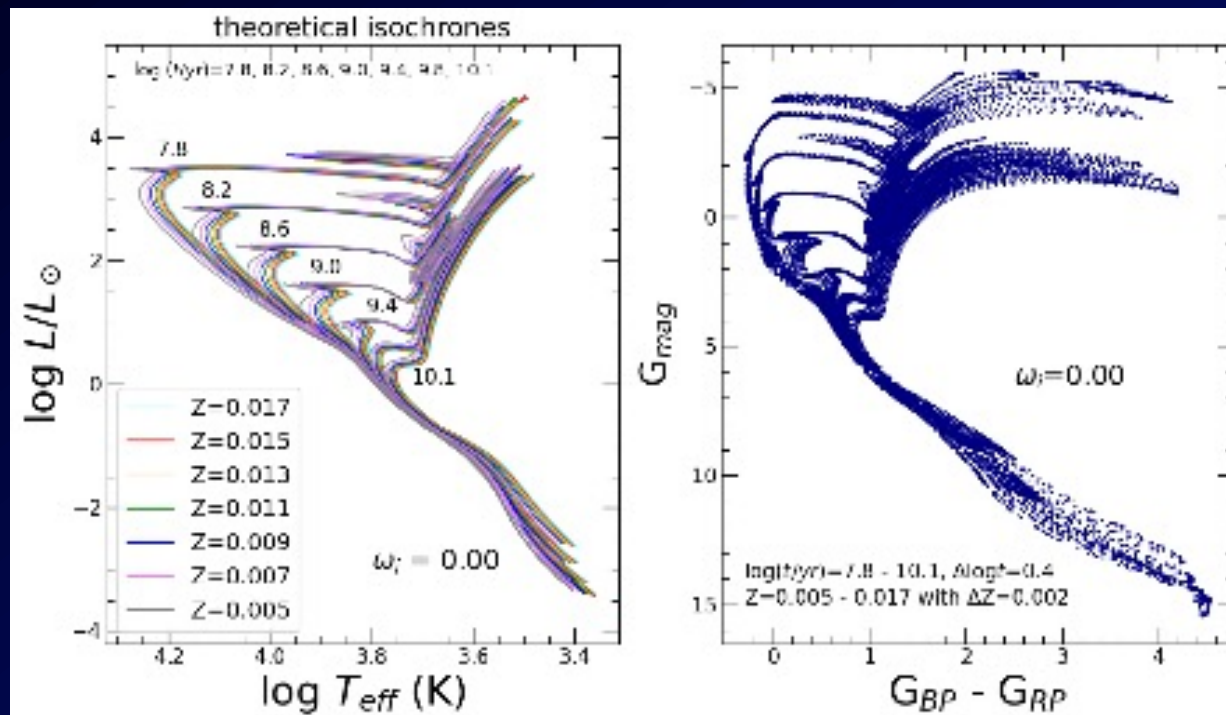

Life cycle of stars

- ❖ Mechanisms of star formation
- ❖ Fundamental physical processes in stars
 - ❖ Convection, rotation, magnetic fields
 - ❖ Asteroseismology
- ❖ Explosions and compact remains

Theoretical isochrones
 Helping understanding the
 Star formation history
 of the Milky WAY

GAIA photometry

PARSEC models

Life cycle of stars

- ❖ Mechanisms of star formation
- ❖ Fundamental physical processes in stars
- Explosions and stellar remnants
 - ❖ From star to supernova to compact object
 - ❖ New types of star explosions

Supernova Explosions

SN 2006X

Multi-messenger astrophysics

- ❖ Gravitational waves
 - ❖ Participation in the Einstein Telescope
- ❖ Electromagnetic counterparts
- ❖ Extra-galactic neutrinos
- ❖ Cosmic rays

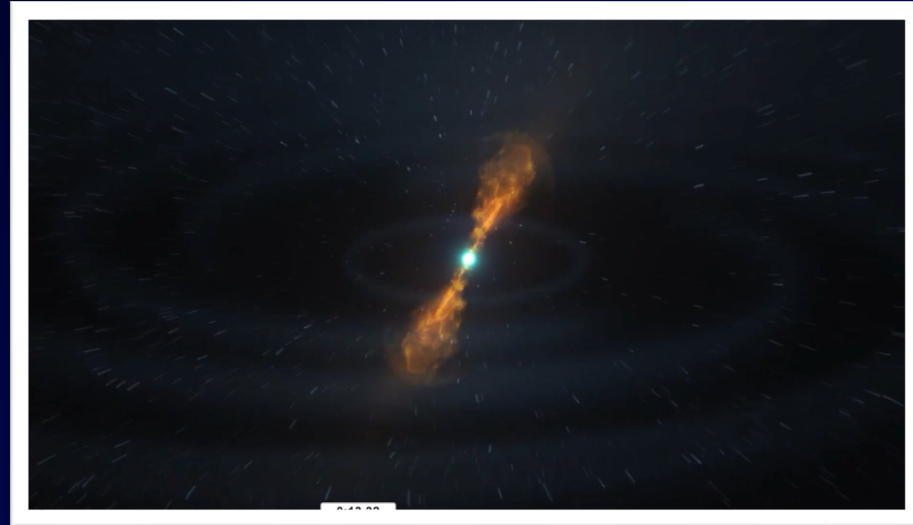

Multi-messenger astrophysics

- ❖ Gravitational waves
- ❖ Electromagnetic counterparts
 - ❖ Neutron star merger
 - ❖ Production of heavy chemical elements
- ❖ Extra-galactic neutrinos
- ❖ Cosmic rays

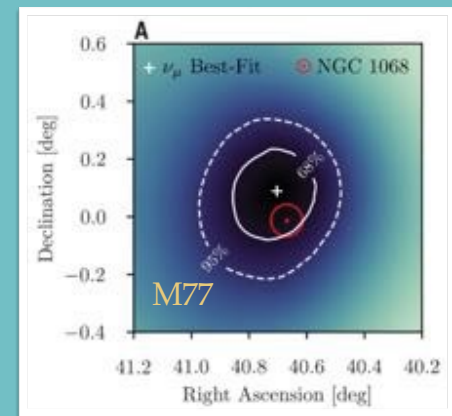

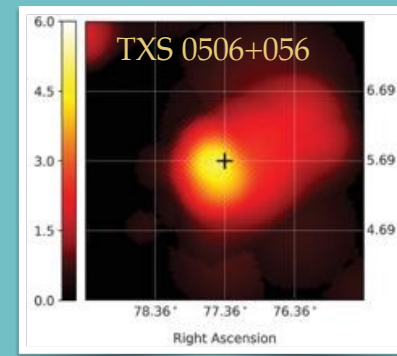

Kilonova event GW170817

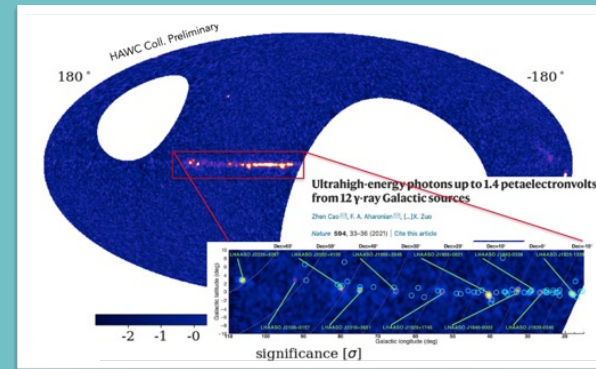

Multi-messenger astrophysics

- ❖ Gravitational waves
- ❖ Electromagnetic counterparts
- ❖ Extra-solar neutrinos
 - ❖ Supernovae
 - ❖ Active nuclei of galaxies
- ❖ Cosmic rays

Multi-messenger astrophysics

- ❖ Gravitational waves
- ❖ Electromagnetic counterparts
- ❖ Extra-galactic neutrinos
- ❖ Cosmic rays / very high energies
 - ❖ PeVatron
 - ❖ Supernova remnants
 - ❖ Very high energies: extragalactic

Origin and evolution of the Universe

- ❖ Formation and evolution of galaxies
 - ❖ Formation of supermassive black holes
 - ❖ Galaxy-central black hole interaction
- ❖ Large-scale structure
- ❖ Dark matter

Nearby Galaxies

Origin and evolution of the Universe

- ❖ Formation and evolution of galaxies
- ❖ Large-scale structure
 - ❖ Euclid & Rubin-LSST
- ❖ Dark Matter

EUCLID ERO extragalactic images

Perseus cluster of galaxies

Perseus cluster of galaxies

Origin and evolution of the Universe

- ❖ Formation and evolution of galaxies
- ❖ Large-scale structure
- ❖ **Dark matter**

Black holes and the violent Universe

- ❖ Compact objects of stellar mass
 - ❖ Binary systems and relativistic jets
 - ❖ Pulsars and neutron stars
- ❖ Active Galactic Cores
- ❖ Effects of General Relativity
- ❖ Gamma-ray Bursts
- ❖ Ultra-energetic gamma-ray sources

X-Polarization

Black holes and the violent Universe

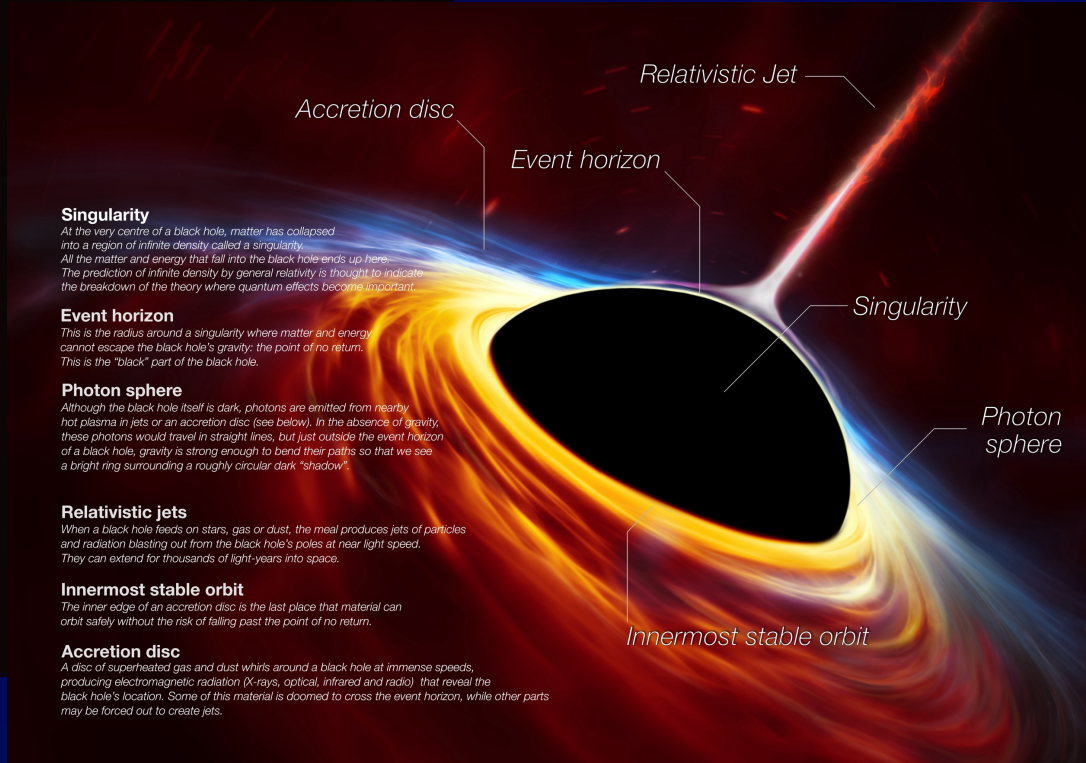

- ❖ Compact objects of stellar mass
- ❖ Active Galactic Nuclei
- ❖ Effects of General Relativity
- ❖ Gamma-ray Bursts
- ❖ Ultra-energetic gamma-ray sources
 - ❖ In our galaxy
 - ❖ From active galactic nuclei

Galaxies with Quasars and Black Holes

Black Holes

Singularity

At the very centre of a black hole, matter has collapsed into a region of infinite density called a singularity. All the matter and energy that fall into the black hole ends up here. The prediction of infinite density by general relativity is thought to indicate the breakdown of the theory where quantum effects become important.

Event horizon

This is the radius around a singularity where matter and energy cannot escape the black hole's gravity: the point of no return. This is the "black" part of the black hole.

Photon sphere

Although the black hole itself is dark, photons are emitted from nearby hot plasma in jets or an accretion disc (see below). In the absence of gravity, these photons would travel in straight lines, but just outside the event horizon of a black hole, gravity is strong enough to bend their paths so that we see a bright ring surrounding a roughly circular dark "shadow".

Relativistic jets

When a black hole feeds on stars, gas or dust, the meal produces jets of particles and radiation blasting out from the black hole's poles at near light speed. They can extend for thousands of light-years into space.

Innermost stable orbit

The inner edge of an accretion disc is the last place that material can orbit safely without the risk of falling past the point of no return.

Accretion disc

A disc of superheated gas and dust whirrs around a black hole at immense speeds, producing electromagnetic radiation (X-rays, optical, infrared and radio) that reveal the black hole's location. Some of this material is doomed to cross the event horizon, while other parts may be forced out to create jets.

Large international structures and instruments

The science of INAF

- ❖ Activities in the most important fields of astrophysics
- ❖ Observations from the ground and space, planetary exploration
- ❖ High-level involvement in international structures and instruments
- ❖ Understanding the Universe from the Solar System to the Boundaries of Space-Time

Observatory Staff

70 Astronomers

23 Technical and Administrative

35 Research Fellows and Fellows

14 PhD students in collaboration
with the University

12 students in thesis
