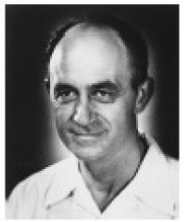
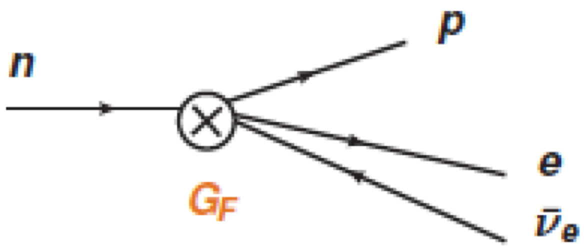
PAST of Flavour Physics

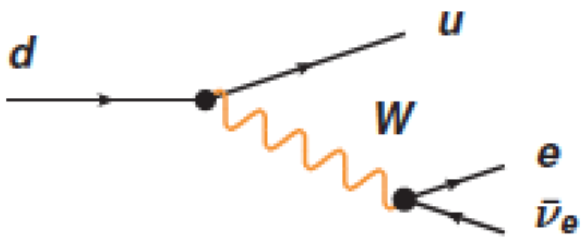
Historical example: β decay





Fermi constant

$$G_F \simeq 1.17 \times 10^{-5}\ \text{GeV}^{-2}$$



W-boson exchange

$$\frac{G_F}{\sqrt{2}} = \frac{g_2^2}{8 m_W^2}$$

E. Fermi, Attempt at a Theory of β-rays, Il Nuovo Cimento, Vol 11, p 1 (1934); Zeitschrift fur Physik, Vol 88, p 161 (1934)

Unitarization of the Fermi theory:
New Physics at 10^2 GeV (indirect evidence)

PAST of Flavour Physics

***1963:** Cabibbo Angle*
***1964:** CP violation in K decays* *
***1970** GIM Mechanism*
***1973:** CP Violation needs at least three quark families (CKM)* *
***1975:** discovery of the tau lepton – 3rd lepton family* *
***1977:** discovery of the b quark - 3rd quark family*
***2003/4:** CP violation in B meson decays*

* Nobel Prize

Discoveries from Flavor Physics

CP Violation

!!

- the tiny branching ratio of the decay $K_L \to \mu^+\mu^-$ led to the prediction of the charm quark to suppress FCNCs
  (Glashow, Iliopoulos, Maiani 1970)

$$\Gamma(K \to \mu\mu) \ll \Gamma(K \to \mu\nu)$$

- the measurement of the frequency of kaon anti-kaon oscillations allowed a successful prediction of the charm quark mass
  (Gaillard, Lee 1974)

$$\Delta m_K$$

(direct discovery of the charm quark in 1974 at SLAC and BNL)

- the observation of CP violation in kaon anti-kaon oscillations led to the prediction of the 3rd generation of quarks
  (Kobayashi, Maskawa 1973)

$$\varepsilon_K$$

- the measurement of the frequency of B - $\bar{B}$ oscillations allowed to predict the large top quark mass
  (various authors in the late 80's)

$$\Delta m_B$$

(direct discovery of the bottom quark in 1977 at Fermilab)

(direct discovery of the top quark in 1995 at Fermilab)

indirect evidence

30 years of UT fit

- Since early '90s, the UT framework has been established to probe CP violation in the flavor sector
  - sin2b (CPV in $B_d\bar{B}_d$ mixing) the reference quantity

PREDICTIONS

  - jump in accuracy ~ '95, when the first full statistical analysis was attempted, strongly benefiting of the first determination of the top mass. The UT analysis was born, predicting a few still unknown quantities
    - $\sin 2\beta = 0.65 \pm 0.12$
  - In 2000, Rome and Orsay/Genova groups (running similar fits) joined forces. This was the beginning of the UTfit collaboration

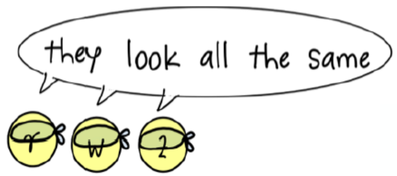
Hints of NP structure: Flavor symmetries of the SM

- Standard Model (SM) gauge sector is flavor blind and CP conserving

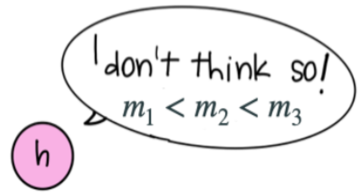
$$\mathcal{G}_F(\text{SM}) = U(3)^5 \equiv U(3)_q \times U(3)_u \times U(3)_d \times U(3)_\ell \times U(3)_e$$



The Higgs introduces the only known non-gauge couplings

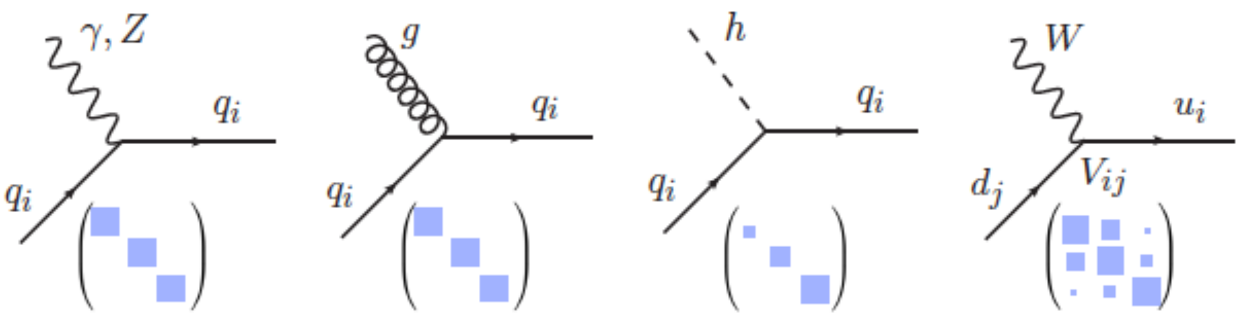
Turn on Yukawas

$$Y_{ij} \bar{\Psi}^i_L H \Psi^j_R$$



$$\mathcal{G}_F(\text{SM}) = U(1)_B \times U(1)_L$$

Higgs couplings are not flavor blind



courtesy of B.A. Stefanek

See talk by R. Barbieri

electromagnetic **neutral currents** **charged currents**

$$\mathcal{L}_{int} = -eA^{\mu}J_{\mu}^{em} - \frac{g_W}{2\cos\theta_W}Z^{\mu}J_{\mu}^{Z} - \frac{g_W}{2\sqrt{2}}[W^{\mu}(J^{W})_{\mu}^{\dagger} + h.c.]$$

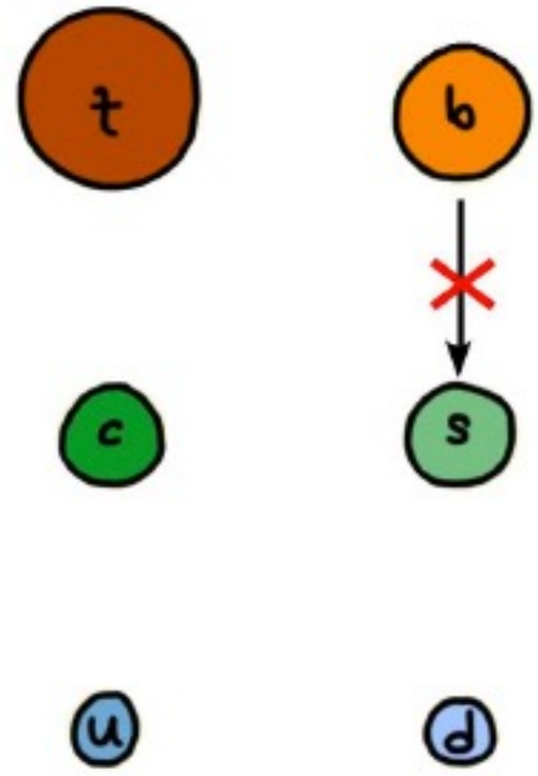
$$J_{\mu}^{Z} = 2J_{\mu}^{3} - 2\sin^2\theta_W J_{\mu}^{em}$$

$$L_{CC}^{weak\,int} = \frac{g_W}{\sqrt{2}}(J_{\mu}^{-}W_{\mu}^{+} + h.c.)$$

$$\rightarrow \quad \frac{g_W}{\sqrt{2}}(\bar{u}_L\mathbf{V}^{CKM}\gamma_{\mu}d_L W_{\mu}^{+} + \ldots)$$

Absence of FCNC at tree level (& GIM suppression of FCNC @loop level)

Almost no CP violation at tree level



Tiny CP violation in K and D mesons due to small coupling between the third and the two first generations

Flavour Physics is extremely sensitive to New Physics (NP)

In competition with Electroweak Precision Measurements

The usual mantra

reasons to go beyond the SM(s):

"Experimental" evidence

1. Neutrino Masses
2. Dark Matter and Dark Energy
3. Matter-Antimatter Asymmetry

"Theoretical" evidence

1. SM instability (hierarchy, naturalness)
2. Flavour Physics (families, Yukawa couplings, CP violation for both quarks and leptons)
3.Unification of forces and quantization of gravity

Why Flavor Physics is so important:

It is sensitive to NP scales $\Lambda_{NP} \gg E_{collider}$
since FCNC are suppressed in the SM by loops and small $|V_{ij}|$

SM Flavor puzzle:
Why flavor parameters are so small and hierarchical?
(and different from the neutrino sector)

NP Flavor puzzle:
If NP is at the TeV scale, why FCNC effects are so small that they have not be detected yet?

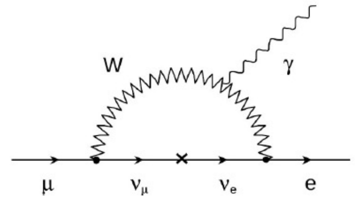
WHY RARE DECAYS ?

Rare decays are a manifestation of broken (accidental) symmetries e.g. of physics beyond the Standard Model

Proton decay — baryon and lepton number conservation

$\mu \rightarrow e + \gamma$ — lepton flavor number

$\nu_i \rightarrow \nu_k$ found !



$$\mathcal{B}(\mu \to e\gamma) \sim \alpha \frac{m_\nu^4}{m_W^4} \sim 10^{-52}$$

Rare decays allowed in the SM

$q_i \rightarrow q_k + \nu\ \nu$

$q_i \rightarrow q_k + l^+ l^-$

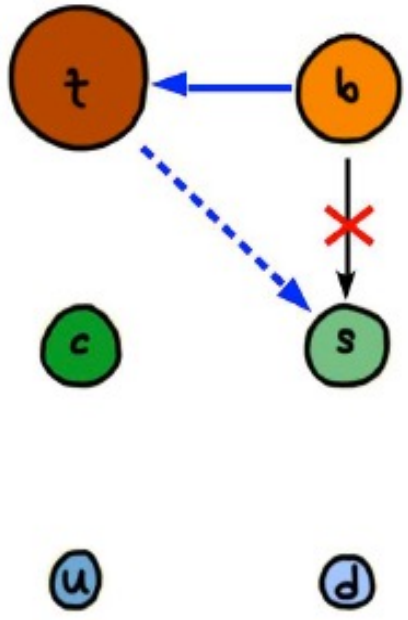
$q_i \rightarrow q_k + \gamma$

these decays occur only via loops and are suppressed by CKM because of GIM

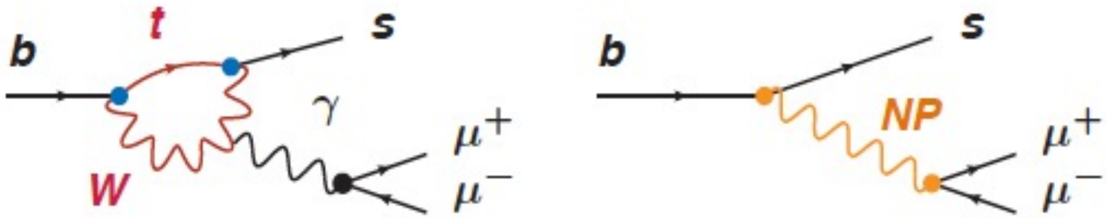
THUS THEY ARE SENSITIVE TO NEW PHYSICS

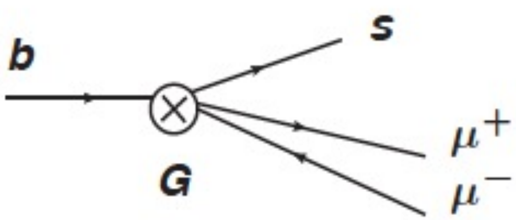
Flavor Changing Neutral Currents in the SM

In the SM, flavor changing neutral currents (FCNCs) are absent at the tree level



FCNCs can arise at the loop level
they are suppressed by loop factors
and small CKM elements

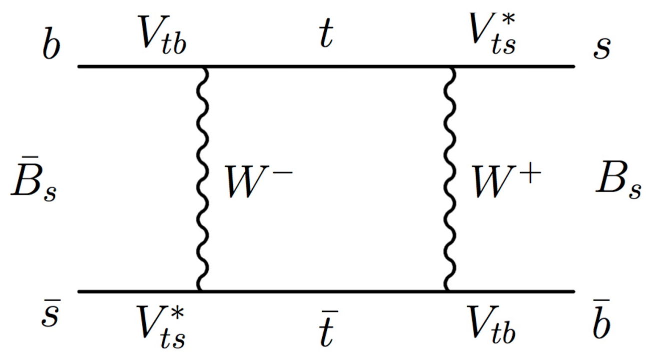




$$G \sim \frac{1}{16\pi^2}\frac{g^4}{m_W^2}\frac{m_t^2}{m_W^2}V_{tb}V_{ts}^* + \frac{C_{NP}}{\Lambda_{NP}^2}$$

→ measuring low energy flavor observables gives information on new physics flavor couplings and the new physics mass scale

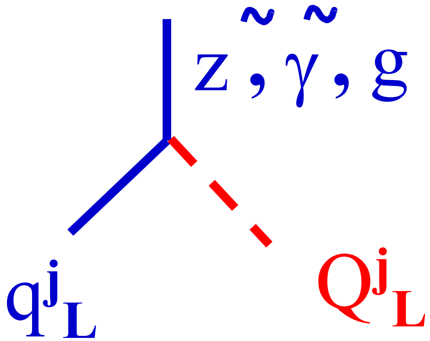
B^0 - $\overline{B^0}$ mixing



Standard Model CKM

$$\Delta m_{B_s} = \frac{G_F^2 M_W^2}{16\pi^2} A^2 \lambda^6 F_{tt}\left(\frac{m_t^2}{M_W^2}\right) \langle B_s|\left(\bar{s}\gamma_\mu(1-\gamma_5)b\right)^2|\bar{B}_s\rangle$$

Hadronic matrix element



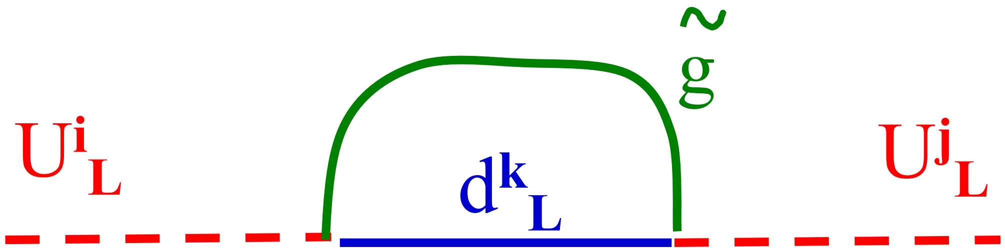
In general the mixing mass matrix of the SQuarks (SMM) is not diagonal in flavour space analogously to the quark case

We may either

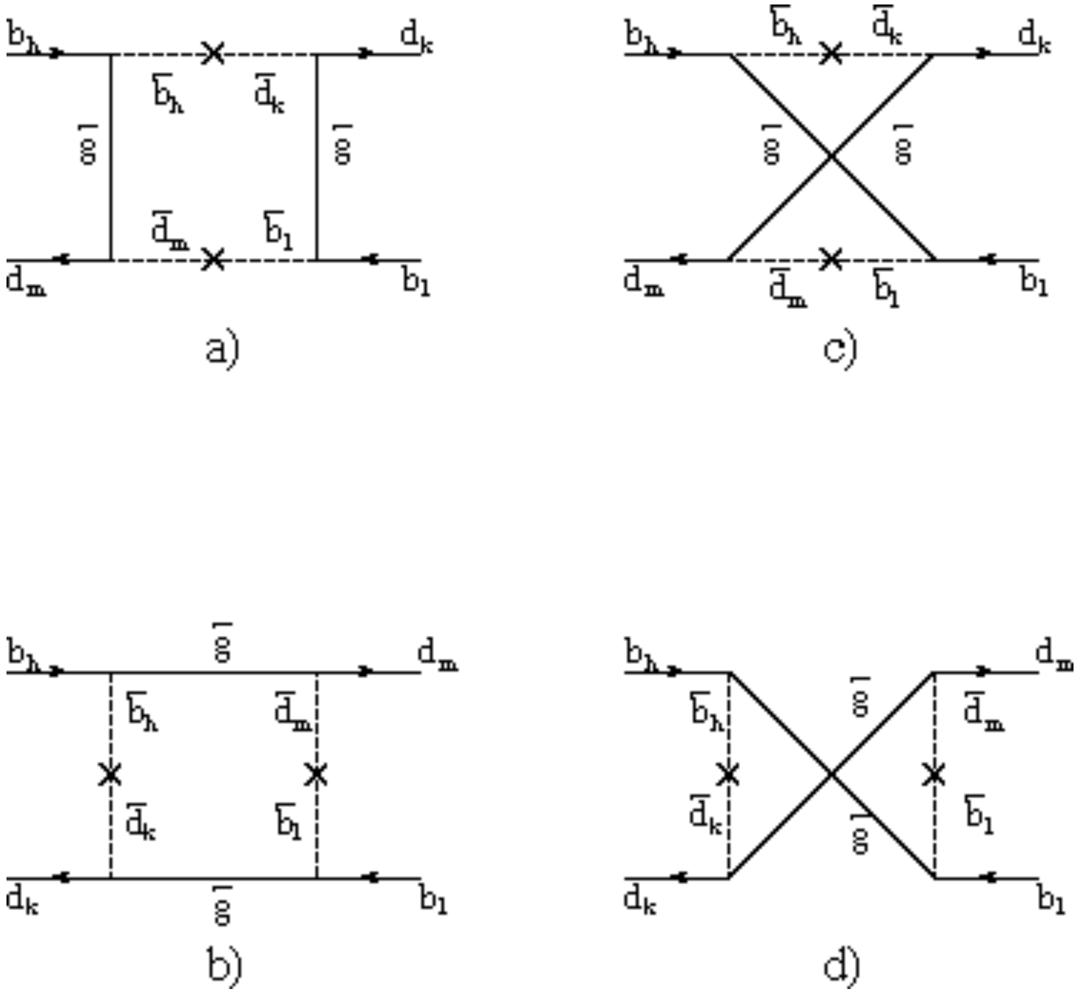
Diagonalize the SMM

or Rotate by the same Matrices the SUSY partners of the u- and d- like quarks

$(Q^j_L)' = U^{ij}_L Q^j_L$

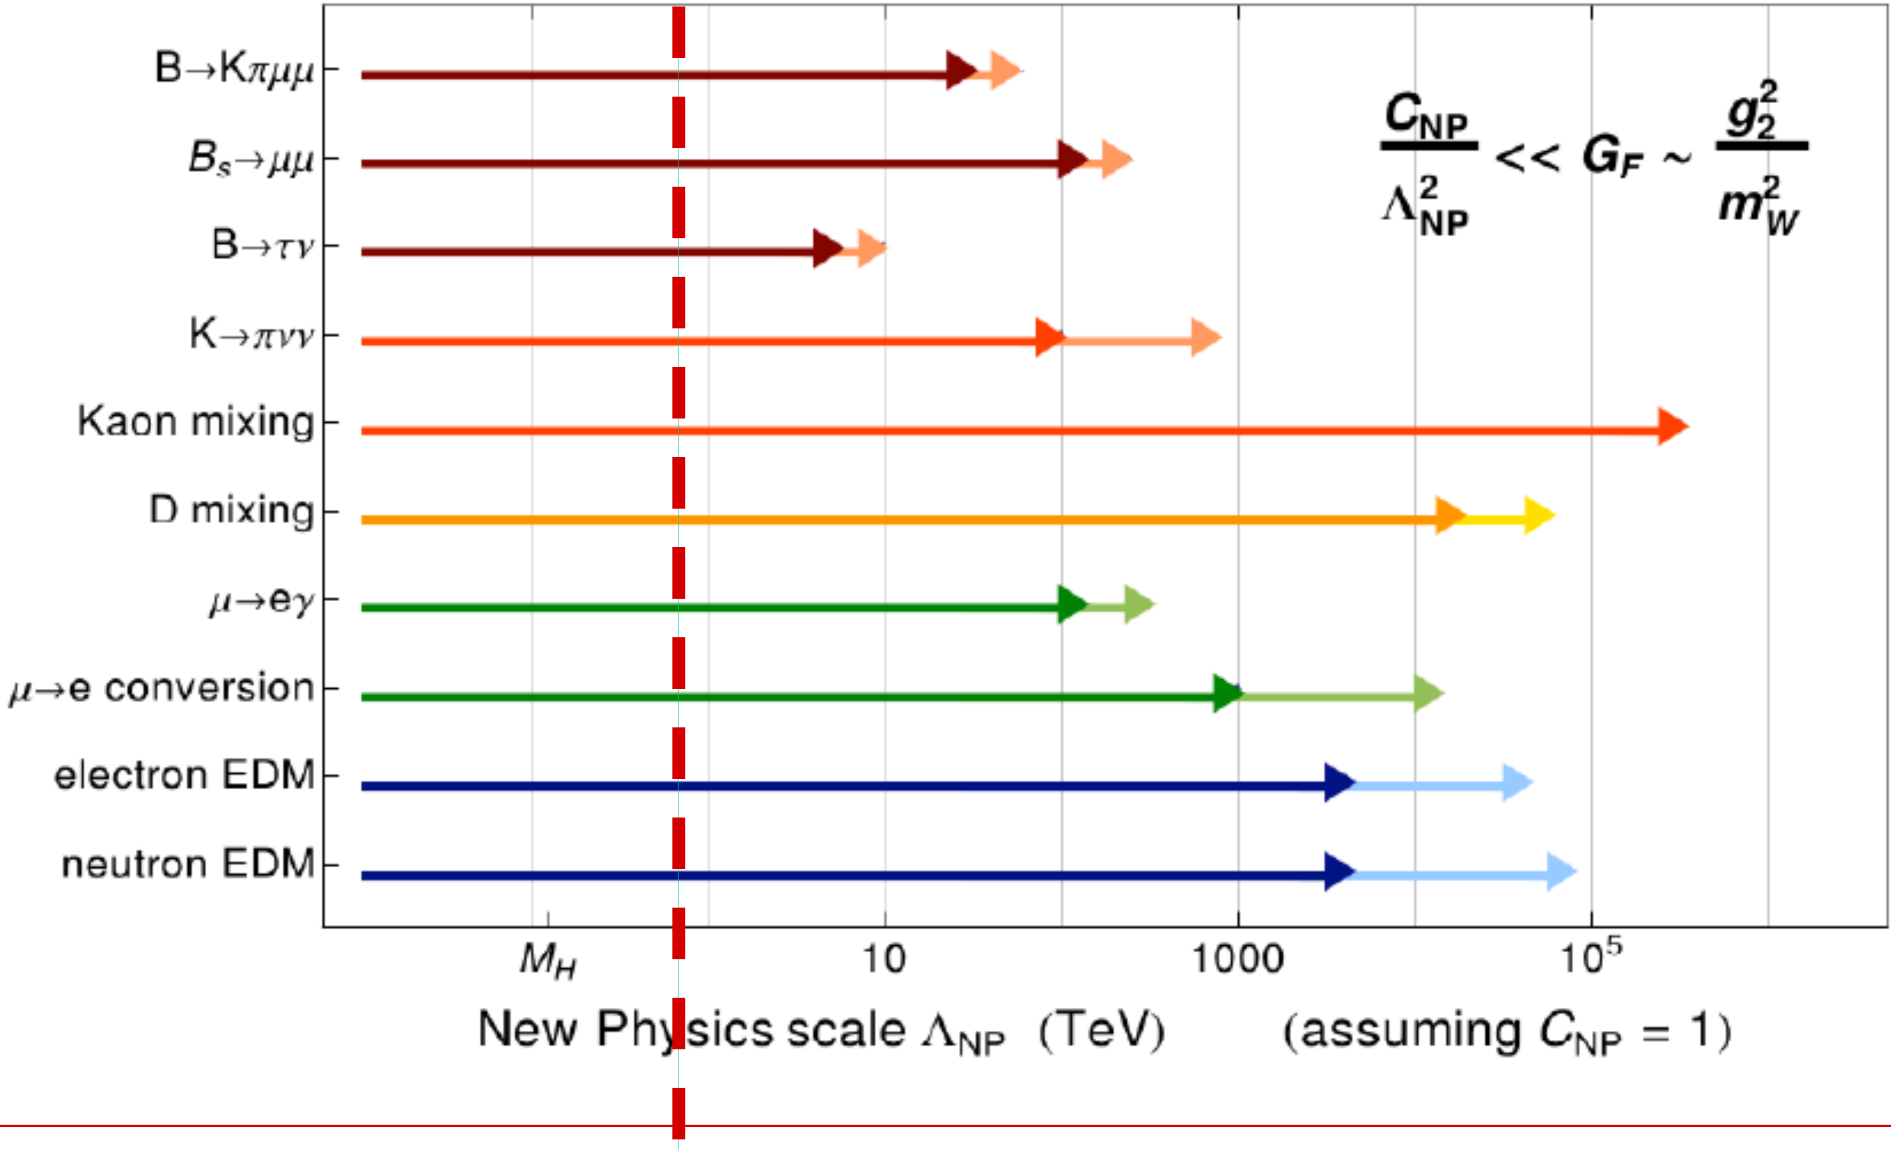


In the latter case the Squark Mass Matrix is not diagonal



$$(m^2{}_Q)_{ij} = m^2{}_{average}\, \mathbf{1}_{ij} + \Delta m_{ij}{}^2 \qquad \delta_{ij} = \Delta m_{ij}{}^2 / m^2{}_{average}$$

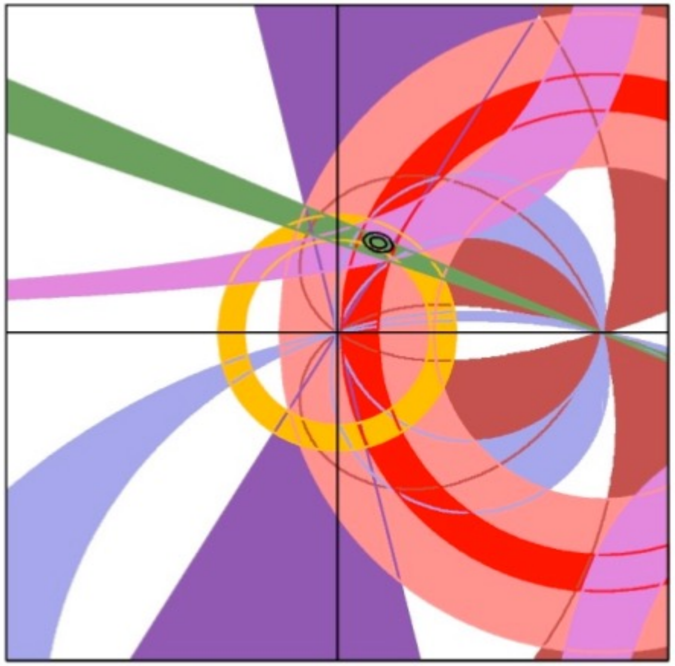
Sensitivity to New Physics from Flavor I



Approximate LHC direct reach

STANDARD MODEL
UNITARITY TRIANGLE ANALYSIS
Tensions and Unknown

1. *Provides the best determination of the CKM parameters;*
2. *Tests the consistency of the SM (``direct" vs ``indirect" determinations) @ the quantum level;*
3. *Provides predictions for SM observables (in the past for example sin 2β and Δm_s)*
4. *It could lead to new discoveries (CP violation, Charm, !?)*
5. *The discovery potential of precision flavor physics should not be underestimated*



New UTfit Analysis of the Unitarity Triangle in the Cabibbo-Kobayashi-Maskawa scheme

It is by now precision physics and we need precise lattice calculations

Rend.Lincei Sci.Fis.Nat. 34 (2023) 37-57
arXiv:2212.03894

N(N-1)/2 angles and (N-1)(N-2) /2 phases

N=3 3 angles + 1 phase KM

the phase generates complex couplings i.e. CP violation;

6 masses +3 angles +1 phase = 10 parameters

V_{ud}	V_{us}	V_{ub}
V_{cd}	V_{cs}	V_{cb}
V_{tb}	V_{ts}	V_{tb}

$$L_{CC}^{weak\,int} = \frac{g_W}{\sqrt{2}}(J_\mu^- W_\mu^+ + h.c.)$$
$$\rightarrow \quad \frac{g_W}{\sqrt{2}}(\bar{u}_L \mathbf{V}^{CKM} \gamma_\mu d_L W_\mu^+ + \ldots)$$

$$= \begin{bmatrix} c_{12}c_{13} & s_{12}c_{13} & s_{13}e^{-i\delta_{13}} \\ -s_{12}c_{23} - c_{12}s_{23}s_{13}e^{i\delta_{13}} & c_{12}c_{23} - s_{12}s_{23}s_{13}e^{i\delta_{13}} & s_{23}c_{13} \\ s_{12}s_{23} - c_{12}c_{23}s_{13}e^{i\delta_{13}} & -c_{12}s_{23} - s_{12}c_{23}s_{13}e^{i\delta_{13}} & c_{23}c_{13} \end{bmatrix}$$

STRONG CP VIOLATION

$$\mathcal{L}_\theta = \theta\, G^{\mu\nu a}\, \tilde{G}^a_{\mu\nu} \qquad \tilde{G}^a_{\mu\nu} = \varepsilon_{\mu\nu\rho\sigma}\, G^a_{\rho\sigma}$$

$$L_\theta \sim \theta\ \vec{E}^a \cdot \vec{B}^a$$

This term violates CP and gives a contribution to the electric dipole moment of the neutron

$$e_n < 3\ 10^{-26}\ e\ cm$$

$\theta < 10^{-10}$ which is quite unnatural !!

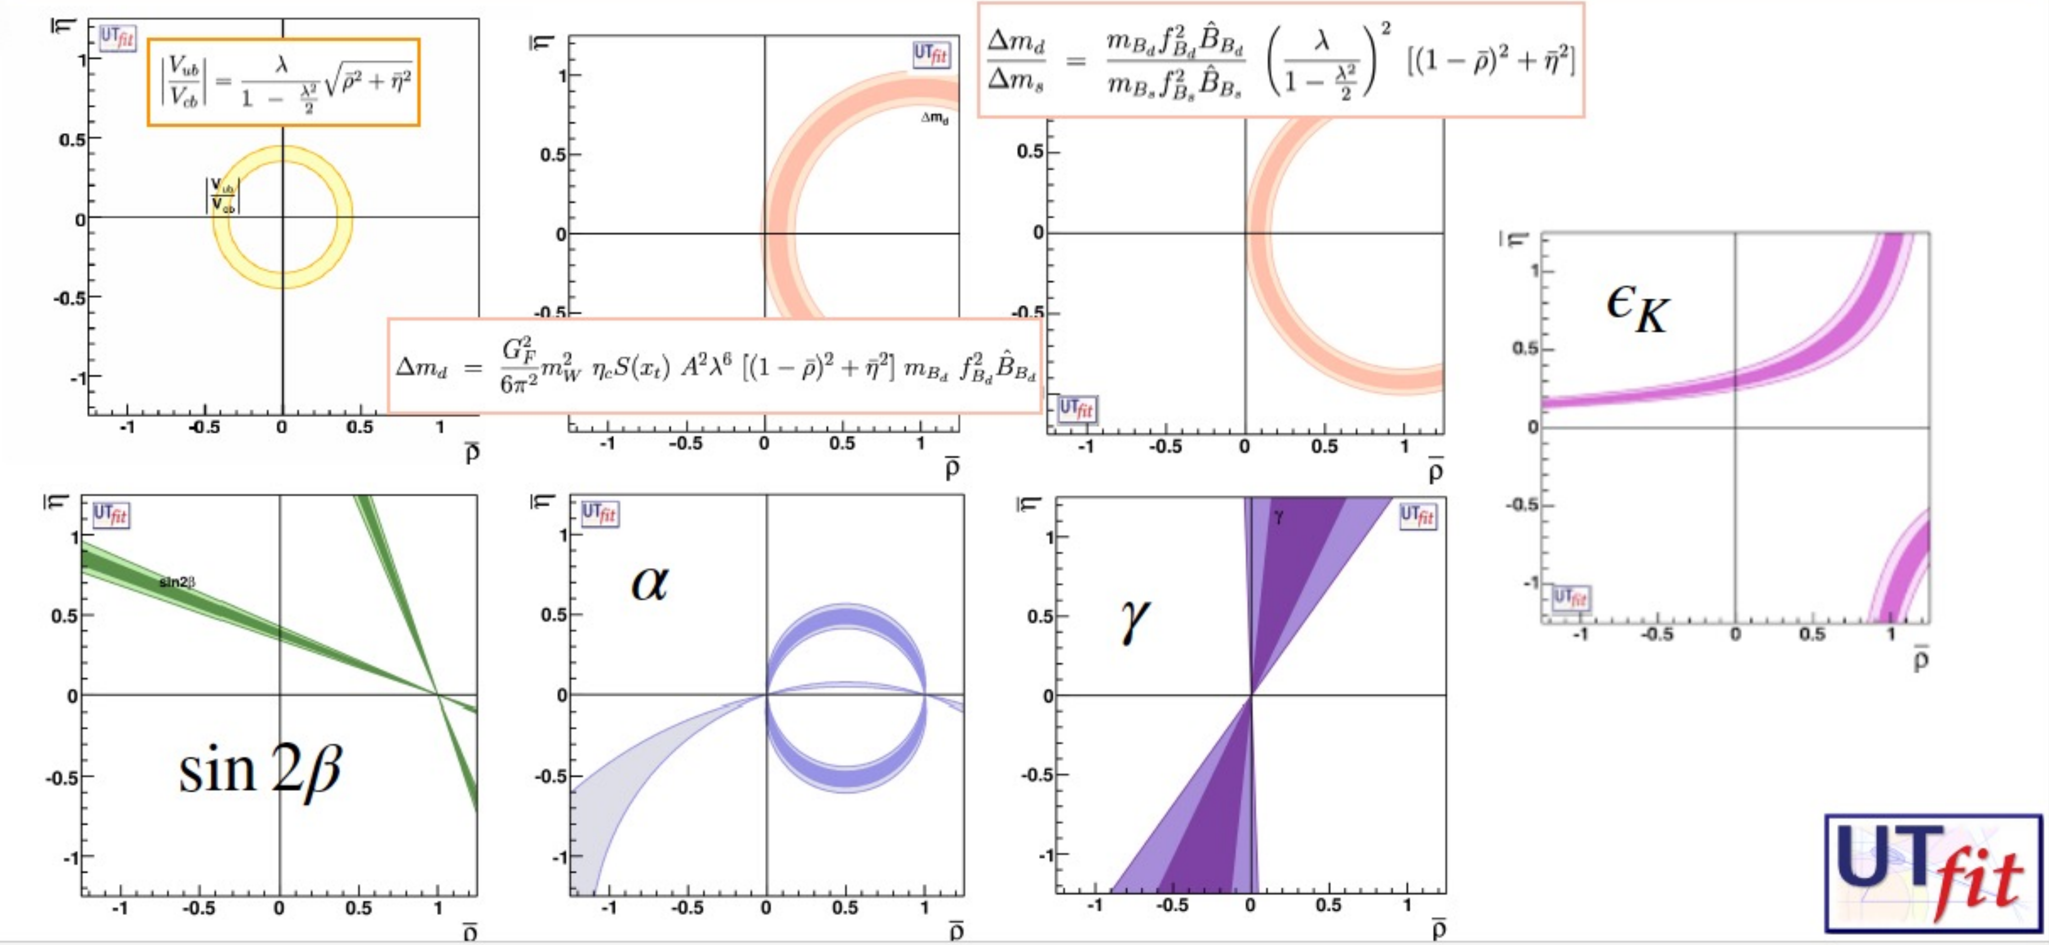
B_d

UT constraints



<u>redundancy</u> is the big strength of the UT analysis

one can remove a subset of inputs and still determine the CKM

one can exclude η=0 using only CP conserving processes

The ancestor of Utfit

M.Lusignoli, L.Maiani, G.Martinelli, L.Reina

MIXING AND CP-VIOLATION IN K AND B-MESONS: A LATTICE QCD POINT OF VIEW

(Revised version)

The main result of our analysis is that if m_t is not too small:

(1.2) $m_t > 140$ GeV

and if f_B is in the range:

(1.3) $200 \text{ MeV} < f_B < 300 \text{ MeV}$

the CP-violating asymmetry in the decay: $B_d\bar{B}_d \to J/\Psi + K_S$+tagging channel, should be considerably larger than previously expected.

To illustrate the results, we make reference to the central case:

m_t=140 GeV

Fig.2.b, gives the distribution of $\cos\delta_1$ and $\cos\delta_2$. A clear separation of positive and negative solutions is seen:

(8.1) $\cos\delta_1=-0.89\pm0.09$

(8.2) $\cos\delta_2=+0.64\pm0.17$

Figs.3.b and 4.b give the corresponding distributions of $\sin(2\beta)$ and $\sin(2\alpha)$. The two solutions for $\cos\delta$ correspond to two reasonably well separated regions in $\sin(2\beta)$:

(8.3) $\sin(2\beta_1)=+0.27\pm0.08$

(8.4) $\sin(2\beta_2)=+0.82\pm0.11$

The extraordinary progress of the experimental measurements requires accurate theoretical predictions

Precision flavor physics requires the control of hadronic effects for which lattice QCD simulations are essential

$$Q^{EXP} = V_{CKM} \langle F | \hat{O} | I \rangle$$

SM

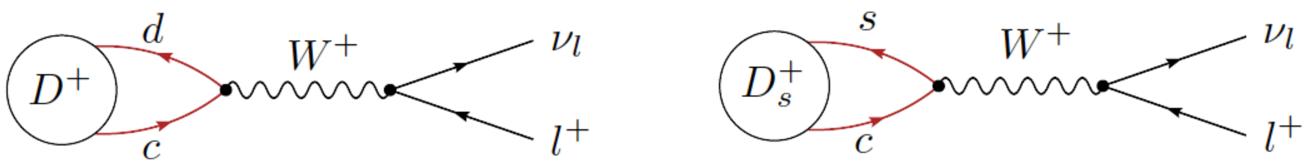
$$Q^{EXP} = \sum_i C^i_{SM}(M_W, m_t, \alpha_s) \langle F | \hat{O}_i | I \rangle + \sum_{i'} C^{i'}_{Beyond}(\tilde{m}_\beta, \alpha_s) \langle F | \hat{O}_{i'} | I \rangle$$

BSM

What can be computed and

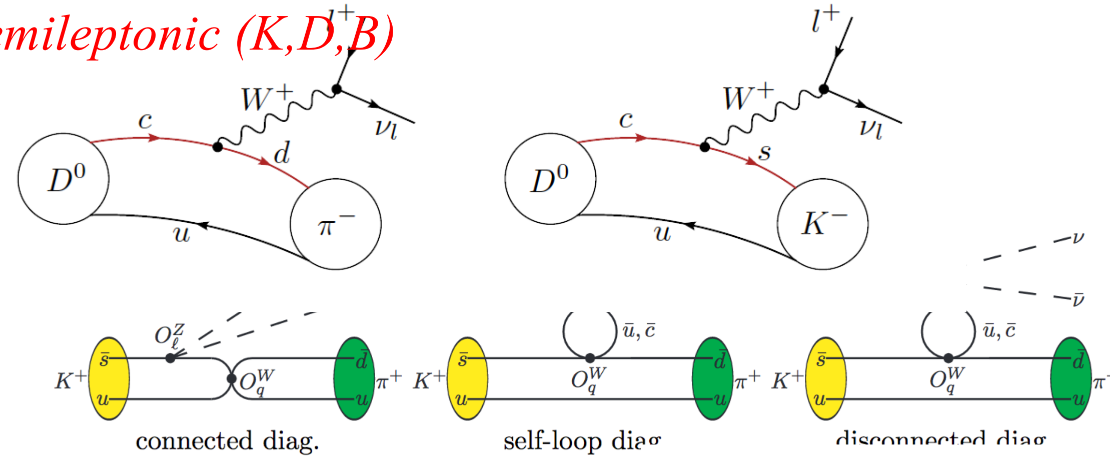
What cannot be computed

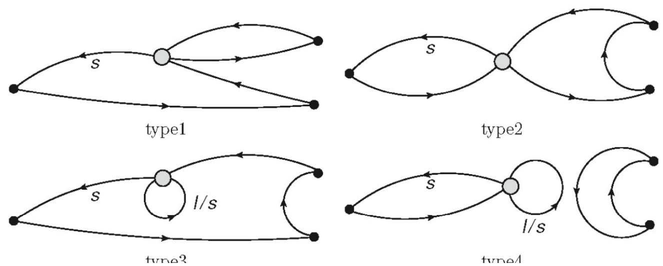
Leptonic (π,K,D,B)



Non-leptonic but only below the inelastic threshold (may be also 3 body decays) now changing

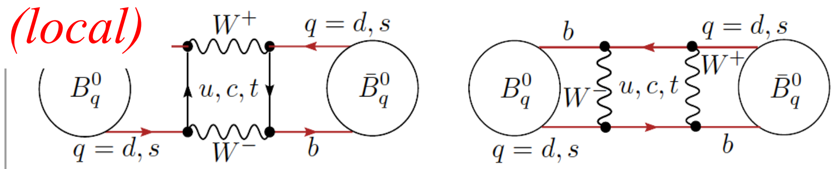
Semileptonic (K,D,B)





B -> ππ,Kπ, etc. No-> maybe !

Neutral meson mixing (local)



(some) Radiative and Rare *long distance effects*

(also $K \to \pi\, l^+ l^-$)

INCLUSIVE DECAYS ON THE LATTICE

Inclusive processes impractical to treat directly on the lattice. Vacuum current correlators computed in euclidean space-time are related to $e^+e^- \to$ hadrons or τ decay via analyticity. In our case the correlators have to be computed in the B meson, but analytic continuation more complicated: two cuts, decay occurs only on a portion of the physical cut.

While the lattice calculation of the spectral density of hadronic correlators is an ***ill-posed problem***, the spectral density is accessible after smearing

1704.06105, J.Phys.Conf.Ser. 1137 (2019) 1, 012005

We include $O(1/m_b^3)$ and $O(\alpha_s)$ terms

Hard scale $\sqrt{m_c^2 + \mathbf{q}^2} \sim 1 - 1.5$ GeV

We do not expect OPE to work at high $|\mathbf{q}|$

Twisted boundary conditions allow for any value of $\vec{q}^2$

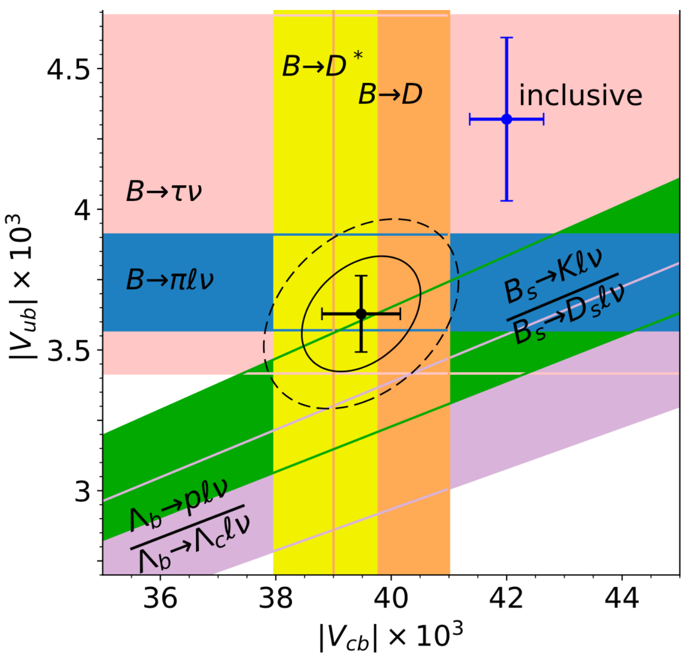
Smaller statistical uncertainties

What can be computed and What cannot be computed

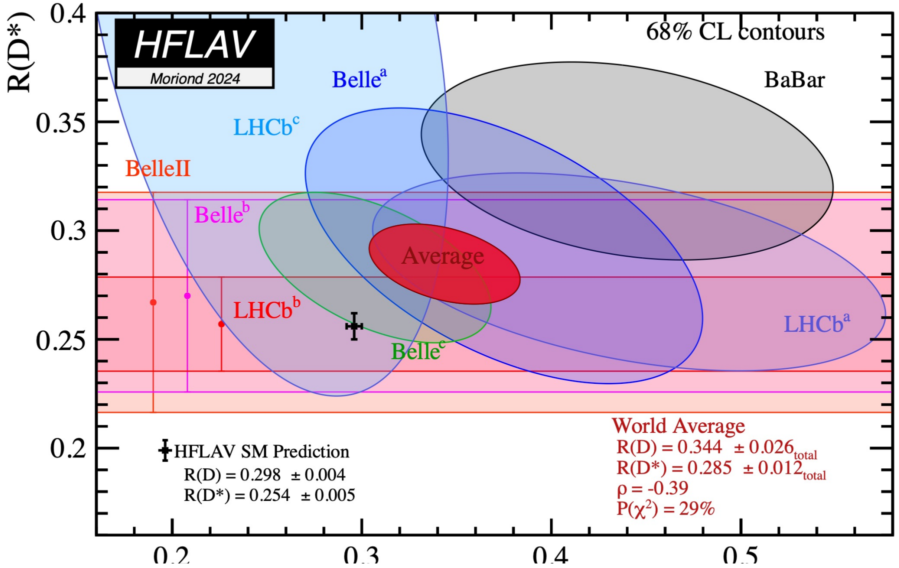
Tension(s) in $b \to c$ decays ? Charged Currents & Tree level

1. |Vcb| (and |Vub|) puzzle

FLAG Review 2021 [EPJC '22 (2111.09849)]



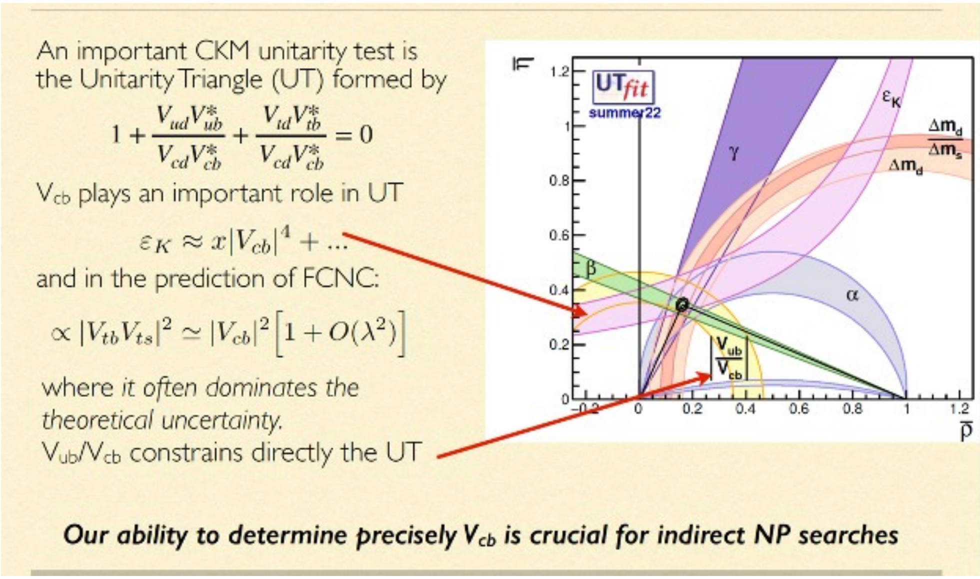
2. Lepton Flavor Universality Violation

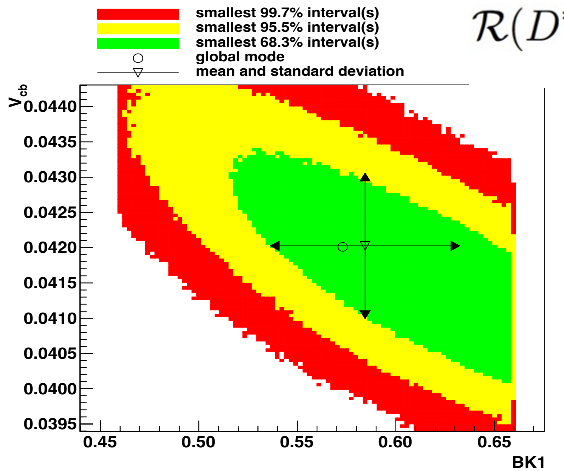


HFLAV Collaboration, PRD '23 [arXiv:2206.07501] (updated plot)

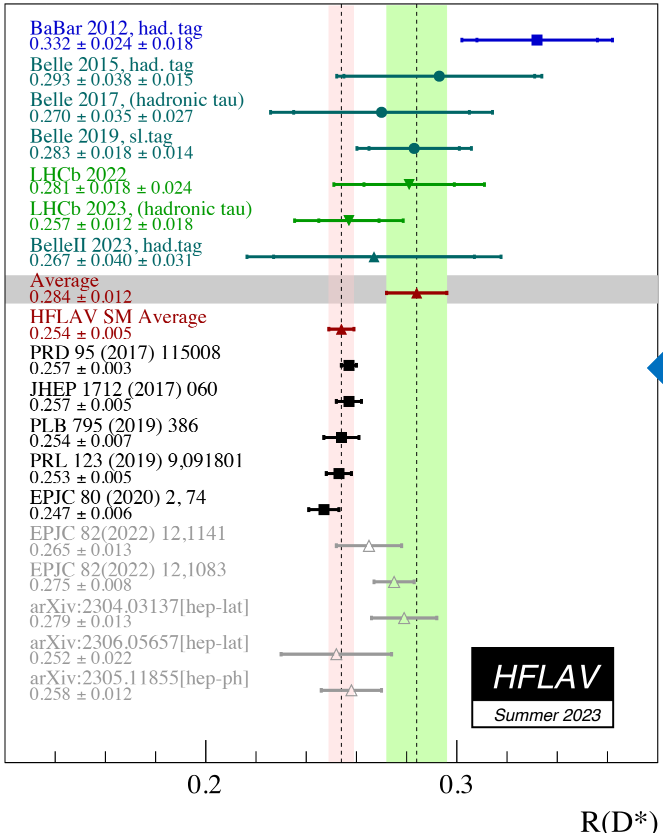
$$\mathcal{R}(D) = \frac{\mathcal{B}(B \to D\tau\nu_\tau)}{\mathcal{B}(B \to D\ell\nu_\ell)},$$

$$\mathcal{R}(D^*) = \frac{\mathcal{B}(B \to D^*\tau\nu_\tau)}{\mathcal{B}(B \to D^*\ell\nu_\ell)}$$





The tension strongly depends on the method used in the theoretical analysis



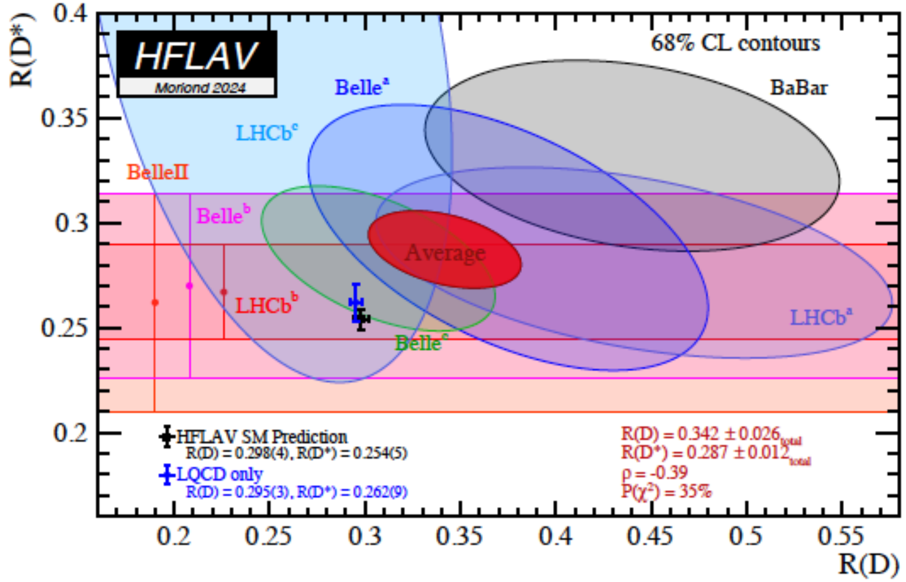


Figure 9. Measurements of $\mathcal{R}(D)$ and $\mathcal{R}(D^*)$ listed in Table 3 and their two-dimensional average. Contours correspond to 68% CL for both the bands and the ellipses. The black and blue points with error bars are two recent SM predictions for $\mathcal{R}(D^*)$ and $\mathcal{R}(D)$. The SM prediction reported is based on the results summarized in Table 1. This prediction and the experimental average deviate from each other by about 3.3σ. The SM prediction based only on LQCD calculations is also reported, where $\mathcal{R}(D)$ is taken from FLAG [25], while $\mathcal{R}(D^*)$ is taken from Ref. [28]. The deviation from the experimental average and this prediction is about 2.5σ. The measurements are listed in Table 3.

Power corrections to the CP-violation parameter ε_K

M. Ciuchini[(a)], E. Franco[(b)], V. Lubicz[(c,a)],
G. Martinelli[(d,b)], L. Silvestrini[(b)], C. Tarantino[(c,a)]

$$\varepsilon_K^{exp} = 2.228 \pm 0.011) \cdot 10^{-3}$$

2021: an estimate from the 1/mc expansion of the effective Hamiltonian + UTfit

$$\varepsilon_K = 2.00\,(15) \times 10^{-3}$$

Computing the long-distance contributions to ε_K

Ziyuan Bai
Columbia University, USA
bzyhty@gmail.com

Norman Christ∗ †
Columbia University, USA
E-mail: nhc@phys.columbia.edu

RBC and UKQCD Collaborations

2015: a real exploratory calculation

no physical masses, no extrapolation to the continuum

$$|\varepsilon| = (1.806(41) + 0.891(11) + 0.209(6) + 0.112(13)) \times 10^{-3} = 3.019(45) \times 10^{-3}$$

tt $\quad ut_{SD}$ $\quad ut_{LD}$ $\quad \mathrm{Im}(A_0)$,

Final result for ε'

- Combining our new result for Im(A_0) and our 2015 result for Im(A_2), and again using expt. for the real parts, we find

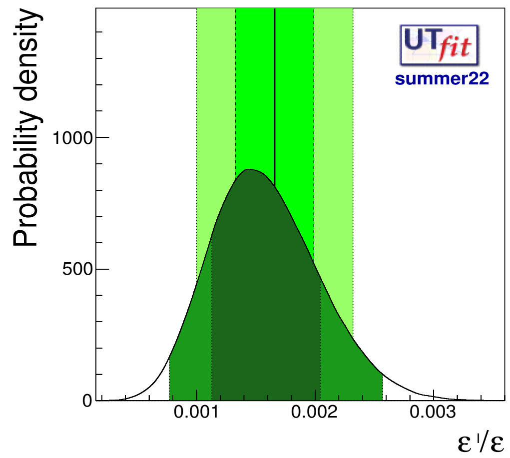
$$\mathrm{Re}\left(\frac{\varepsilon'}{\varepsilon}\right) = \mathrm{Re}\left\{\frac{i\omega e^{i(\delta_2-\delta_0)}}{\sqrt{2}\varepsilon}\left[\frac{\mathrm{Im}A_2}{\mathrm{Re}A_2} - \frac{\mathrm{Im}A_0}{\mathrm{Re}A_0}\right]\right\}$$

$$= 0.00217(26)(62)(50)$$

stat sys IB + EM

Consistent with experimental result:

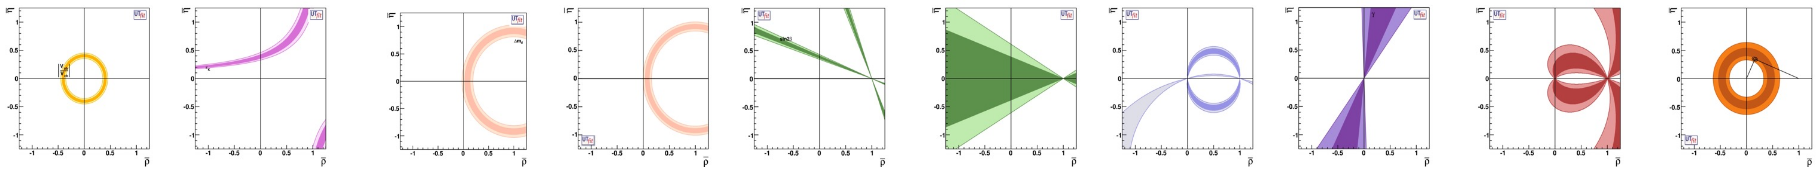
$$\mathrm{Re}(\epsilon'/\epsilon)_{\mathrm{expt}} = 0.00166(23)$$



RBC/UKQCD: e'/ e= 16.7 x10^{-4}

Utfit: e'/ e= 15.2(4.7) x10^{-4}

A second group should do this calculation!!

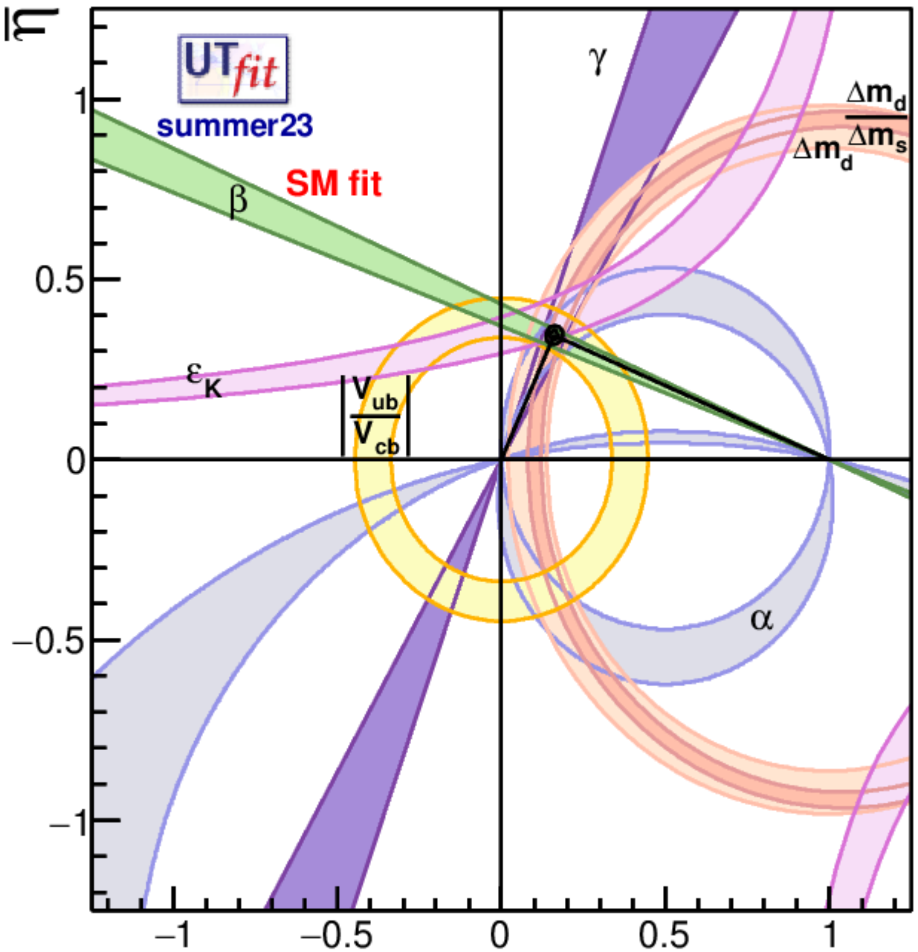


2023 results

$\bar{\rho} = 0.160 \pm 0.009 \quad \bar{\eta} = 0.345 \pm 0.011$

To be updated

In the hadronic sector, the SM CKM pattern represents the principal part of the flavor structure and of CP violation



$\alpha = (92.4 \pm 1.4)^0$

$\sin 2\beta = 0.703 \pm 0.014$

$\beta = (22.46 \pm 0.68)^0$

$\gamma = (65.1 \pm 1.3)^0$

$A = 0.828 \pm 0.011$

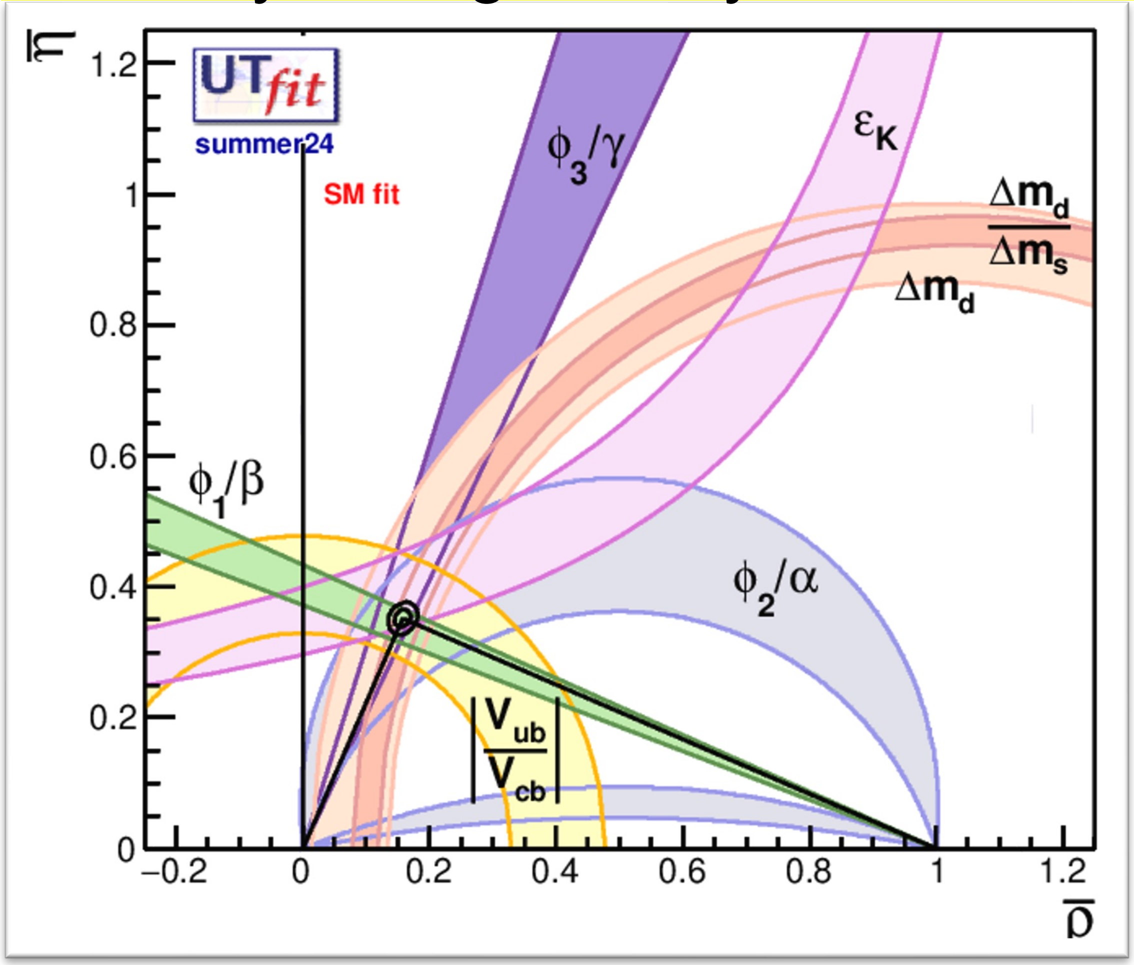
$\lambda = 0.22519 \pm 0.00083$

2022

Consistence on an over constrained fit of the CKM parameters

CKM matrix is the dominant source of flavour mixing and CP violation

Unitarity Triangle analysis in the SM:



levels @
95% Prob

$\rho = 0.158 \pm 0.009$
$\eta = 0.352 \pm 0.010$

$\lambda = 0.2250 \pm 0.0007$

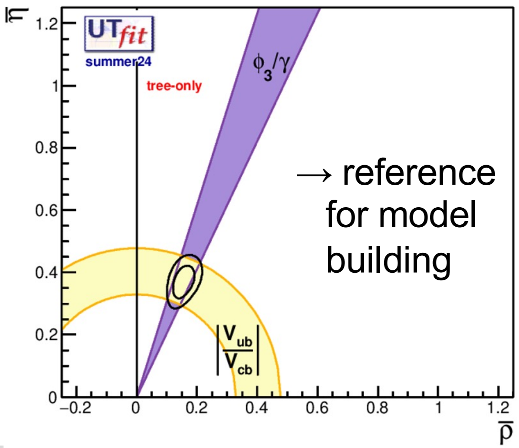
$A = 0.826 \pm 0.009$

Some interesting configurations

"Tree only"

$\rho = \pm 0.156 \pm 0.024$

$\eta = \pm 0.372 \pm 0.035$

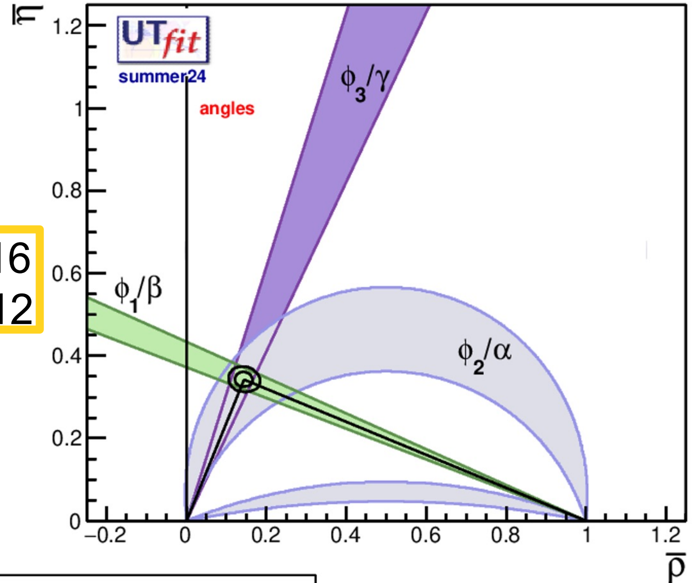


→ reference for model building

Angles only

$\rho = 0.144 \pm 0.016$

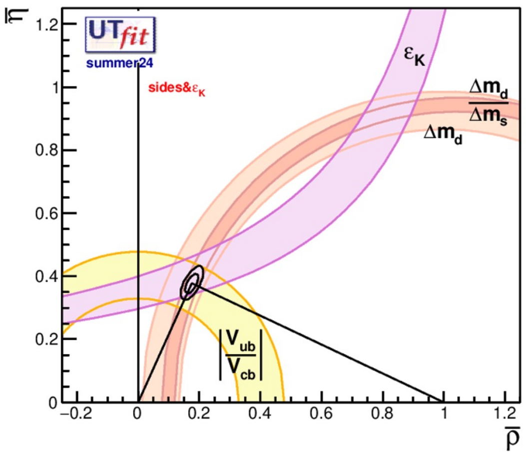
$\eta = 0.343 \pm 0.012$

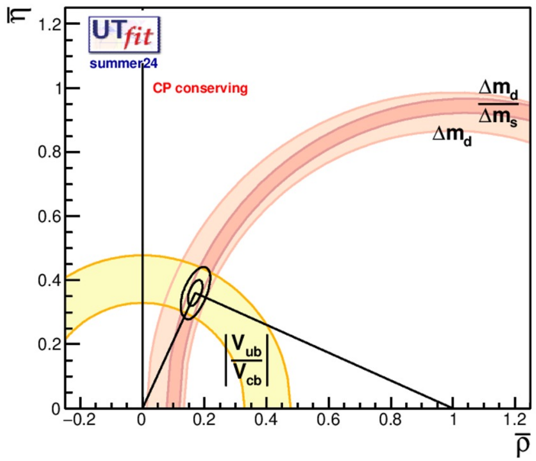


Sides and ϵ_K

$\rho = 0.176 \pm 0.015$

$\eta = 0.377 \pm 0.022$





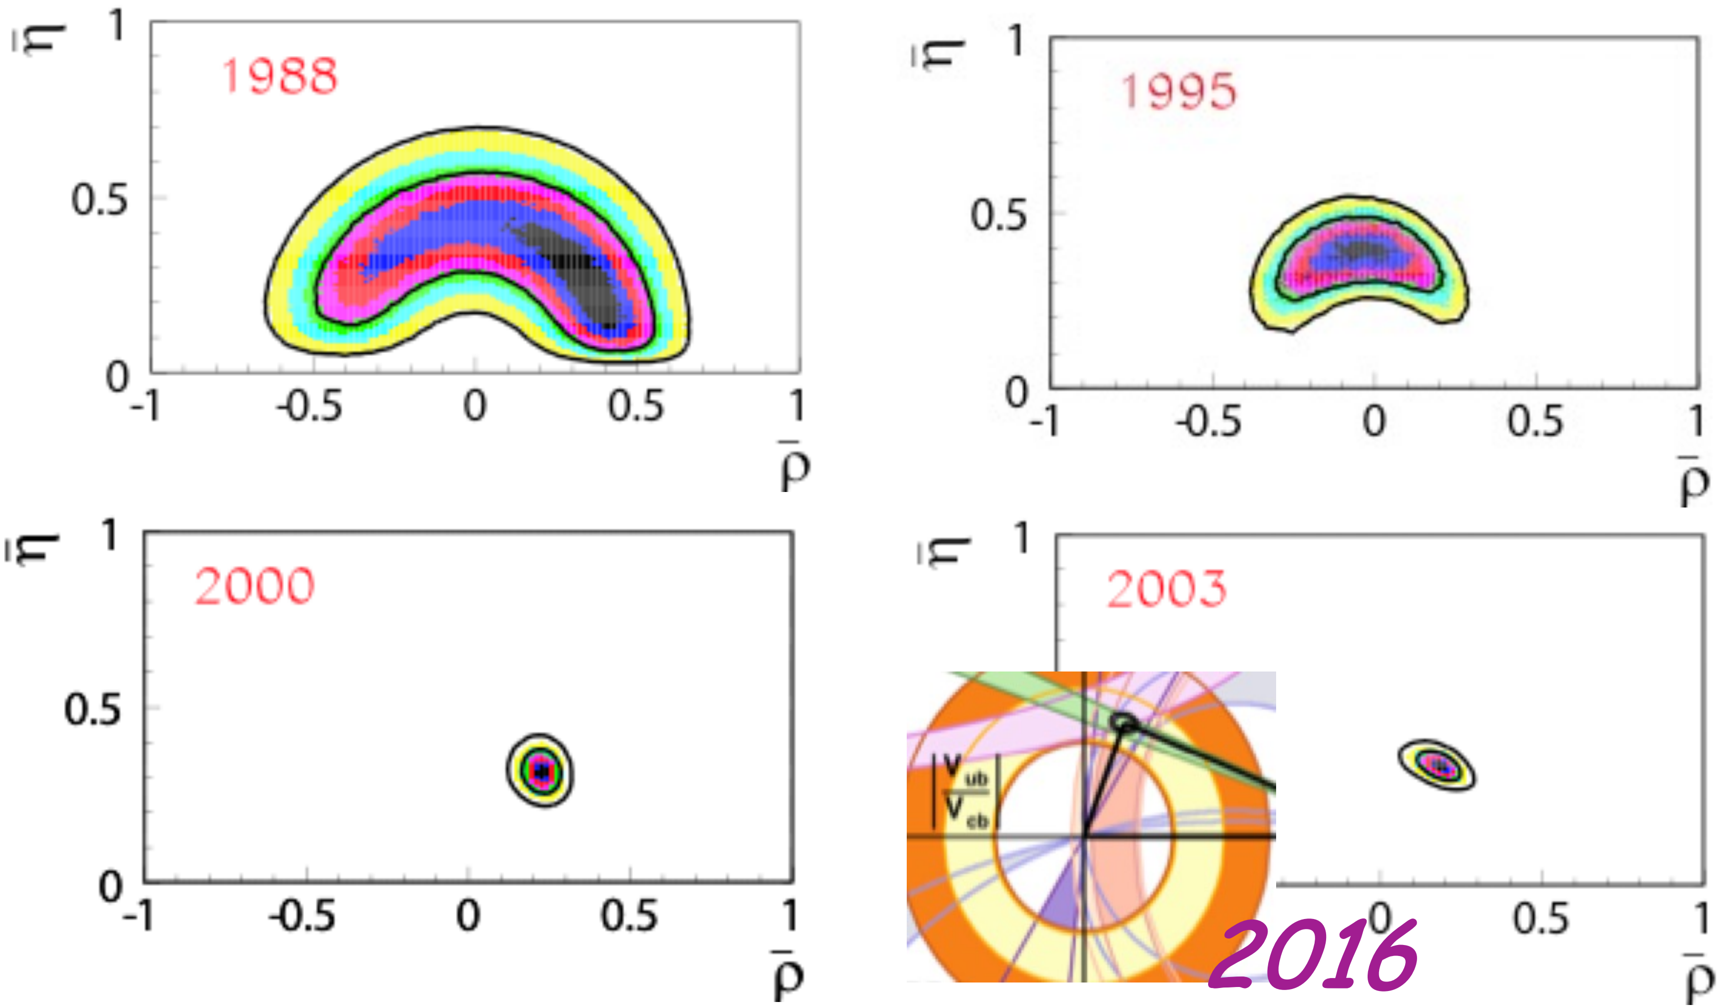
CP conserving constraints

$\rho = 0.170 \pm 0.017$

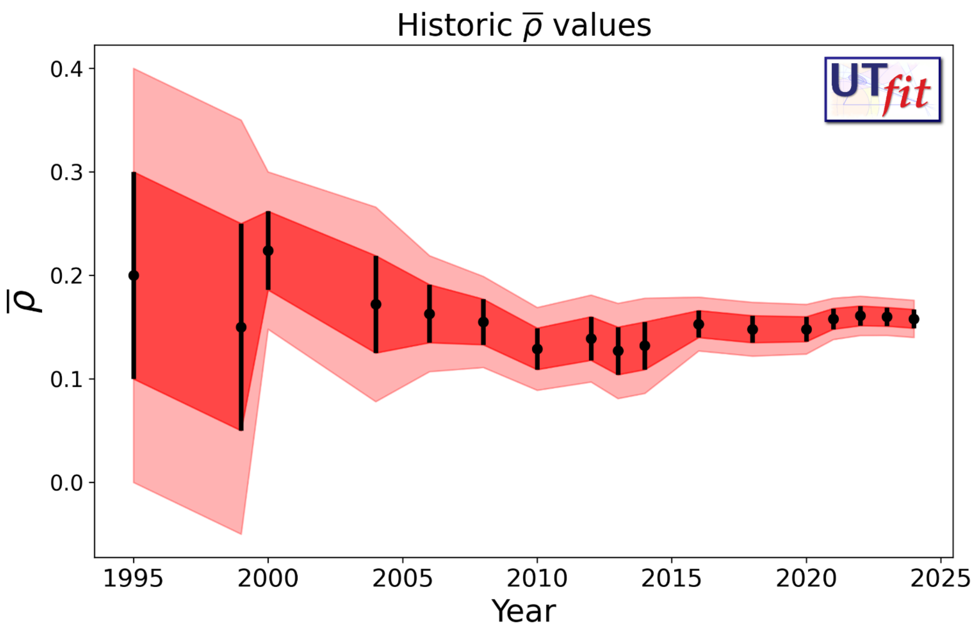
$\eta = 0.361 \pm 0.035$

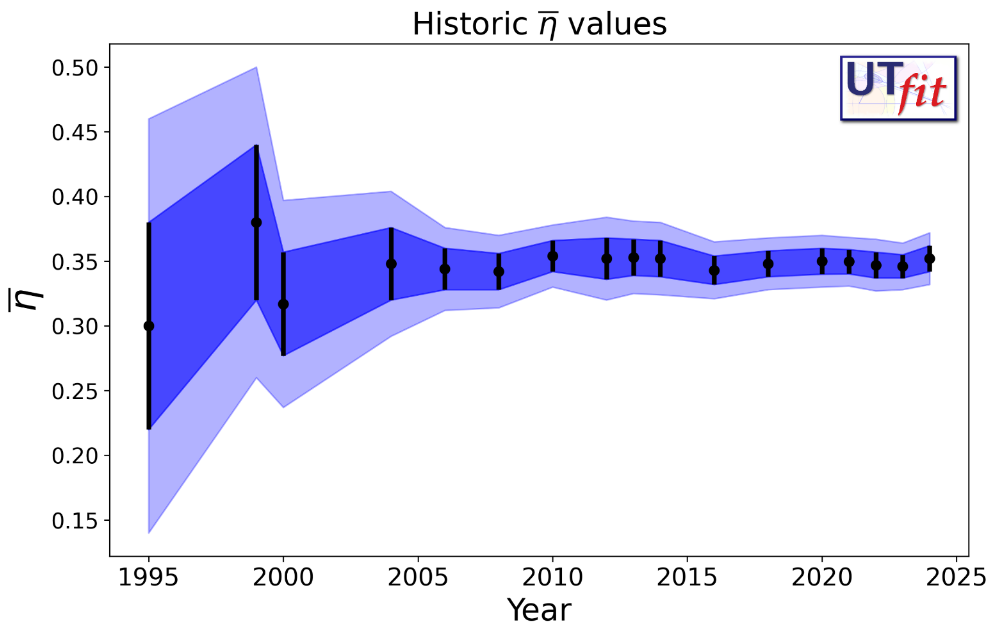
PROGRESS SINCE 1988

Experimental progress so impressive that we can fit the hadronic matrix elements (in the SM)

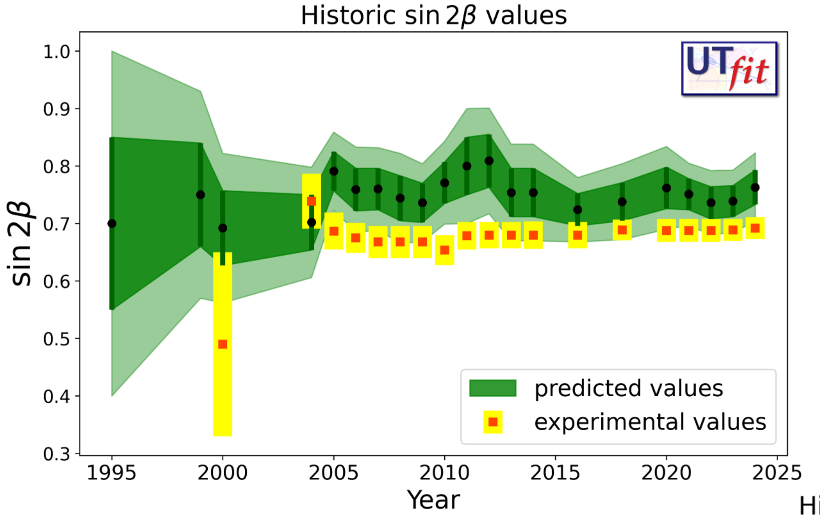


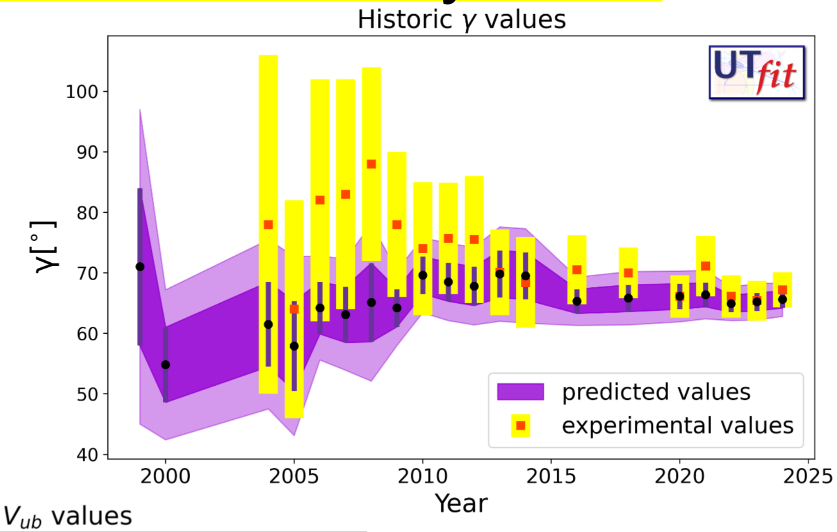
UTfit results across the years:

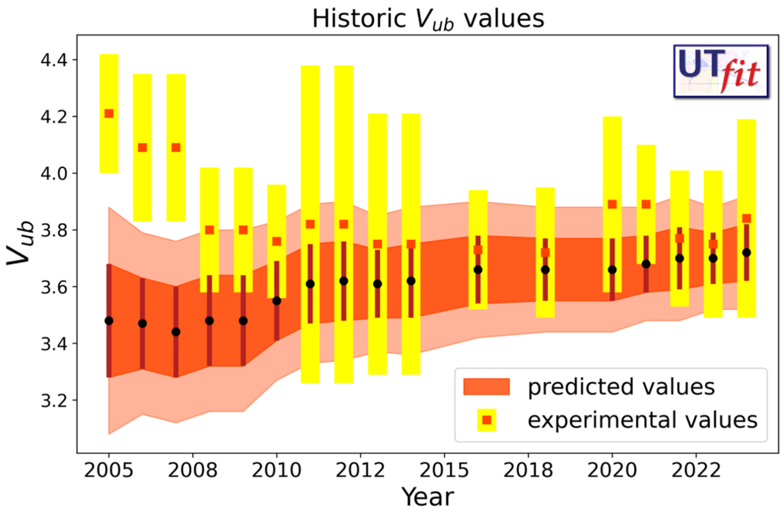




UTfit and experimental results across the years:





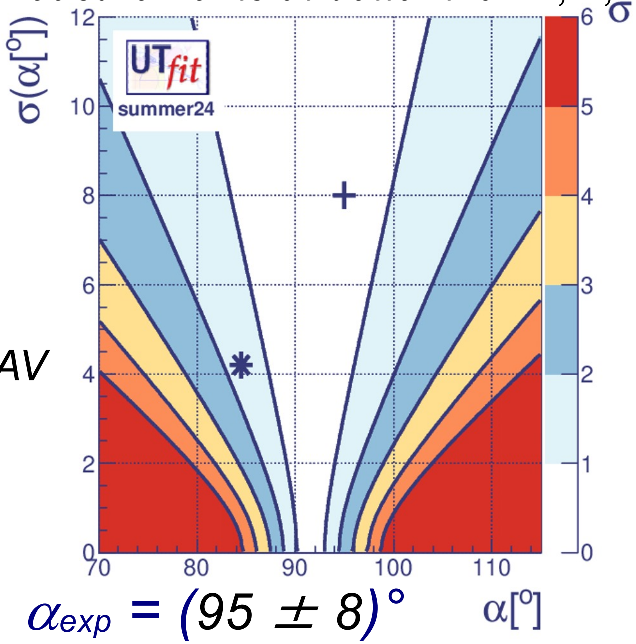


Compatibility plots

A way to "measure" the agreement of a single measurement with the indirect determination from the fit using all the other inputs: test for the SM description of the flavour physics

Colour code: agreement between the predicted values and the measurements at better than 1, 2, ...nσ

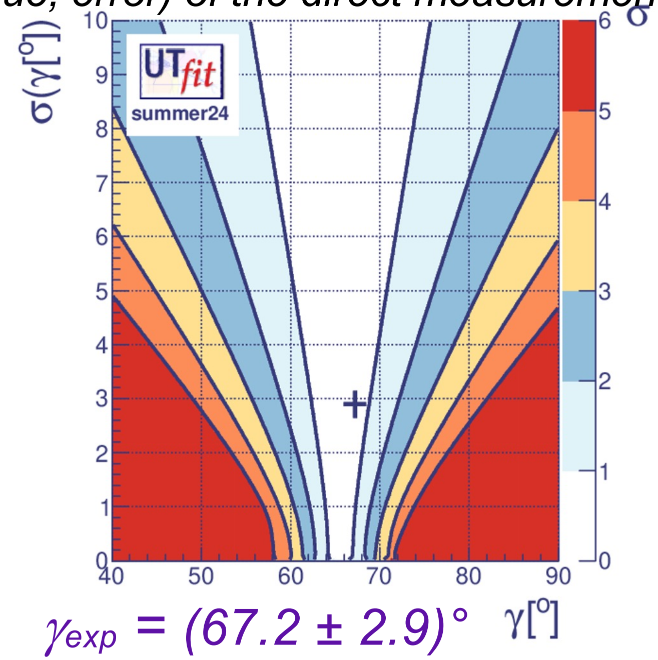
The cross has the coordinates (x,y)=(central value, error) of the direct measurement



$*$ = *HFLAV*

α_{exp} = (95 ± 8)°

α_{UTfit} = (91.4 ± 1.4)°

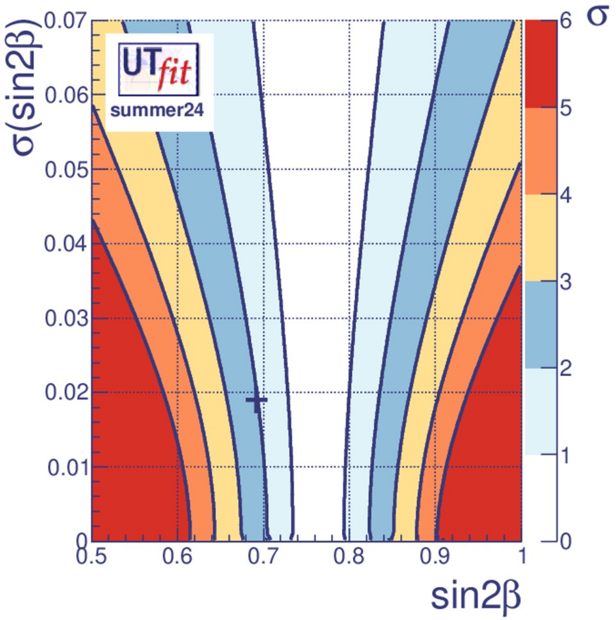


γ_{exp} = (67.2 ± 2.9)°

γ_{UTfit} = (65.6 ± 1.4)°

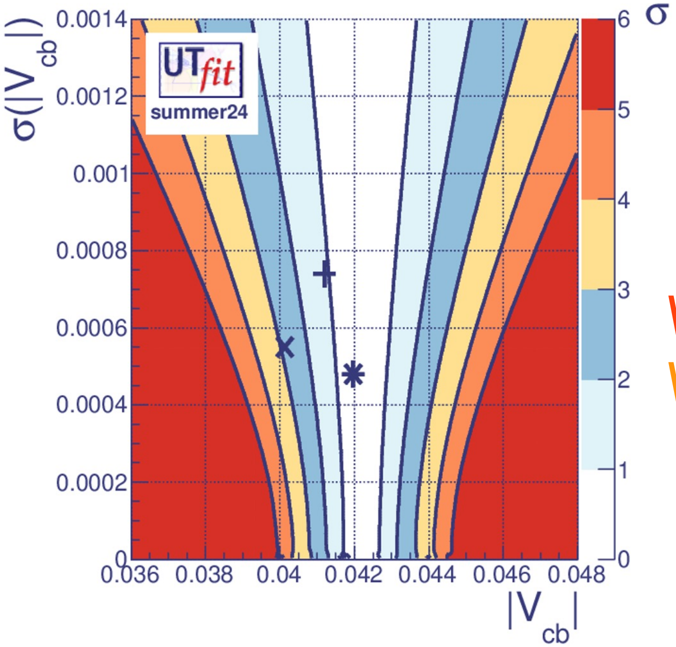
γ = (68.4 ± 2.6)° **F. Betti et al.** ***e-Print:*** ***2409.06449 [hep-ph]***

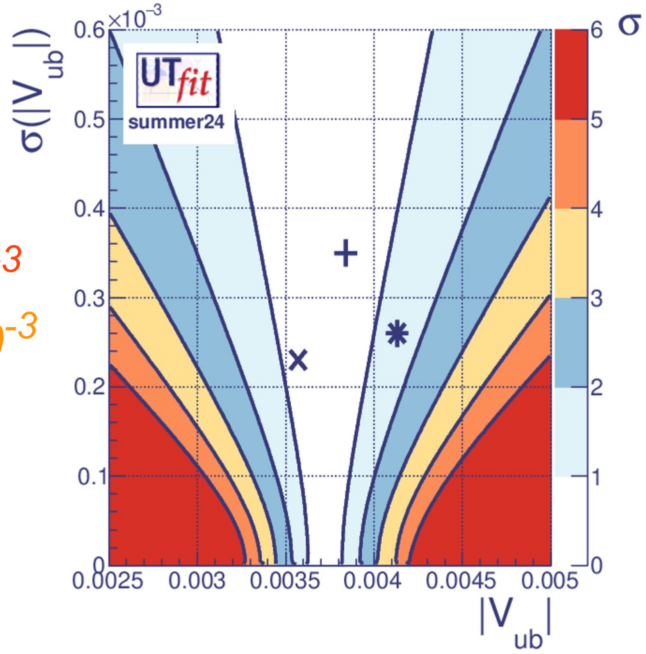
Checking the usual tensions..



$sin2\beta_{exp}$ = 0.692 ± 0.019
$sin2\beta_{UTfit}$ = 0.763 ± 0.030

$Vcb_{exp} = (41.20 \pm 0.74) \cdot 10^{-3}$
$Vcb_{UTfit} = (42.19 \pm 0.48) \cdot 10^{-3}$





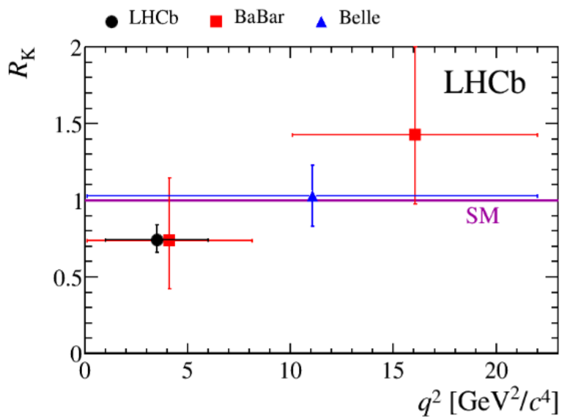
$Vub_{exp} = (3.84 \pm 0.35) \cdot 10^{-3}$
$Vub_{UTfit} = (3.72 \pm 0.10) \cdot 10^{-3}$

x = exclusive
$*$ = inclusive

Tension(s) in $b \to s$ decays ?
Neutral Currents & Loop level

Reminder:
$R_K = B(B^+ \to K^+ \mu^+ \mu^-) / B(B^+ \to K^+ e^+ e^-)$

- Test of lepton universality : $R_K \sim 1$ in SM, with negligible theoretical uncertainties



LHCb, PRL 113 151601
Belle, PRL 103 171801
BaBar, PRD 86 032012

$$R_K(1 < q^2 < 6 \text{ GeV}^2) = 0.745^{+0.090}_{-0.074}(\text{stat}) \pm 0.036(\text{syst})$$

- Compatible with SM at 2.6σ
- Experimentally challenging
  - lower trigger efficiency for electrons, resolution deteriorated by bremsstrahlung
- Other modes suitable for same test: $B^0 \to K^{*0} l^+ l^-$, $B_s \to \phi l^+ l^-$, $\Lambda_B \to \Lambda l^+ l^-$

Old slide

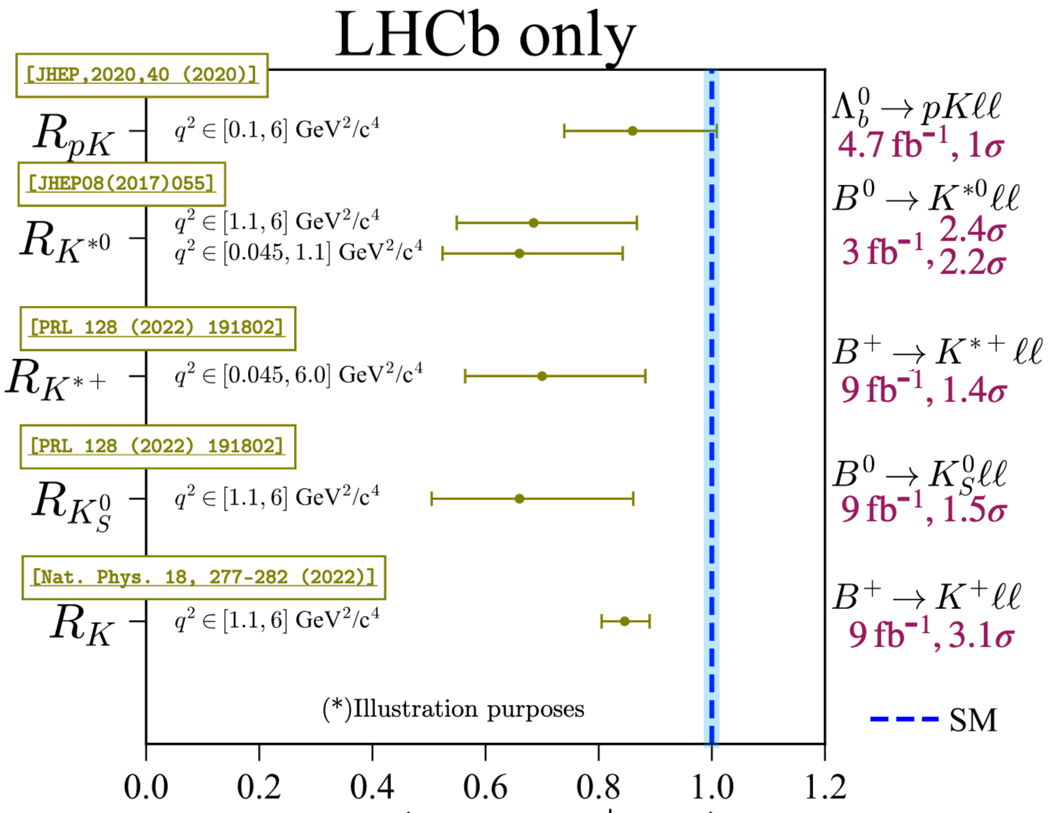
Analysis

Lepton Flavour Universality (LFU) tests in $b \to s\ell^+\ell^-$

- Coherent pattern of tension to SM in LFU test with $b \to s\ell^+\ell^-$ transition:
- R_X ratio extremely well predicted in SM
  - Cancellation of hadronic uncertainties at 10^{-4}
  - $\mathcal{O}(1\%)$ QED correction [Eur.Phys.J.C 76 (2016) 8]
  - Statistically limited
- **Any departure from unity is a clear sign of New Physics**



$$R_X = \frac{\mathcal{B}(b \to s\mu^+\mu^-)}{\mathcal{B}(b \to se^+e^-)}$$

(*) Measurements from Belle not shown (larger statistical uncertainties)

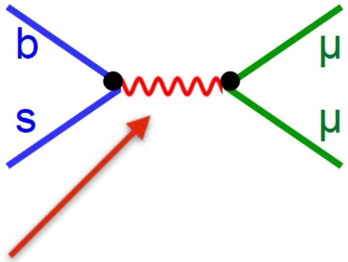
A EFT description

b ⟶ s

A relatively sizable New Physics effect...

~30% of the Standard Model contribution (arising at one loop)

...hinting towards a relatively low New Physics scale:



generic tree	$\frac{1}{\Lambda_{\mathrm{NP}}^2}(\bar{s}\gamma_\nu P_L b)(\bar{\mu}\gamma^\nu \mu)$	$\Lambda_{\mathrm{NP}} \simeq 35\ \mathrm{TeV} \times (C_9^{\mathrm{NP}})^{-1/2}$
MFV tree	$\frac{1}{\Lambda_{\mathrm{NP}}^2} V_{tb} V_{ts}^* (\bar{s}\gamma_\nu P_L b)(\bar{\mu}\gamma^\nu \mu)$	$\Lambda_{\mathrm{NP}} \simeq 7\ \mathrm{TeV} \times (C_9^{\mathrm{NP}})^{-1/2}$
generic loop	$\frac{1}{\Lambda_{\mathrm{NP}}^2}\frac{1}{16\pi^2}(\bar{s}\gamma_\nu P_L b)(\bar{\mu}\gamma^\nu \mu)$	$\Lambda_{\mathrm{NP}} \simeq 3\ \mathrm{TeV} \times (C_9^{\mathrm{NP}})^{-1/2}$
MFV loop	$\frac{1}{\Lambda_{\mathrm{NP}}^2}\frac{1}{16\pi^2} V_{tb} V_{ts}^* (\bar{s}\gamma_\nu P_L b)(\bar{\mu}\gamma^\nu \mu)$	$\Lambda_{\mathrm{NP}} \simeq 0.6\ \mathrm{TeV} \times (C_9^{\mathrm{NP}})^{-1/2}$

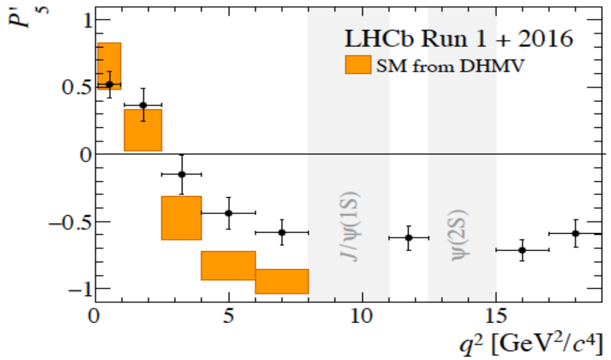
B anomalies in the post-R_K era

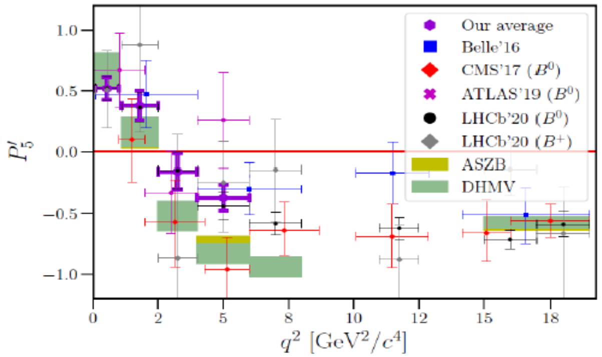
Nazila Mahmoudi *Corfu 2023*

Tension in the angular observables - 2020 updates

$P_5'(B^0 \to K^{*0}\mu^+\mu^-)$: 2020 LHCb update with 4.7 fb^{-1}: $\sim 2.9\sigma$ local tension



Phys. Rev. Lett. 125, 011802 (2020)

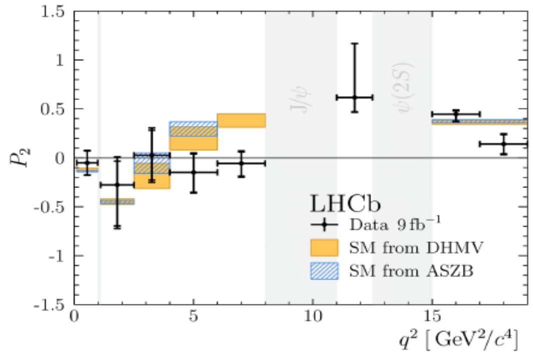


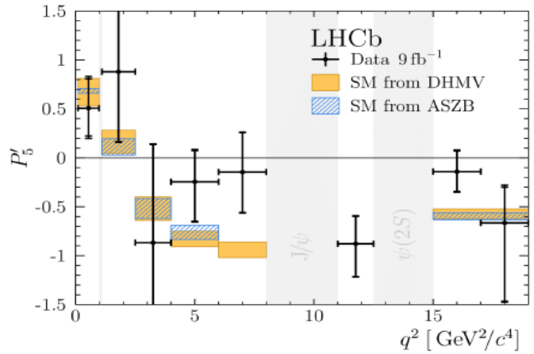
ATLAS-CONF-2017-023; CMS-PAS-BPH-15-008

anomalies hunters never surrender

desperately seeking ~~Susan~~ NP

First measurement of $B^+ \to K^{*+}\mu^+\mu^-$ angular observables using the full Run 1 and Run 2 dataset (9 fb^{-1}):





Phys. Rev. Lett. 126, 161802 (2021)

theoretical estimates of unnown amplitudes

The results confirm the global tension with respect to the ~~SM!~~

Comparison of one-operator NP fits:

All observables 2022 ($\chi^2_{\rm SM}=253.3$)			
	b.f. value	$\chi^2_{\rm min}$	$\rm Pull_{SM}$
δC_9	-0.95 ± 0.13	215.8	6.1σ
δC_9^e	0.82 ± 0.19	232.4	4.6σ
δC_9^μ	-0.92 ± 0.11	195.2	7.6σ
δC_{10}	0.08 ± 0.16	253.2	0.5σ
δC_{10}^e	-0.77 ± 0.18	230.6	4.8σ
δC_{10}^μ	0.43 ± 0.12	238.9	3.8σ
$\delta C_{\rm LL}^e$	0.42 ± 0.10	231.4	4.7σ
$\delta C_{\rm LL}^\mu$	-0.43 ± 0.07	213.6	6.3σ

All observables 2023 ($\chi^2_{\rm SM}=231.3$)			
	b.f. value	$\chi^2_{\rm min}$	$\rm Pull_{SM}$
δC_9	-0.96 ± 0.13	230.7	6.3σ
δC_9^e	0.21 ± 0.16	269.2	1.3σ
δC_9^μ	-0.69 ± 0.12	240.4	5.5σ
δC_{10}	0.15 ± 0.15	270.0	1.0σ
δC_{10}^e	-0.18 ± 0.14	269.3	1.3σ
δC_{10}^μ	0.16 ± 0.10	268.3	1.6σ
$\delta C_{\rm LL}$	-0.54 ± 0.12	249.1	4.7σ
$\delta C_{\rm LL}^e$	0.10 ± 0.08	269.2	1.3σ
$\delta C_{\rm LL}^\mu$	-0.23 ± 0.06	257.4	3.7σ

$\delta C_{\rm LL}^\ell$ basis corresponds to $\delta C_9^\ell = -\delta C_{10}^\ell$.

But … really a reliable estimate of uncertainties is missing and theory must be improved otherwise we will continue to generate anomalies out of our ingnorance

Known unknowns in B → K*μμ

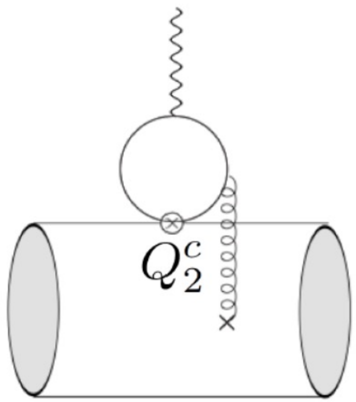
$$\mathrm{H}_V{}^{\lambda} = \frac{4iG_F m_B}{\sqrt{2}} \frac{e^2}{16\pi^2} \lambda_t \left\{ C_9^{\mathrm{eff}} \tilde{V}_{L\lambda} + \frac{m_B^2}{q^2} \left[\frac{2m_b}{m_B} C_7^{\mathrm{eff}} \tilde{T}_{L\lambda} - 16\pi^2 h_\lambda \right] \right\}$$

$$h_\lambda(q^2) = \frac{\epsilon_\mu^*(\lambda)}{m_B^2} \int d^4x e^{iqx} \langle \bar{K}^* | T\{ j^\mu_{\mathrm{em}}(x) \mathcal{H}_{\mathrm{eff}}^{\mathrm{had}}(0) \} | \bar{B} \rangle$$

Non-factorizable power-suppressed contributions of 4-quark operators to the matrix element

- dominated by

$$Q_1^c = (\bar{s}_L \gamma_\mu T^a c_L)(\bar{c}_L \gamma^\mu T^a b_L)\,,$$
$$Q_2^c = (\bar{s}_L \gamma_\mu c_L)(\bar{c}_L \gamma^\mu b_L)\,,$$



the charm pair can be close to the resonant region

Do we know how to compute them?

In general, no!

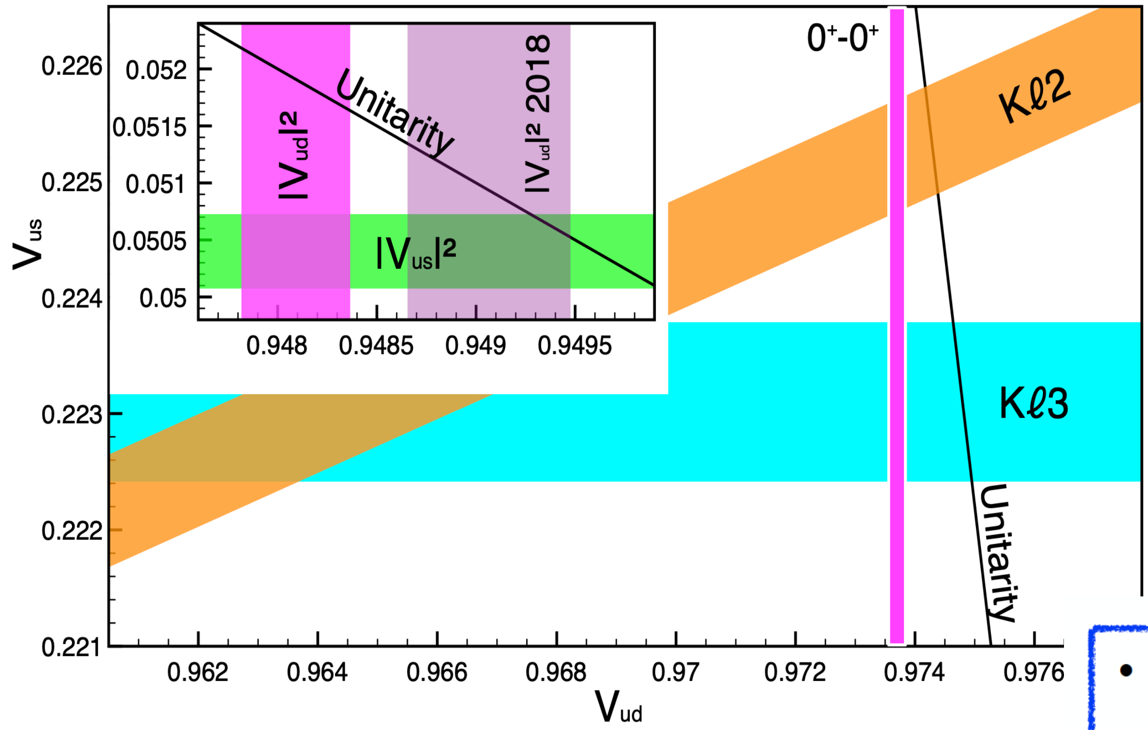
Tensions with the unitarity of the first CKM row ?



M. Gorshteyn, talk @ CKM23 conference

Both theory and experiments demands a closer scrutiny of systematic errors

- Until ~2018, bands *did* intersect in the same region on the unitarity circle (< 2σ)
- *Main* changes since then:
  - V_{us} from Kl3 decreased (<V> increased with smaller uncertainty, 2+1+1 lattice QCD)
  - V_{ud} decreased (radiative corrections in nuclear & neutron increased with smaller uncertainty, dispersive)

$$\underset{\sim 0.95}{|V_{ud}|^2} + \underset{\sim 0.05}{|V_{us}|^2} + \underset{\sim 10^{-5}}{|V_{ub}|^2} = 0.9985(6)_{V_{ud}}(4)_{V_{us}}$$

Courtesy of L. Vittorio

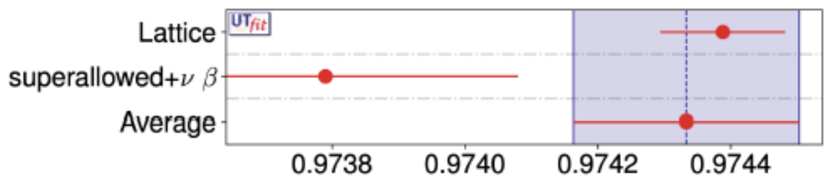
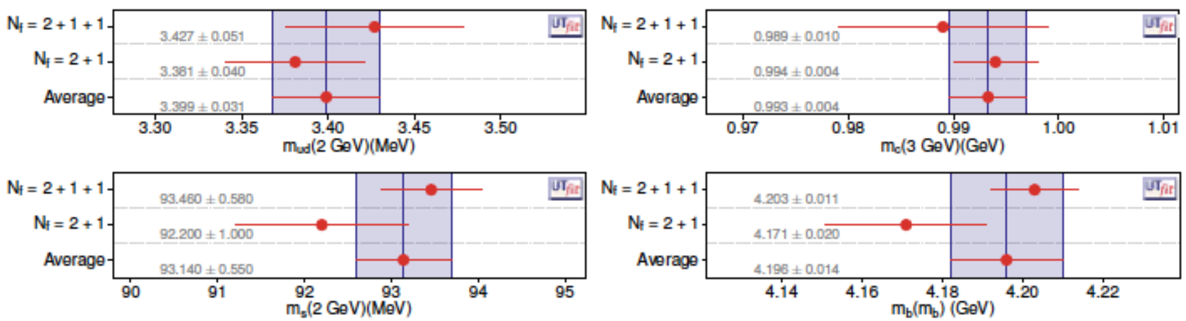
Istituto Nazionale di Fisica Nucleare

What's new for EPS23

- Theory updates:
  - New V_{ud} extraction from neutron decays, following V. Cirigliano et al. arXiv:2306.03138
  - New lattice values for masses
  - New lattice form factors for exclusive $b \to q\ell\nu$
- Experiment updates:
  - New sin2β by LHCb
  - New γ by LHCb
  - New α
- …

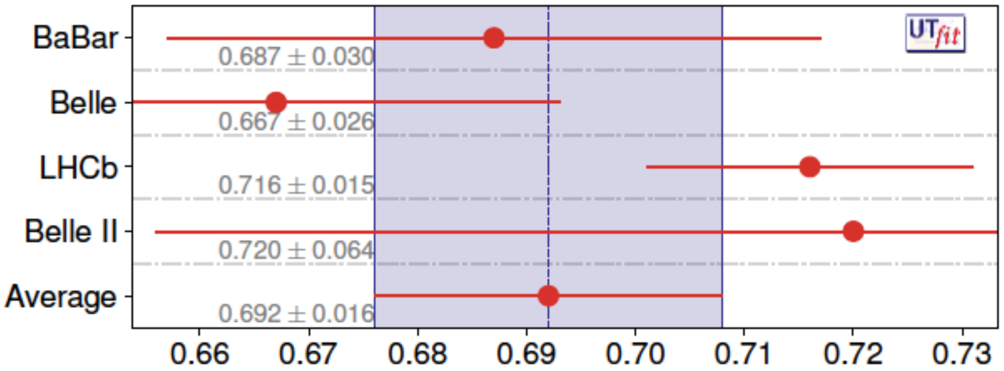


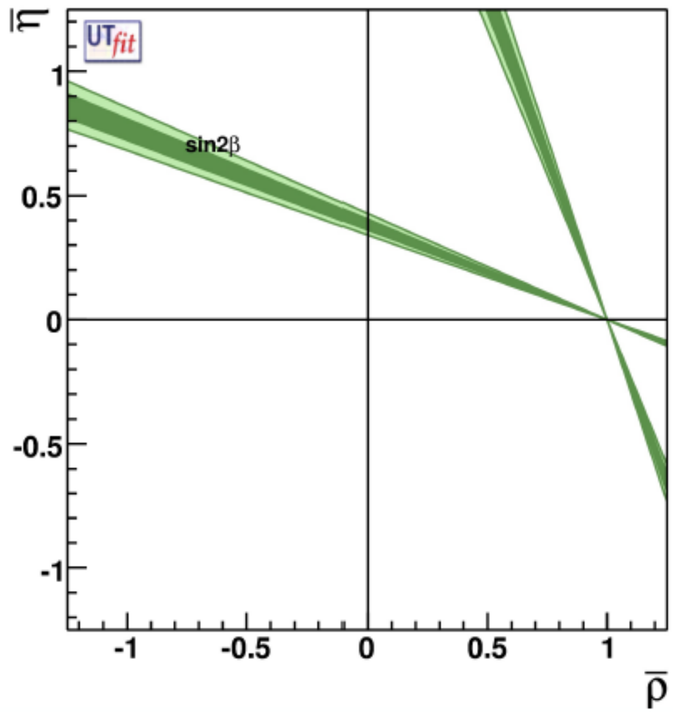
All masses computed in $\overline{\mathrm{MS}}$ and averaged with PDG scale factors



What's new for EPS23: $sin(2\beta)$

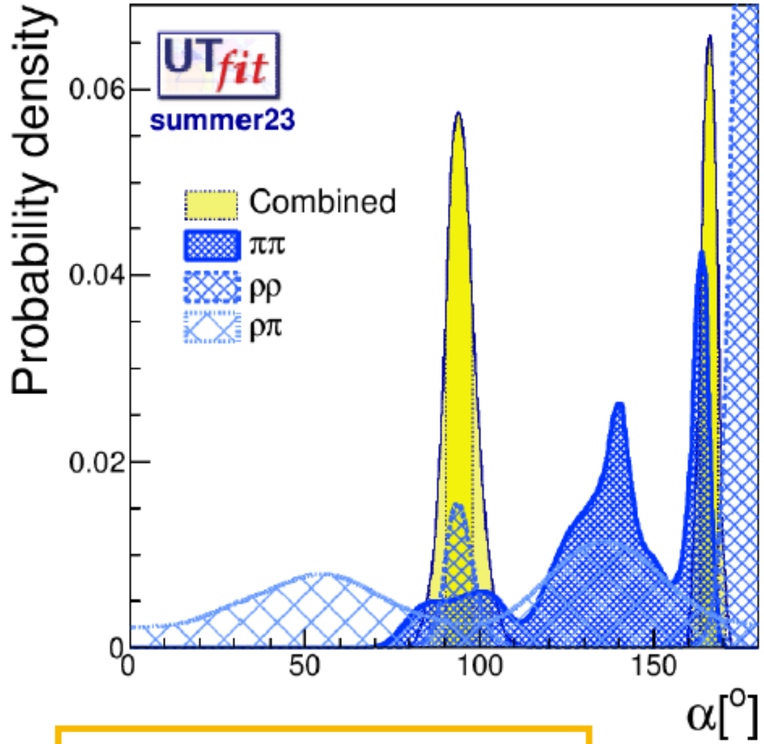
- Averaged charmonium values
- New sin2β from LHCb
- Average including correction due to Cabibbo-suppressed penguin contribution:
  - Most recent estimate $\Delta(\sin 2\beta) = -\,0.1 \pm 0.1$
  - Theoretical uncertainty comparable to experimental error





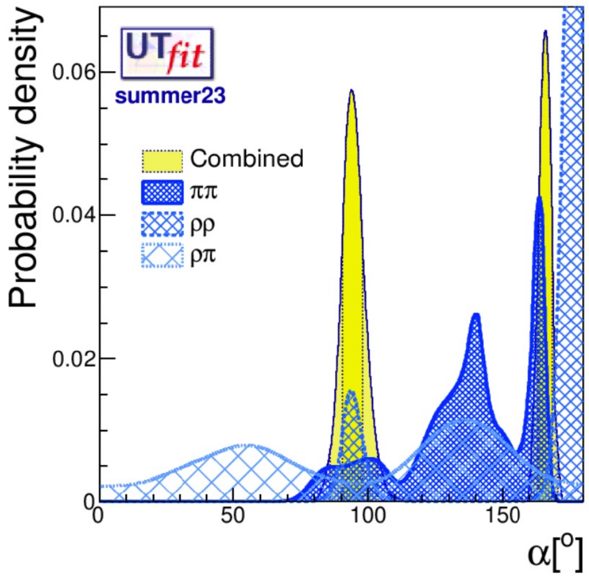
What's new for EPS23

- Updated the bound on α with
  - Bounds from ππ and ρρ derived from PDG averages (including PDG rescaling of the error)
  - Bound from ρπ derived from same inputs used by HFLAV
- As usual, main difference wrt other combinations is in the treatment of the multiple solutions
  - Profiling vs marginalization: in our case, multiple overlapping solutions counts more than a single solution when integrating out the other quantities (T, P, and strong phases)

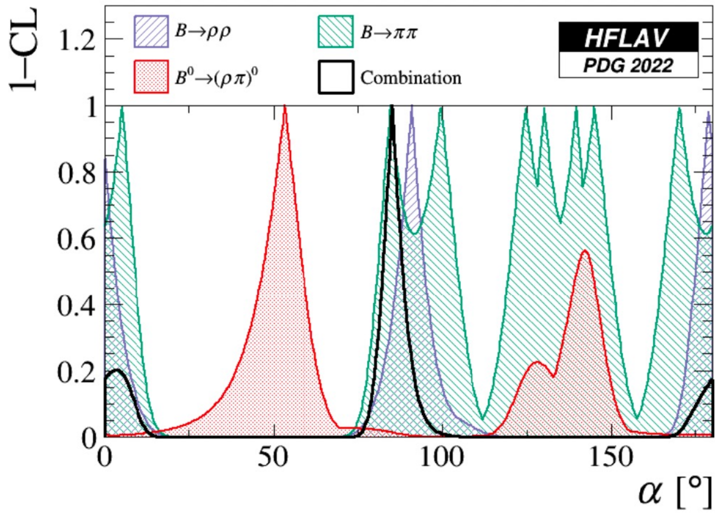


$$\alpha = (93.8 \pm 4.5)^o$$

More on α



$\alpha^{exp} = 93.8° \pm 4.5°$



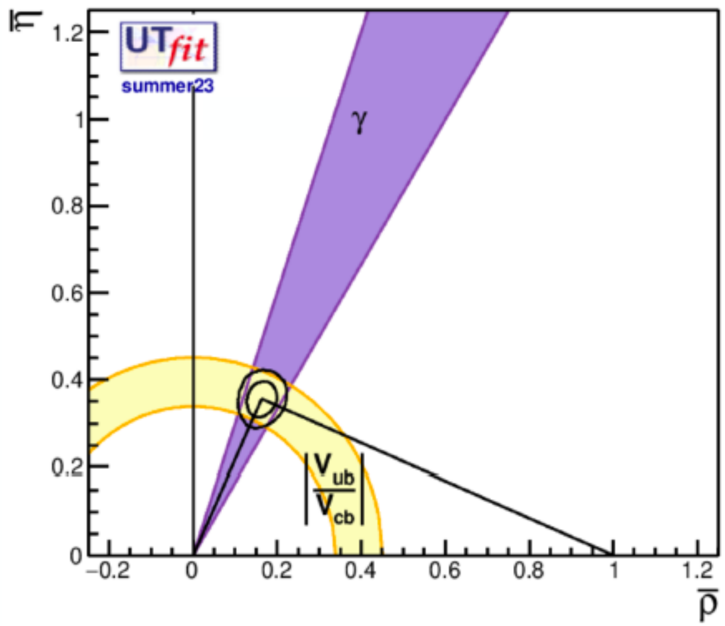
$\alpha_{HFLAV} = 85.5 \pm 4.6$

Inputs are slighly different from what HFLAV because for the BR averages we use the PDG (with the error inflation if there is a tension), while HFLAV would use their averages without error inflation.
So the pipi BR inputs are slightly different. We also use the updated rhopi.

HFLAV
It seems that the reason why the combination falls on the pipi solution on the left of the rhorho peak (while the right solution would be just as probable and even not distinguishable) is due to the small bump from the rhopi distribution which instead goes to zero for the pipi solution on the right.

What's new for EPS23

- Determination combining all $D^{(*)}K^{(*)}$ modes
  - Simultaneous extraction of γ and $D\bar{D}$ mixing parameters (which enter the BSM analysis)
  - ~~Details are given in dedicated talk by R. Di Palma on Friday~~
- Tree-level determination
  - Baseline determination of CP violation in the SM, assuming BSM effects enter only at loop
  - With $|V_{ub}/V_{cb}|$, allows for a robust fit of the CKM parameters in the SM, even in presence of new physics



$$\bar{\rho} = \pm 0.163 \pm 0.024$$
$$\bar{\eta} = \pm 0.356 \pm 0.027$$

FNAL 0.275 \pm 0.008
JLQCD 0.248 \pm 0.008
HPQCD 0.276 \pm 0.009

Predictions based only on Fermilab & HPQCD lead to larg agreement with exp, mostly because of the suppression at high w of the denominator.
I see no reason not to use experimental data for a SM test, especially in presence of tensions in lattice data.

B meson real photon emissions

Factorization at leading power in an expansion of the decay amplitude in Λ_{QCD}/E_γ and Λ_{QCD}/mb has been established to all orders in the strong coupling α_s. In this approximation, the branching fraction depends only on the leading-twist B-meson light-cone distribution amplitude (LCDA) $\phi_+(\omega, \mu)$

More precisely, it is proportional to $1/\lambda_B$, the most important LCDA parameter in exclusive decays, is uncertain by a large factor ranging from 200 MeV favoured by non-leptonic decays to 460 MeV from QCD sum rules.

The radiative leptonic decay has therefore been suggested as a measurement of λ_B

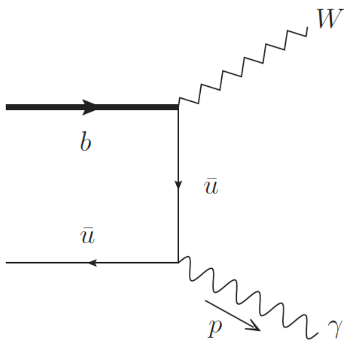

Figure 1. Leading contribution to $B \to \gamma \ell \nu_\ell$.

For large photon energies the form factors can be written as [9]

$$F_V(E_\gamma) = \frac{e_u f_B m_B}{2E_\gamma \lambda_B(\mu)} R(E_\gamma, \mu) + \xi(E_\gamma) + \Delta\xi(E_\gamma)\,,$$

$$F_A(E_\gamma) = \frac{e_u f_B m_B}{2E_\gamma \lambda_B(\mu)} R(E_\gamma, \mu) + \xi(E_\gamma) - \Delta\xi(E_\gamma)\,. \quad (2.7)$$

The first term is equal in both expressions and represents the leading-power contribution in the heavy-quark expansion (HQE). It originates only from photon emission from the light spectator quark in B meson (Fig. 1). In the above, f_B is the decay constant of B meson, and the quantity λ_B is the first inverse moment of the B-meson LCDA,

$$\frac{1}{\lambda_B(\mu)} = \int_0^\infty \frac{d\omega}{\omega}\, \phi_+(\omega, \mu)\,. \quad (2.8)$$

$B_s \to \mu^+\mu^-\gamma$ at large q^2 from lattice QCD

Giuseppe Gagliardi, INFN Sezione di Roma Tre

In collaboration with:
R. Frezzotti, V. Lubicz, G. Martinelli, C.T. Sachrajda,
F. Sanfilippo, S. Simula, N. Tantalo

[pre-print: arXiv:2402.03262]

Why $B_s \to \mu^+\mu^-\gamma$ at large q^2 ?

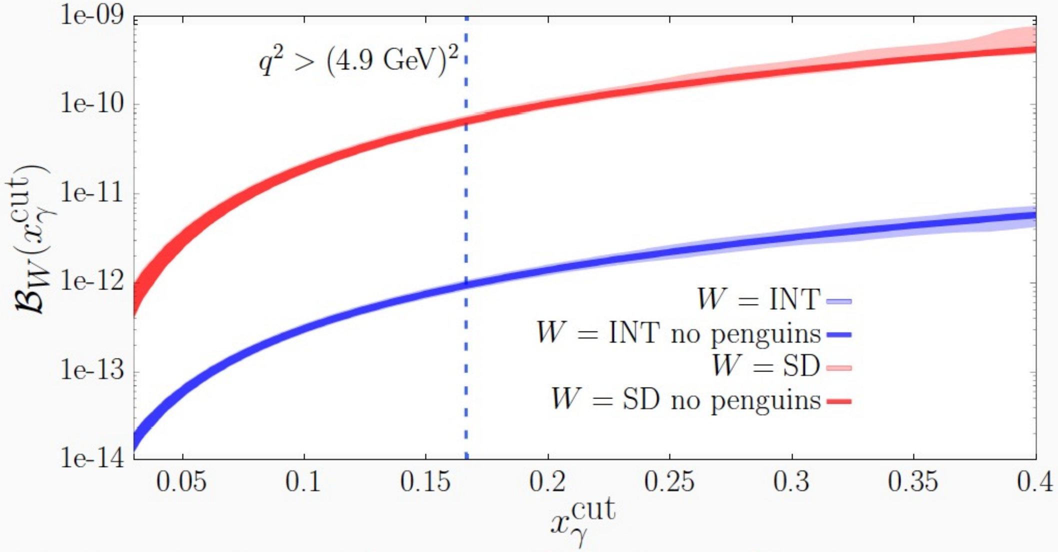
- The $B_s \to \mu^+\mu^-\gamma$ decay allows for a new test of the SM predictions in $b \to s$ FCNC transitions.
- Despite the $\mathcal{O}(\alpha_{\rm em})$-suppression w.r.t. the widely studied $B_s \to \mu^+\mu^-$, removal of helicity-suppression makes the two decay rates comparable in magnitude.
- At very high $\sqrt{q^2}$ = invariant mass of the $\mu^+\mu^-$, the contributions from penguin operators appearing in the weak effective-theory, which are difficult to compute on the lattice, are suppressed [Guadagnoli, Reboud, Zwicky, JHEP '17] ✓.

In this talk I will present the first, ($\simeq$) first-principles lattice QCD calculation of the $B_s \to \mu^+\mu^-\gamma$ decay rate for $q^2 \gtrsim (4.2\ \mathrm{GeV})^2$.

The branching fractions

$$\mathcal{B}(x_\gamma^{\rm cut}) = \int_0^{x_\gamma^{\rm cut}} {\rm d}x_\gamma \, \frac{{\rm d}\mathcal{B}}{{\rm d}x_\gamma} \qquad x_\gamma^{\rm cut} \equiv 1 - \frac{q^2_{\rm cut}}{m^2_{B_s}}$$

- $E_\gamma^{\rm cut} = x_\gamma^{\rm cut} m_{B_s}/2$ is the upper-bound on the measured photon energy.

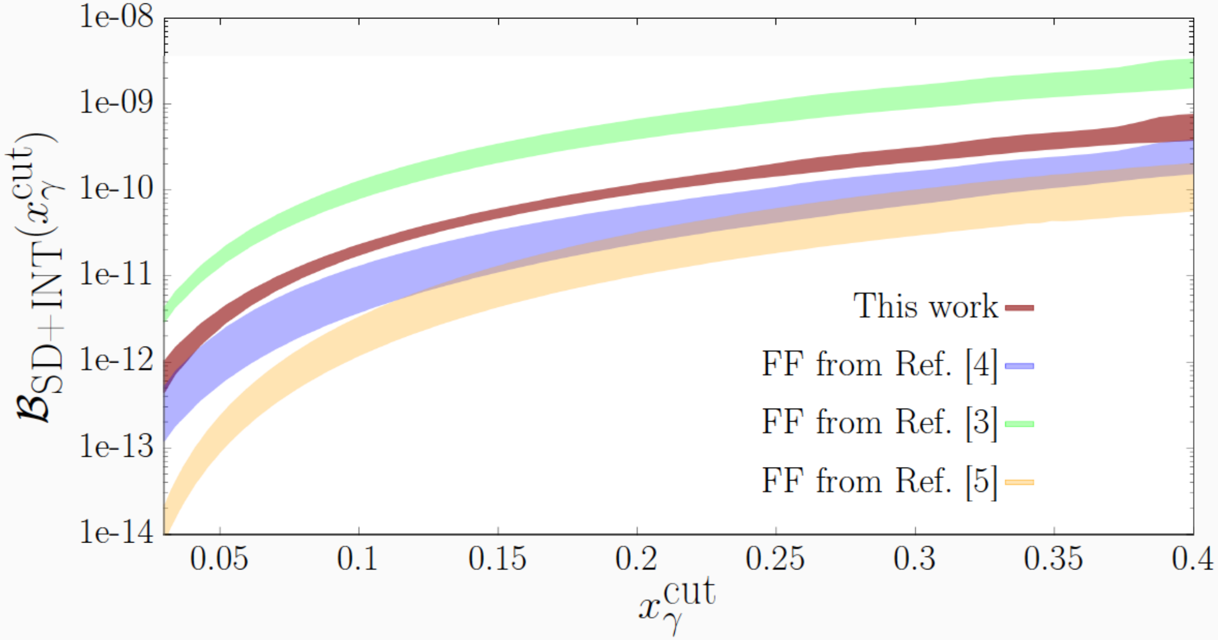


- SD contribution dominated by vector form factor F_V. Tensor form-factor contributions suppressed by small Wilson coefficient $C_7 \ll C_9, C_{10}$.
- At $x_\gamma^{\rm cut} \sim 0.4$ our estimate of charming-penguins uncertainties is around 30% [previous works quoted few percent uncertainties].

Comparison with current LHCb upper-bound for $x_\gamma^{\rm cut} \sim 0.166$.

$$\mathcal{B}_{\rm SD}^{\rm LHCb}(0.166) < 2 \times 10^{-9}\,, \qquad \mathcal{B}_{\rm SD}(0.166) = 6.9(9) \times 10^{-11} \qquad \text{[This work]}$$

Comparison with previous works



- Ref. [3] = Janowski, Pullin , Zwicky , JHEP '21 , light-cone sum rules.
- Ref. [4] = Kozachuk, Melikhov, Nikitin , PRD '18 , relativistic dispersion relations.
- Ref. [5] = Guadagnoli, Normand, Simula, Vittorio, JHEP '23, VMD/Lattice.

Differences with earlier estimates can be traced back to the fact that our determination of F_V (which gives the dominant contribution to the branching) is larger (smaller) than the one of Refs. [4-5] (Ref. [3]) by a factor of about $1.5 - 2$.

Conclusions

- We have presented a first-principles lattice calculation of the form factors F_V, F_A, F_{TV}, F_{TA} entering the $\bar{B}_s \to \mu^+\mu^-\gamma$ decay, in the electroquenched approximation.
- Systematic errors have been controlled thanks to the use of gauge configurations produced by the ETM Collaboration, which correspond to four values of the lattice spacing $a \in [0.057 : 0.09]$ fm, and through the use of five different heavy-strange masses $m_{H_s} \in [m_{D_s} : 2m_{D_s}]$.
- Presently our result for the branching fractions have uncertainties ranging from $\sim 15\%$ at $\sqrt{q^2_{\rm cut}} = 4.9$ GeV to $\sim 30\%$ at $\sqrt{q^2_{\rm cut}} = 4.2$ GeV.
- At small $q^2_{\rm cut}$ uncertainty dominated by the charming-penguins which we included using a phenomenological parameterization.

Outlook:

- Evaluate electro-unquenching effects.
- Evaluate charming-penguins contributions from first-principles.
- Simulate on finer lattice spacings to be able to reach higher m_{H_s} and reduce the impact of the mass-extrapolation.
