Information Management: A Proposal  
Abstract

An Updated Historical Profile of the Higgs Boson  
John Ellis (Imperial Coll. London & CERN), Mary K. Gaillard (SLAC, Berkeley & UC, Berkeley), GORON 'V. Nikougian (Fermi Lab & USC, Redlands & Johns Hopkins)

Apr 27, 2015 - 22 pages

# What is White Rabbit?

- Initially meant for Big Physics facilities/projects: CERN, GSI, Nikhef. . .
- **Based on well-established standards**
  - Ethernet (IEEE 802.3)
  - Bridged Local Area Network (IEEE 802.1Q)
  - Precision Time Protocol (IEEE 1588)
- **Extends standards** to meet new requirements and provides
  - Sub-ns synchronisation
  - Deterministic data transfer
- Initial specs: links  $\leq 10$  km &  $\leq 2000$  nodes
- **Open source and commercially available**

# Open and commercially available off-the-shelf

**WR Switch**  
Safran, Spain  
Creotech, Poland  
OPNT, Netherlands  
SyncTechnology, China

**Simple VME FMC carrier (SVEC)**  
Janz Tec AG, Germany

**Simple PCIe FMC carrier (SPEC)**  
Creotech, Poland  
INCAA, Netherlands  
Safran, Spain  
ISD S.A., Greece

**Compact Universal Timing Endpoint (Cute-WR-DP)**  
SyncTech, China

**Digitizers**  
Struck, Germany  
SP Devices, Sweden

**GPS Disciplined Oscillator**  
Safran, Spain

**ZEN TP-32 BNC**  
Safran, Spain

**PXI module**  
Sundance, UK

## Companies selling White Rabbit:

[www.ohwr.org/projects/white-rabbit/wiki/wrcompanies](http://www.ohwr.org/projects/white-rabbit/wiki/wrcompanies)

# White Rabbit technology - sub-ns synchronisation

## Based on

- IEEE 1588 Precision Time Protocol on Gigabit Ethernet over fibre

# White Rabbit technology - sub-ns synchronisation

## Based on

- IEEE 1588 Precision Time Protocol on Gigabit Ethernet over fibre

## Enhanced with

- Layer 1 syntonisation
- Digital Dual Mixer Time Difference (DDMTD)
- Link delay model

# Precision Time Protocol (IEEE 1588)

- Frame-based synchronisation protocol
- Simple calculations:
  - link delay:  $\delta_{ms} = \frac{(t_4 - t_1) - (t_3 - t_2)}{2}$
  - offset from master:  $OFM = t_2 - (t_1 + \delta_{ms})$

# Precision Time Protocol (IEEE 1588)

- Frame-based synchronisation protocol
- Simple calculations:
  - link delay:  $\delta_{ms} = \frac{(t_4 - t_1) - (t_3 - t_2)}{2}$
  - offset from master:  $OFM = t_2 - (t_1 + \delta_{ms})$
- Hierarchical network

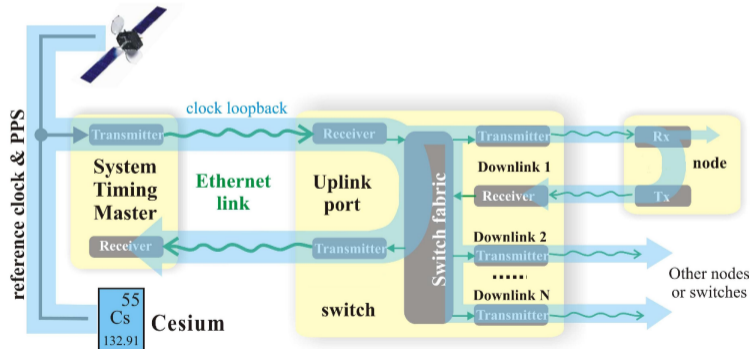

# Precision Time Protocol (IEEE 1588)

- Frame-based synchronisation protocol
- Simple calculations:
  - link delay:  $\delta_{ms} = \frac{(t_4 - t_1) - (t_3 - t_2)}{2}$
  - offset from master:  $OFM = t_2 - (t_1 + \delta_{ms})$
- Hierarchical network
- Shortcomings of traditional PTP:
  - devices have free-running oscillators
  - frequency drift compensation traffic can compromise determinism of other messages
  - assumes symmetry of medium
  - resolution of timestamps

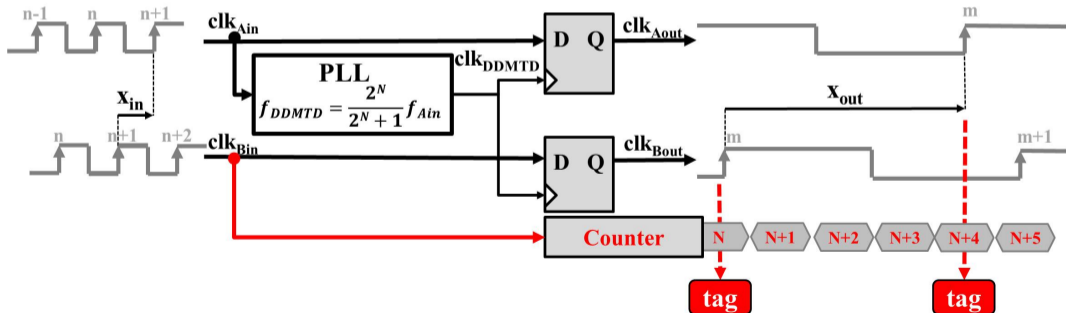

# Layer 1 Syntonisation

- Clock is encoded in the Ethernet carrier and recovered by the receiver chip
- All network devices use the same physical layer clock
- Clock loopback allows phase detection to enhance precision of timestamps

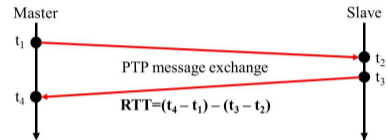

# Digital Dual Mixer Time Difference (DDMTD)

- Precise phase measurements in FPGA
- WR parameters:
  - $clk_{in}$  = 62.5 MHz
  - $clk_{DDMTD}$  = 62.496185 MHz (N=14)
  - $clk_{out}$  = 3.814 kHz
- Theoretical resolution of 0.977 ps

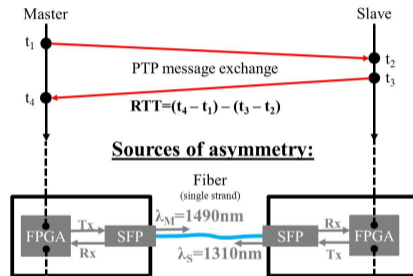

# Link delay model

- Correction of Round Trip Time (RTT) for asymmetries

# Link delay model

- Correction of Round Trip Time (RTT) for asymmetries
- Asymmetry sources: FPGA, PCB, electrical/optical conversion, chromatic dispersion

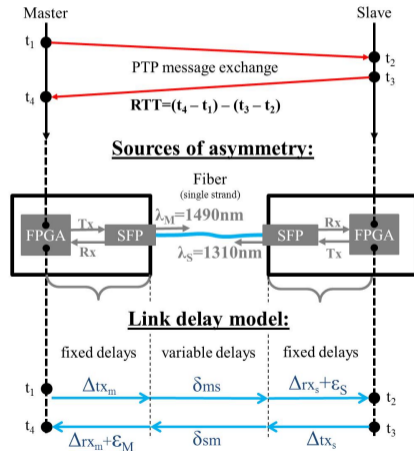

# Link delay model

- Correction of Round Trip Time (RTT) for asymmetries
- Asymmetry sources: FPGA, PCB, electrical/optical conversion, chromatic dispersion

- Link delay model:

- **Fixed delays** – calibrated/measured
- **Variable delays** – evaluated online with:

$$\alpha = \frac{\nu_g(\lambda_s)}{\nu_g(\lambda_m)} - 1 = \frac{\delta_{ms} - \delta_{sm}}{\delta_{sm}}$$

# Link delay model

- Correction of Round Trip Time (RTT) for asymmetries
- Asymmetry sources: FPGA, PCB, electrical/optical conversion, chromatic dispersion

- Link delay model:

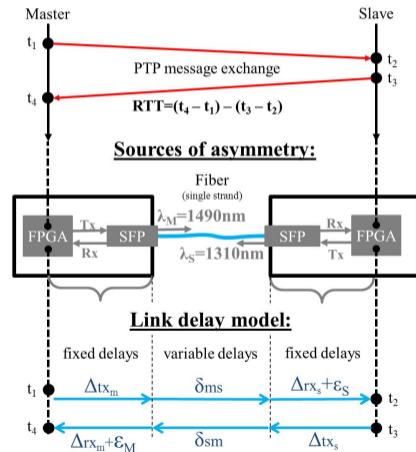

- **Fixed delays** – calibrated/measured
- **Variable delays** – evaluated online with:

$$\alpha = \frac{\nu_g(\lambda_s)}{\nu_g(\lambda_m)} - 1 = \frac{\delta_{ms} - \delta_{sm}}{\delta_{sm}}$$

- Accurate offset from master (OFM):

$$\delta_{ms} = \frac{1+\alpha}{2+\alpha} (RTT - \sum \Delta - \sum \epsilon)$$

$$OFM = t_2 - (t_1 + \delta_{ms} + \Delta_{txm} + \Delta_{rxs} + \epsilon_S)$$

# WR-derived reference clock signal for RF synthesis and sampling

# Minimising jitter by using a good OCXO

# The eRTM14/15 MTCA.4 module for SPS LLRF

See <https://ohwr.org/project/ertm15-llrf-wr/wikis> for details

# RF over Ethernet (RFoE) using WR: the WR2RF board

See also <https://roe-mapping.web.cern.ch/>

# Fundamental limits

- WR is about getting the best possible time and frequency using off-the-shelf components and following standards.

# Fundamental limits

- WR is about getting the best possible time and frequency using off-the-shelf components and following standards.
- “The [DDMTD] phase detector introduces a limitation in short-term stability equal to MDEV  $4E-13$  at  $\tau = 1$  s (ENBW 50 Hz), with a flicker PM behavior from  $\tau = 1$  s to  $\tau = 100$  s and more. The origin of flicker PM is due to the LVDS input clock buffer of the currently used FPGA and its related internal clock distribution. Similar results are observed for newer FPGAs, where a (slightly reduced) flicker PM is still present.”

# Fundamental limits

- WR is about getting the best possible time and frequency using off-the-shelf components and following standards.
- “The [DDMTD] phase detector introduces a limitation in short-term stability equal to  $MDEV\ 4E-13$  at  $\tau = 1\ s$  (ENBW 50 Hz), with a flicker PM behavior from  $\tau = 1\ s$  to  $\tau = 100\ s$  and more. The origin of flicker PM is due to the LVDS input clock buffer of the currently used FPGA and its related internal clock distribution. Similar results are observed for newer FPGAs, where a (slightly reduced) flicker PM is still present.”
- See <https://ohwr.org/project/wr-low-jitter/wikis> for more details, in particular *M. Rizzi et al. “White Rabbit Clock Synchronization: Ultimate Limits on Close-In Phase Noise and Short-Term Stability Due to FPGA Implementation”*

# Outline

- 1 CERN's knowledge dissemination mandate
- 2 White Rabbit
- 3 White Rabbit and RF
- 4 Community**
- 5 The White Rabbit Collaboration
- 6 Plans

# Short history of WR

- 2008: first meeting at CERN
- 2009: first switch prototype
- 2012: first COTS switch available (open-source hardware, gateway, firmware, software)
- 2012: first operational deployment of WR (Gran Sasso National Lab)
- 2013-2018: WR concepts standardised within IEEE 1588
- 2024: creation of the WR Collaboration (see [launch event](#))

# WR post-standardisation

A technology supported by a friendly community working on a fully open-source implementation of IEEE 1588-2019 High-Accuracy (HA) profile, with a guaranteed sub-nanosecond accuracy

# Outline

- 1 CERN's knowledge dissemination mandate
- 2 White Rabbit
- 3 White Rabbit and RF
- 4 Community
- 5 The White Rabbit Collaboration**
- 6 Plans

# Entering a new phase

## Post-standardisation issues

- How to maintain good support after the increase in uptake of the technology, both in industry and academia?
- How to ensure a high level of quality in the foundations of WR (switch and WR PTP core)?

# The White Rabbit Collaboration in a nutshell

## Ensuring sustainability

- Members pay a yearly fee and shape the future of the technology
- Fees are used to pay the WR Collaboration Bureau, which offers support (including training) and ensures WRS and WRPC are always in good health

# The White Rabbit Collaboration in a nutshell

## Letting information flow

- Collaboration with vendors ensures coherent growth of the WR ecosystem
- Keeping members well informed: online presentations, forum, regular meetings. . .
- Connecting people, institutes, companies (e.g. connecting NRENs with industry)

# The White Rabbit Collaboration in a nutshell

## Ensuring high-quality

- Making the evolution of WRS and WRPC the main task of the Bureau
- Teaming up with laboratories to establish a set of tests and qualification criteria
- Connecting the use of the WRC logo to the successful passing of those tests

# The White Rabbit Collaboration in a nutshell

## Projects! Some examples:

- Ongoing: [collaboration with GMV and IQD](#) on hold-over.
- Quantum: see e.g. CERN's Quantum Tech Initiative at <https://quantum.cern>
- Under discussion: robust, long-distance WR for smart grids

# An experiment in public-private partnerships

## Getting the best of both worlds

- Dissemination according to our Open Science mandate
- Impact and sustainability

## Economics

- Companies can add value of top of WR and monetise products based on those developments
- They decide what they contribute as open source and what they keep proprietary

# WRC members in 2024

# White Rabbit Collaboration

- 4 Community
- 5 The White Rabbit Collaboration
- 6 Plans**

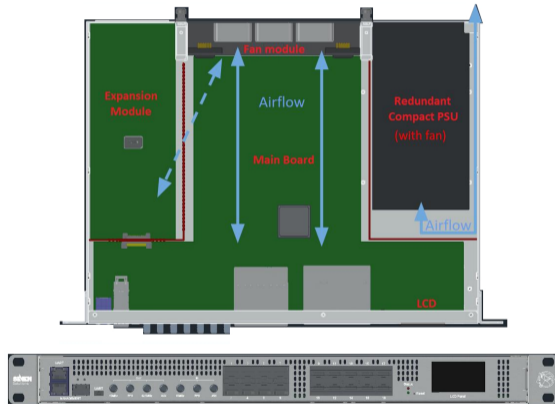

# Plans

## WR Switch v4

- GbE and 10GbE support
- Redundant and serviceable fans and power supplies
- Based on Xilinx/AMD Zynq UltraScale+ System-on-Chip (SoC)
- Expansion board slot for enhancements (low phase noise, hold-over...)

See <https://ohwr.org/project/wr-switch-hw-v4/wikis> for more details.

# WR Switch v4

Prototyping stage, v3 functionality before the end of the year.

# WR Switch v4

# Standardisation++

Courtesy Henk Peek and Peter Jansweijer

# Standardisation++ (P. Jansweijer, M. Lipiński)

## Amendments to IEEE 1588-2019

- Absolute calibration
- In-situ calibration of asymmetry

## Within the SNIA SFF working group

Storage of calibration parameters in SFP EEPROM

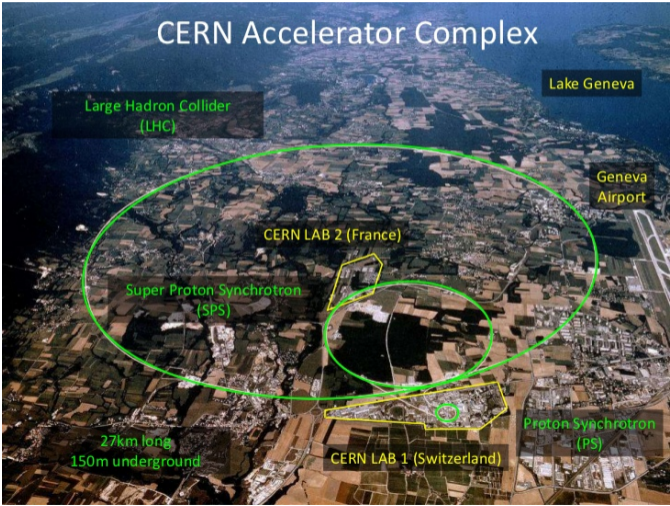

## Possibilities for collaboration: non-exhaustive list

- Improving WR performance
  - In-depth studies of transceiver behaviour inside SoCs
  - Sensitivity to external factors such as temperature variations
- Improving WR usability
  - Monitoring and logging of important parameters and events with time stamps
  - Automation of calibration of port delays and fibre asymmetry
- Quantum: both QKD and entangled qubits
- Robustness: hardware and system-wide (clock ensemble). Redundancy and seamless switch-over (<1ns jump)
- Other?
