Unitarity Triangle Angles Explained: a Predictive New Quark Mass Matrix Texture

Plus, un antipasto on the house: A Brief Historical Perspective on TriBimaximal Mixing

> Paul Harrison University of Warwick

Talk at FLASY 2025 30th June 2025

arXiv: 2501.18508 with Bill Scott (to be published in JHEP)

v Oscillation Landscape pre-1994

• Solar ν problem had been around since 1970s:

Early HOMESTAKE solar v data 1970-1994

 $\Rightarrow Data/SSM = 0.30 \pm 0.04 \pm 0.09$

4 **A** N A **B** N A **B** N

ν Oscillation Landscape pre-1994

- Solar ν problem had been around since 1970s:
 - ► Early HOMESTAKE solar ν data 1970-1994 $\Rightarrow Data/SSM = 0.30 \pm 0.04 \pm 0.09$
 - Confirmed by Water Cherenkov (Kamiokande, 1989) and with Gallium (GALLEX, 1992)
 - Generally-accepted solution was small angle MSW effect (typically considered in two flavours)

不得る とうちょうちょ

ν Oscillation Landscape pre-1994

- Solar ν problem had been around since 1970s:
 - Early HOMESTAKE solar ν data 1970-1994 $\Rightarrow Data/SSM = 0.30 \pm 0.04 \pm 0.09$
 - Confirmed by Water Cherenkov (Kamiokande, 1989) and with Gallium (GALLEX, 1992)
 - Generally-accepted solution was small angle MSW effect (typically considered in two flavours)
- Atmospheric ν anomaly was known as a simple deficit of ν_{μ} c.f. ν_{e} : IMB (1985) and Kamiokande (1988) :
 - \blacktriangleright Was initially a simple deficit $\sim 50\%,$ with no L/E dependence
 - Suggested large mixing angles

1994 Provided Step-change in Perspective

Solar Data: P. Darriulat's ICHEP Conference Summary talk:

Experiment	Data/SSM (BP) %	Data/SSM (TCL) %
GALLEX	$60 \pm 8 \pm 5$	$64 \pm 8 \pm 5$
SAGE	$52 \pm 8 \pm 5$	$56 \pm 9 \pm 5$
Kamiokande	$51 \pm 4 \pm 6$	$66 \pm 5 \pm 8$
Homestake	(Pro memoria) $29 \pm 3 \pm 9$

- TMX ⇒ universal survival (and appearance) probabilities (in vacuo) - eminently testable
- Survival probabilities vs. L/E, including resolution-smearing:

Plotted with Data (taken from HPS1)

Included

A prediction:

The HPS "5/9-1/3-5/9" Bathtub

NB. required $\Delta m_{31}^2 \sim 10^{-8} - 10^{-5} \text{ eV}^2$

< 6 b

Included

A prediction:

The HPS "5/9-1/3-5/9" Bathtub

NB. required $\Delta m_{31}^2 \sim 10^{-8} - 10^{-5} \text{ eV}^2$

In fact, it is the case as understood today for Large Mixing Angle MSW effect in TriBimaximal mixing (see below) for Δm_{21}^2 as above

Included

A prediction:

The HPS "5/9-1/3-5/9" Bathtub

NB. required $\Delta m_{31}^2 \sim 10^{-8} - 10^{-5} \text{ eV}^2$

In fact, it is the case as understood today for Large Mixing Angle MSW effect in TriBimaximal mixing (see below) for Δm_{21}^2 as above

 HPS4 (PLB 458 (1999) 79) predicted for TMX "spectacular effects expected in long-baseline reactor and accelerator experiments"! viz. CHOOZ, PALO VERDE, MINOS etc.

The **smeared P(L/E) plot** and its variants had a **significant impact** on the community's appreciation of the phenomenology of neutrino oscillations

Our proposed symmetric forms of the mass matrices are suggestive of deeper symmetries, and are exploited (and gently broken) in building BSM models of lepton masses and mixing

The **smeared P(L/E) plot** and its variants had a **significant impact** on the community's appreciation of the phenomenology of neutrino oscillations

Our proposed symmetric forms of the mass matrices are suggestive of deeper symmetries, and are exploited (and gently broken) in building BSM models of lepton masses and mixing

Currently, $|U_{e3}|^2 \sim 0.02$. Thus TBM remains a useful zeroth-order approximation to U_{PMNS} , while allowing the exciting prospect that leptonic CP violation may be accessible in the future

Mystery of Quark Mass Spectra

• Quark masses show marked hierarchical structure:

Noted by very many authors
Mystery of Quark Mass Spectra

• Quark masses show marked hierarchical structure:

Generation Number

- Noted by very many authors
- Masses not predicted in the SM
- Hierarchy certainly not explained within SM
- BSM, Froggatt-Neilsen mechanism has had some success

Mystery of Quark Mixing Spectrum

• CKM quark mixing matrix:

$$V_{CKM} = \begin{pmatrix} V_{ud} & V_{us} & V_{ub} \\ V_{cd} & V_{cs} & V_{cb} \\ V_{td} & V_{ts} & V_{tb} \end{pmatrix}$$

э

3 + 4 = +

< 17 ▶

Mystery of Quark Mixing Spectrum

 q_{iL}

• CKM guark mixing matrix: $V_{CKM} = \begin{pmatrix} V_{ud} & V_{us} & V_{ub} \\ V_{cd} & V_{cs} & V_{cb} \\ V_{cs} & V_{cs} & V_{cs} \end{pmatrix}$ $q_{\alpha L}$ $\sim egin{pmatrix} 1 & \lambda & A\lambda^3(\overline{
ho}-i\overline{\eta}) \ -\lambda & 1 & A\lambda^2 \ A\lambda^3(1-\overline{
ho}-i\overline{\eta}) & A\lambda^2 & 1 \end{pmatrix} + \mathcal{O}(\lambda^4),$

where $\lambda \equiv |V_{us}| \simeq 0.22$

A, $\overline{\rho}$ and $\overline{\eta} \leq \mathcal{O}(1)$

Mystery of Quark Mixing Spectrum

 $A, \ \overline{\rho} \text{ and } \overline{\eta} \lesssim \mathcal{O}(1)$

- Elements not predicted by the SM
- Strong hierarchy certainly not explained within SM
- But masses and mixings *both* arise in the Yukawa/Mass matrices

Mysteries of the Unitarity Triangle

- Sides/Angles of UT are arbitrary in SM.
- But measured angles:

$$\alpha = (91.6 \pm 1.4)^{\circ}$$

$$\beta = (22.6 \pm 0.4)^{\circ}$$

$$\gamma = (65.7 \pm 1.3)^{\circ}$$

consistent with "special" values:

$$(\alpha, \beta, \gamma) \simeq (\frac{\pi}{2}, \frac{\pi}{8}, \frac{3\pi}{8}) \equiv (\alpha_0, \beta_0, \gamma_0).$$

Seems striking!

Renormalisation Scale (TeV)

The Leading Order UT (LO-UT)

• Define useful complex constants:

$$\begin{aligned} \boldsymbol{z_0} &\equiv \boldsymbol{\lambda_u^*} / \lambda_0 = i s_0 \, e^{-i\beta_0} = \rho_0 + i \eta_0, \\ \overline{\boldsymbol{z_0}} &\equiv \boldsymbol{\lambda_d^*} / \lambda_0 = c_0 \, e^{-i\beta_0} = 1 - \boldsymbol{z_0}, \end{aligned}$$

where

 $s_0 \equiv \sin \frac{\pi}{8}; \quad c_0 \equiv \cos \frac{\pi}{8}; \quad \eta_0 = s_0 c_0 = \frac{1}{2\sqrt{2}} \text{ and } \rho_0 = \sin^2 \frac{\pi}{8}.$

э

The Leading Order UT (LO-UT)

• Define useful complex constants:

$$\begin{aligned} \boldsymbol{z_0} &\equiv \boldsymbol{\lambda_u^*}/\lambda_0 = is_0 \, e^{-i\beta_0} = \rho_0 + i\eta_0, \\ \overline{\boldsymbol{z_0}} &\equiv \boldsymbol{\lambda_d^*}/\lambda_0 = c_0 \, e^{-i\beta_0} = 1 - \boldsymbol{z_0}, \end{aligned}$$

where

 $s_0 \equiv \sin \frac{\pi}{8}; \quad c_0 \equiv \cos \frac{\pi}{8}; \quad \eta_0 = s_0 c_0 = \frac{1}{2\sqrt{2}} \quad \text{and} \quad \rho_0 = \sin^2 \frac{\pi}{8}.$

Use to construct LO-UT

Symmetries of the MMs

• Properties of the *paired system* (M_u, M_d) , rather than of either in isolation

WARWICK

- *CP*:
- Under *CP*, all complex numbers in the MMs are complex-conjugated.

4 E 5

TH 161

< — —

- *CP*:
- Under *CP*, all complex numbers in the MMs are complex-conjugated.
- Observable effect is to flip orientation of UT in complex plane $(\overline{\eta} \rightarrow -\overline{\eta})$
- Unless $\overline{\eta} = 0$ (*CP* is conserved)

- *CP*:
- Under *CP*, all complex numbers in the MMs are complex-conjugated.
- Observable effect is to flip orientation of UT in complex plane (η
 → −η
)
- Unless $\overline{\eta} = 0$ (*CP* is conserved)
- Rephasing:
- Simultaneous *phase changes* of *M_u* and *M_d* unobservable

- *CP*:
- Under *CP*, all complex numbers in the MMs are complex-conjugated.
- Observable effect is to flip orientation of UT in complex plane (η
 → −η
)
- Unless $\overline{\eta} = 0$ (*CP* is conserved)
- Rephasing:
- Simultaneous *phase changes* of *M_u* and *M_d* unobservable
- UT simply rotates in complex plane
- (Physical) shape and size invariant

Symmetry for $\alpha_0 = \frac{\pi}{2}$

- In HS texture, simple sign change of z₀ (or of z
 ₀, but not both), flips orientation of the UT (see fig)
- Is only observable effect

• But iff
$$\alpha = \pm \frac{\pi}{2}$$

Symmetry for $\alpha_0 = \frac{\pi}{2}$

- In HS texture, simple sign change of z₀ (or of z
 ₀, but not both), flips orientation of the UT (see fig)
- Is only observable effect
- But iff $\alpha = \pm \frac{\pi}{2}$
- It is equivalent to a *CP* transformation
- Can be reversed by a subsequent actual CP transformation
- Symmetry is good to all orders

Symmetry for $\beta_0 = \frac{\pi}{8}$

- First consider $\beta_0 = \tilde{\beta} \neq \frac{\pi}{8}$ (fig \rightarrow) Im keeping $\alpha = \frac{\pi}{2}$ and $\lambda_u + \lambda_d = \lambda_0$
- Clearly now

$$\left|\frac{\boldsymbol{\lambda}_{\boldsymbol{u}}}{\boldsymbol{\lambda}_{\boldsymbol{d}}}\right| = \tan \tilde{\beta},$$

and $-\frac{\pi}{2} < \tilde{\beta} < \frac{\pi}{2}$

Symmetry for $\beta_0 = \frac{\pi}{8}$

- First consider $\beta_0 = \tilde{\beta} \neq \frac{\pi}{8}$ (fig \rightarrow) Im keeping $\alpha = \frac{\pi}{2}$ and $\lambda_u + \lambda_d = \lambda_0$
- Clearly now

$$\left|\frac{\boldsymbol{\lambda}_{\boldsymbol{u}}}{\boldsymbol{\lambda}_{\boldsymbol{d}}}\right| = \tan \tilde{\beta},$$

and $-\frac{\pi}{2} < \tilde{\beta} < \frac{\pi}{2}$

Consider the following rotation of λ_d:

$$\tilde{\beta} \to \tilde{\beta} - \frac{\pi}{4} \qquad (*)$$

• Iff $\tilde{\beta} = \frac{\pi}{8}$, the result is just a *CP* transformation

Symmetry for $\beta_0 = \frac{\pi}{8}$

- First consider $\beta_0 = \tilde{\beta} \neq \frac{\pi}{8}$ (fig \rightarrow) Im keeping $\alpha = \frac{\pi}{2}$ and $\lambda_u + \lambda_d = \lambda_0$
- Clearly now

$$\left|\frac{\boldsymbol{\lambda}_{\boldsymbol{u}}}{\boldsymbol{\lambda}_{\boldsymbol{d}}}\right| = \tan \tilde{\beta},$$

and $-\frac{\pi}{2} < \tilde{\beta} < \frac{\pi}{2}$

Consider the following rotation of λ_d:

$$\tilde{\beta} \to \tilde{\beta} - \frac{\pi}{4} \qquad (*)$$

• Iff $\tilde{\beta} = \frac{\pi}{8}$, the result is just a *CP* transformation

• \Rightarrow to fix $\beta_0 = \frac{\pi}{8}$ require symmetry under transformation (*) followed by CP flip

Isospin Reflection Symmetry?

• Can re-write texture:

$$M_q^{HS} \equiv n_q \begin{pmatrix} c'\lambda_q^4 & b'\lambda_q^3 & 0\\ b'\lambda_q^{*3} & b'\lambda_q^2 & A_0\lambda_q^2\\ 0 & A_0\lambda_q^{*2} & 1 \end{pmatrix} \pm d\lambda_q^4 I$$

 $b' \simeq b$. Still get good fit to data.

- First (leading) matrix solely responsible for quark mass differences and mixing parameters.
- Second (small) matrix is I_z -dependent "pedestal" on quark masses. Symmetric under a family-SU(3) symmetry.
- All coefficients (λ₀, A₀, b', c', d) symmetric under isospin reflection operator u ↔ d.
- Symmetry broken (only) by λ_q , n_q and the sign of d.

イロト イヨト イヨト イヨト

Analytic NLO Solutions: 1) Mixing Parameters WARWICK

• We give here the algebraic NLO solutions of the texture:

$$\begin{split} \lambda &= \lambda_0 \left(1 + f_\lambda \lambda_0^2 \right) + \mathcal{O}(\lambda_0^5) \\ A &= A_0 \left\{ 1 + \left[\frac{1}{4} (3b - 2\rho_0) - 2f_\lambda \right] \lambda_0^2 \right\} + \mathcal{O}(\lambda_0^4) \\ \overline{\rho} &= \rho_0 \left(1 + c_0 f_\rho \lambda_0^2 \right) + \mathcal{O}(\lambda_0^4) \\ \overline{\eta} &= \eta_0 \left\{ 1 + \left[s_0 f_\rho + \frac{1}{2} (1 - 5b) \right] \lambda_0^2 \right\} + \mathcal{O}(\lambda_0^4), \end{split}$$

where
$$f_{\lambda} = \frac{1}{4}(3f_A + 4\eta_0 f_c - 5),$$

 $f_A = \frac{1}{b} \left[A_0^2 + \frac{1}{2}(c_d + c_u) \right], \quad f_c = \frac{1}{b}(c_d - c_u)$
and $f_{\rho} = s_0(1 + f_c) - \frac{1}{4s_0} [2f_A + 2f_c - 7b].$

• NLO corrections above, as fractions of LO terms are respectively: -5.8×10^{-3} , +2.6%, +3.6% and -1.8% (using fitted param values from table).

Analytic NLO Solutions: 2) Mass Ratios

• For the quark mass ratios, we find:

$$\begin{split} \frac{m_1^q}{m_2^q} &= -\lambda_q^2 (1 - r_q) \left\{ 1 + \left[r_A \frac{(2 - r_q)}{(1 - r_q)} - 2 \right] \lambda_q^2 \right\} + \mathcal{O}(\lambda_q^6) \\ \frac{m_2^q}{m_3^q} &= b \lambda_q^2 \left[1 + (1 - r_A) \lambda_q^2 \right] + \mathcal{O}(\lambda_q^6), \end{split}$$

where $r_q = \frac{c_q}{b}$ and $r_A = \frac{A_0^2}{b}$.

- NLO corrections to mass ratios m_c/m_t , m_s/m_b , m_u/m_c , m_d/m_s as fractions of LO terms are (resp.) -4.3×10^{-3} , -2.5%, +4.3%, and +4.5% (using fitted param values from table).
- All results compatible with full numerical results reported in table.
