

# Framework R&D activities

- We started isolating some parts of the SuperB FastSim to work on smaller pieces and minimize the dependencies
  - in particular we isolated a simple TwoPhoton Fortran generator and the smallest set of packages needed for the current Framework to build
- In the meanwhile we started to study Intel® Tbb  
<http://threadingbuildingblocks.org>  
and to exercise with it
  - in particular we think that the management of graphs is particularly interesting and we're concentrating in exercising with this feature of Tbb
- For the near future our idea is to come to the Frascati Collaboration meeting with some working piece of code
