

ePIC Hackathon

Simon Gardner, Dmitry Kalinkin, Karthik Suresh
January 2025

Purpose of this Hackathon

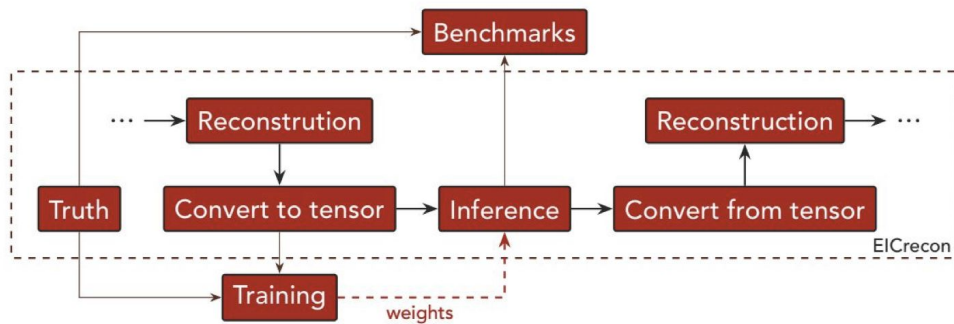

For you to learn how to deploy Machine Learning into ePIC reconstruction.

It's not just that one needs to come up with a model (usually using Python tools).

Need to be able to deploy!

Integration of trained models into EICrecon (written C++) is done via ONNX format. And the training has to take EDM4eic files as input, as that is our standard format for reconstruction.

Some motivation is given in the past presentations: [1](#), [2](#)

Challenges

We have prepared 2 challenges for this hackathon.

1. Low-Q2 Tagger - Regression to reconstruct initial electron momentum from a detected track transported through beamline components
2. DIRC - Classification/PID of pions and kaons based on the distribution of the scattered photons detected on the sensors.

Further information and detailed instructions can be found here:

<https://hedgedoc.kalinkin.science/s/zbt6G6eKc>

And the codes are posted at <https://github.com/eic/epic-hackathon-2025>

These can be completed both during the session at the ePIC collaboration meeting or carried out at your leisure until Tuesday, January 28th.

Submitting

You must be a member of the <https://github.com/eic/> organization. If not, please DM Dmitry Kalinkin (~veprbl) on Mattermost. We kindly request that your GitHub profile reflects your full name and affiliation.

Use the submission portal at <https://epichackathon2025.pythonanywhere.com>

Simply login using your GitHub credentials in the app. The app requests for read access for your organizations (to verify your membership).

Once logged in you can look at your Profile and make changes to some profile information if needed.

Make sure to have your solution files **only** in **.edm4eic.root** format **within 20MB**

If you have any question or face difficulties contact [~hackathon-2025](#) on Mattermost.

Questions?

Hackathon-2025

Please ask in [~hackathon-2025](#) on Mattermost.

You are welcome to work in teams and discuss among yourselves.

EICrecon integration checklist

Not something you should need to directly worry about during this hackathon

- Create onnx file with a script that will be possible to reproduce on GitHub CI
- Add the onnx file to the epic-data repository [eic/epic-data: Supplementary files for Geometry Description of the ePIC Experiment](#)
- Add a link to the specific epic-data commit to the epic calibrations.xml file [epic/compact/calibrations.xml at main · eic/epic](#)
- This is now downloaded/linked locally when EICrecon is run so can be accessed through algorithms
- Make algorithms in EICrecon which convert the input data into edm4eic::Tensors and edm4eic::Tensors back to the output data. Using the available onnx inference factory to carry out the inference. [EICrecon/src/factories/meta/ONNXInference_factory.h at main · eic/EICrecon](#)

Other neural network exchange formats, than onnx, are available but should be strongly justified for inclusion.
