Stefano Catani Memorial Symposium GGI, Firenze 9 Gennaio 2025

## Hadronic Physics: new frontiers and Stefano's legacy

Michelangelo L. Mangano Theory Department, CERN, Geneva

# Dedicato alla memoria di Stefano, un caro amico

Alla fisica, che è pur stata il grande motore della sua vita, ha sempre anteposto l'amore per Anna e la famiglia, l'amicizia, il rispetto e l'affetto per tutti quelli che hanno avuto la fortuna di incontrarlo

Scuola Normale Superiore

• We were later colleagues for several years at CERN, when the scientific collaboration was accompanied by the buildup of friendship of Anna and Stefano with Paola and myself

- outweighs what I've been able to give in return

The friendship with Stefano goes back to the Spring of 1984, when we first met in Cortona for the annual meeting of Italian theorists. At the time, we shared the exposure to the teaching of Marcello Ciafaloni, who was his mentor in Florence and whose lectures on QCD I had recently followed in

The friends who spoke before me already highlighted facts, anecdotes and appreciation for Stefano's contributions to the progress of physics and of the community at large, from experiments to theory

In particular, Paolo covered the fraction of Stefano's work that I've been fortunate enough to participate in, together with him an Luca. On the scale of what Stefano has done in his career, this was just a minor event and, as is often the case in collaborations with Stefano, what I have learned far

# the LHC and of future colliders.

- of his cornerstone contributions, which define Stefano's legacy
- same...

• The goal of this tribute to Stefano is to put in perspective the impact that progress in QCD is having on re-shaping the physics programme and goals of

• This is clearly a tribute to the work of all of you, and to the whole community, but you will all recognize the imprint of Stefano's vision and the direct impact

• It's fair to say that without this progress physics at the LHC would not be the

#### From the Preface of the Yellow Report:

The specific goal of the Workshop, not directly evident from the somewhat mysterious title, was to promote physics studies at the LHC in areas beyond the Higgs and new particles search (especially supersymmetric particles). That is, the purpose was to explore additional possibilities of the experiments beyond the well-studied subjects that are the main focus of the physics programme at the LHC. A strong encouragement to promote this Workshop came from the physicists community, which is very much interested in keeping the discussion on physics alive and focused during the long years of machine and detector construction.

#### WGs:

- QCD (TH conv: **Catani** Soper Stirling)
- EW physics (TH conv: Hollik Kunszt)
- Bottom quark production (TH conv: Nason Ridolfi)
- Bottom quark decays (TH conv: Ball Fleischer)
- Top quark (TH conv: Beneke MLM)

### The ultimate goal of Higgs studies is to address the question

### Where does this come from?

# $V(H) = -\mu^2 |H|^2 + \lambda |H|^4$

\* Higgs, Brout, Englert, Guralnik, Hagen, Kibble 1964

The Higgs mechanism\*, as implemented in the SM (á la Weinberg, 1967), provides the *minimal* set of *ingredients* required to enable a consistent breaking of the EW symmetry.

The Higgs mechanism\*, as implemented in the SM (á la Weinberg, 1967), provides the *minimal* set of *ingredients* required to enable a consistent breaking of the EW symmetry.

- relevant dynamics.
- this, and we must look beyond.

• The relation between the Higgs phenomenon and the SM is similar to the relation between superconductivity and the Landau-Ginzburg theory of phase transitions: a quartic potential for a bosonic order parameter, with negative quadratic term, and the ensuing symmetry breaking. If superconductivity had been discovered after Landau-Ginzburg, we would be in a similar situations as we are in today: an experimentally proven phenomenological model. But we would still lack a deep understanding of the

• For superconductivity, this came later, with the identification of e-e- Cooper pairs as the underlying order parameter, and BCS theory. In particle physics, we still don't know whether the Higgs is built out of some sort of Cooper pairs (composite Higgs) or whether it is elementary, and in both cases we have no clue as to what is the dynamics that generates the Higgs potential.With Cooper pairs it turned out to be just EM and phonon interactions. With the Higgs, none of the SM interactions can do

10

### examples of possible scenarios

- **BCS-like**: the Higgs is a composite object
- Supersymmetry: the Higgs is a fundamental field and •  $\lambda^2 \sim g^2 + g'^2$ , it is not arbitrary (MSSM, w/out susy breaking, has one parameter less
- than SM!)
  - potential is fixed by susy & gauge symmetry
  - EW symmetry breaking (and thus  $m_H$  and  $\lambda$ ) determined by the parameters of SUSY breaking

### The LHC experiments have been exploring a vast multitude of scenarios of physics beyond the Standard Model

In search of the origin of known departures from the SM

- Dark matter, long lived particles
- Neutrino masses
- Matter/antimatter asymmetry of the universe

<u>To explore alternative extensions of the SM</u>

- New gauge interactions (Z', W') or extra Higgs bosons
- Additional fermionic partners of quarks and leptons, leptoquarks, ...
- **Composite nature of quarks and leptons**
- Supersymmetry, in a variety of twists (minimal, constrained, natural, RPV, ...)
- **Extra dimensions**
- New flavour phenomena
- unanticipated surprises ...

### So far, no conclusive signal of physics beyond the SM

#### **ATLAS Heavy Particle Searches\* - 95% CL Upper Exclusion Limits**

### **Diversity in the LHC scientific production**

Over 4000 papers published/submitted to refereed journals by the 7 experiments that operated in Run 1 and 2 (ALICE, ATLAS, CMS, LHCb, LHCf, TOTEM, MoEDAL)... and the first papers are appearing by the new experiments started in Run 3 (FASER, SND@LHC)

Of these:

~10% on Higgs (15% if ATLAS+CMS only)

~30% on searches for new physics (35% if ATLAS+CMS only)

~60% of the papers on SM measurements (jets, EW, top, b, Hls, ...)

• Tycho Brahe (1546-1601) spent his life measuring planets' positions more and more precisely

• Tycho Brahe (1546-1601) spent his life measuring planets' positions more and more precisely Johannes Kepler (1571-1630) used those data to extract a "phenomenological"

interpretation, based on his 3 laws

## The future: precision measurements of the Higgs pt spectrum

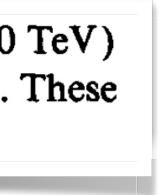

Catani, d'Emilio, Trentadue, The **Gluon Form-factor to Higher Orders: Gluon Gluon Annihilation at Small Q**<sub>T</sub> PLB 211 (1988) 335

In the foreseeable future, at the energies of the large hadron colliders as LHC (16 TeV) and SSC (40 TeV) the large majority of physical processes will be generated via initial state interactions among gluons [1]. These will give rise to states such as Higgs particles [2], neutral heavy mesons and jets.

ATLAS, <u>2207.08615</u>

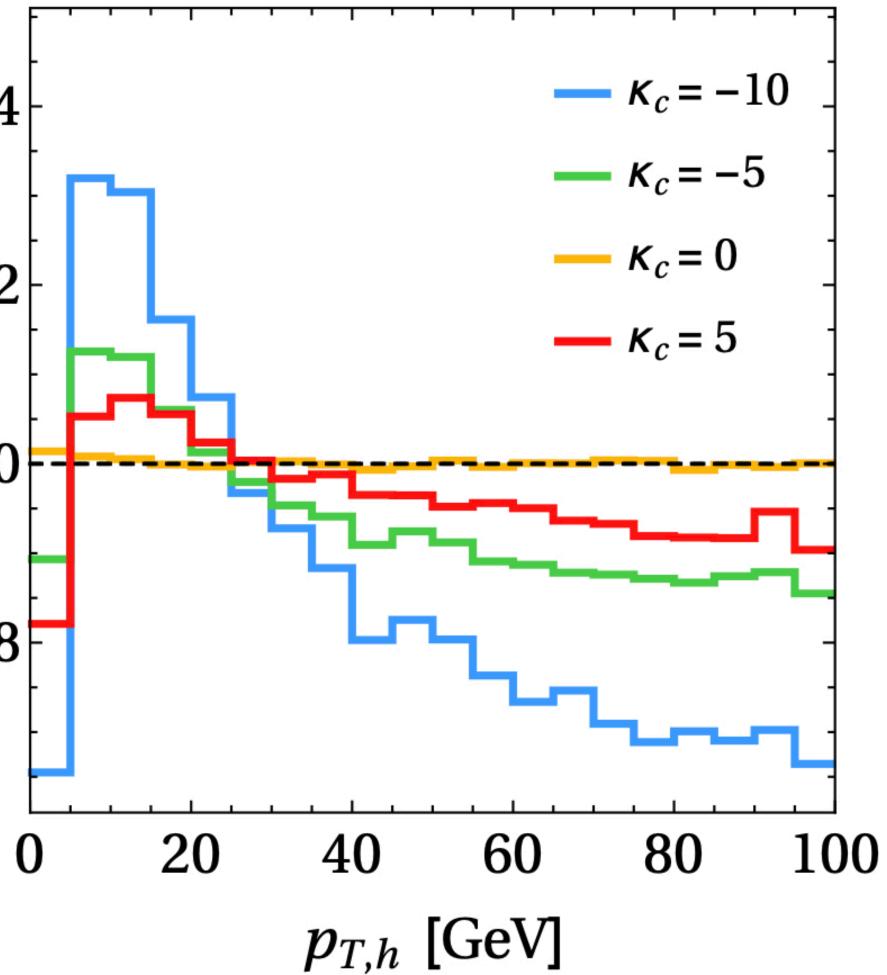

### The future: precision measurements of the Higgs pt spectrum

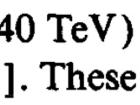

Catani, d'Emilio, Trentadue, The **Gluon Form-factor to Higher Orders: Gluon Gluon Annihilation at Small Q**<sub>T</sub> PLB 211 (1988) 335

... and improved experimental precision drives new opportunities for precise theoretical interpretations of the results

#### Asymmetric transverse energy-energy correlations

$$\frac{1}{\sigma} \frac{\mathrm{d}\Sigma}{\mathrm{d}\cos\phi} := \frac{1}{N} \sum_{A=1}^{N} \sum_{ij} \frac{E_{\mathrm{T}i}^{A} E_{\mathrm{T}j}^{A}}{\left(\sum_{k} E_{\mathrm{T}k}^{A}\right)^{2}} \delta(\cos\phi - \cos\varphi_{ij}).$$

$$\frac{1}{\sigma} \frac{\mathrm{d}\Sigma^{\mathrm{asym}}}{\mathrm{d}\cos\phi} = \frac{1}{\sigma} \frac{\mathrm{d}\Sigma}{\mathrm{d}\cos\phi} \bigg|_{\phi} - \frac{1}{\sigma} \frac{\mathrm{d}\Sigma}{\mathrm{d}\cos\phi} \bigg|_{\pi-\phi}$$

- uncertainties ...
- ... but while these discussions back in 2000 dealt with factors of 100% systematics, we are now dealing with factors of few %
- reliable instrument

 Hot discussions always take place on whether the theoretical systematics are properly accounted for, resulting in over-optimistic estimates of the real

• QCD @ hadron colliders has since matured into a powerful, accurate and

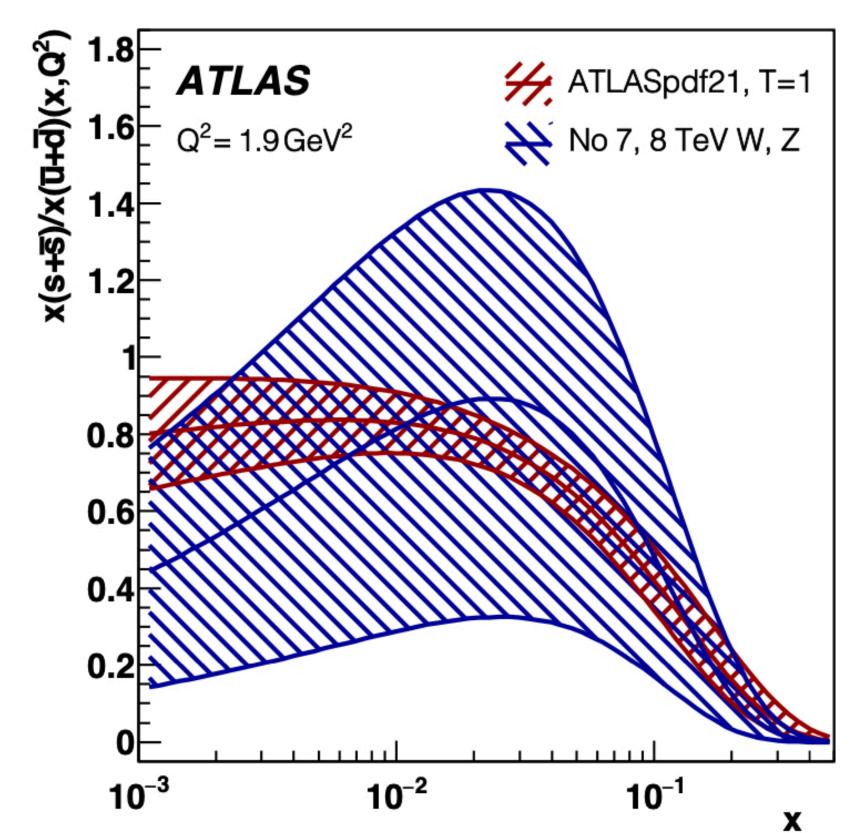

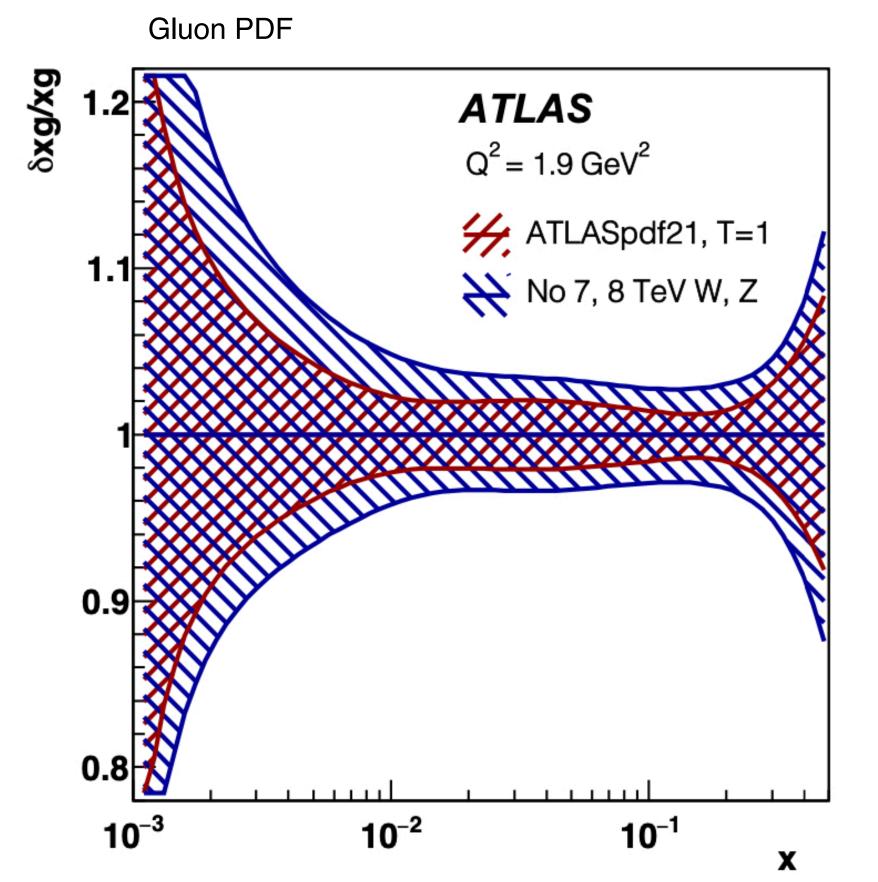

## **Example: PDF fits from LHC data**

ATLASpdf21 fit, https://arxiv.org/pdf/2112.11266.pdf including HERA and ATLAS data

Data set	$\sqrt{s}$ [TeV]	Luminosity [fb <sup>-1</sup> ]	Decay channel	Observables entering the fit
Inclusive $W, Z/\gamma^*$ [9]	7	4.6	$e, \mu$ combined	$\eta_{\ell}$ (W), $y_{Z}$ (Z)
Inclusive $Z/\gamma^*$ [13]	8	20.2	$e, \mu$ combined	$\cos \theta^*$ in bins of $y_{\ell\ell}, m_{\ell\ell}$
Inclusive W [12]	8	20.2	$\mu$	$\eta_{\mu}$
$W^{\pm} + jets [24]$	8	20.2	e	$p_{\mathrm{T}}^{W}$
Z + jets [25]	8	20.2	е	$p_{\rm T}^{\rm jet}$ in bins of $ y^{\rm jet} $
tī [26, 27]	8	20.2	lepton + jets, dilepton	$m_{t\bar{t}}, p_{\mathrm{T}}^{t}, y_{t\bar{t}}$
tī [15]	13	36	lepton + jets	$m_{t\bar{t}}, p_{T}^{t}, y_{t}, y_{t\bar{t}}^{b}$
Inclusive isolated $\gamma$ [14]	8,13	20.2, 3.2	-	$E_{\rm T}^{\gamma}$ in bins of $\eta^{\gamma}$
Inclusive jets [16–18]	7, 8, 13	4.5, 20.2, 3.2		$p_{\rm T}^{\rm jet}$ in bins of $ y^{\rm jet} $

From the conclusions: "While data and the MC samples are in good agreement for particle correlations inside low- and mid-Nj ch jets, the extracted long-range elliptic azimuthal anisotropy vj2{2} shows a distinct increase in data for Nj > 80. Such a feature is not observed  $>^{\circ}$  0.1in any of MC event generators that model the parton fragmentation process. Therefore, results presented in this note may pave a new direction in uncovering novel effects related to nonperturbative QCD dynamics of parton fragmentation in the vacuum. "

- and facilities, built and operated by different communities
- dedicated facilities
  - HERA  $\rightarrow$  PDFs, B-factories  $\rightarrow$  flavour, RHIC  $\rightarrow$  HIs, LEP/SLC  $\rightarrow$  EWPT, etc.
- of competition and complementarity

# Remarks

The 4000 papers mentioned before reflect the underlying existence, at the LHC, of 100's of scientifically "independent" experiments, which historically would have required different detectors

On each of these topics the LHC expts are advancing the knowledge previously acquired by

Even in the perspective of new dedicated facilities, eg SuperKEKB or EIC, LHC maintains a key role

- and facilities, built and operated by different communities
- dedicated facilities
  - HERA  $\rightarrow$  PDFs, B-factories  $\rightarrow$  flavour, RHIC  $\rightarrow$  HIs, LEP/SLC  $\rightarrow$  EWPT, etc
- of competition and complementarity

I have a broad concept of "new physics", which includes SM phenomena, emerging from the data, that are unexpected, surprising, or simply poorly understood.

I consider as "new", and as a discovery, everything that is not obviously predictable, or that requires deeper study to be clarified, even if it belongs to the realm of SM phenomena.

"New physics" is emerging every day at the LHC and contributes to our deeper understanding of QCD

# Remarks

The 4000 papers mentioned before reflect the underlying existence, at the LHC, of 100's of scientifically "independent" experiments, which historically would have required different detectors

On each of these topics the LHC expts are advancing the knowledge previously acquired by

Even in the perspective of new dedicated facilities, eg SuperKEKB or EIC, LHC maintains a key role

# Final words

- Progress with QCD is critical to exploit the excellent performance of the LHC: • On one side, in absence of direct and unambiguous BSM signals, the only challenges to the SM and the only probes of the origin of EWSB will come from the reliable
- theoretical interpretation of precision measurements
  - On the other side, strong interactions remain the least understood and most challenging aspect of the SM dynamics, with a broad set of implications ranging from spectroscopy to astrophysical domains.
- The diverse collider phenomenology —particularly the hadronic one —probes a huge dynamical range of phenomena, challenging the theoretical understanding, both at the level of fundamental understanding and of computational complexity.
- The goal of measuring and theoretically describing "SM data " goes hand in hand with the search for BSM physics, whether directly or via precision SM tests: It provides the motivational challenge and the intellectual reward to ensure the continued progress of collider physics for the next decades
