

THE AIDA PROJECT: GALAXY FORMATION IN ALTERNATIVE DARK MATTER MODELS

Giulia Despali

Department of Physics and Astronomy

University of Bologna

WP3 Flagship UC

ALMA MATER STUDIORUM
UNIVERSITÀ DI BOLOGNA

EuroHPC
Joint Undertaking

Standard model: **Cold Dark Matter**

heavy particles (~GeV)
only gravitational interactions
do not emit any light

works well to explain the large scale structure
of the Universe but may fail on small scales

Stars, planets, galaxies,
everything we can observe

68%
Dark energy

Warm Dark Matter

(Lovell et al. 2012)

model with less massive particles \sim keV scale
still only gravitational interactions

the number of low-mass structures is reduced

Strong lensing

MW satellites
&
stellar streams

(Garrison-Kimmel+14)

Lyman- α forest
(Lee et al. 2014)

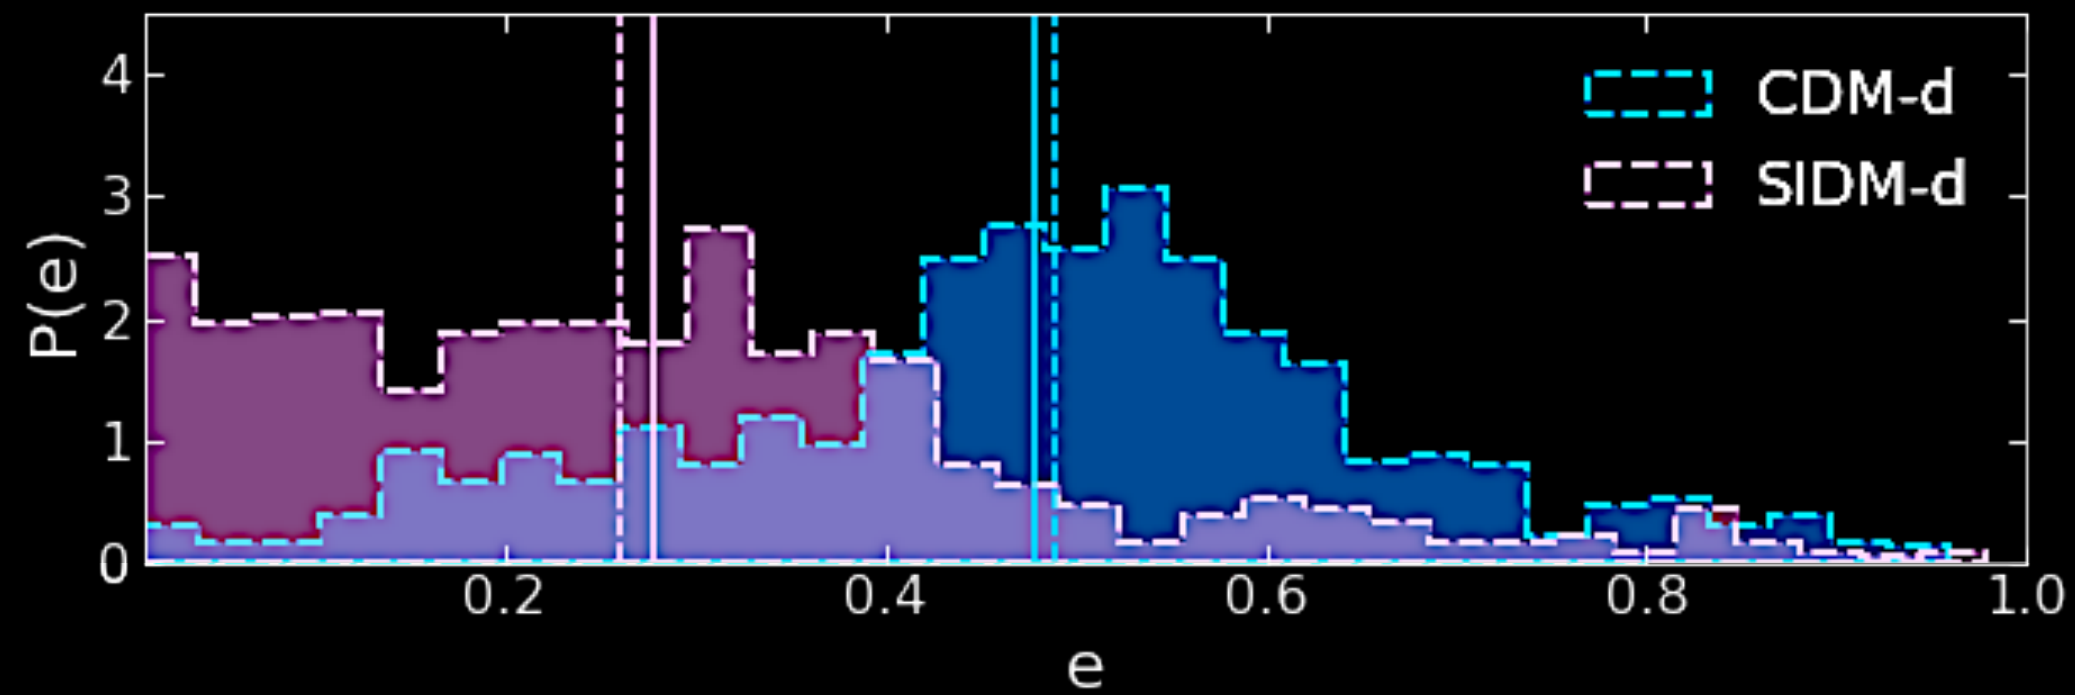

Self-Interacting Dark Matter

model where the dark matter particles have interactions beyond gravitation

the matter distribution & density inside haloes is modified

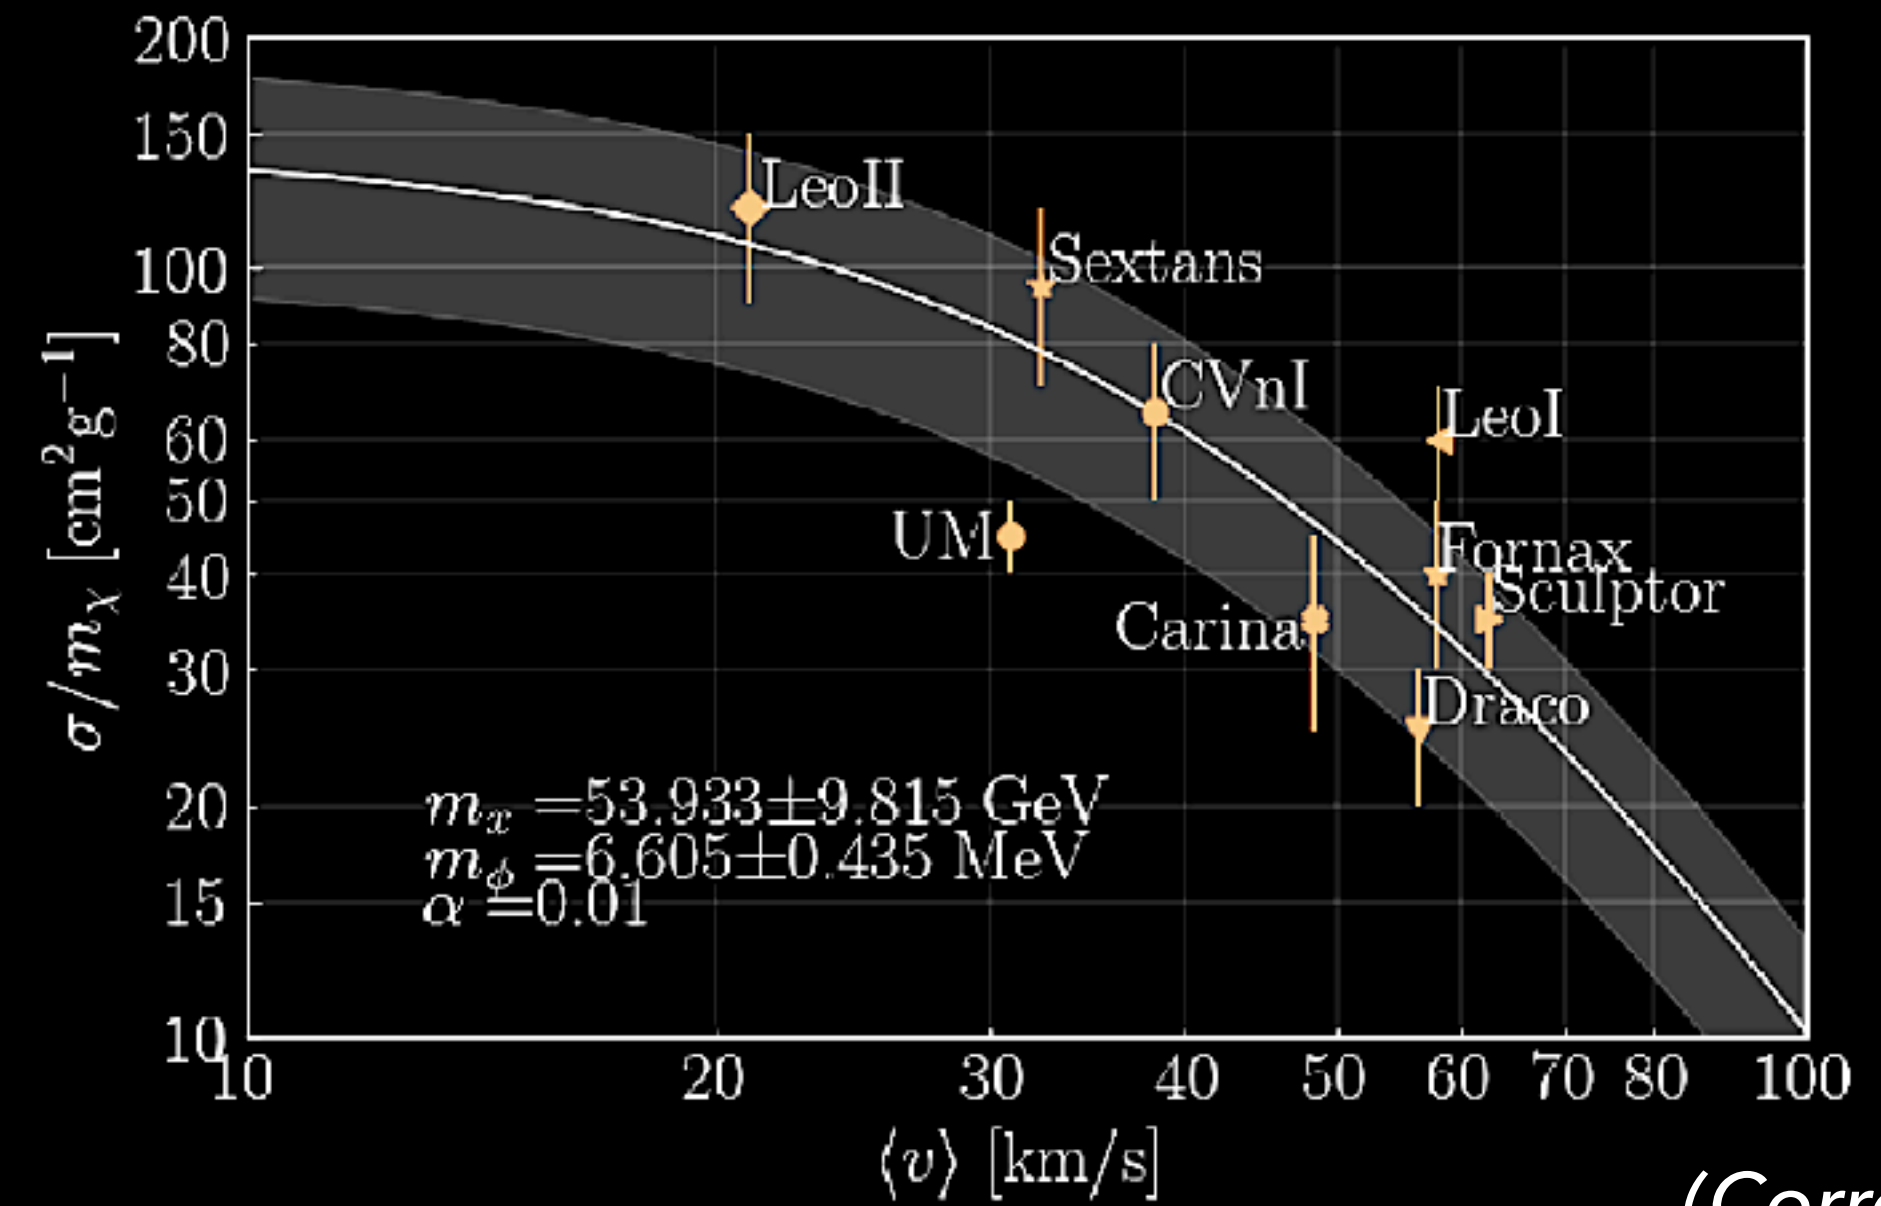

(Meneghetti+2020)

halo shapes

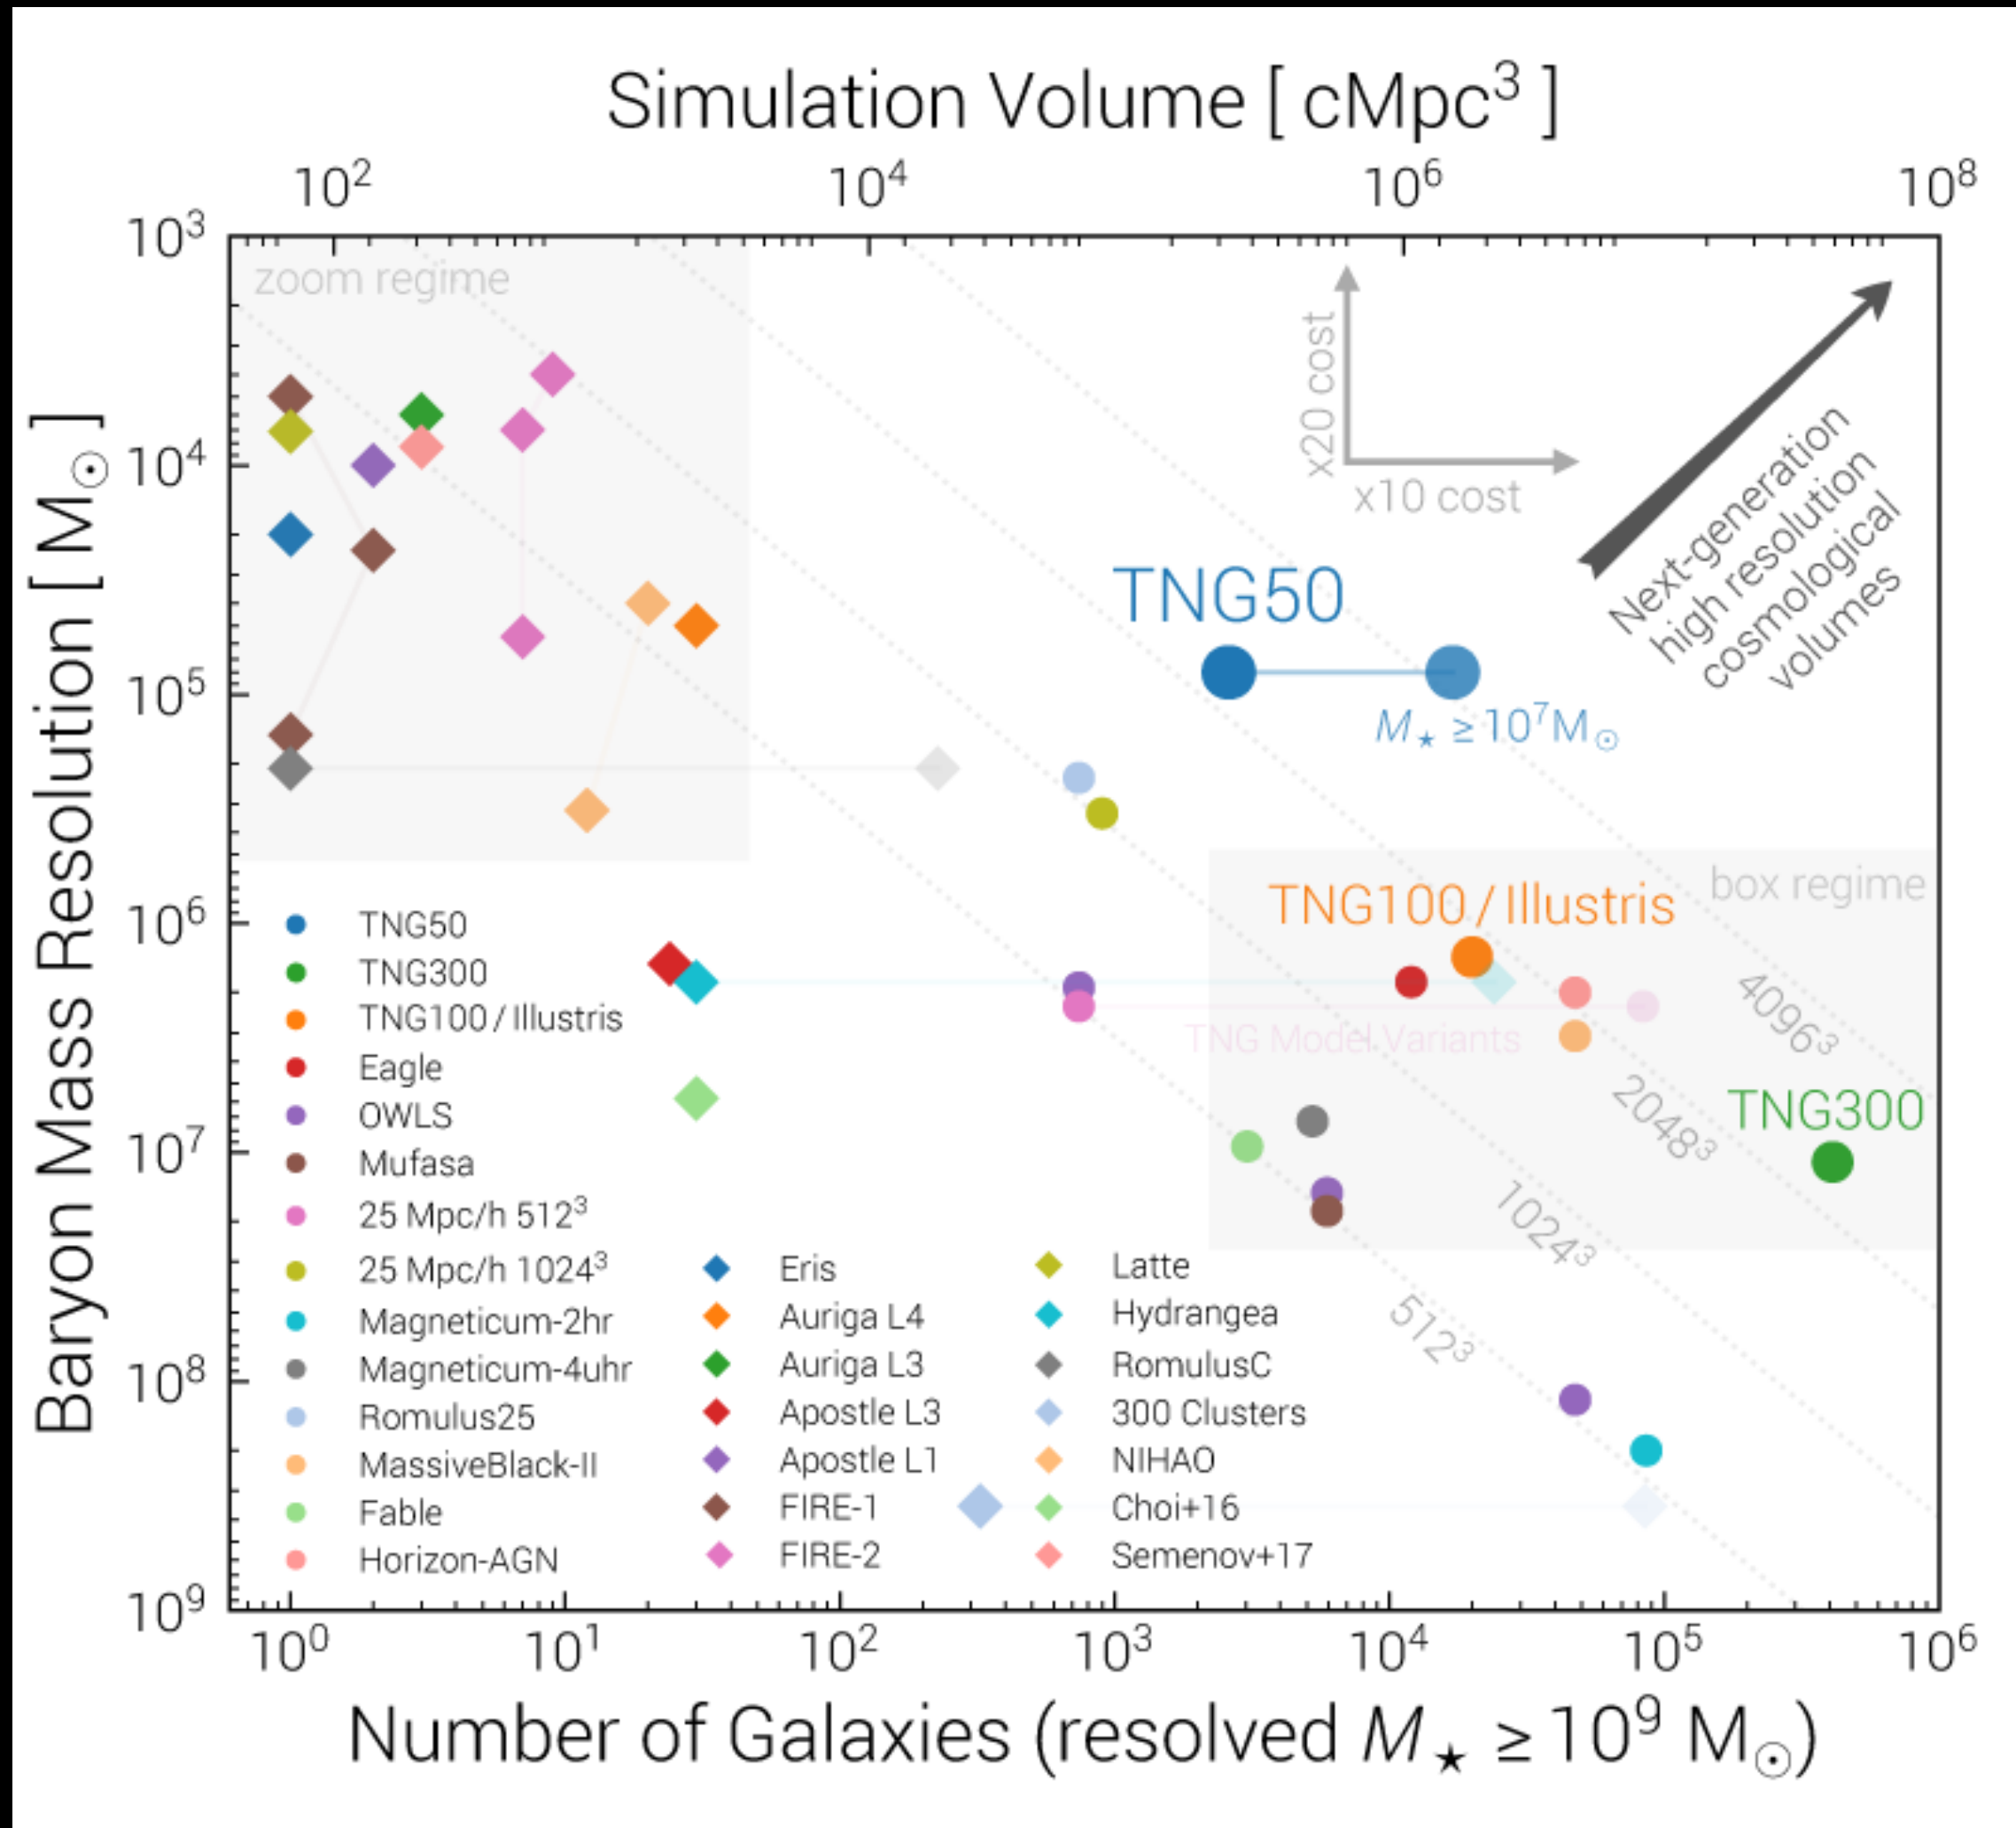

(Despali+2022)

dwarf galaxies

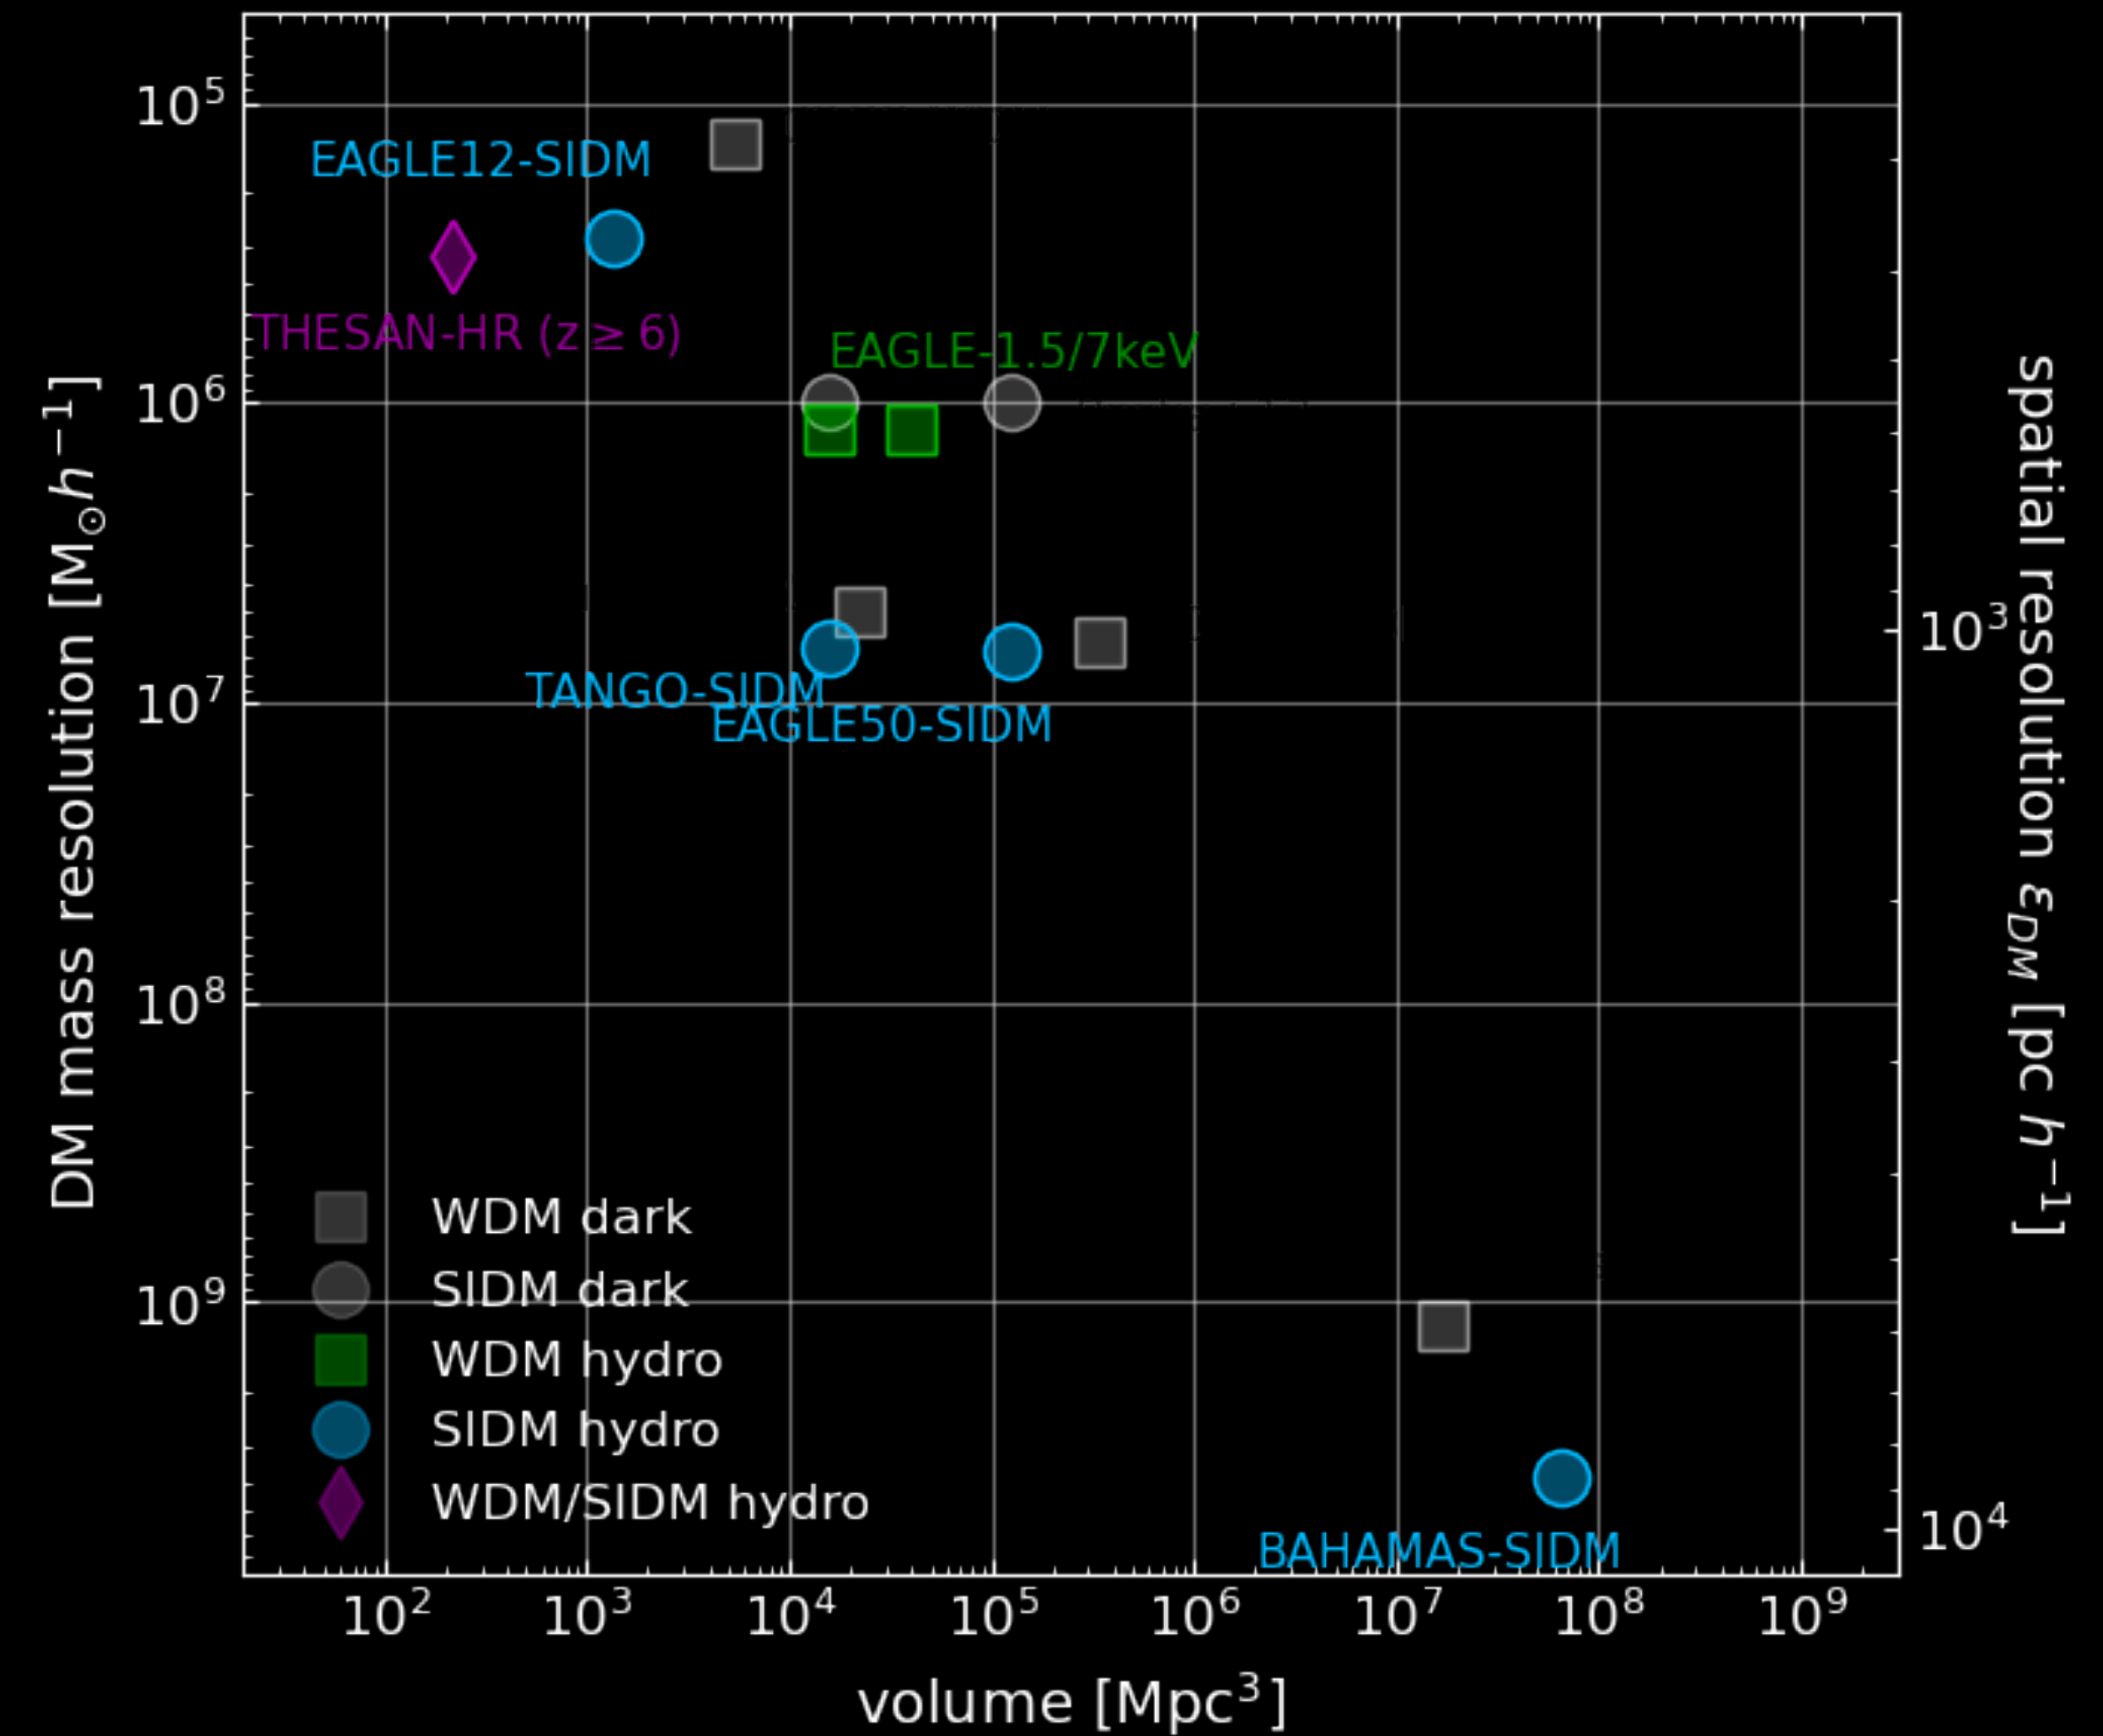

(Correa+2020)

Cold Dark Matter + Hydrodynamics simulations

(Nelson+2019)

Hydro simulations with other dark matter models

AIDA-TNG SIMULATIONS

- ✓ three cosmological boxes
- ✓ AREPO - moving mesh
- ✓ TNG galaxy formation model
- ✓ CDM, 3xWDM, 2xSIDM
- ✓ multiple resolution levels

100 Mpc

50 Mpc

new
20 Mpc

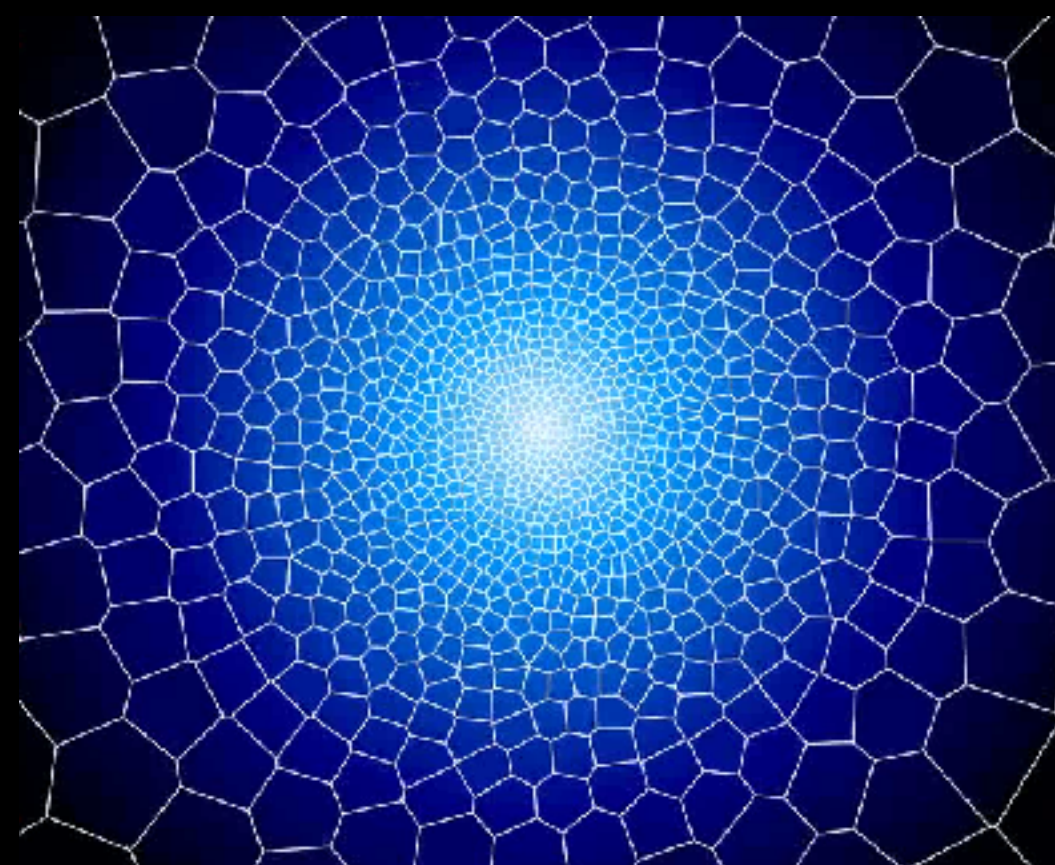

max resolution:
 $4 \times 10^5 M_{\odot}$
280 pc

LAURO MOSCARDINI

ANNALISA PILLEPICH
MARK VOGELSBERGER
VOLKER SPRINGEL

Arepo

(Springel et al. 2008)

- Gravity with a Tree-PM approach, MPI parallel
- Hydrodynamics on a moving Voronoi tessellation, where the mesh adapts over time
- domain decomposition on a Peano-Hilbert curve that splits the workload into the required number of MPI tasks
- Sophisticated on-the-fly analysis that already produces post-processing catalogues
- highly portable: written in C, with dependences only to gsl, gmo, fftw and hdf5 libraries

AIDA(-TNG) SIMULATIONS

Simulation set-up

- improved routines for alternative DM models
- 8 runs with $(2 \times 910)^3$ resolution elements
- 10 runs with $(2 \times 1080)^3$ resolution elements
- additional lower resolution versions
- ~100 Terabytes of data
- ~ 60 million CPU hours for the entire sample

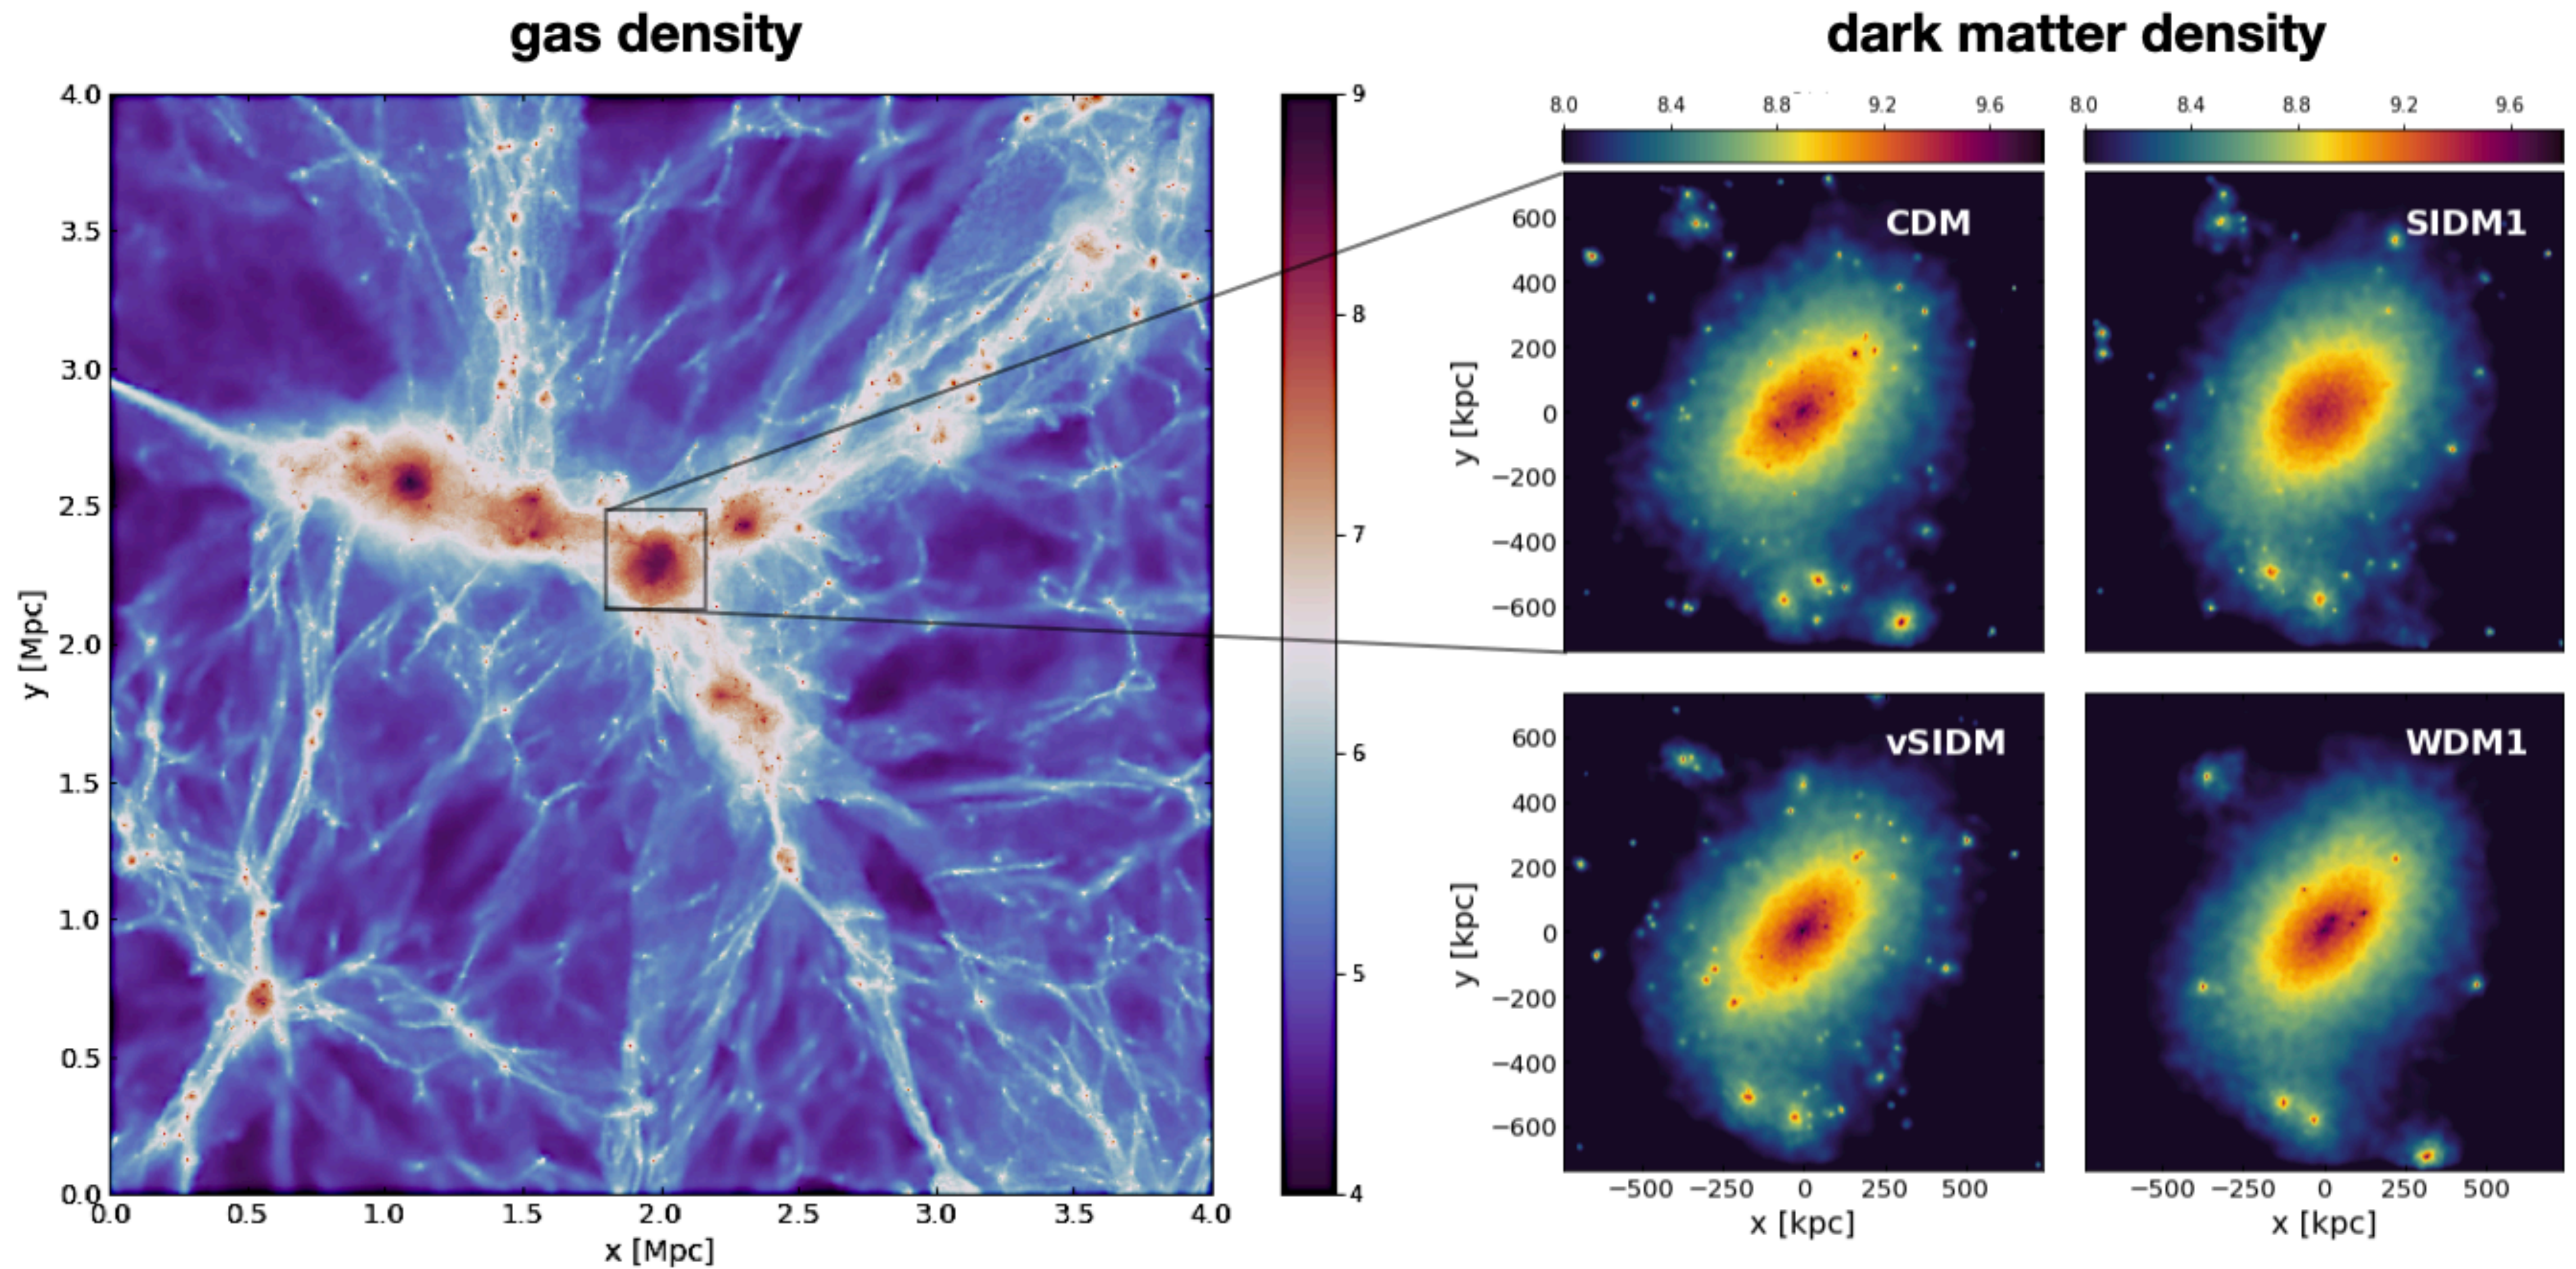

Processing pipeline

- creation of mock observations from the simulations
- acceleration on GPUs (in progress)

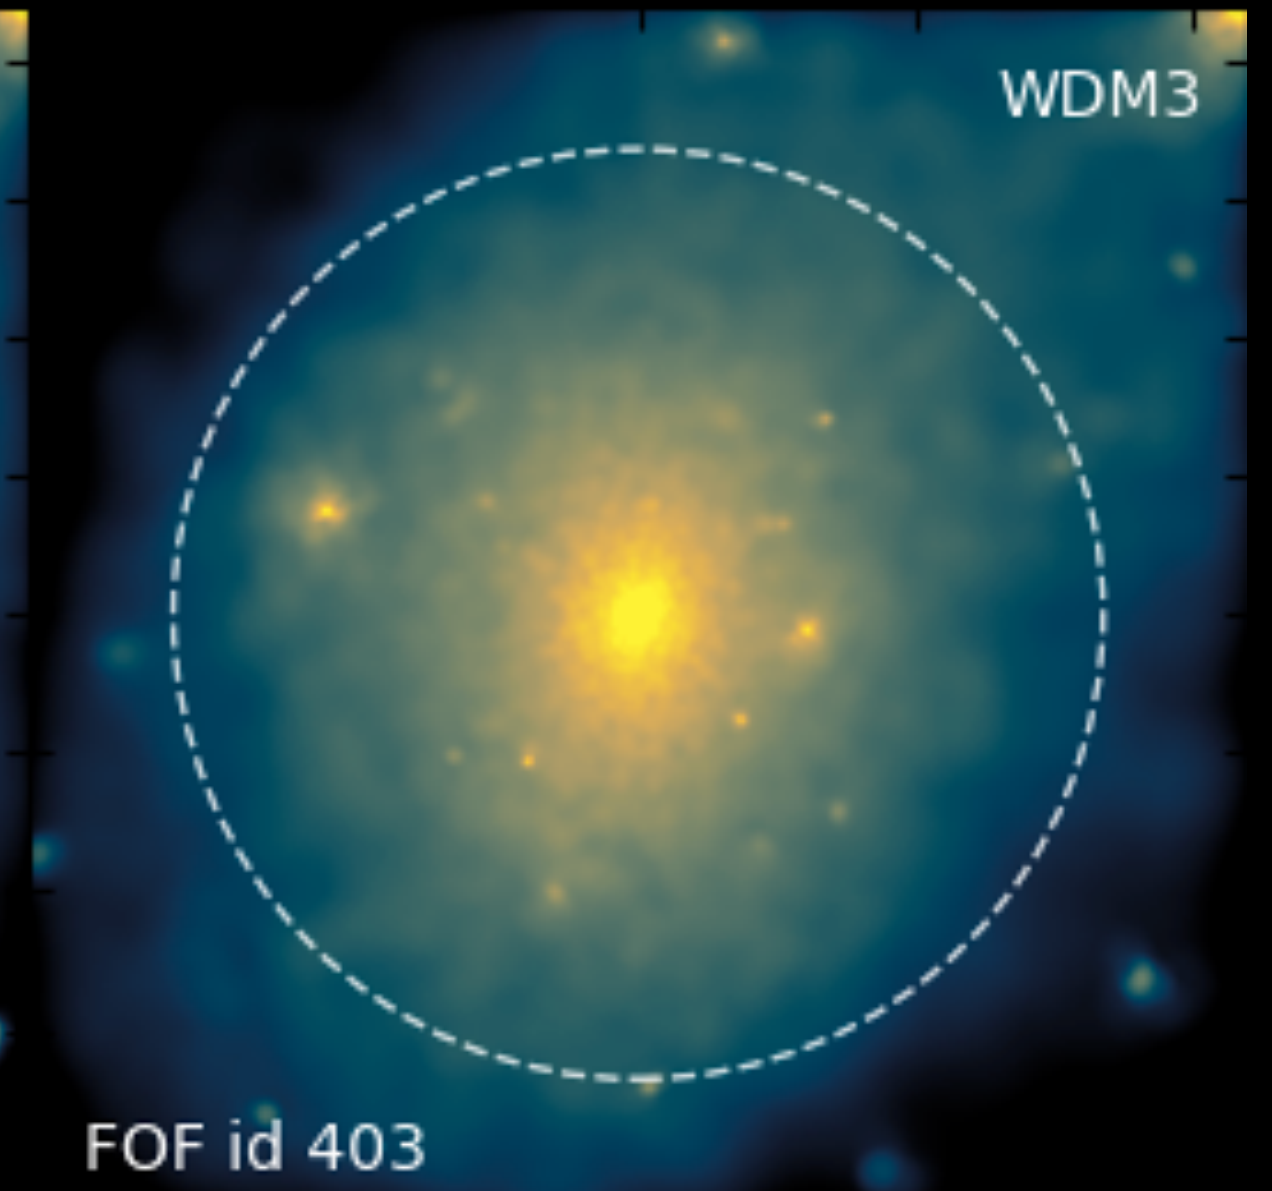

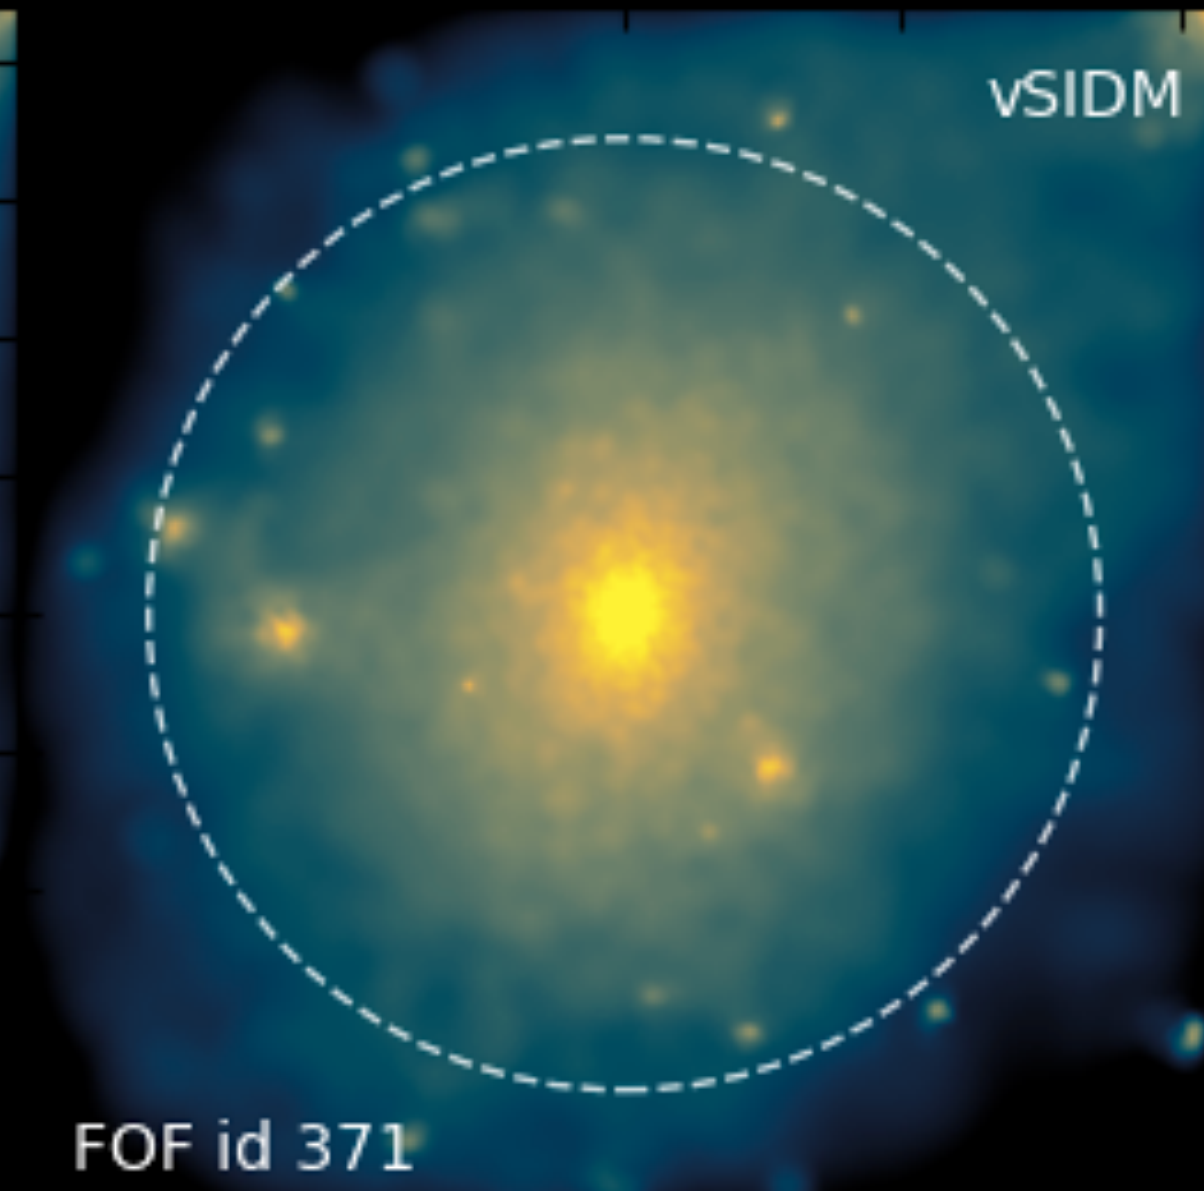

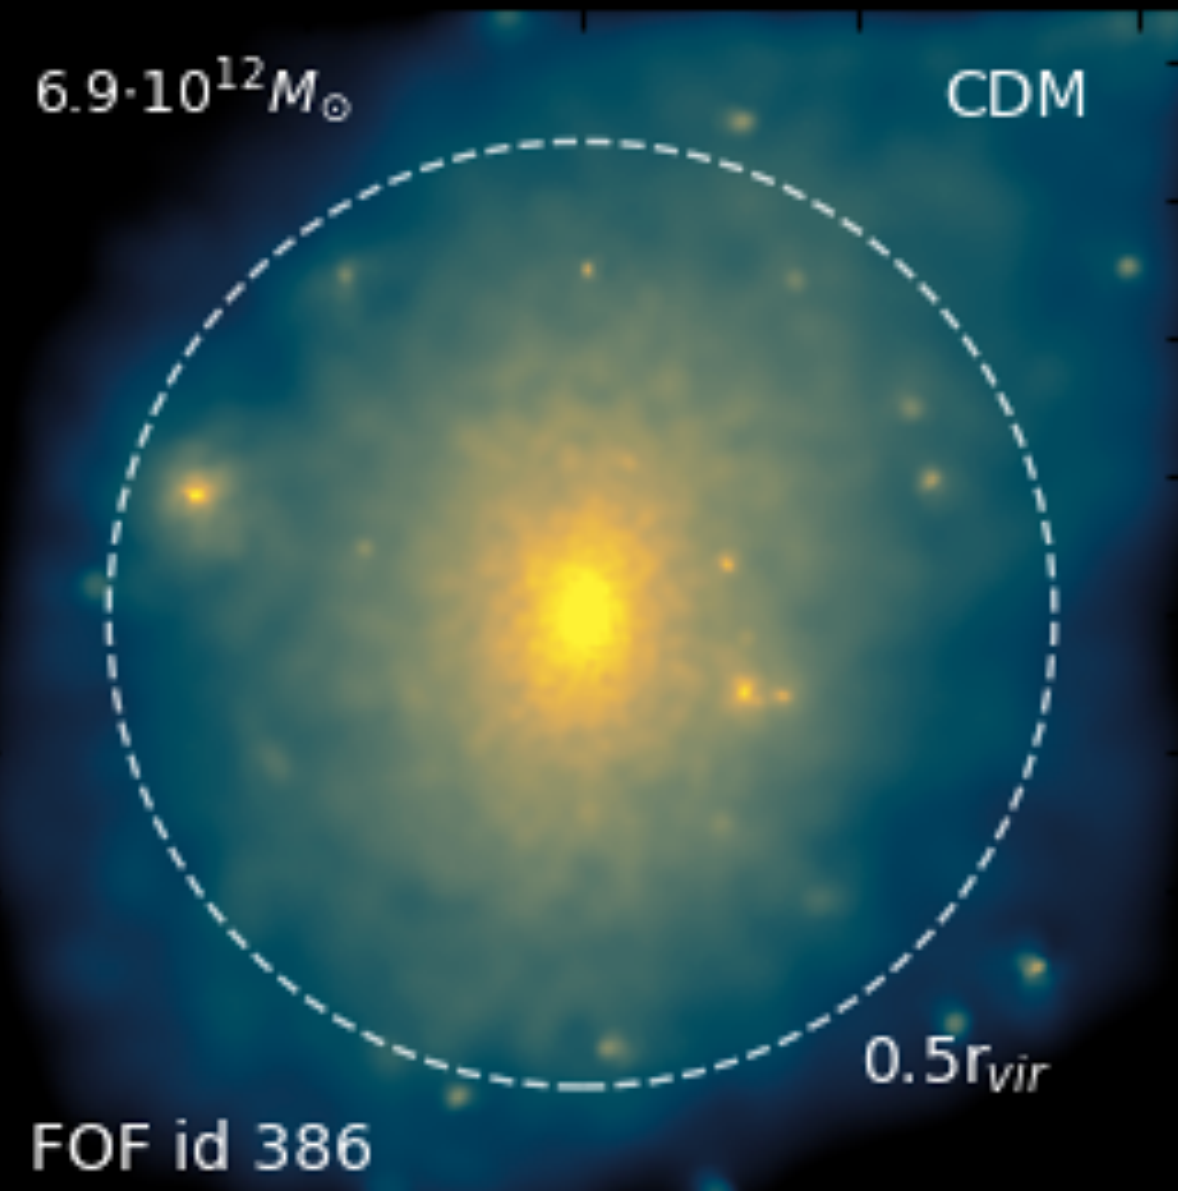

Resources

- computing time (5 Million CPU hours) and storage space (100 TB) on **Leonardo** via **CN HPC**
- computing time on **Lumi** via EuroHPC application

AIDA-TNG SIMULATIONS

dark matter

gas

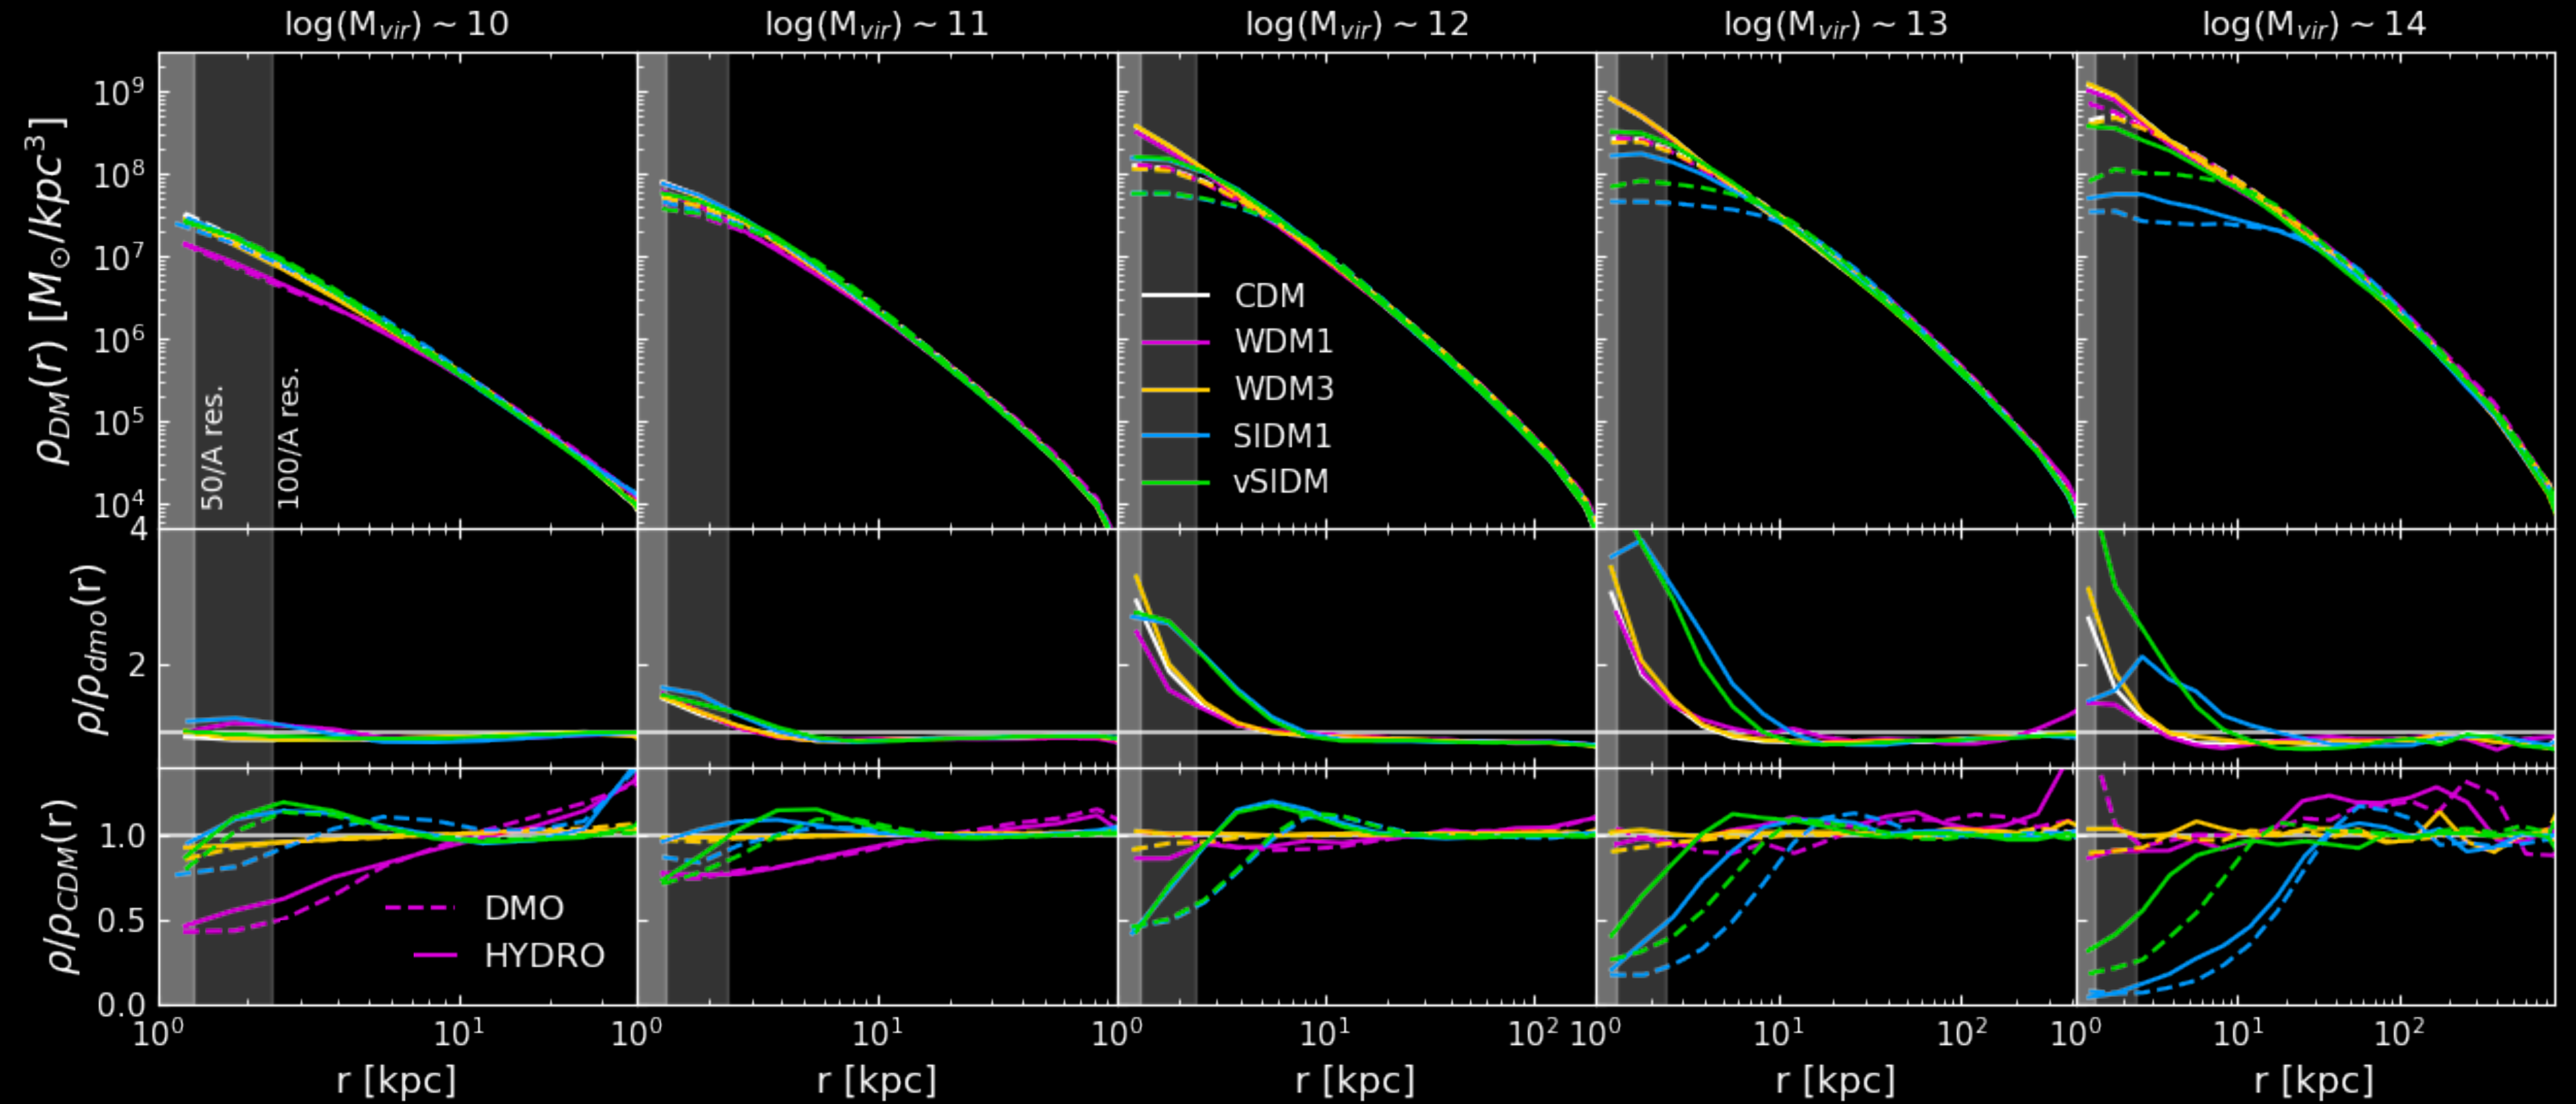

Merger in a group

SIDM and WDM have opposite trends with mass

not only the DM profile is affected, but also the total density

presentation paper to be submitted this month

SUMMARY

new AIDA-TNG simulations

- ✓ three cosmological boxes
- ✓ AREPO - moving mesh
- ✓ TNG galaxy formation model
- ✓ CDM, WDM, SIDM
- ✓ multiple resolution levels
- ✓ large statistics of galaxies
