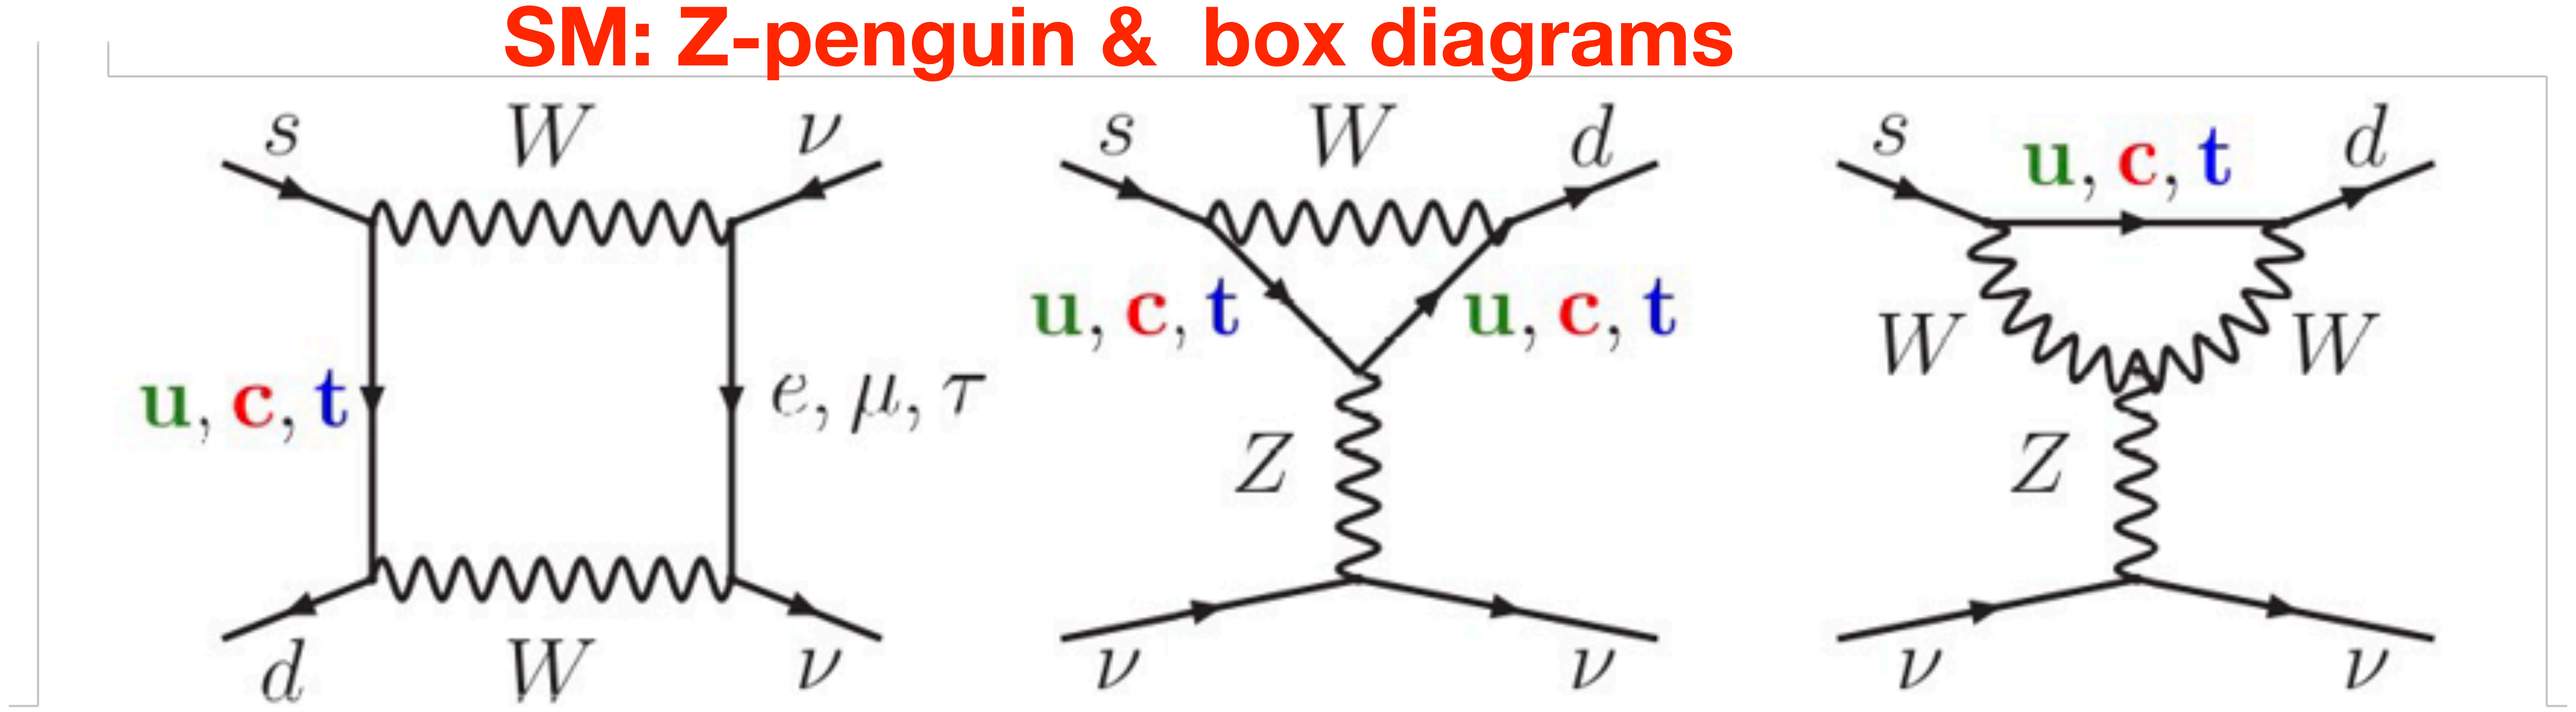
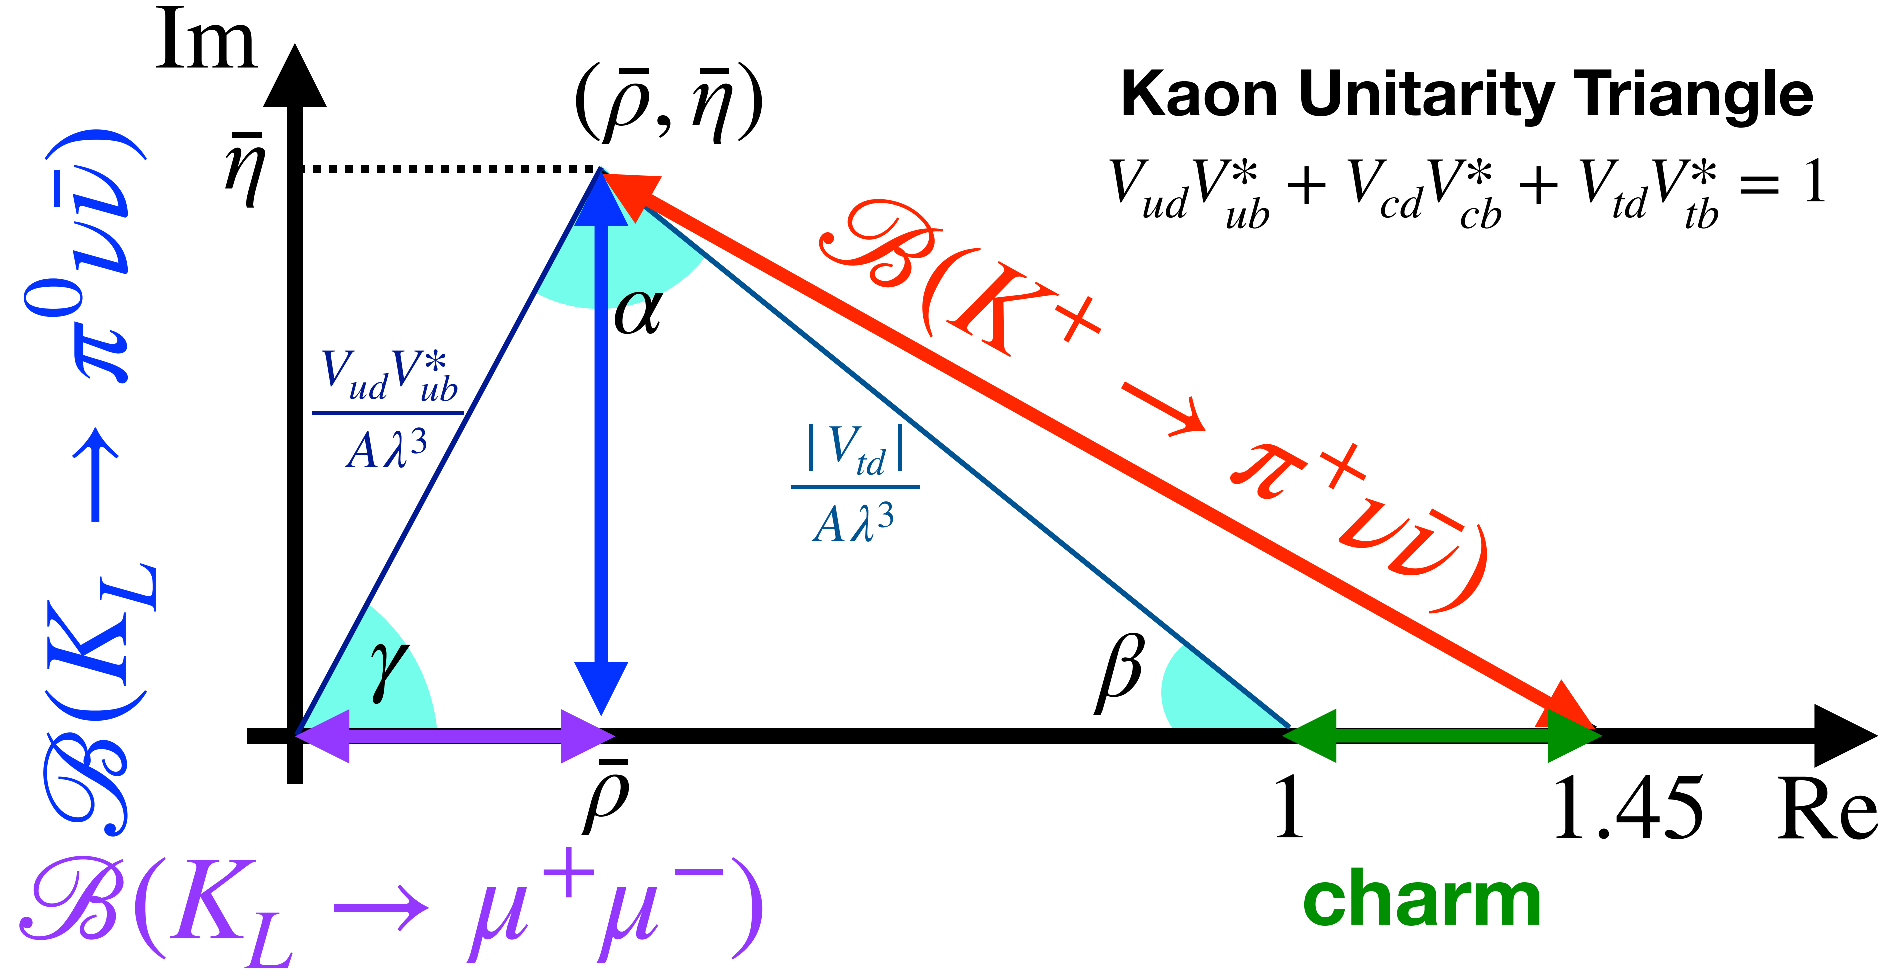
Rare Kaon Decays:
SM and Beyond

The golden modes $K \to \pi\nu\bar{\nu}$

$K \to \pi\nu\bar{\nu}$: Precision test of the Standard Model

SM: Z-penguin & box diagrams





- $\mathcal{B}(K \to \pi\nu\bar{\nu})$ **highly suppressed** in SM
  - GIM mechanism & maximum CKM suppression $s \to d$ transition: $\sim \frac{m_t^2}{m_W^2} \left| V_{ts}^* V_{td} \right|$
- Theoretically clean ⇒ high precision SM predictions
  - Dominated by short distance contributions.
  - Hadronic matrix element extracted from $\mathcal{B}(K \to \pi^0 \ell^+ \nu_\ell)$ decays via isospin rotation.

Mode	SM Branching Ratio [1]	SM Branching Ratio [2]	Experimental Status
$K^+ \to \pi^+\nu\bar{\nu}$	$(8.60 \pm 0.42) \times 10^{-11}$	$(7.86 \pm 0.61) \times 10^{-11}$	$(10.6 \pm 4.0) \times 10^{-11}$ NA62 16−18
$K_L \to \pi^0\nu\bar{\nu}$	$(2.94 \pm 0.15) \times 10^{-11}$	$(2.68 \pm 0.30) \times 10^{-11}$	$< 2 \times 10^{-9}$ KOTO (2021 data)

^Recent SM calculations [1:Buras et al. EPJC 82 (2022) 7, 615][2:D'Ambrosio et al. JHEP 09 (2022) 148]

$K^+ \to \pi^+ \nu \bar{\nu}$ at NA62

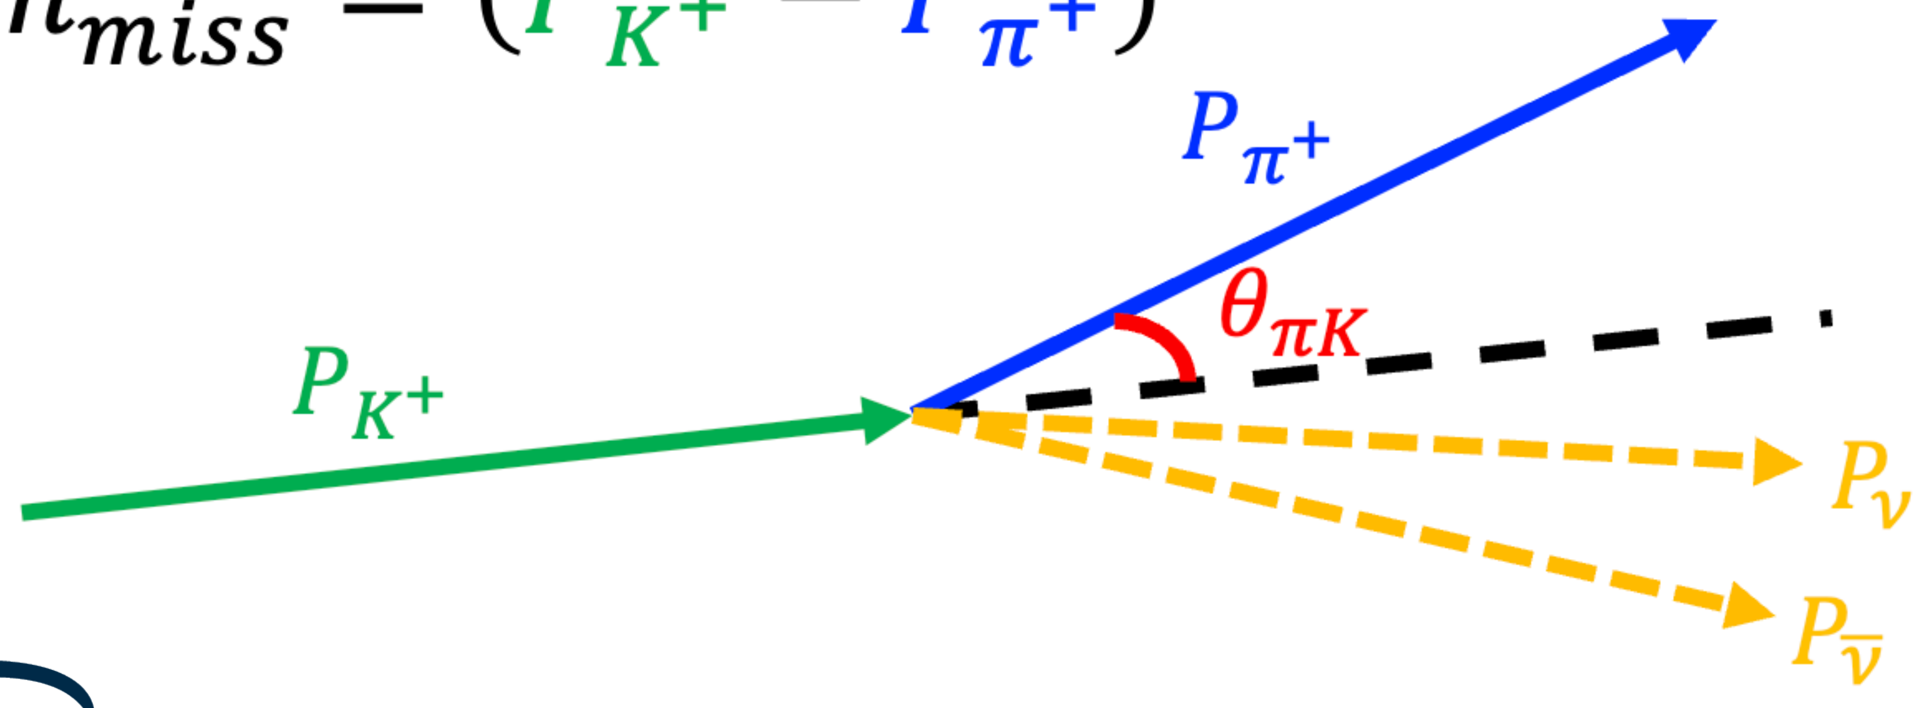
NA62 Strategy:

- Tag K^+ and measure momentum.
- Identify π^+ and measure momentum.
- Match K^+ and π^+ in time & form vertex.
  - Determine $m^2_{miss} = (P_K - P_\pi)^2$
- Reject **any** additional activity.

NA62 Performance Keystones:

- $\mathcal{O}(100)\,ps$ timing between detectors
- $\mathcal{O}(10^4)$ background suppression from kinematics
- $> 10^7$ muon rejection
- $> 10^7$ rejection of π^0 from $K^+ \to \pi^+ \pi^0$ decays

$$m^2_{miss} = (P_{K^+} - P_{\pi^+})^2$$

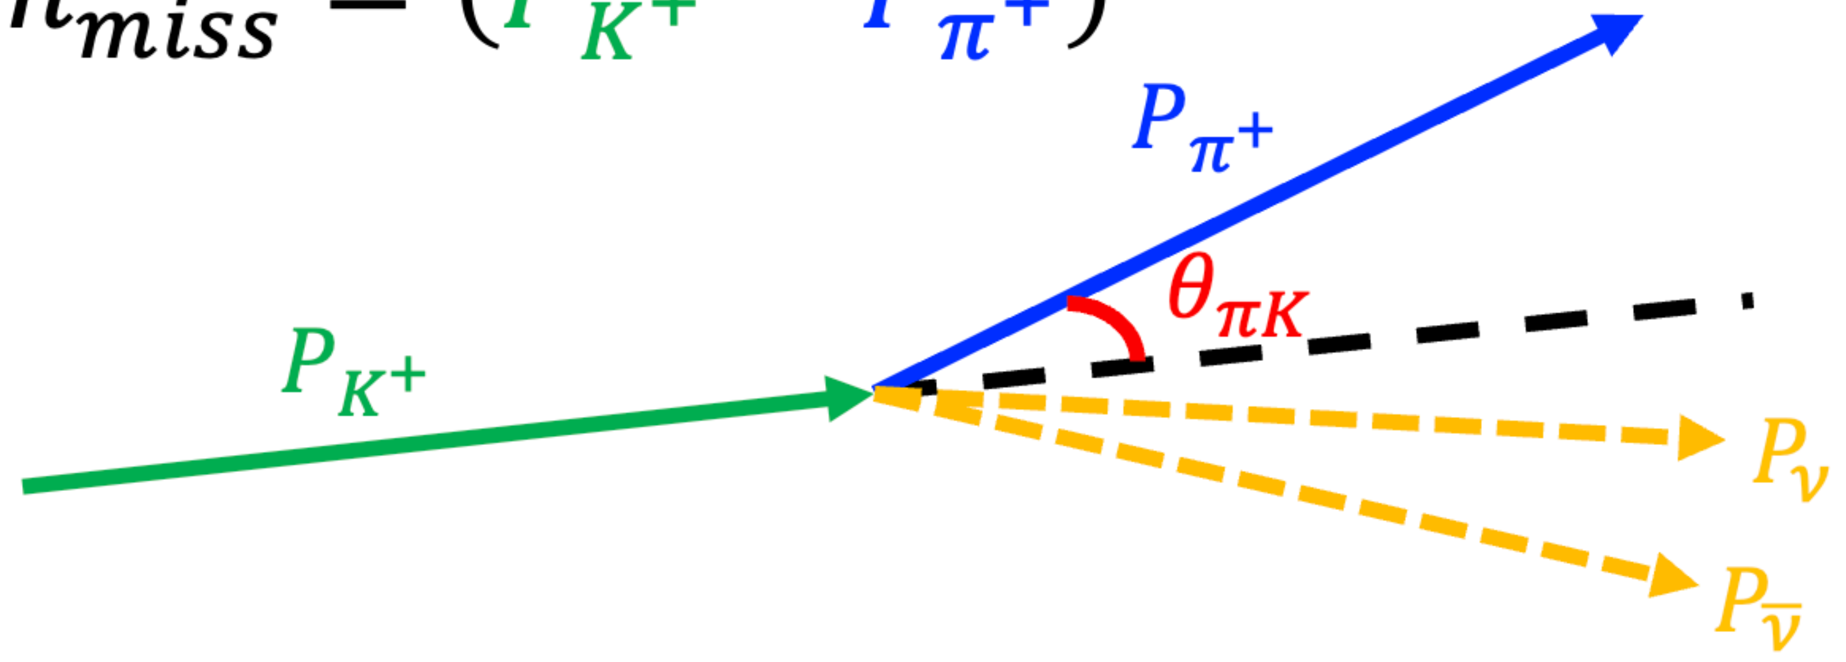


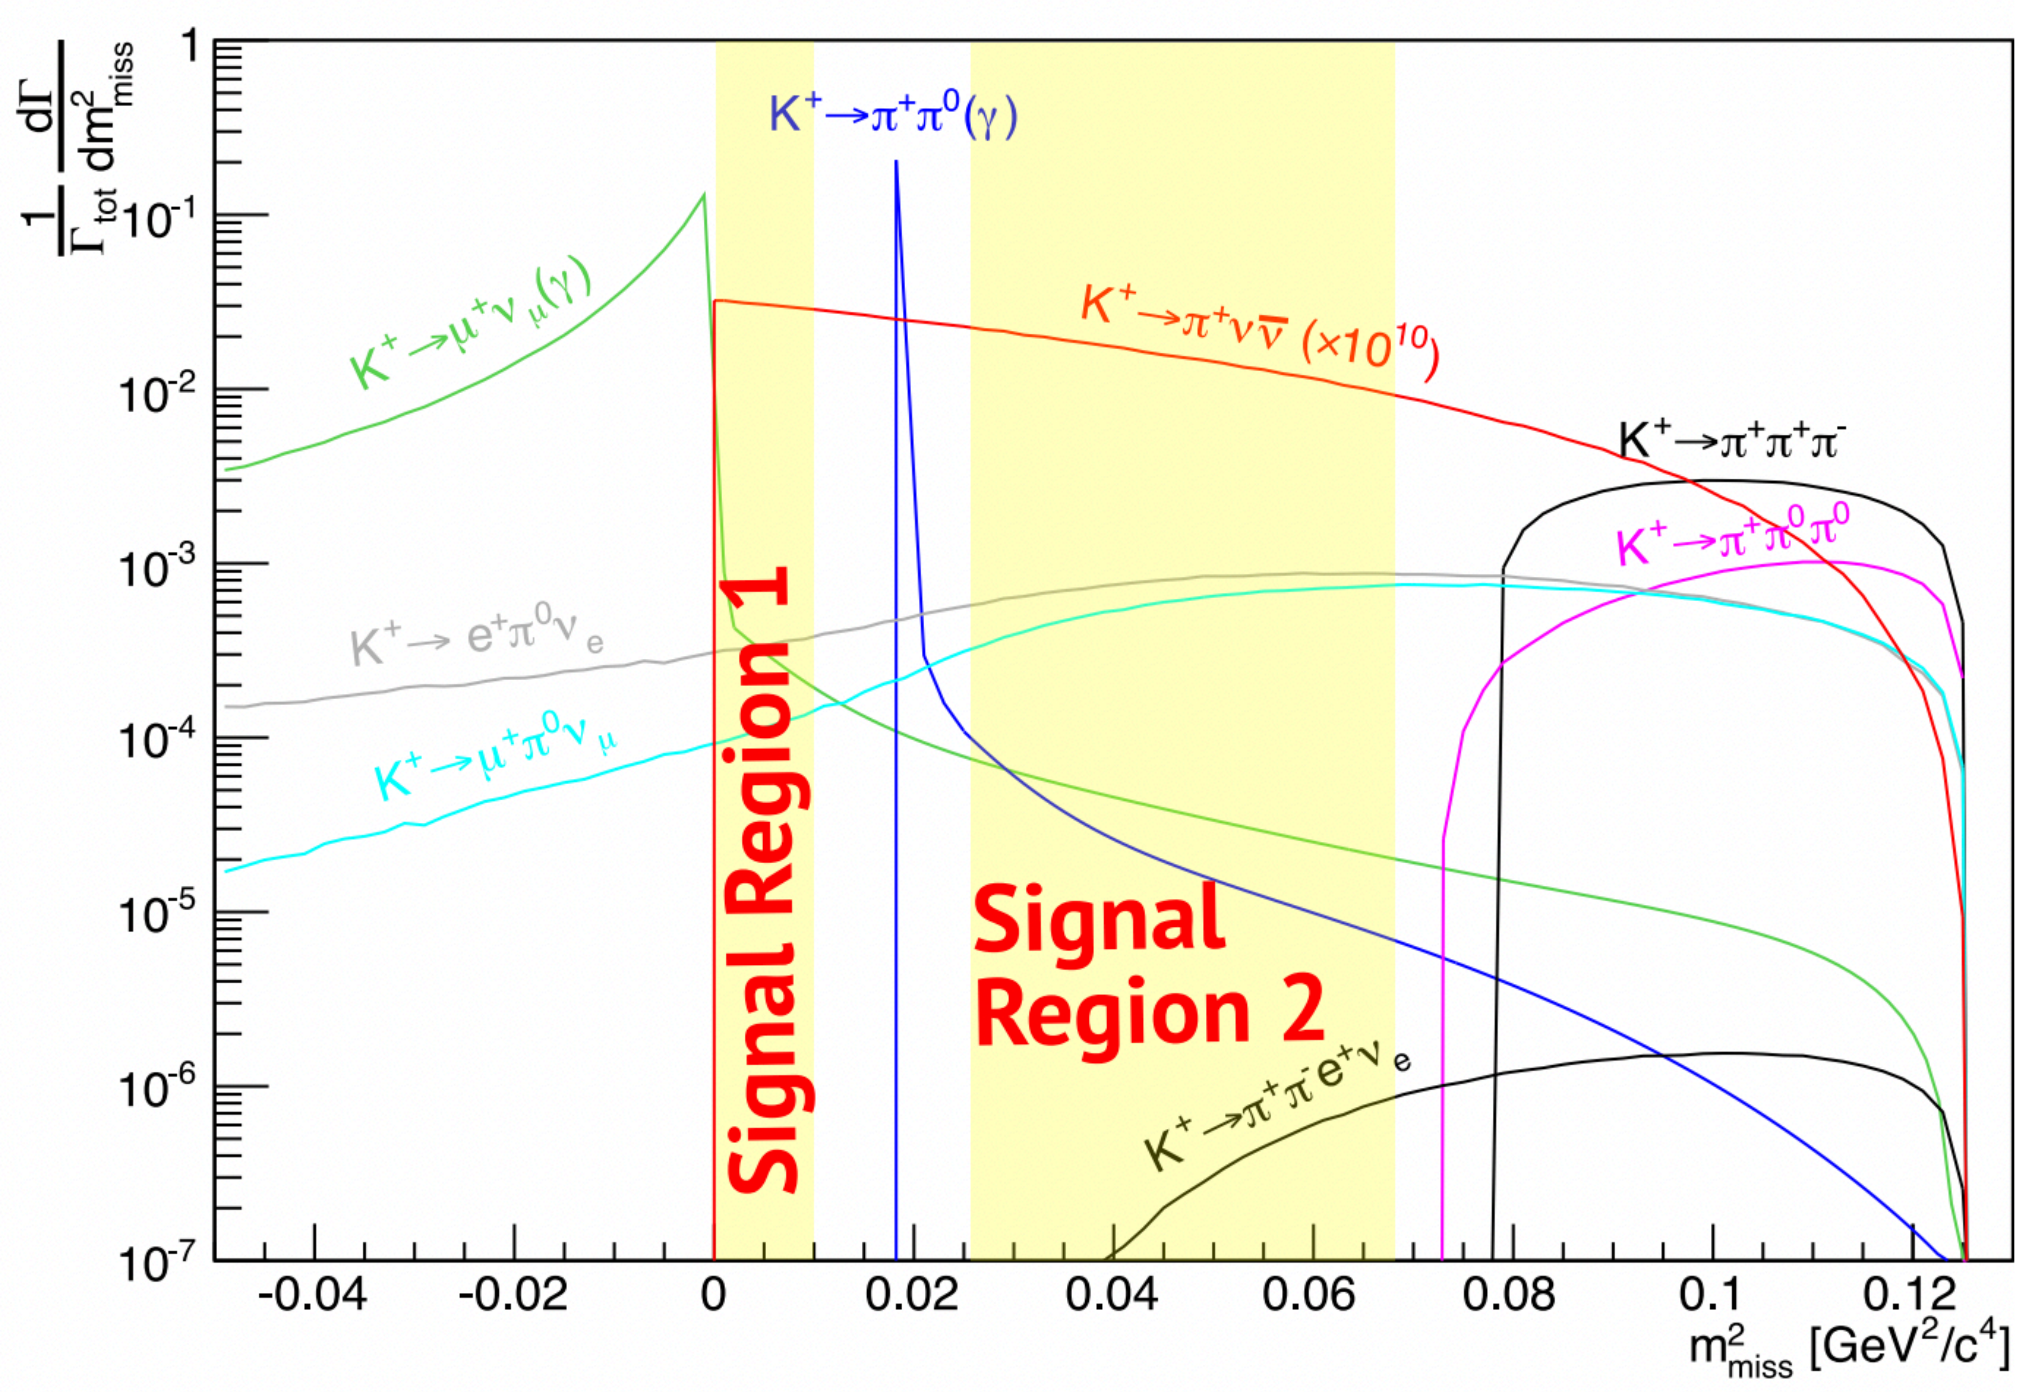
Decay mode	Branching Ratio [PDG]
$K^+ \to \mu^+ \nu_\mu$	$(63.56 \pm 0.11)\,\%$
$K^+ \to \pi^+ \pi^0$	$(20.67 \pm 0.08)\,\%$
$K^+ \to \pi^+ \pi^+ \pi^-$	$(5.583 \pm 0.024)\,\%$
$K^+ \to \pi^+ \pi^- e^+ \nu_e$	$(4.247 \pm 0.024) \times 10^{-5}$
$K^+ \to \pi^+ \nu \bar{\nu}$	$(8.60 \pm 0.42) \times 10^{-11}$ [SM]

Buras et al. EPJC 82 (2022) 7, 615

Kinematic constraints & signal regions

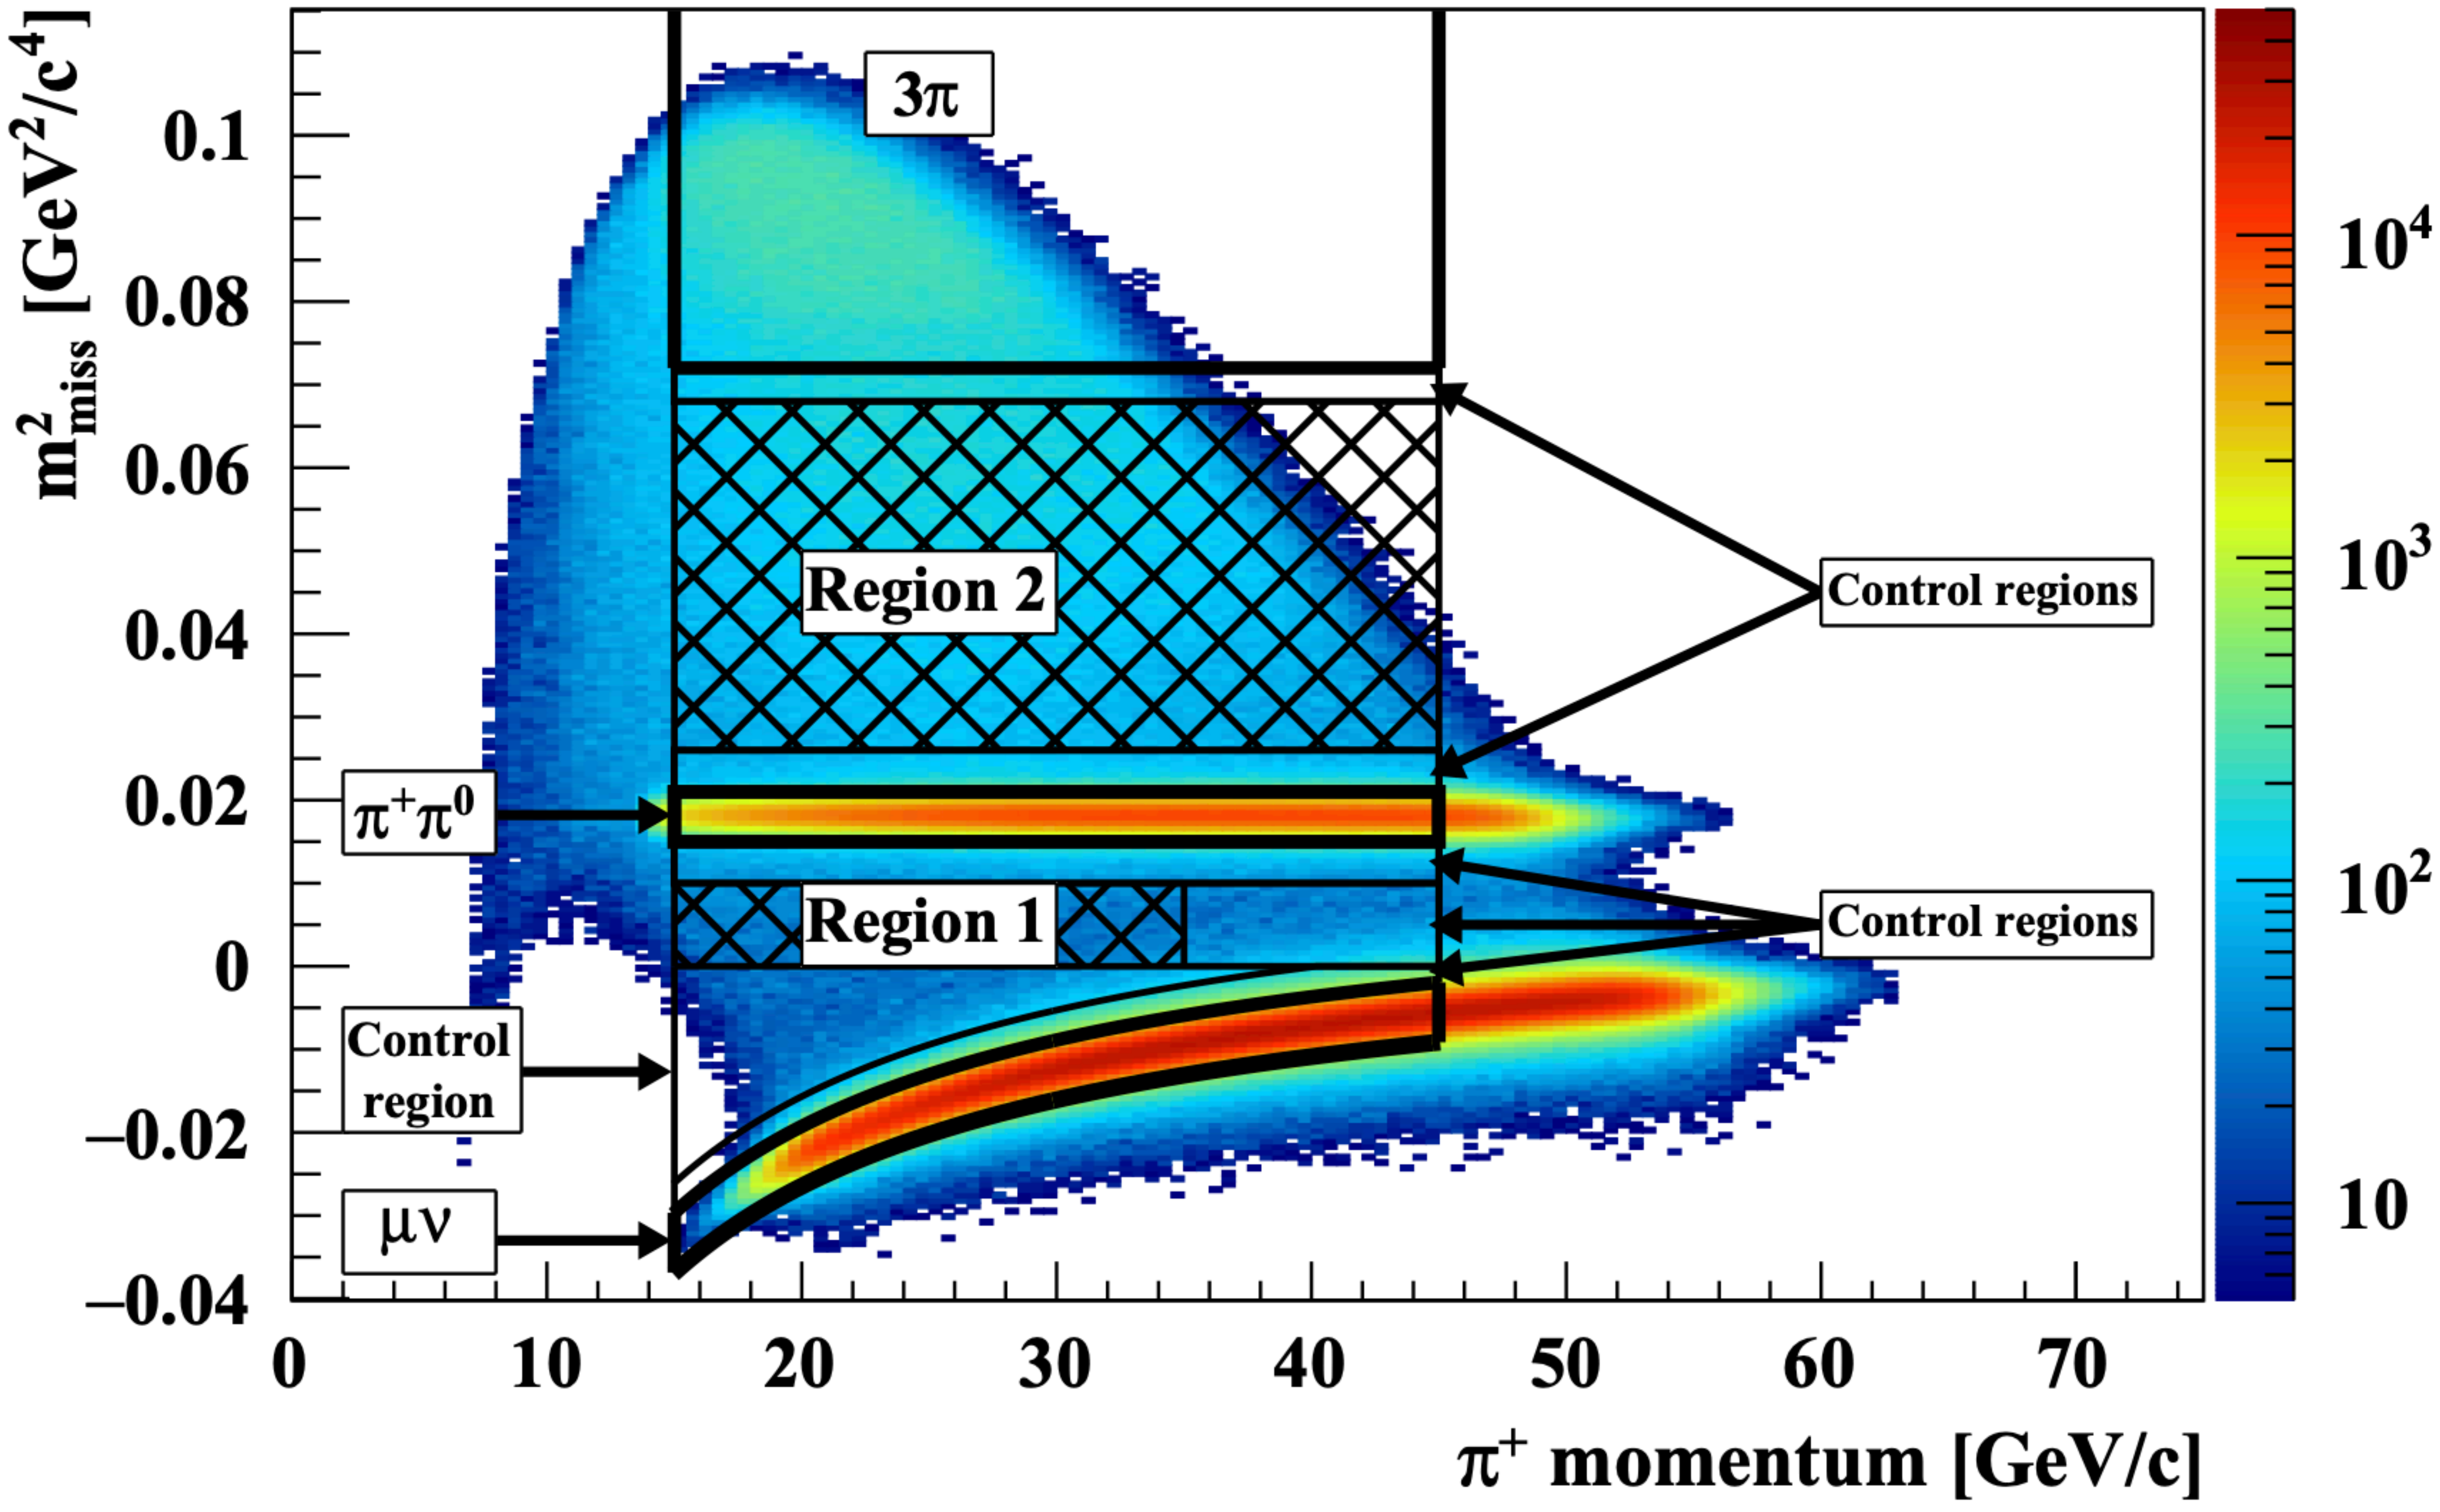
$$m_{miss}^2 = (P_{K^+} - P_{\pi^+})^2$$





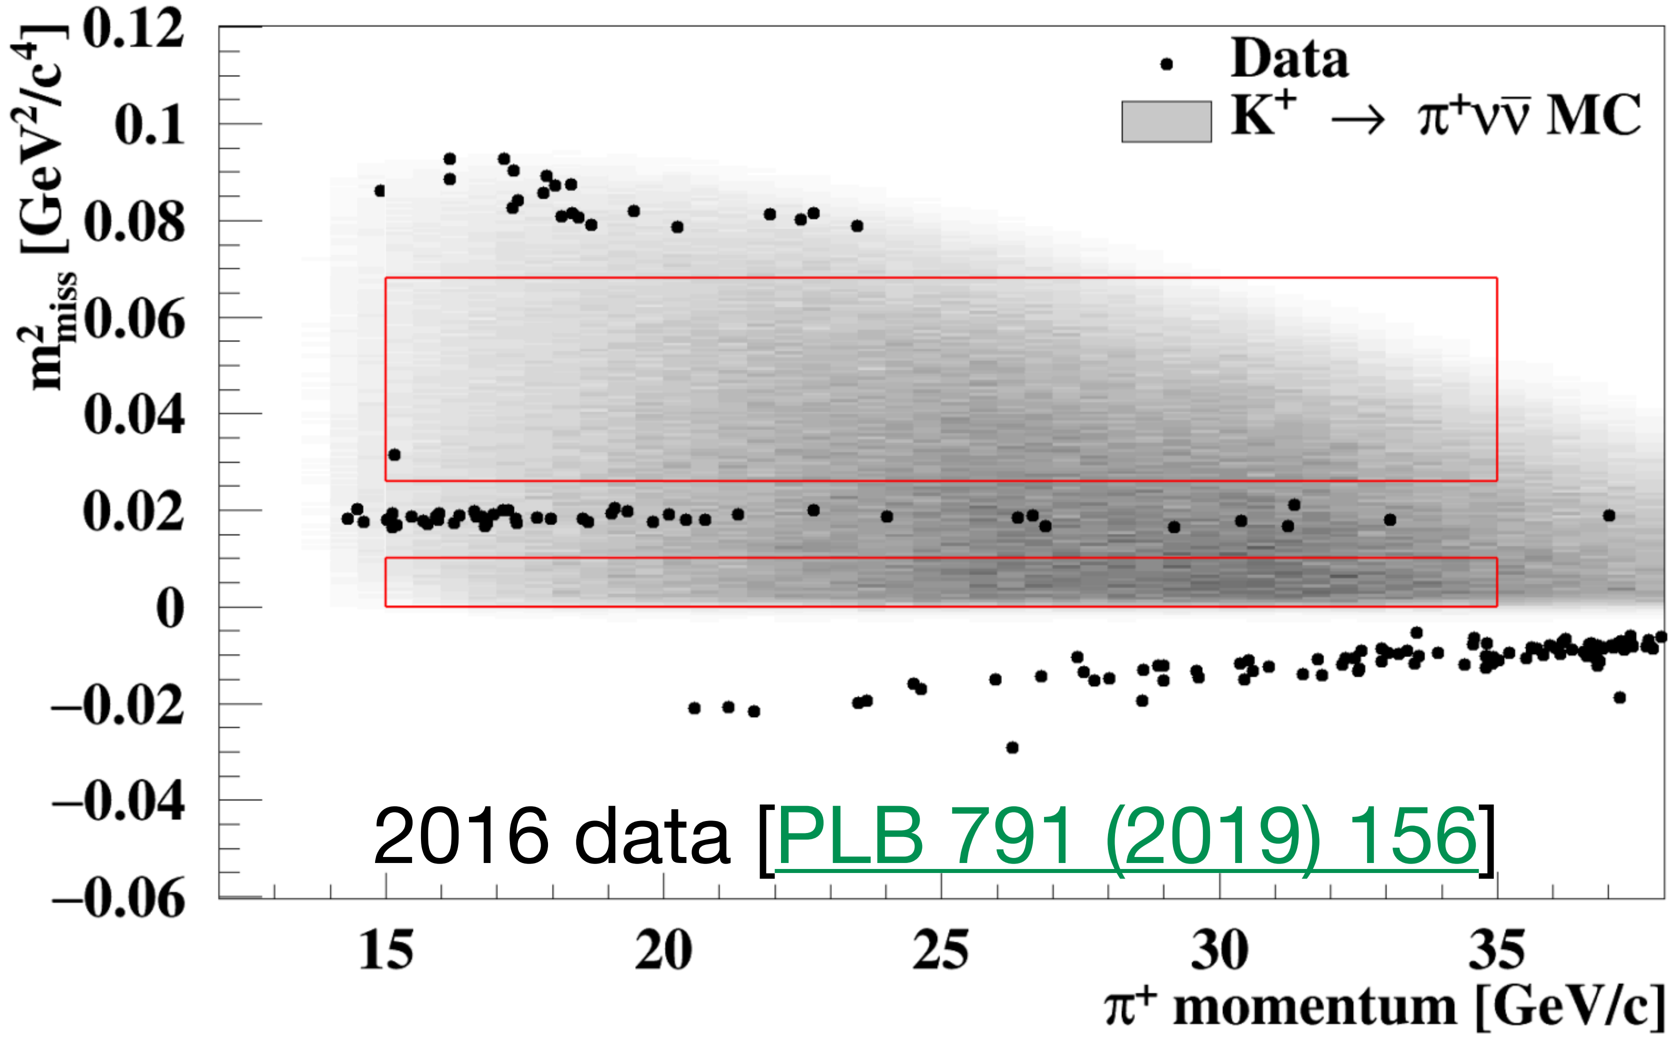
$\mathcal{O}(10^4)$ background suppression from kinematics

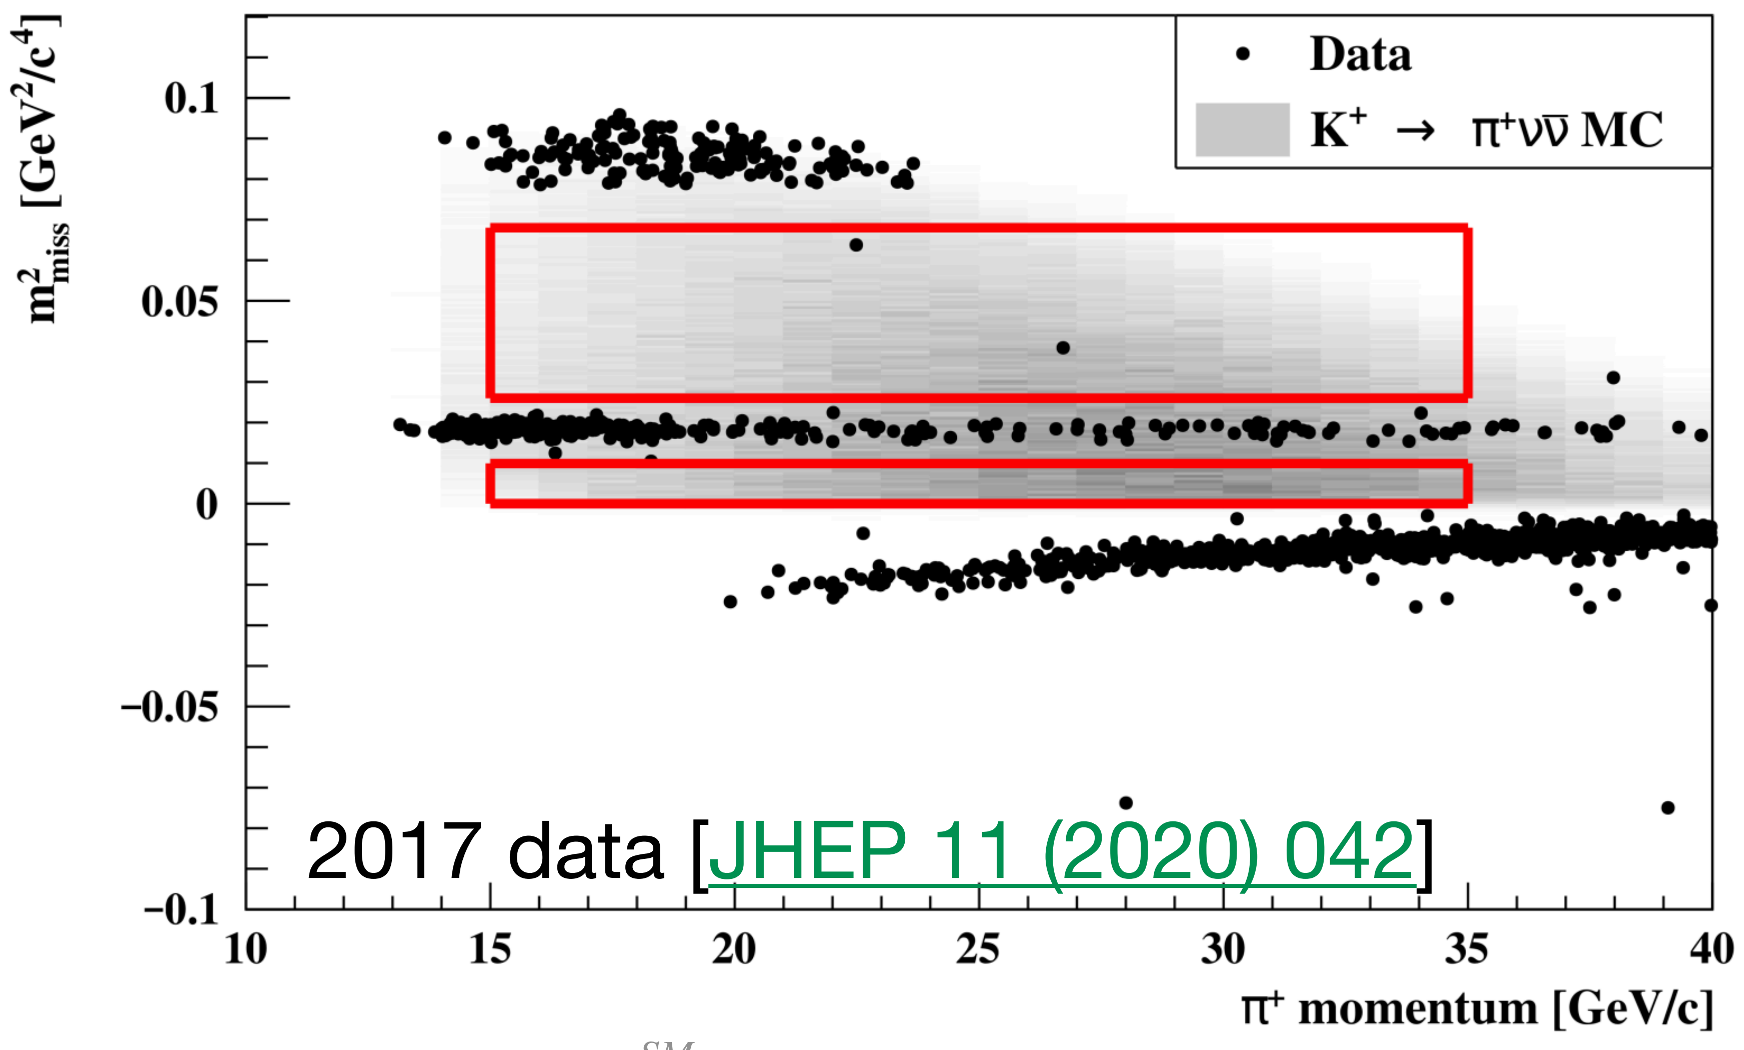
[JHEP 06 (2021) 093]



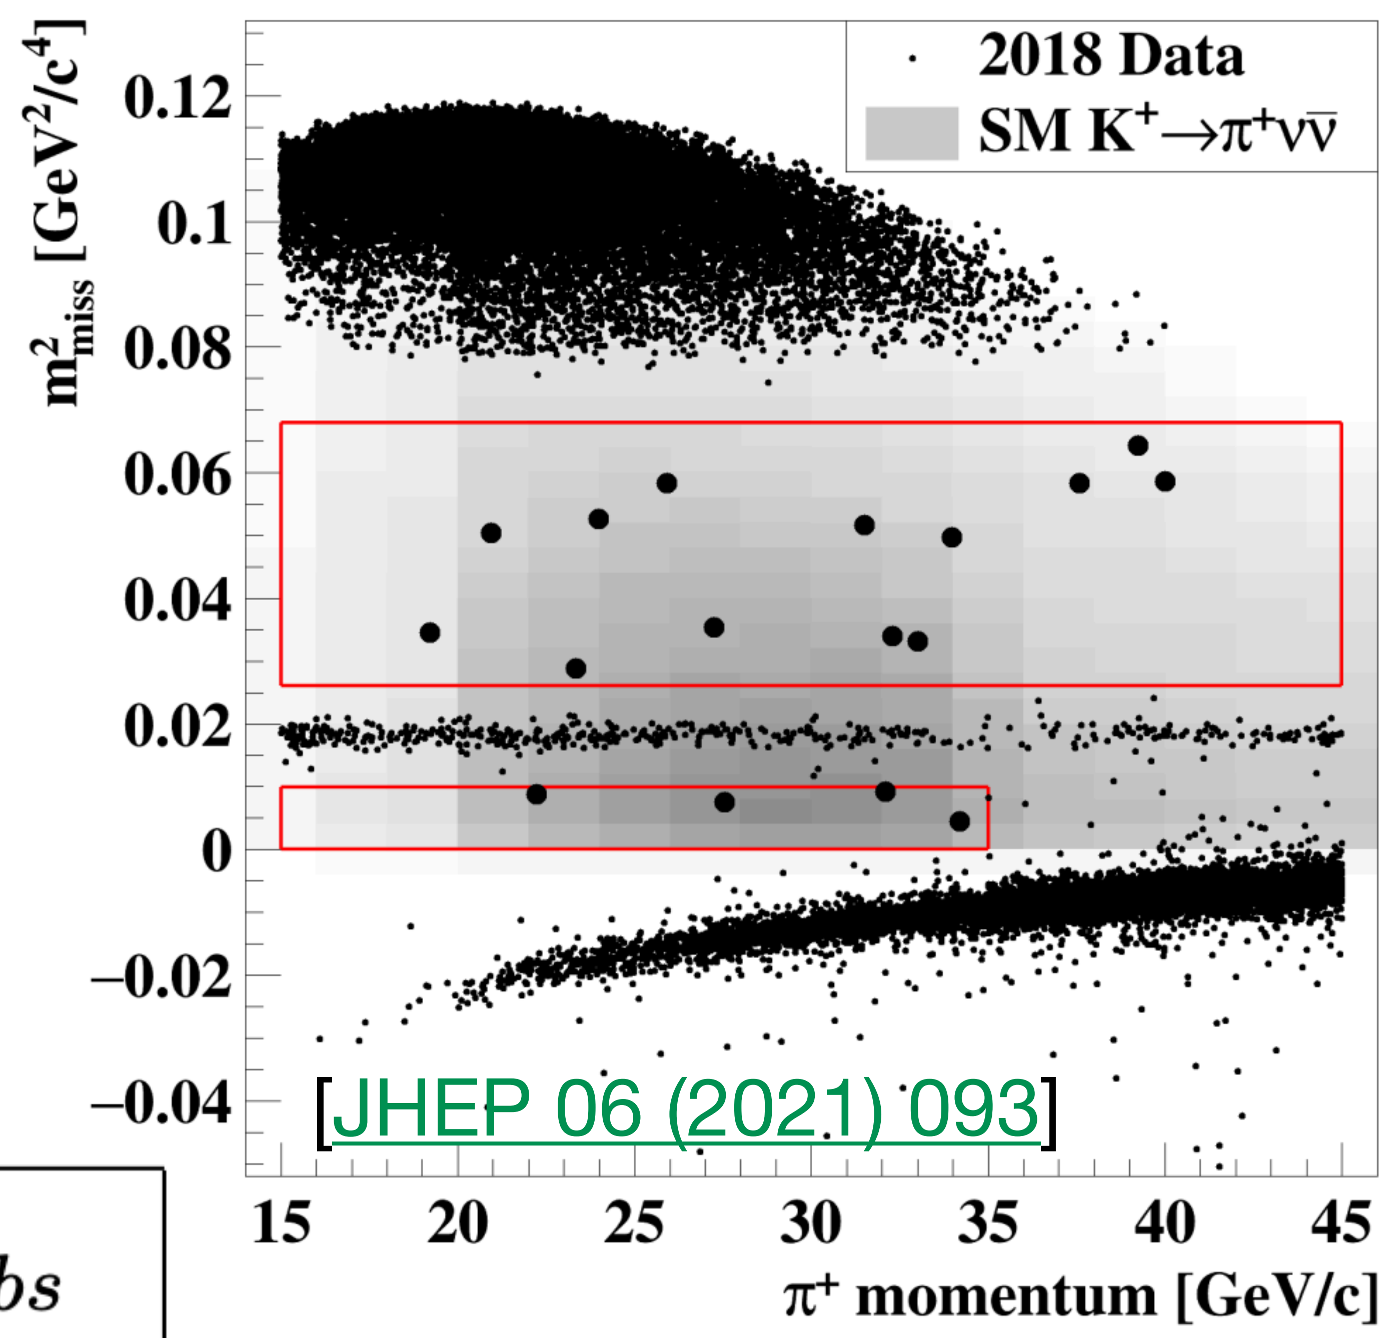
π^+ momentum range: 15—45 GeV/c

The story so far: $K^+ \to \pi^+ \nu\bar{\nu}$ with 2016–18 data





(*$N_{\pi\nu\bar{\nu}}^{SM,exp}$ assumes SM BR from [JHEP 11 (2015) 166])



Data-taking year	[Reference]	N_{bg}	$N_{\pi\nu\bar{\nu}}^{SM,exp}$	N_{obs}
2016	[PLB 791 (2019) 156]	$0.152^{+0.093}_{-0.035}$	0.267 ± 0.020	1
2017	[JHEP 11 (2020) 042]	1.46 ± 0.33	2.16 ± 0.13	2
2018	[JHEP 06 (2021) 093]	$5.42^{+0.99}_{-0.75}$	7.58 ± 0.40	17
2016–18	[JHEP 06 (2021) 093]	$7.03^{+1.05}_{-0.82}$	10.01 ± 0.42	20

Statistical combination: $\mathscr{B}(K^+ \to \pi^+\nu\bar{\nu}) = \left(10.6^{+4.0}_{-3.4}\Big|_{\text{stat}} \pm 0.9_{\text{syst}}\right) \times 10^{-11}$ at 68 % CL

In background-only hypothesis: $p = 3.4 \times 10^{-4} \Rightarrow$ significance=3.4σ.

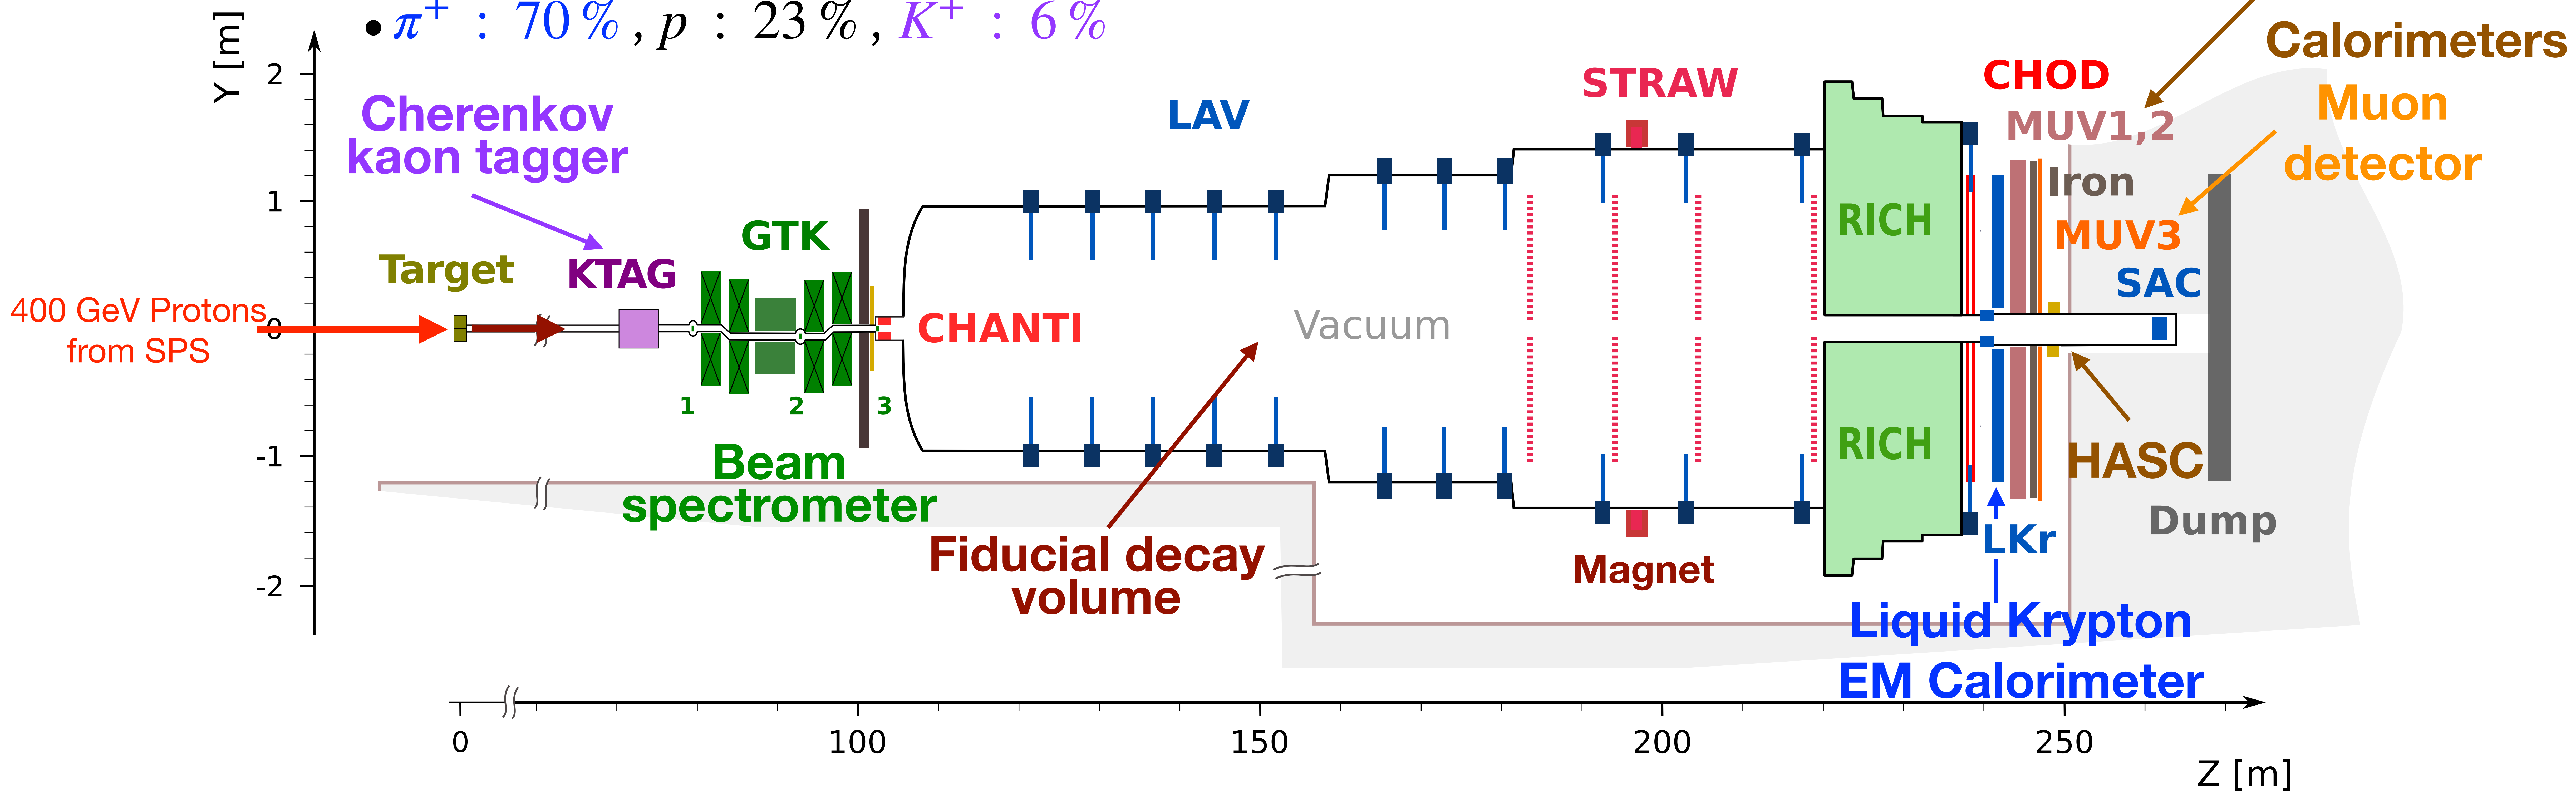
NA62 Detector, Upgrades & Performance

NA62 beamline & detector

[JINST 12 (2017) 05, P05025]

Secondary 75 GeV/c beam:

- π^+ : 70 %, p : 23 %, K^+ : 6 %

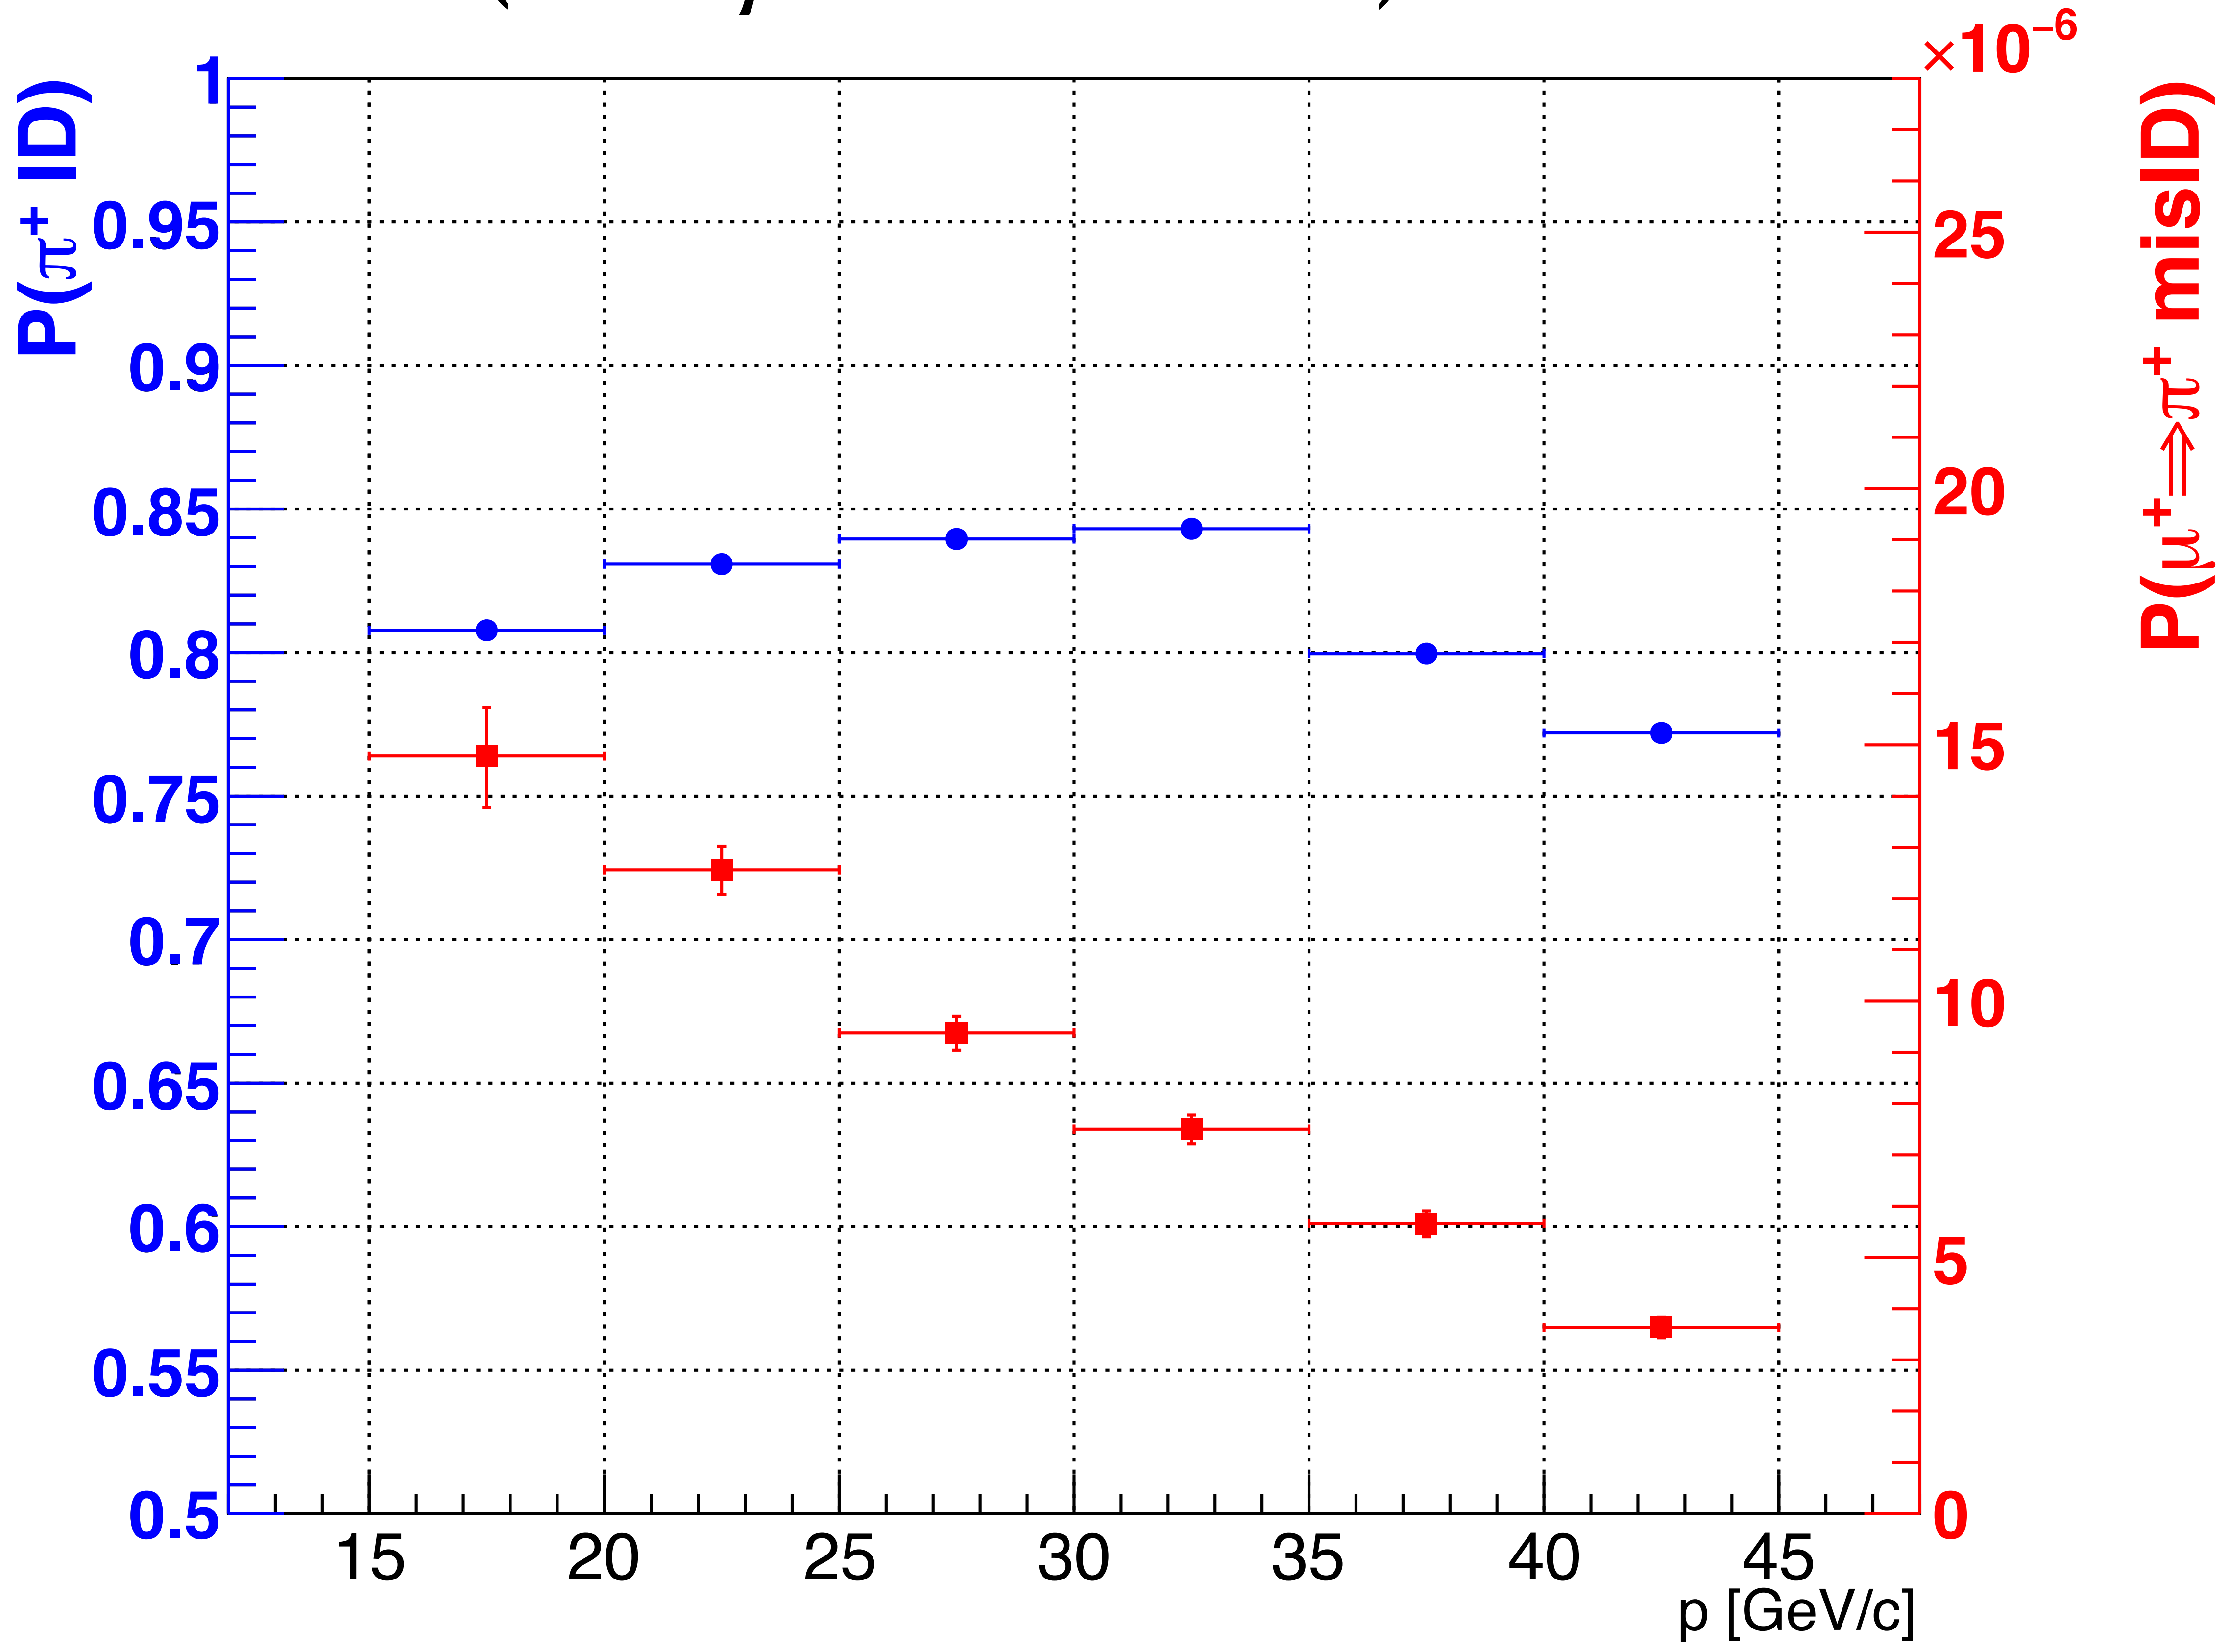


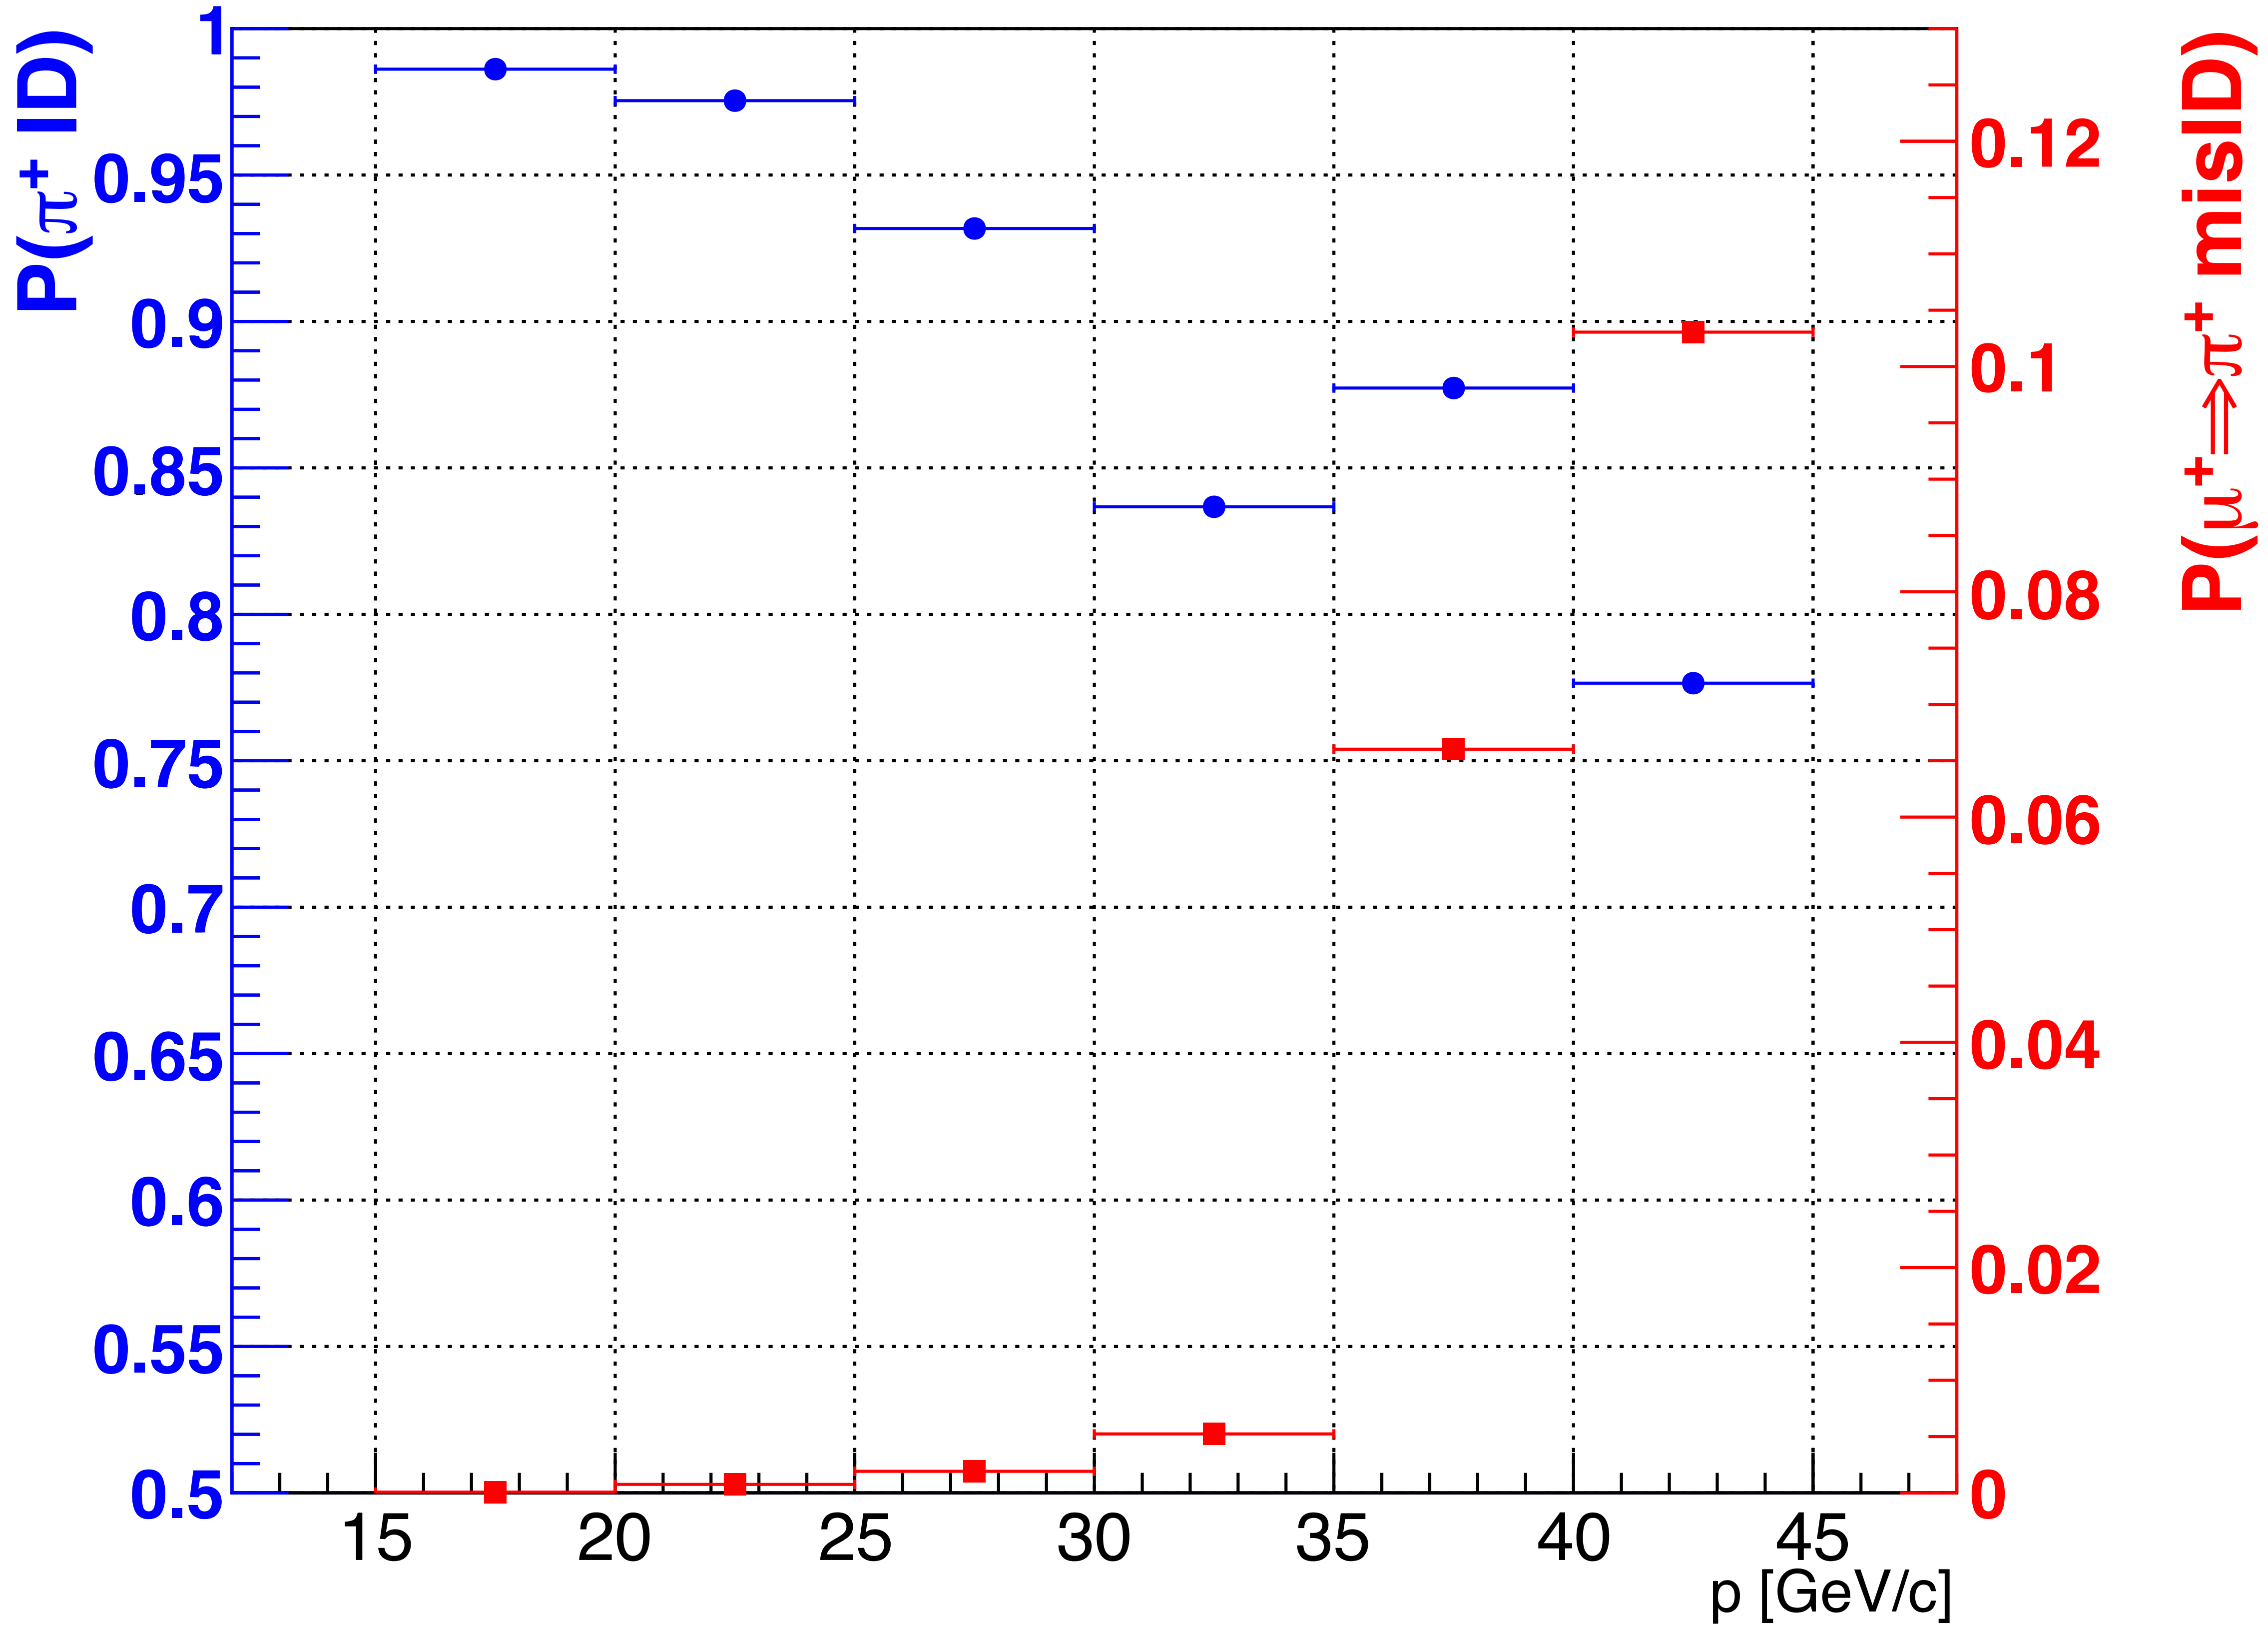
- Designed & optimised for study of $K^+ \to \pi^+ \nu \bar{\nu}$:
  - **Particle tracking:** beam particle (GTK) & downstream tracks (STRAW)
  - **PID:** K^+ - KTAG, π^+ - RICH, Calorimeters (LKr, MUV1,2), MUV3 (μ detector)
  - **Comprehensive veto systems:** CHANTI (beam interactions), LAV,LKr,IRC,SAC (γ)

Particle ID performance : 2021—22 data

- Use BDT classifier for LKr & MUV1,2
- + **MUV3** (fast μ^+ detector)

Designed to distinguish between π^+/μ^+ with $15 - 35$ GeV/c.

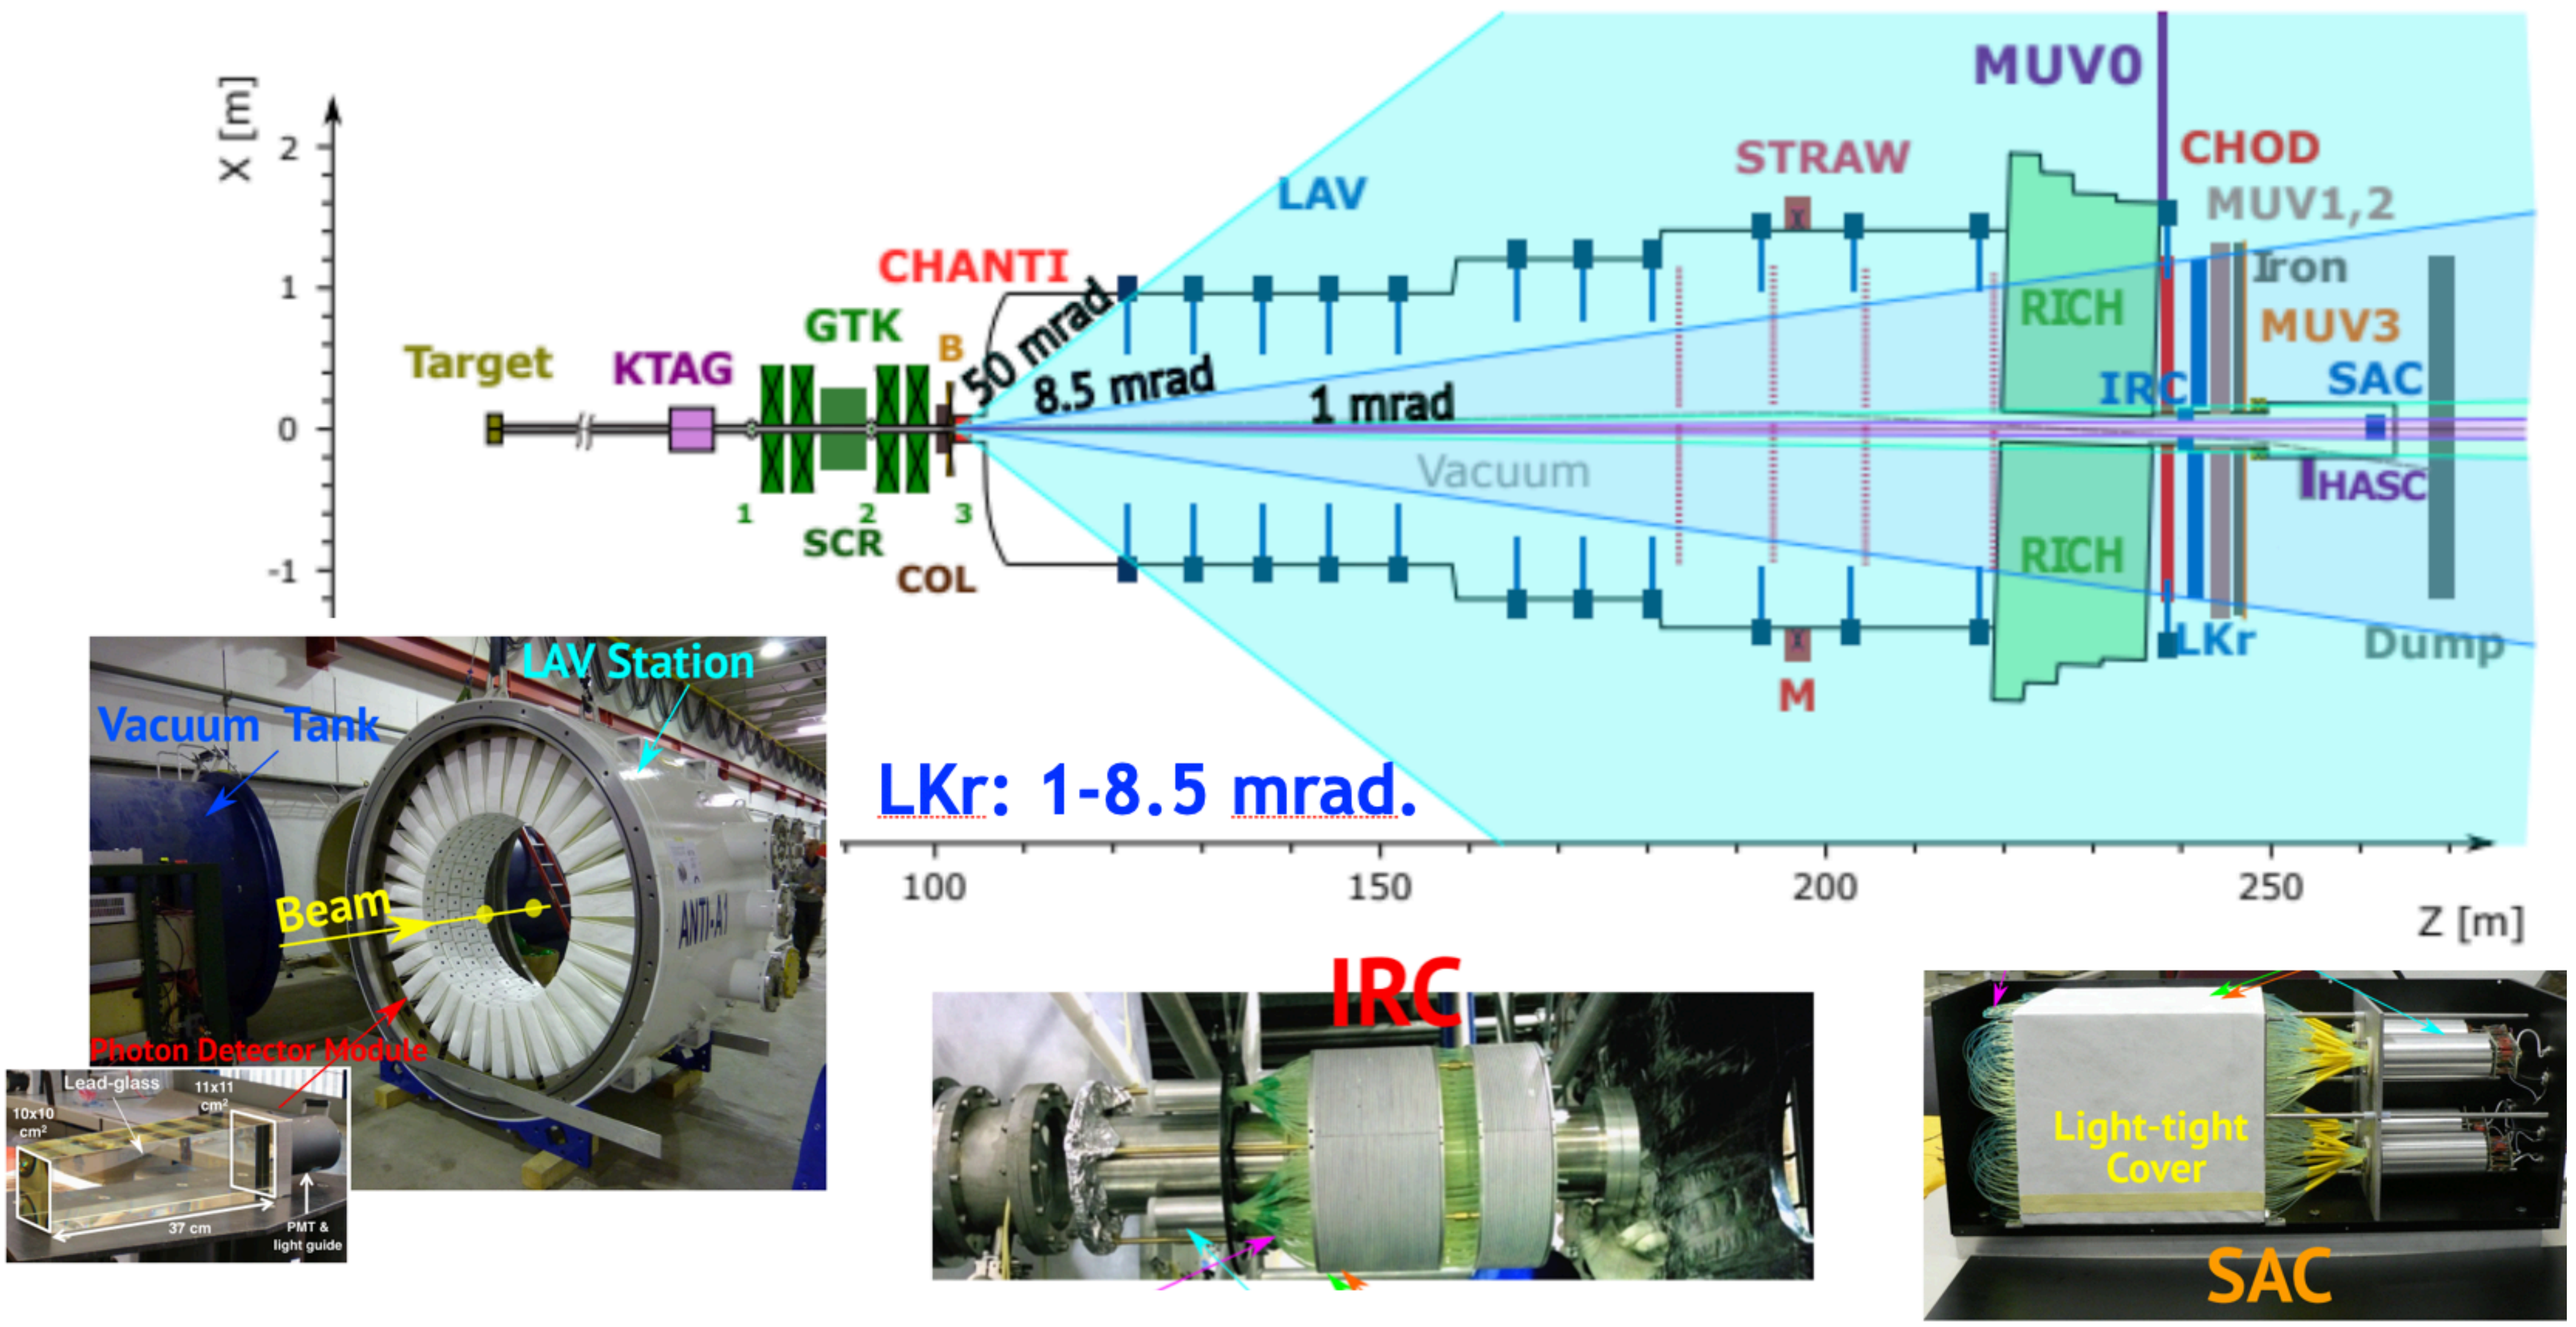




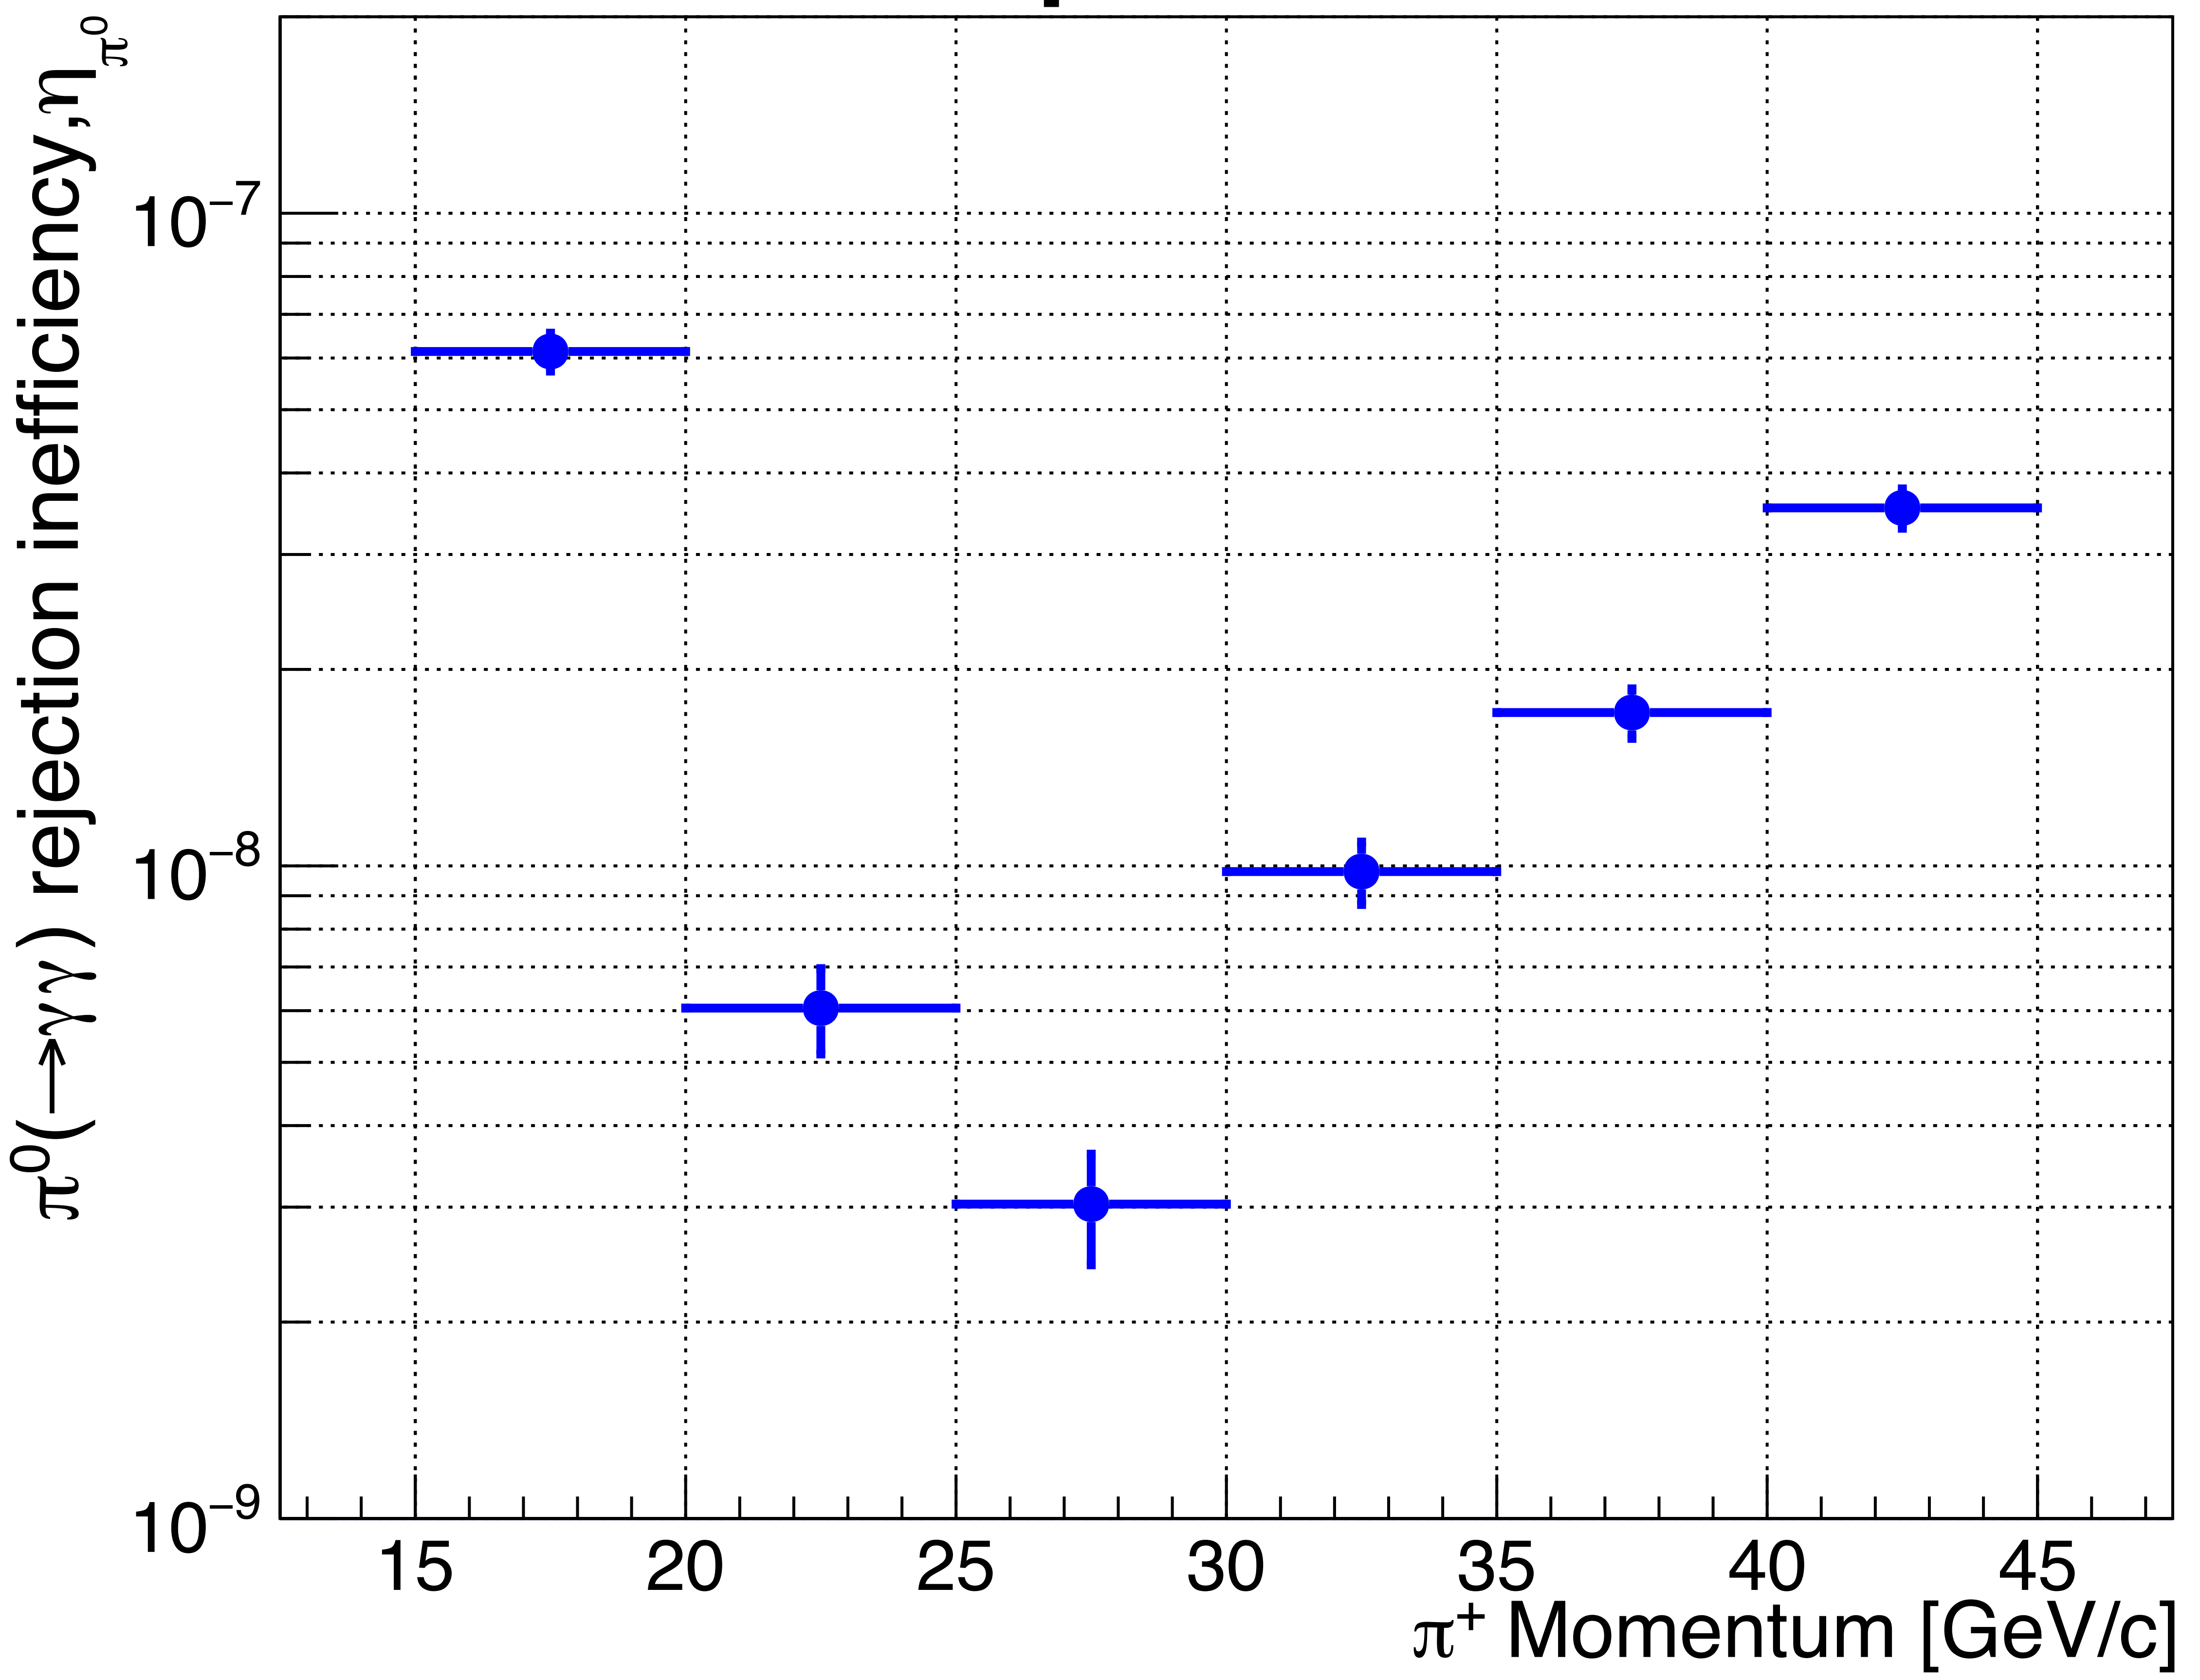
$\varepsilon(\pi\,\text{ID}) = (73.00 \pm 0.01)\,\%$

$P(\mu^+\,\text{misID as}\,\pi^+) = (1.3 \pm 0.2) \times 10^{-8}$

Comprehensive photon veto system: 2021—22



Control sample of $K^+ \to \pi^+\pi^0$



- Probability of $K^+ \to \pi^+\pi^0$, $\pi^0 \to \gamma\gamma$ events passing all photon veto conditions:

$$\eta_{\pi^0} = (1.72 \pm 0.07) \times 10^{-8}$$

- **Meets target: combined γ/π^0 rejection of $\mathcal{O}(10^8)$.**

Upgrading NA62

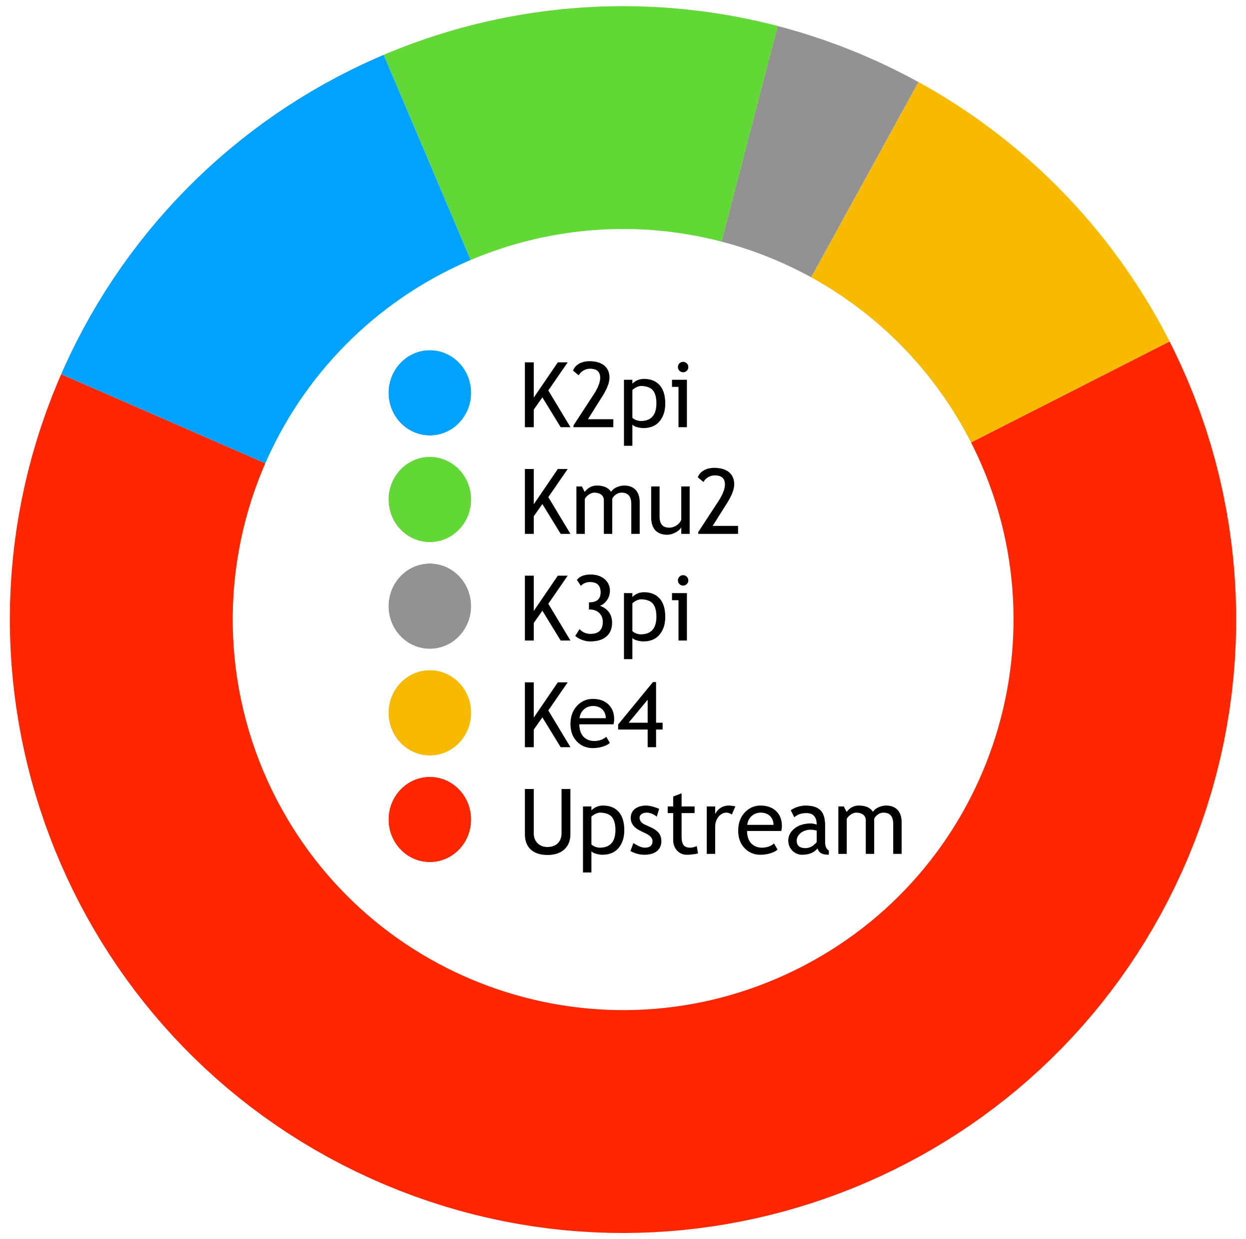
- 2016—18 analysis proved NA62 technique.
- Limitation: tight cuts to reject backgrounds ⇒ reduces signal efficiency.
- To improve: need new tools to control background.

Upgrading NA62

- 2016—18 analysis proved NA62 technique.
- Limitation: tight cuts to reject backgrounds ⇒ reduces signal efficiency.
- To improve: need new tools to control background.

Background	N(exp) 2018 (S2)
Upstream	$2.76^{+0.90}_{-0.70}$
$K^+ \to \pi^+\pi^0$	0.52 ± 0.05
$K^+ \to \mu^+\nu$	0.45 ± 0.06
$K^+ \to \pi^+\pi^-e^+\nu$	0.41 ± 0.10
$K^+ \to \pi^+\pi^+\pi^-$	0.17 ± 0.08
Total	$4.31^{+0.91}_{-0.72}$

K^+ decays in decay tank



Upstream background

Largest backgrounds:

1. Upstream
2. $K^+ \to \pi^+\pi^0$

Veto by detecting previously missed particles…

Mid 2018 - installed TCX Collimator

Much improved shielding - blocking almost all upstream decay paths.

2021 - addition of VetoCounter
Upstream decays can be detected and actively vetoed.

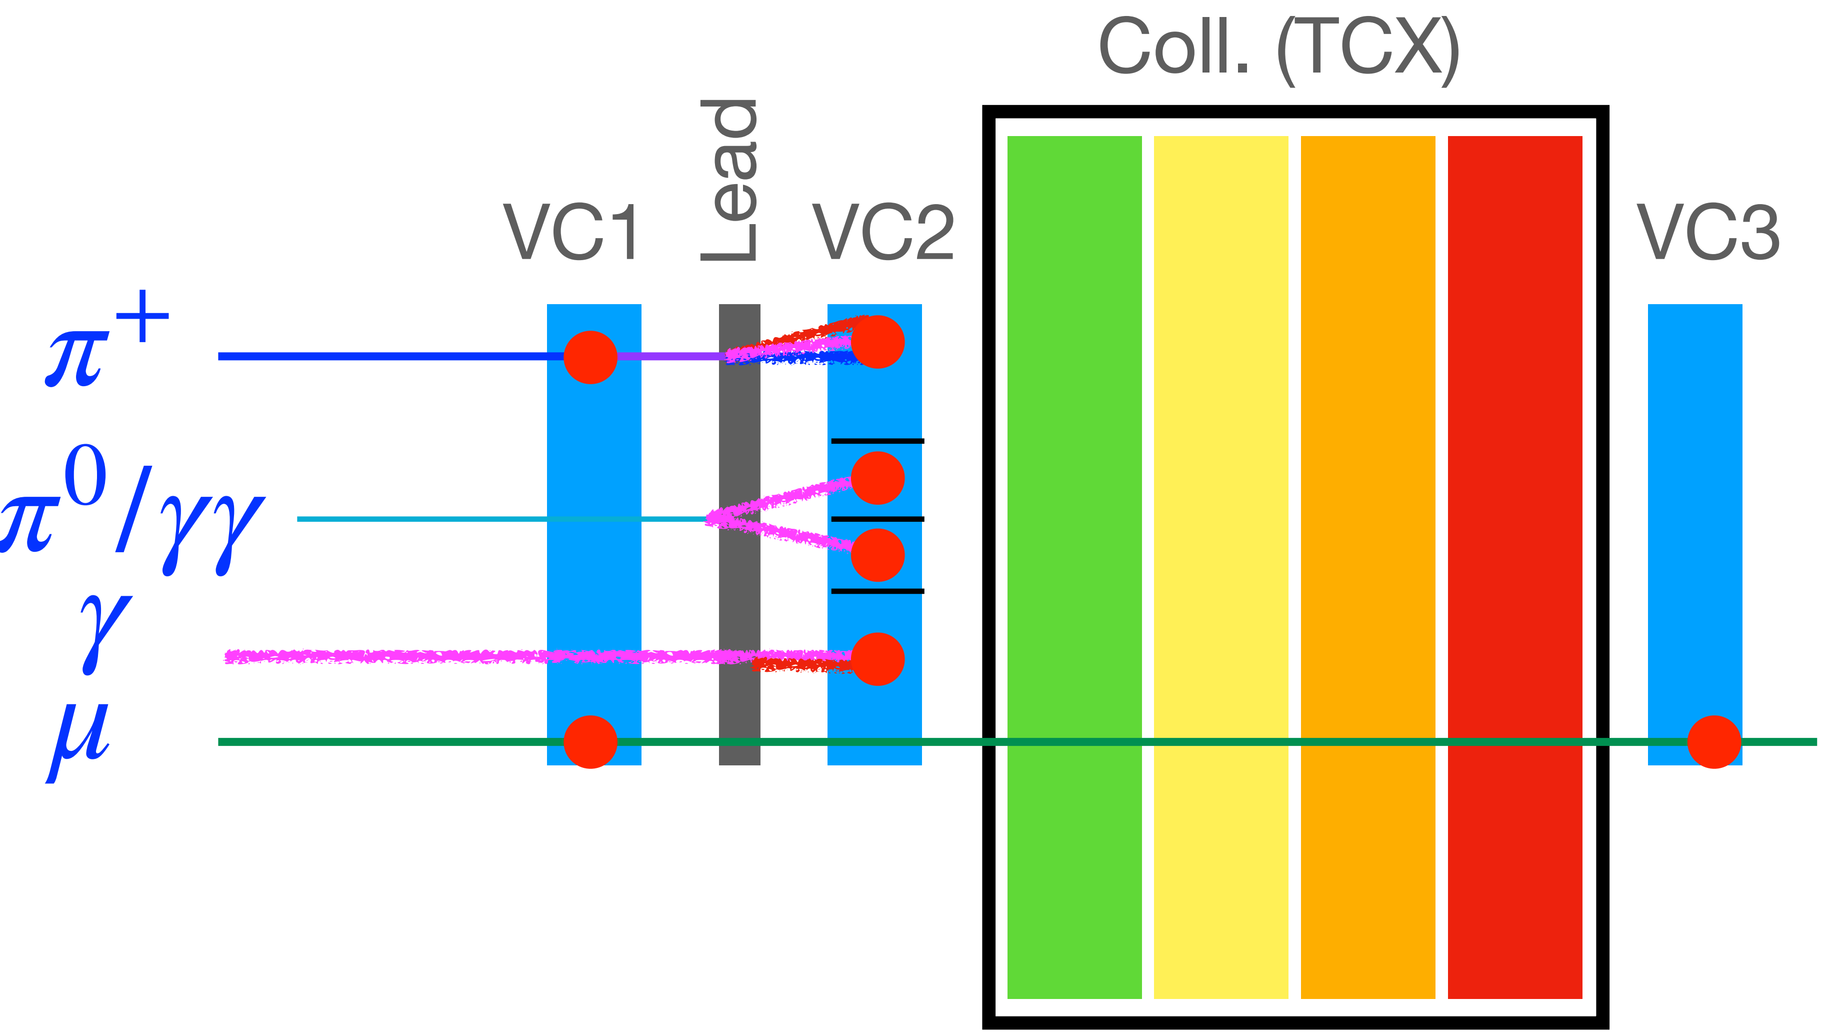
Signal in-time with true K^+ which decays upstream.
Signal in-time with pileup beam particle (π^+) which does not leave beam pipe

New upstream vetos: VetoCounter & ANTI0

[FELIX readout: Streaming Readout Workshop talk 2021]



VetoCounter

- Detect particles from decays upstream of final collimator.
- **Factor ~3 rejection** with ~2% accidental veto.

ANTI0

- Detect particles up to ~1 m from beam line.
- **Reject ~20% of upstream background** with <1% signal loss.

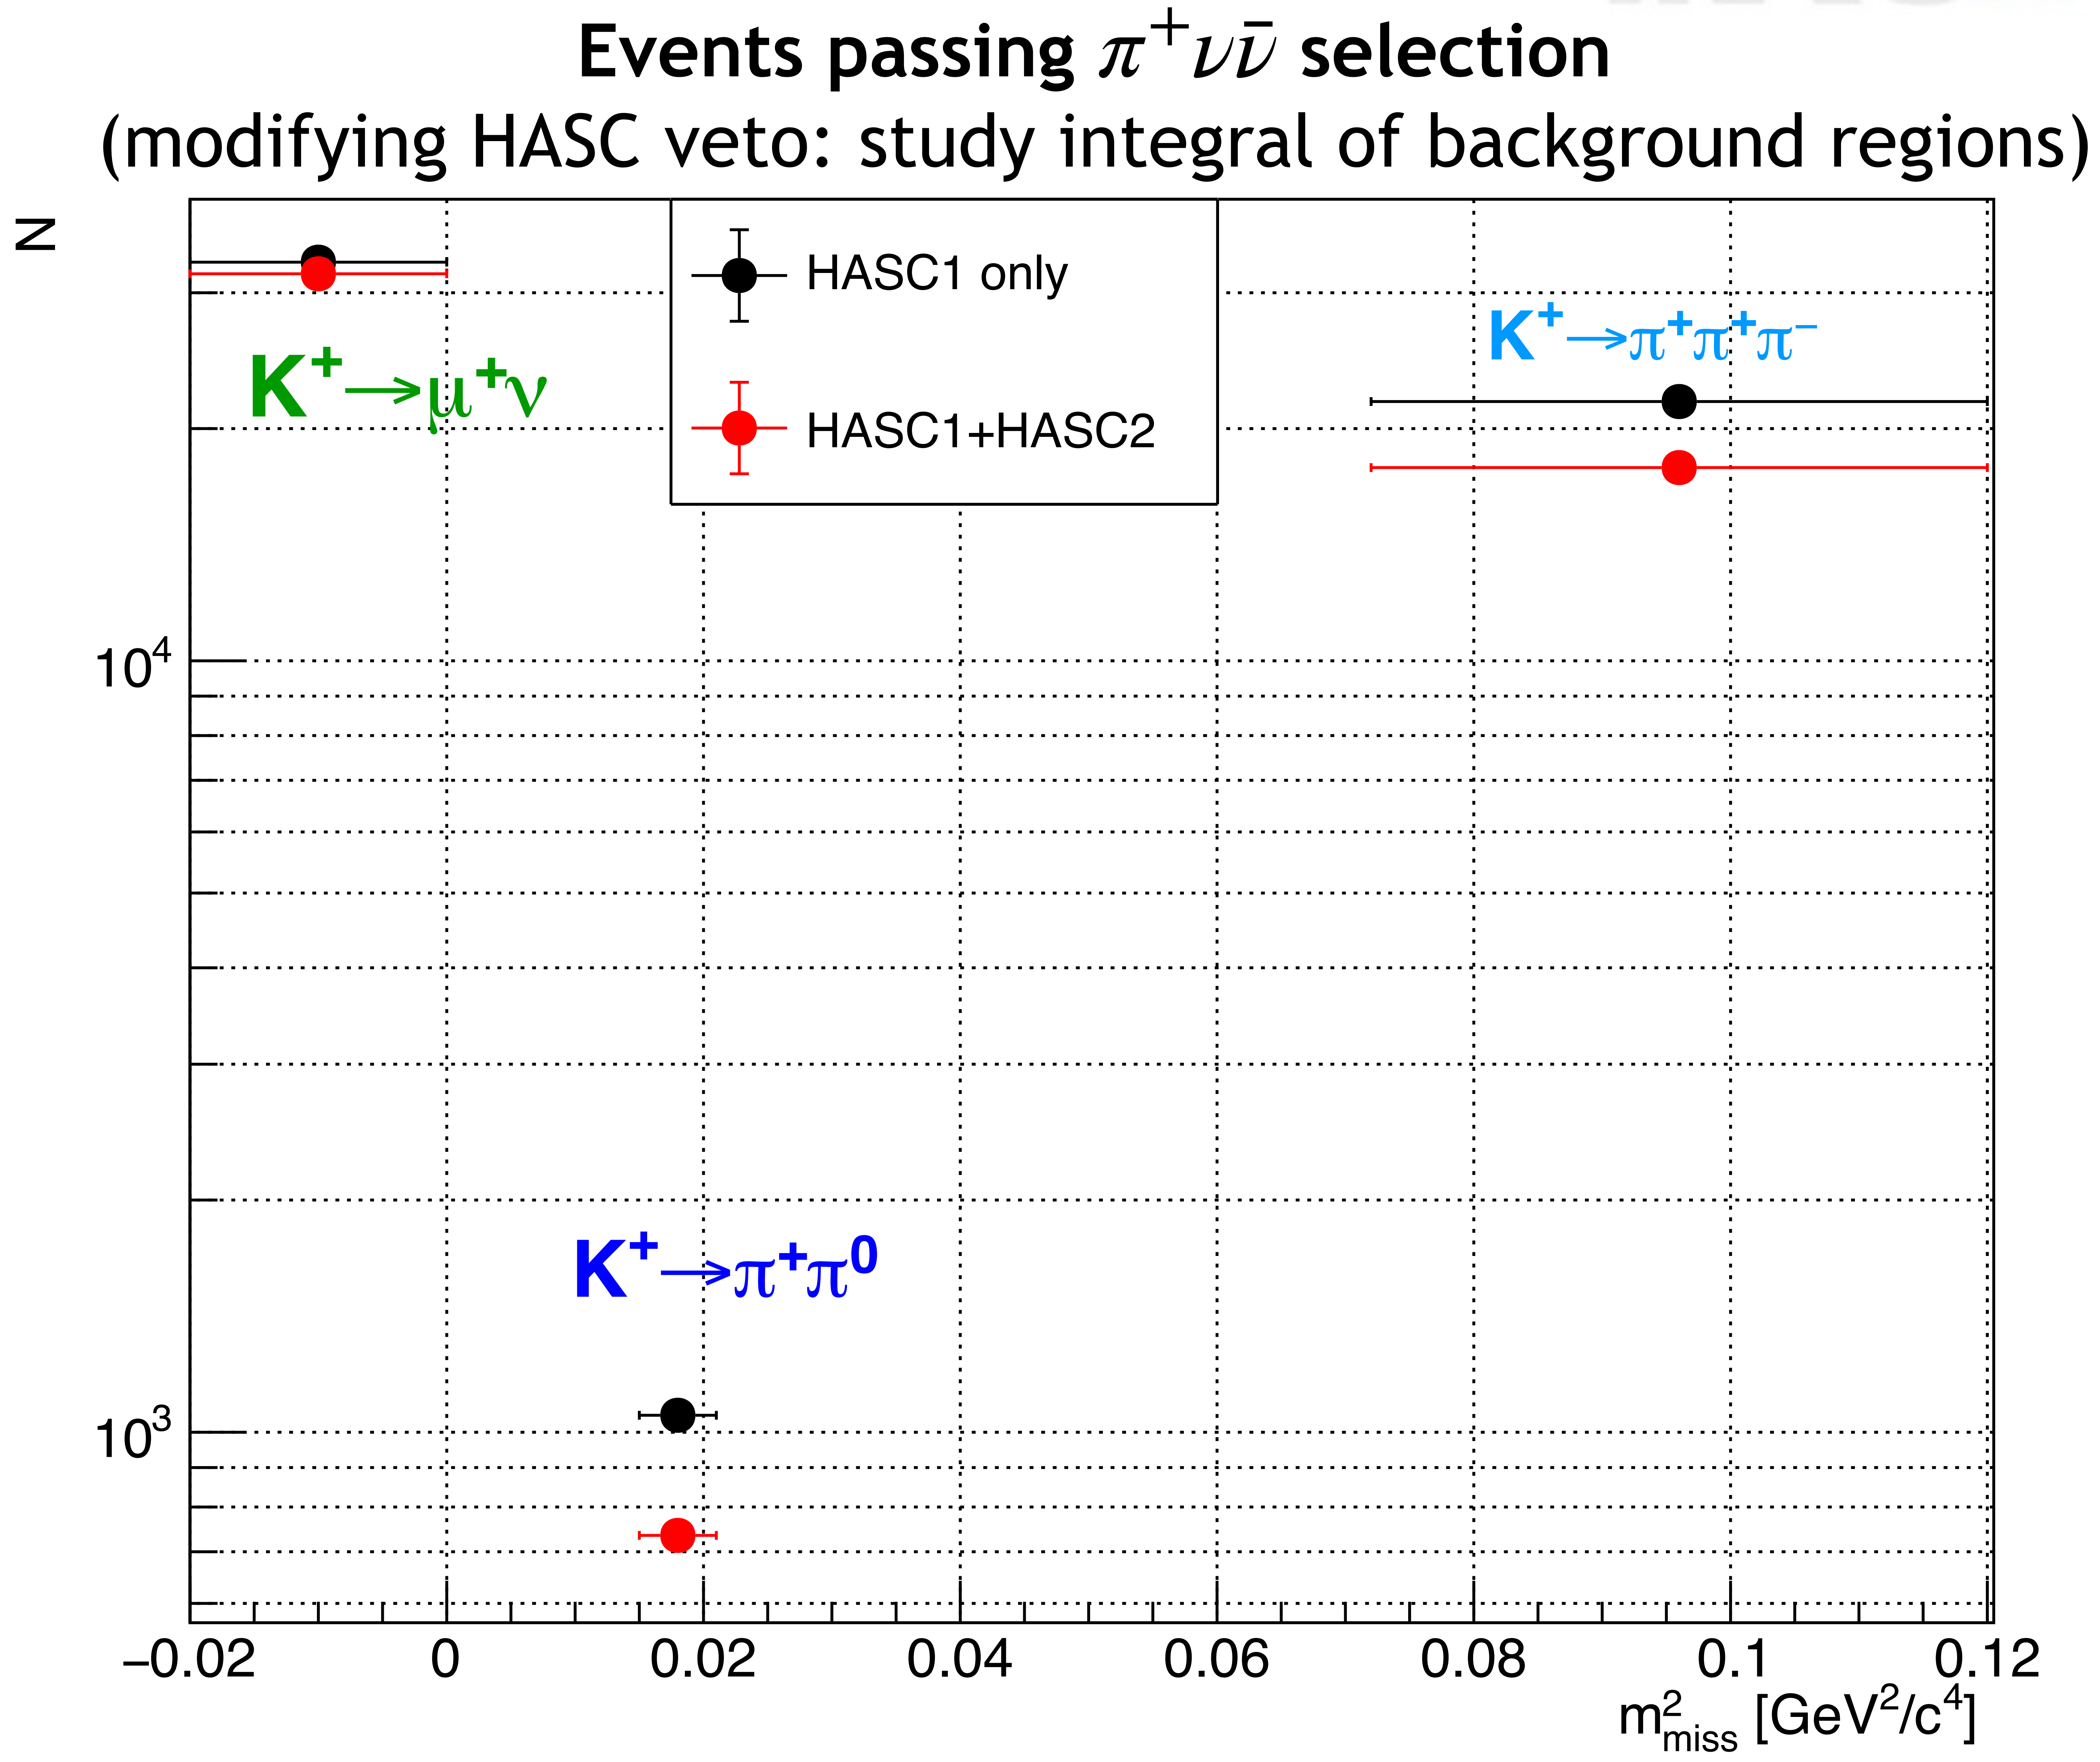
HASC2 veto

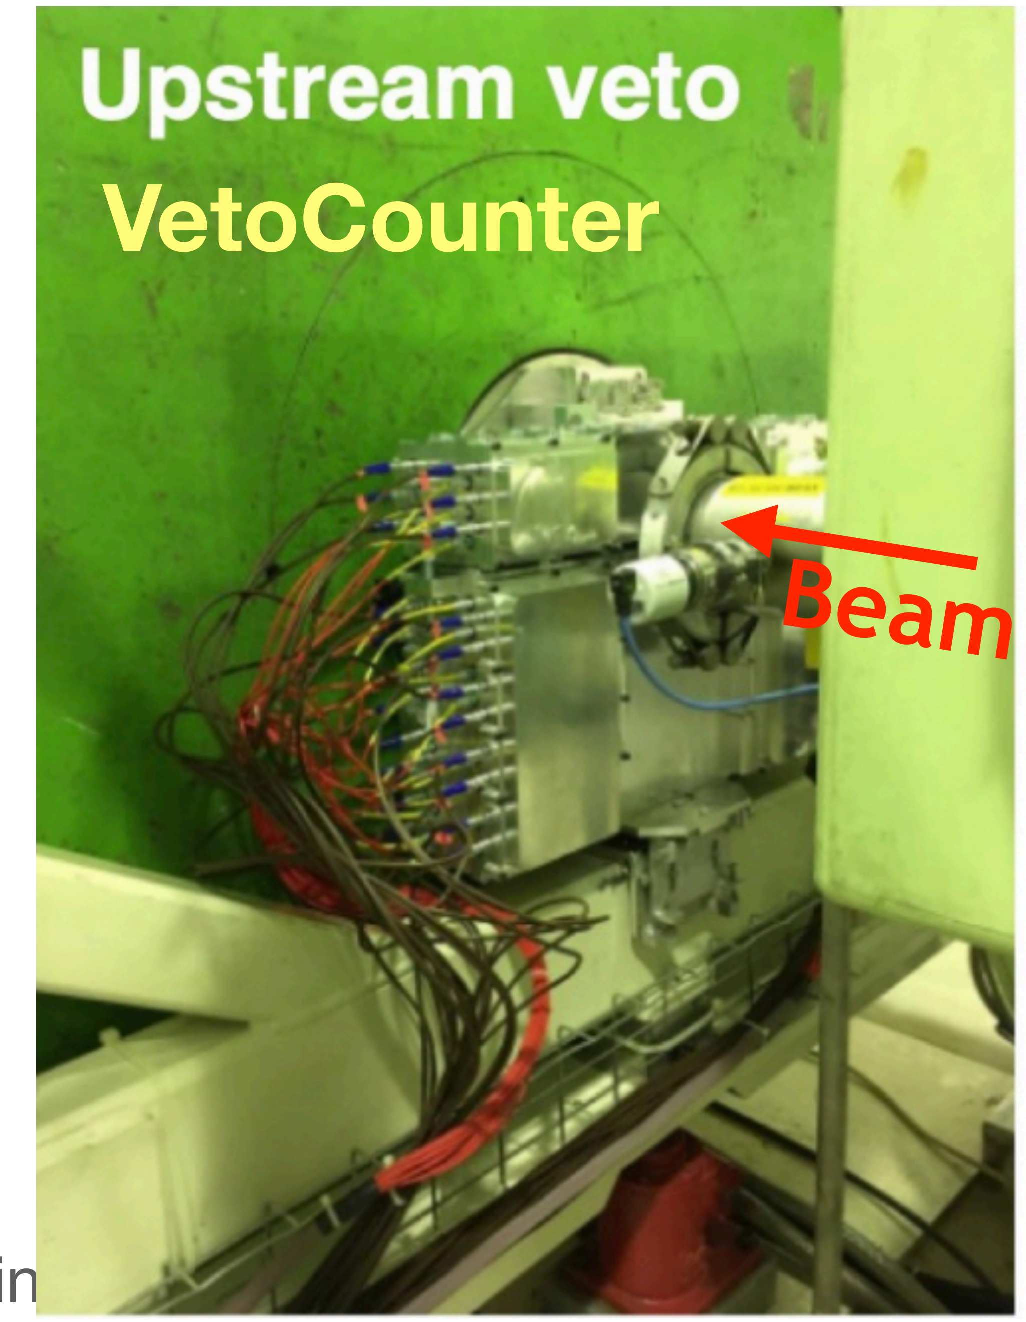
- $K^+ \to \pi^+\pi^0$ **was 2nd largest background for 2018 analysis.**
- Addition of HASC2:
  - **30% less** $K^+ \to \pi^+\pi^0$
  - 18% less $K^+ \to \pi^+\pi^+\pi^-$
  - 3.5% less $K^+ \to \mu^+\nu$
- with only 1.5% signal loss.

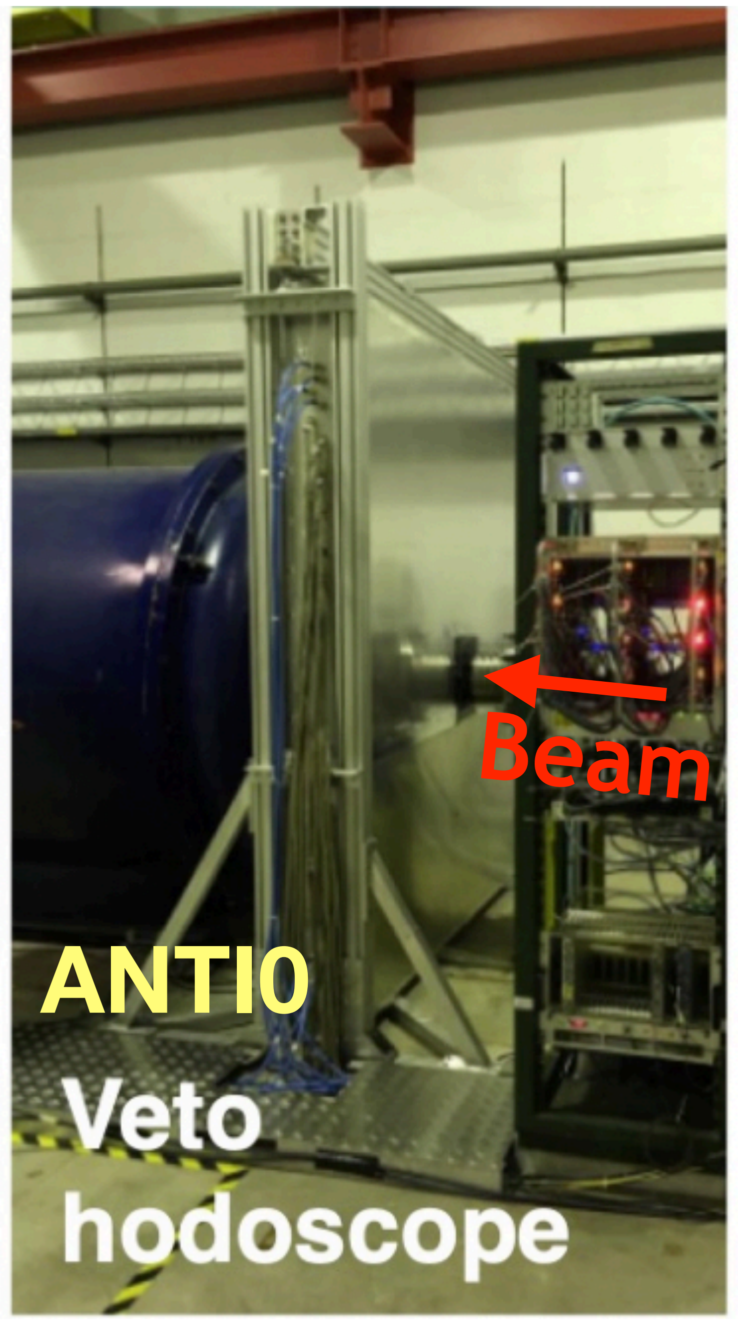


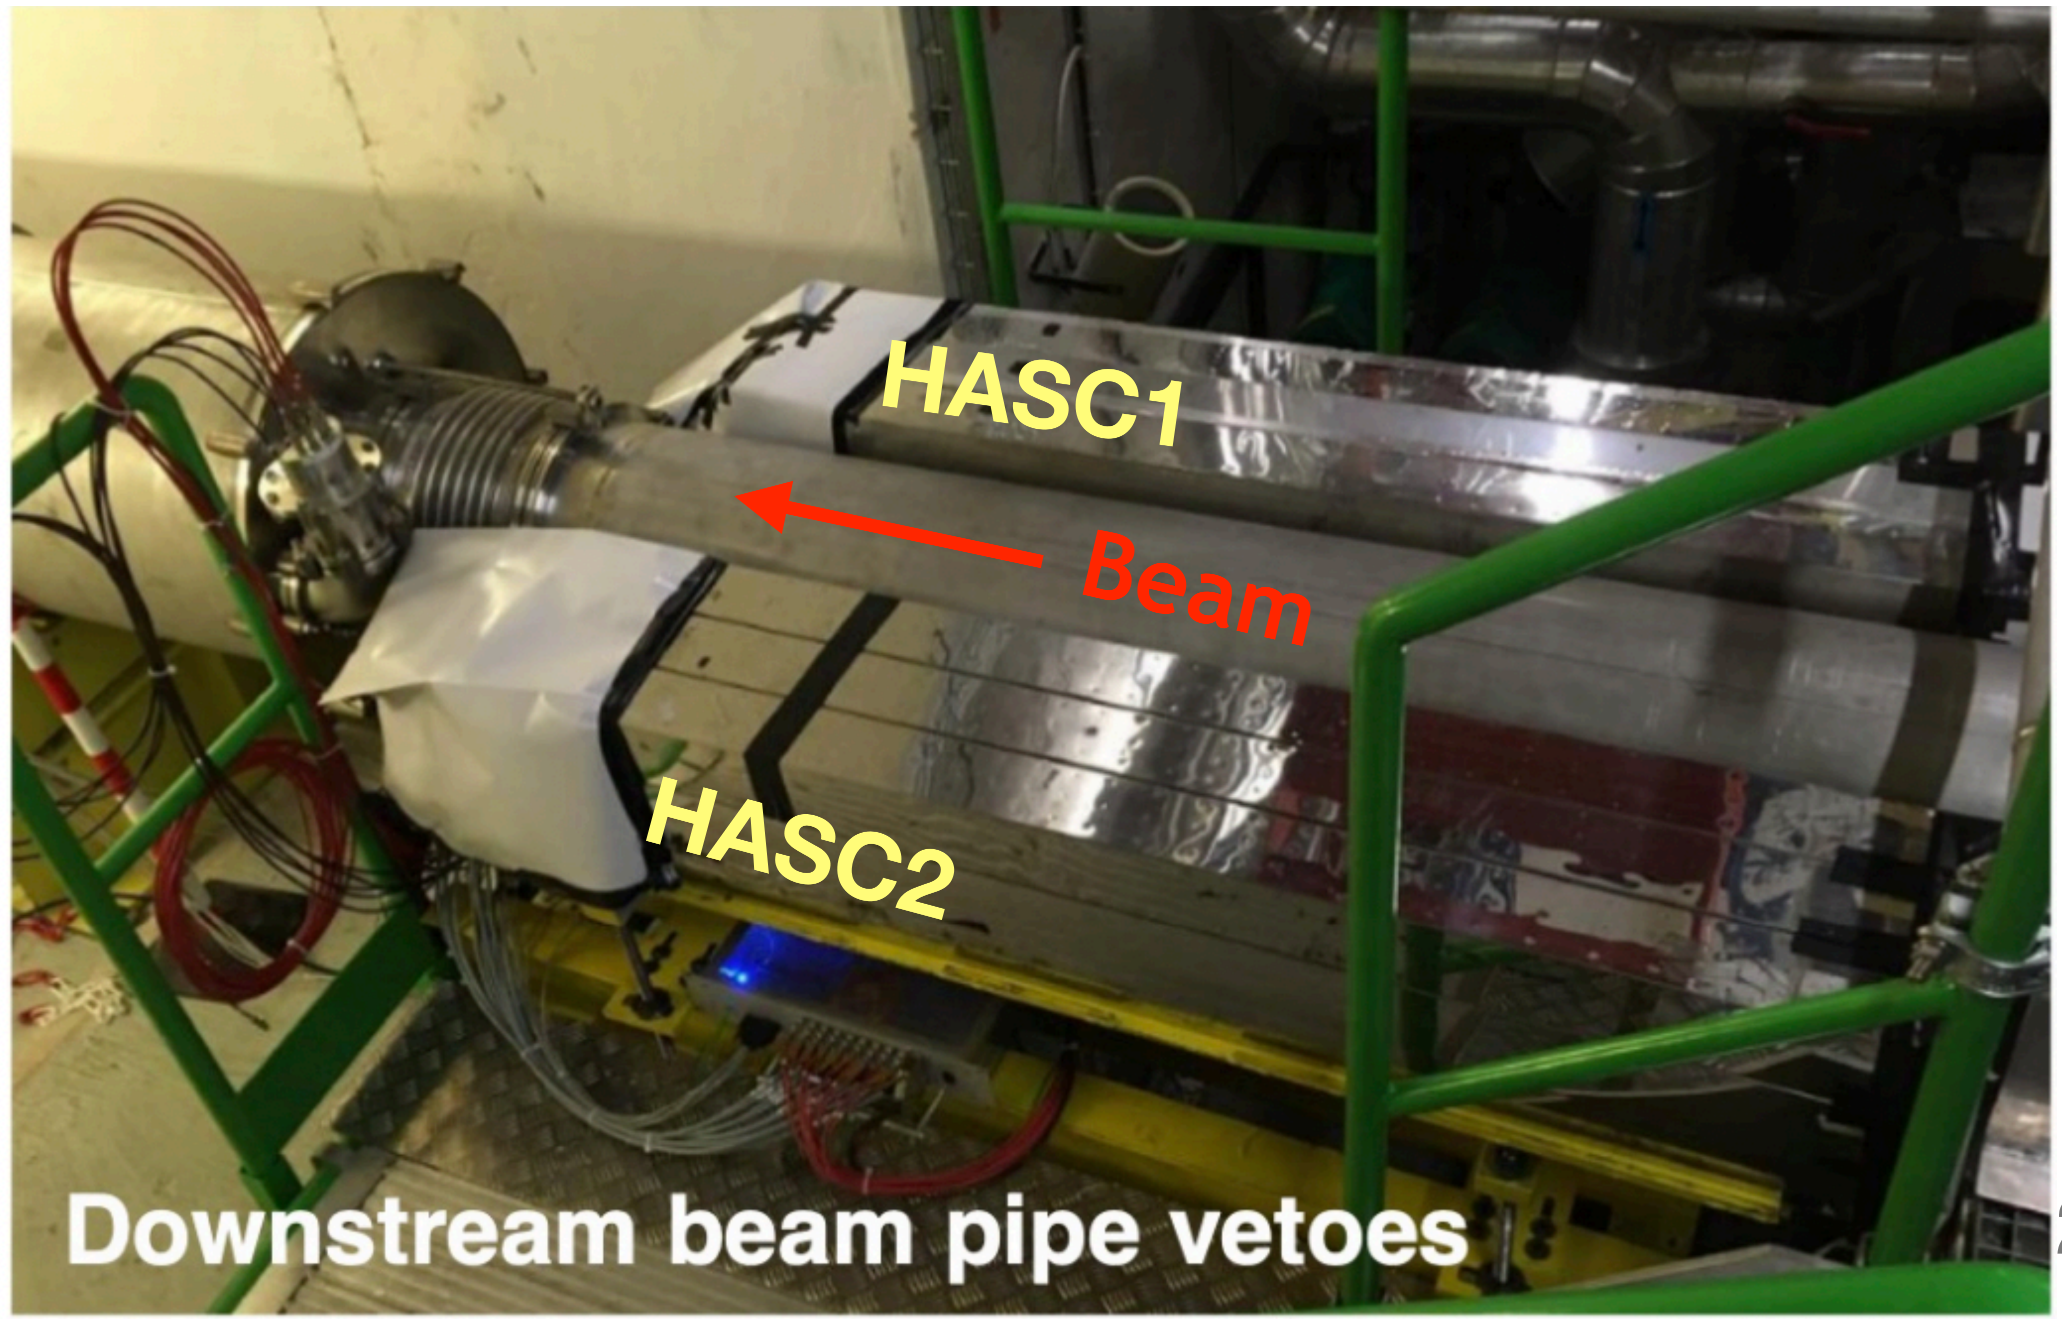
Summary of NA62 upgrades

- New detectors, installed during LS2:
  - 4th GTK (Kaon beam tracker) & rearrange GTK achromat (GTK2 upstream of scraper).
  - New upstream veto (VetoCounter) & veto hodoscope (ANTI0) upstream of decay volume.
  - Additional veto detector (HASC2) at end of beam-line.
- **Intensity increased by** $\sim 35\,\%$ with respect to 2018 [$450 \rightarrow 600$ MHz].
- **Improvements to the trigger configuration.**

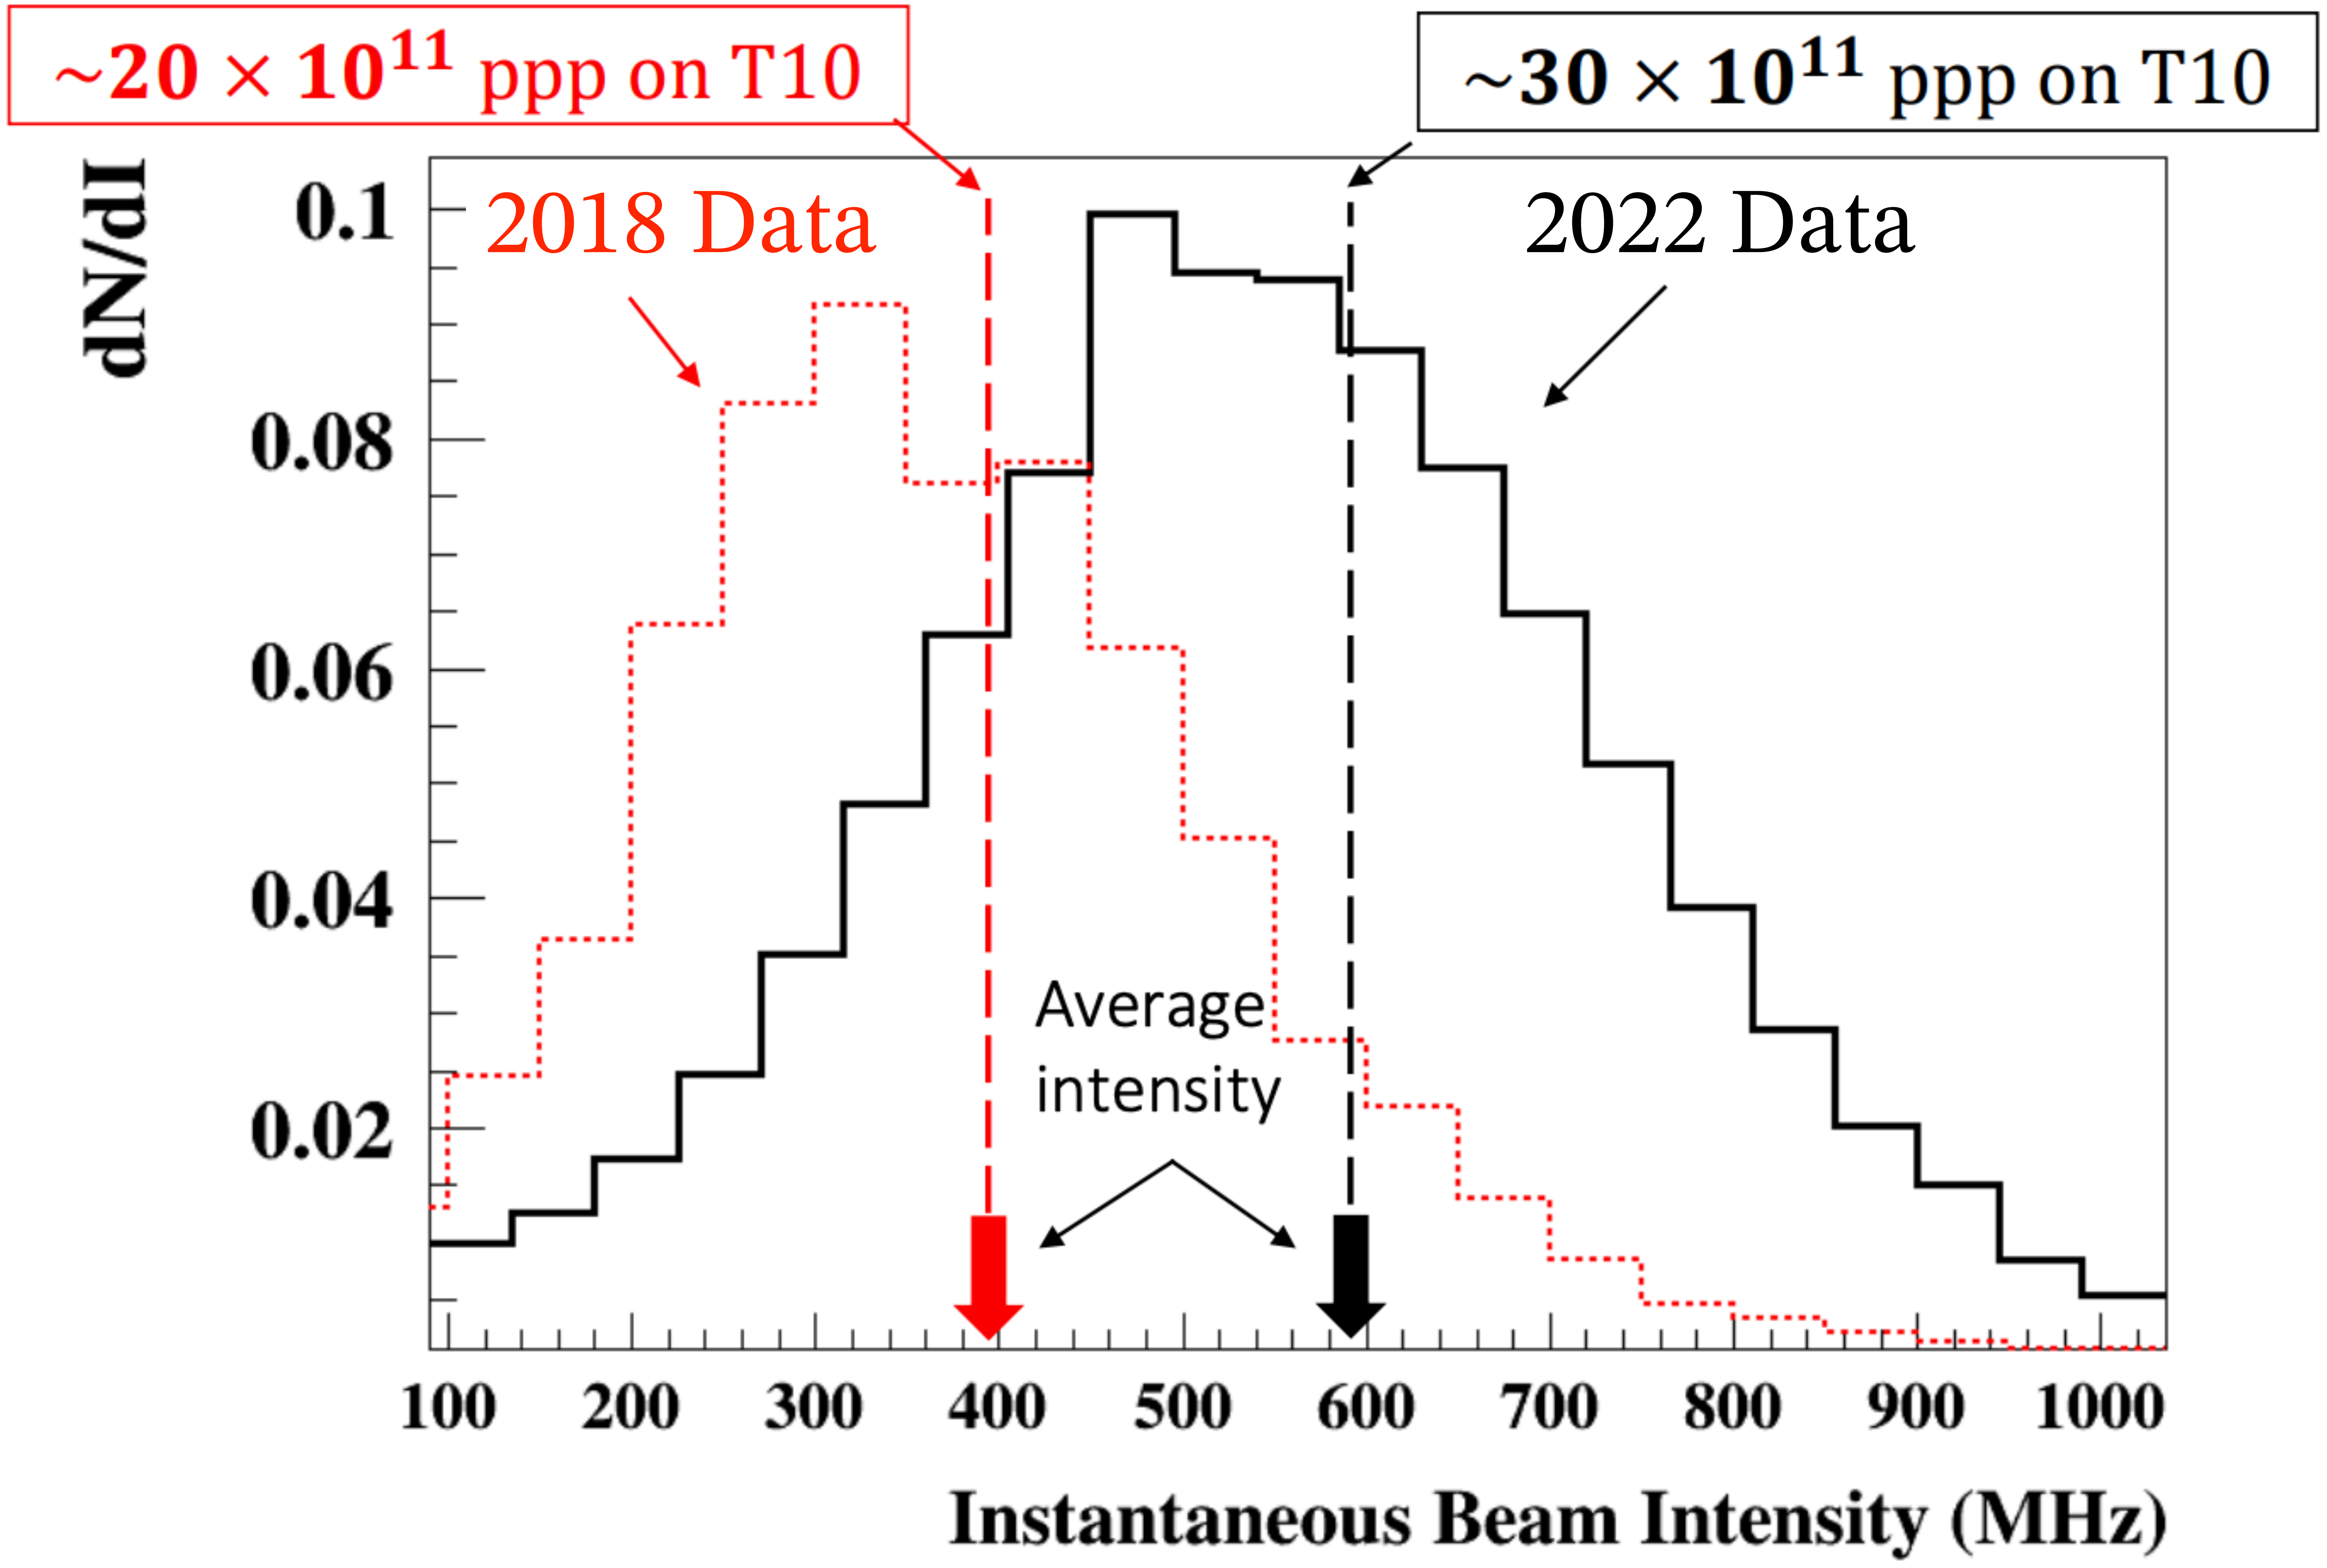
New detectors installed in 2021:







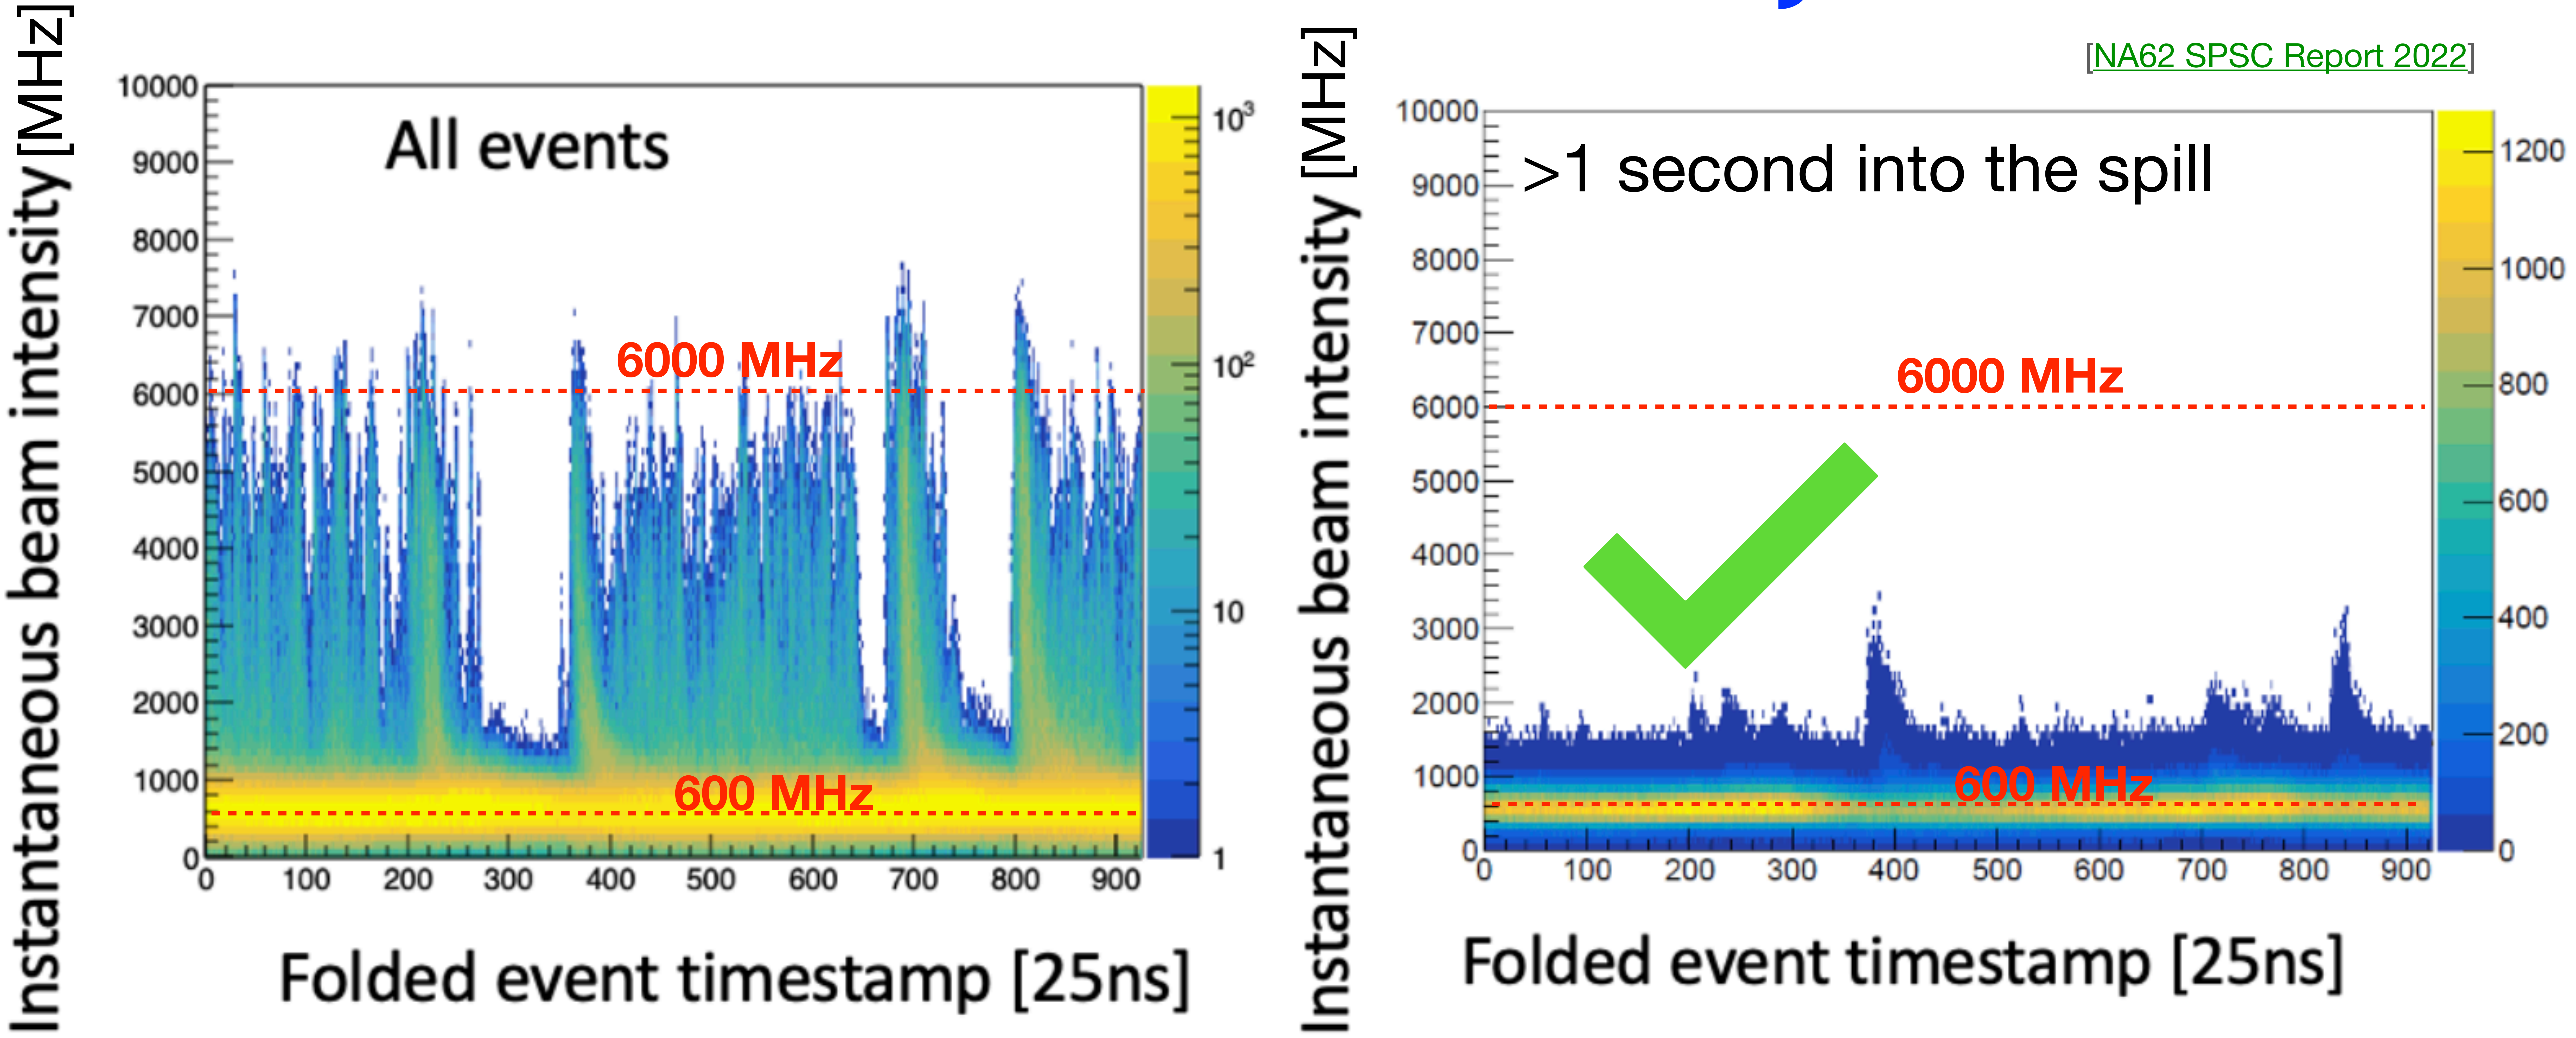
Beam intensity: 2018 vs 2022



- Average beam intensity increased.
- NA62 “Full intensity” with 4.8s spill = 600 MHz

2021 instantaneous beam intensity

[NA62 SPSC Report 2022]



- Remove events in first 1s of 4.8s spill for 2021 data only.
  - DAQ overwhelmed by instantaneous rates up to 10x higher than design.

$K^+ \to \pi^+ \nu \bar{\nu}$: Analysis of new data

2021–2022 data : Signal Sensitivity

Analysis strategy

Triggers:

- **Minimum Bias:** $K^+ \to \mu^+\nu$
- **Normalisation:** $K^+ \to \pi^+\pi^0$
- **Signal:** $K^+ \to \pi^+\nu\bar{\nu}$ candidates

- RICH multiplicity (reference time)
- Signal in CHODs
- No signal in MUV3(μ veto)
- Tag K^+ (≥ 5 KTAG sectors)
- <40 GeV in LKr ($\pi^0/\gamma/e$ veto)
- LAV veto (downstream of vertex).

Common conditions

+ add more conditions

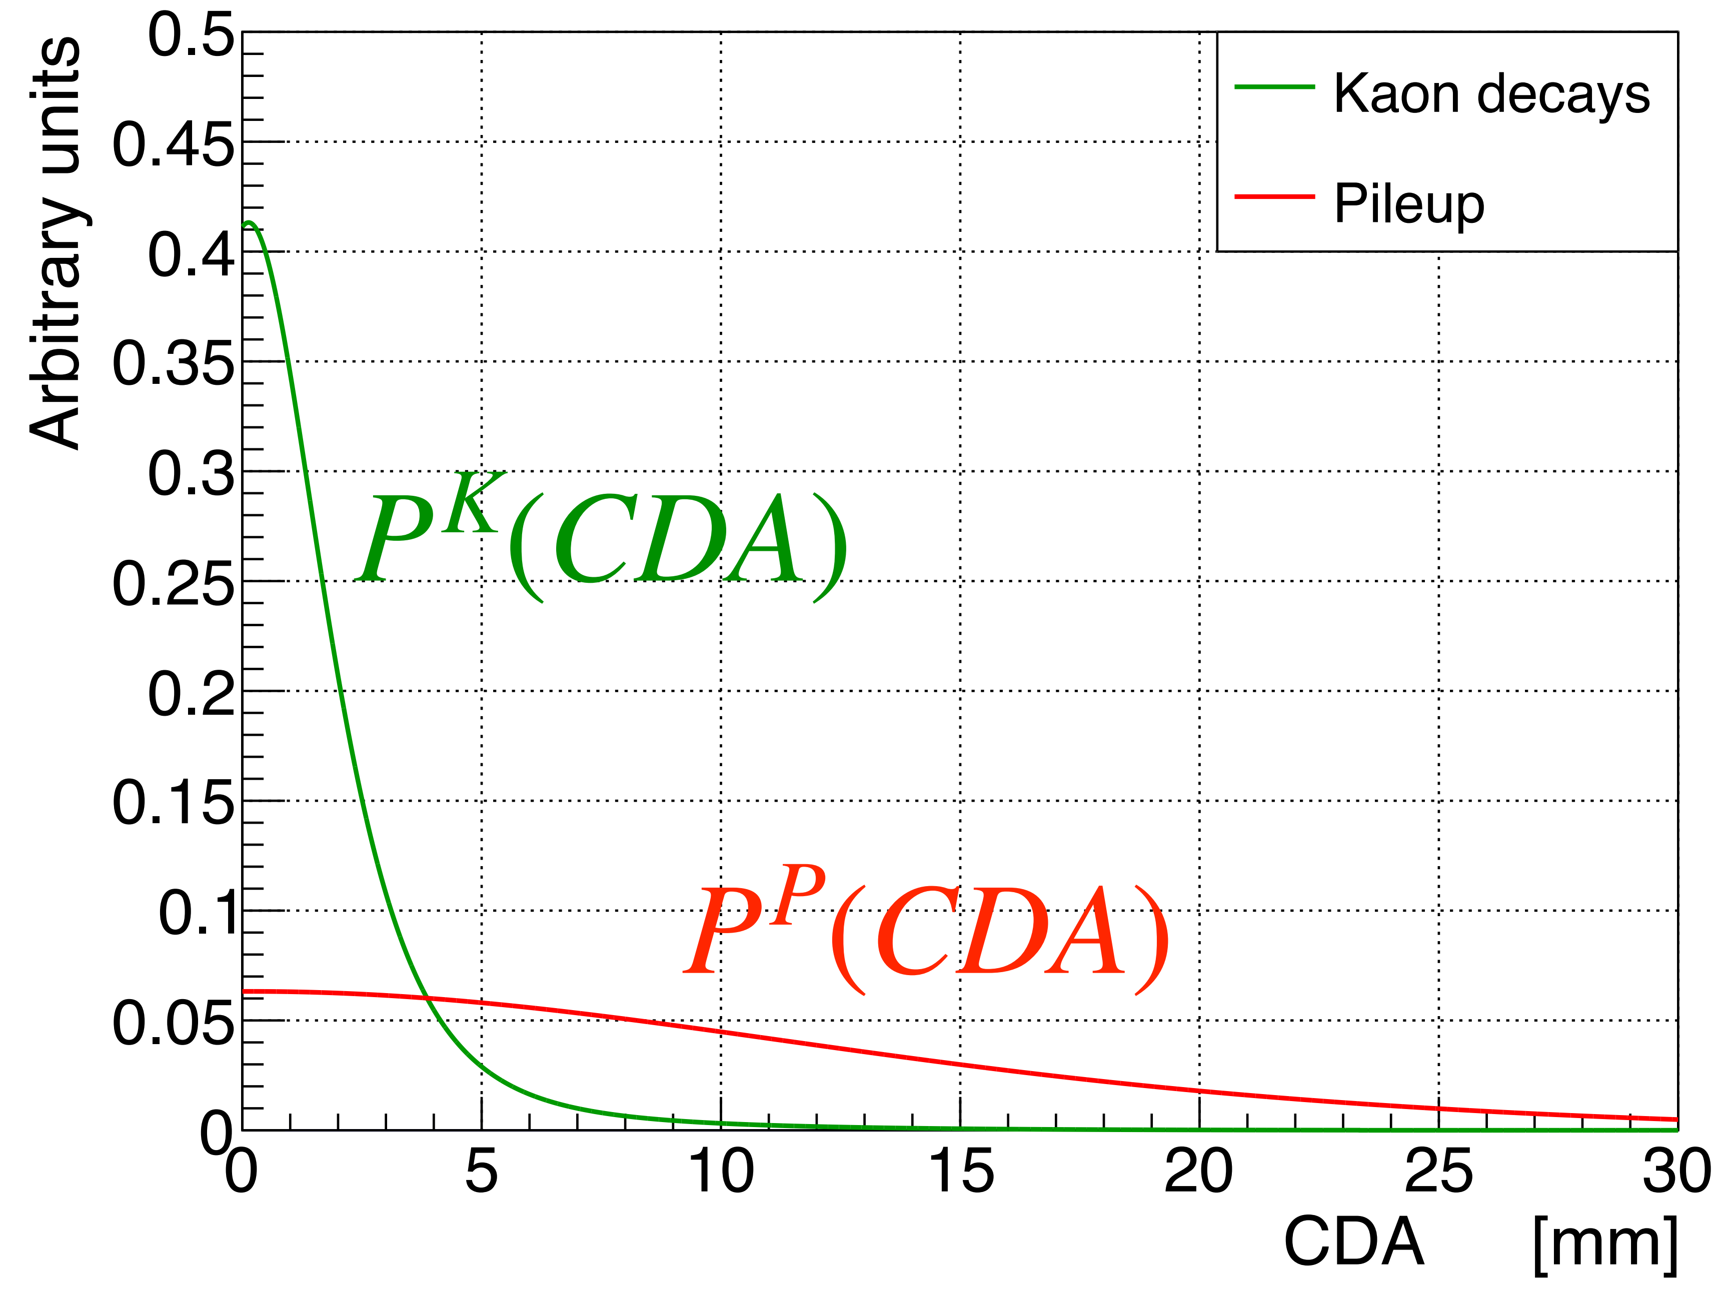
Selection:

- **Normalisation** $K^+ \to \pi^+\pi^0$: 1 downstream track (only); identified as π^+; $K^+ - \pi^+$ matching (space & time); upstream vetos.
- **Signal** $K^+ \to \pi^+\nu\bar{\nu}$ candidates: same as normalisation selection + full photon and detector multiplicity cuts (reject all extra activity).

Bayesian classifier for $K^+ - \pi^+$ matching

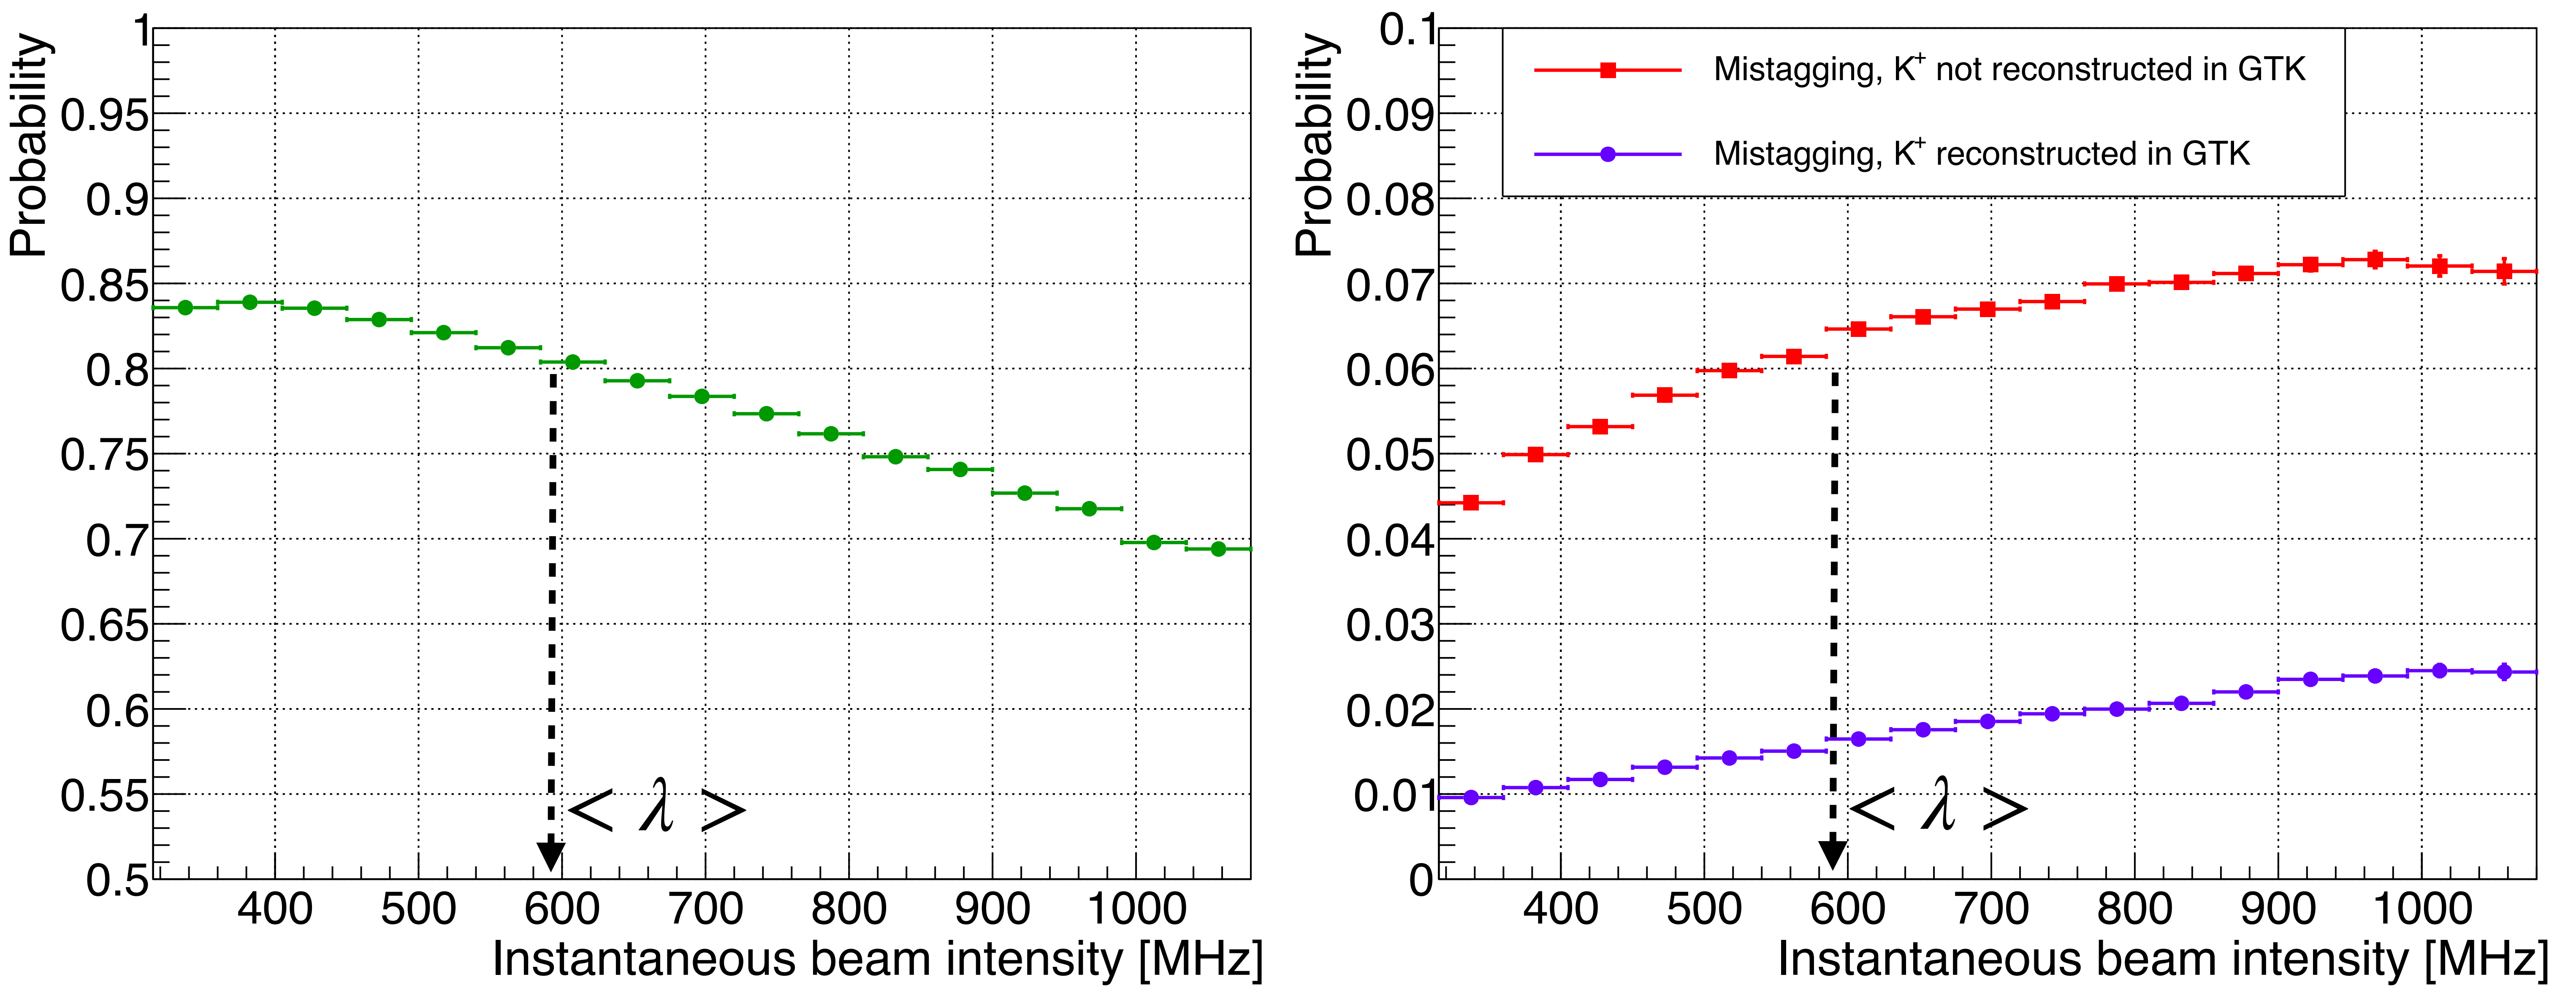
Example of selection update

- **Inputs:** spatial (CDA) & time (ΔT_+) matching, intensity/pileup (N_{GTK}) [prior]
  - Models for PDFs/Prior from $K^+ \to \pi^+\pi^+\pi^-$ data.



- **Output:** posterior probability of GTK track = true K^+
  - Use likelihoods of kaons (K) and pileup (P)
  - Likelihood ratio used to select true match when $N_{GTK} > 1$

$\varepsilon = 80\,\%$ $\quad P^P_{\mathrm{mistag}} = 6\,\%$ $\quad P^K_{\mathrm{mistag}} = 2\,\%$



- Efficiency improved (+10%) and mistagging probability maintained.

Signal sensitivity

NA62

- Normalisation channel: $K^+ \to \pi^+\pi^0$, momentum range $p \in [15{,}45]$ GeV/c.

Effective number of K^+ decays, N_K:

$$N_K = \frac{N_{\pi\pi} D_0}{\mathcal{B}_{\pi\pi} A_{\pi\pi}}$$

- Number of normalisation events ($N_{\pi\pi}$)
- Downscaling factor of normalisation trigger (generally 400) (D_0)
- Branching ratio of $K^+ \to \pi^+\pi^0$ decay ($\mathcal{B}_{\pi\pi}$)
- Acceptance of normalisation selection ($A_{\pi\pi}$)

Single event sensitivity:

(Branching ratio corresponding to expectation of 1 event)

$$\mathcal{B}_{SES} = \frac{1}{N_K \varepsilon_{RV} \varepsilon_{trig} A_{\pi\nu\bar{\nu}}}$$

- Random veto efficiency (ε_{RV})
- Trigger efficiency (ratio) (ε_{trig})
- Signal selection acceptance ($A_{\pi\nu\bar{\nu}}$)

Number of expected SM events:

(For comparison to previous results use $\mathcal{B}^{SM}_{\pi\nu\bar{\nu}} = 8.4 \times 10^{-11}$ [JHEP 11 (2015) 166], but results are independent of this choice)

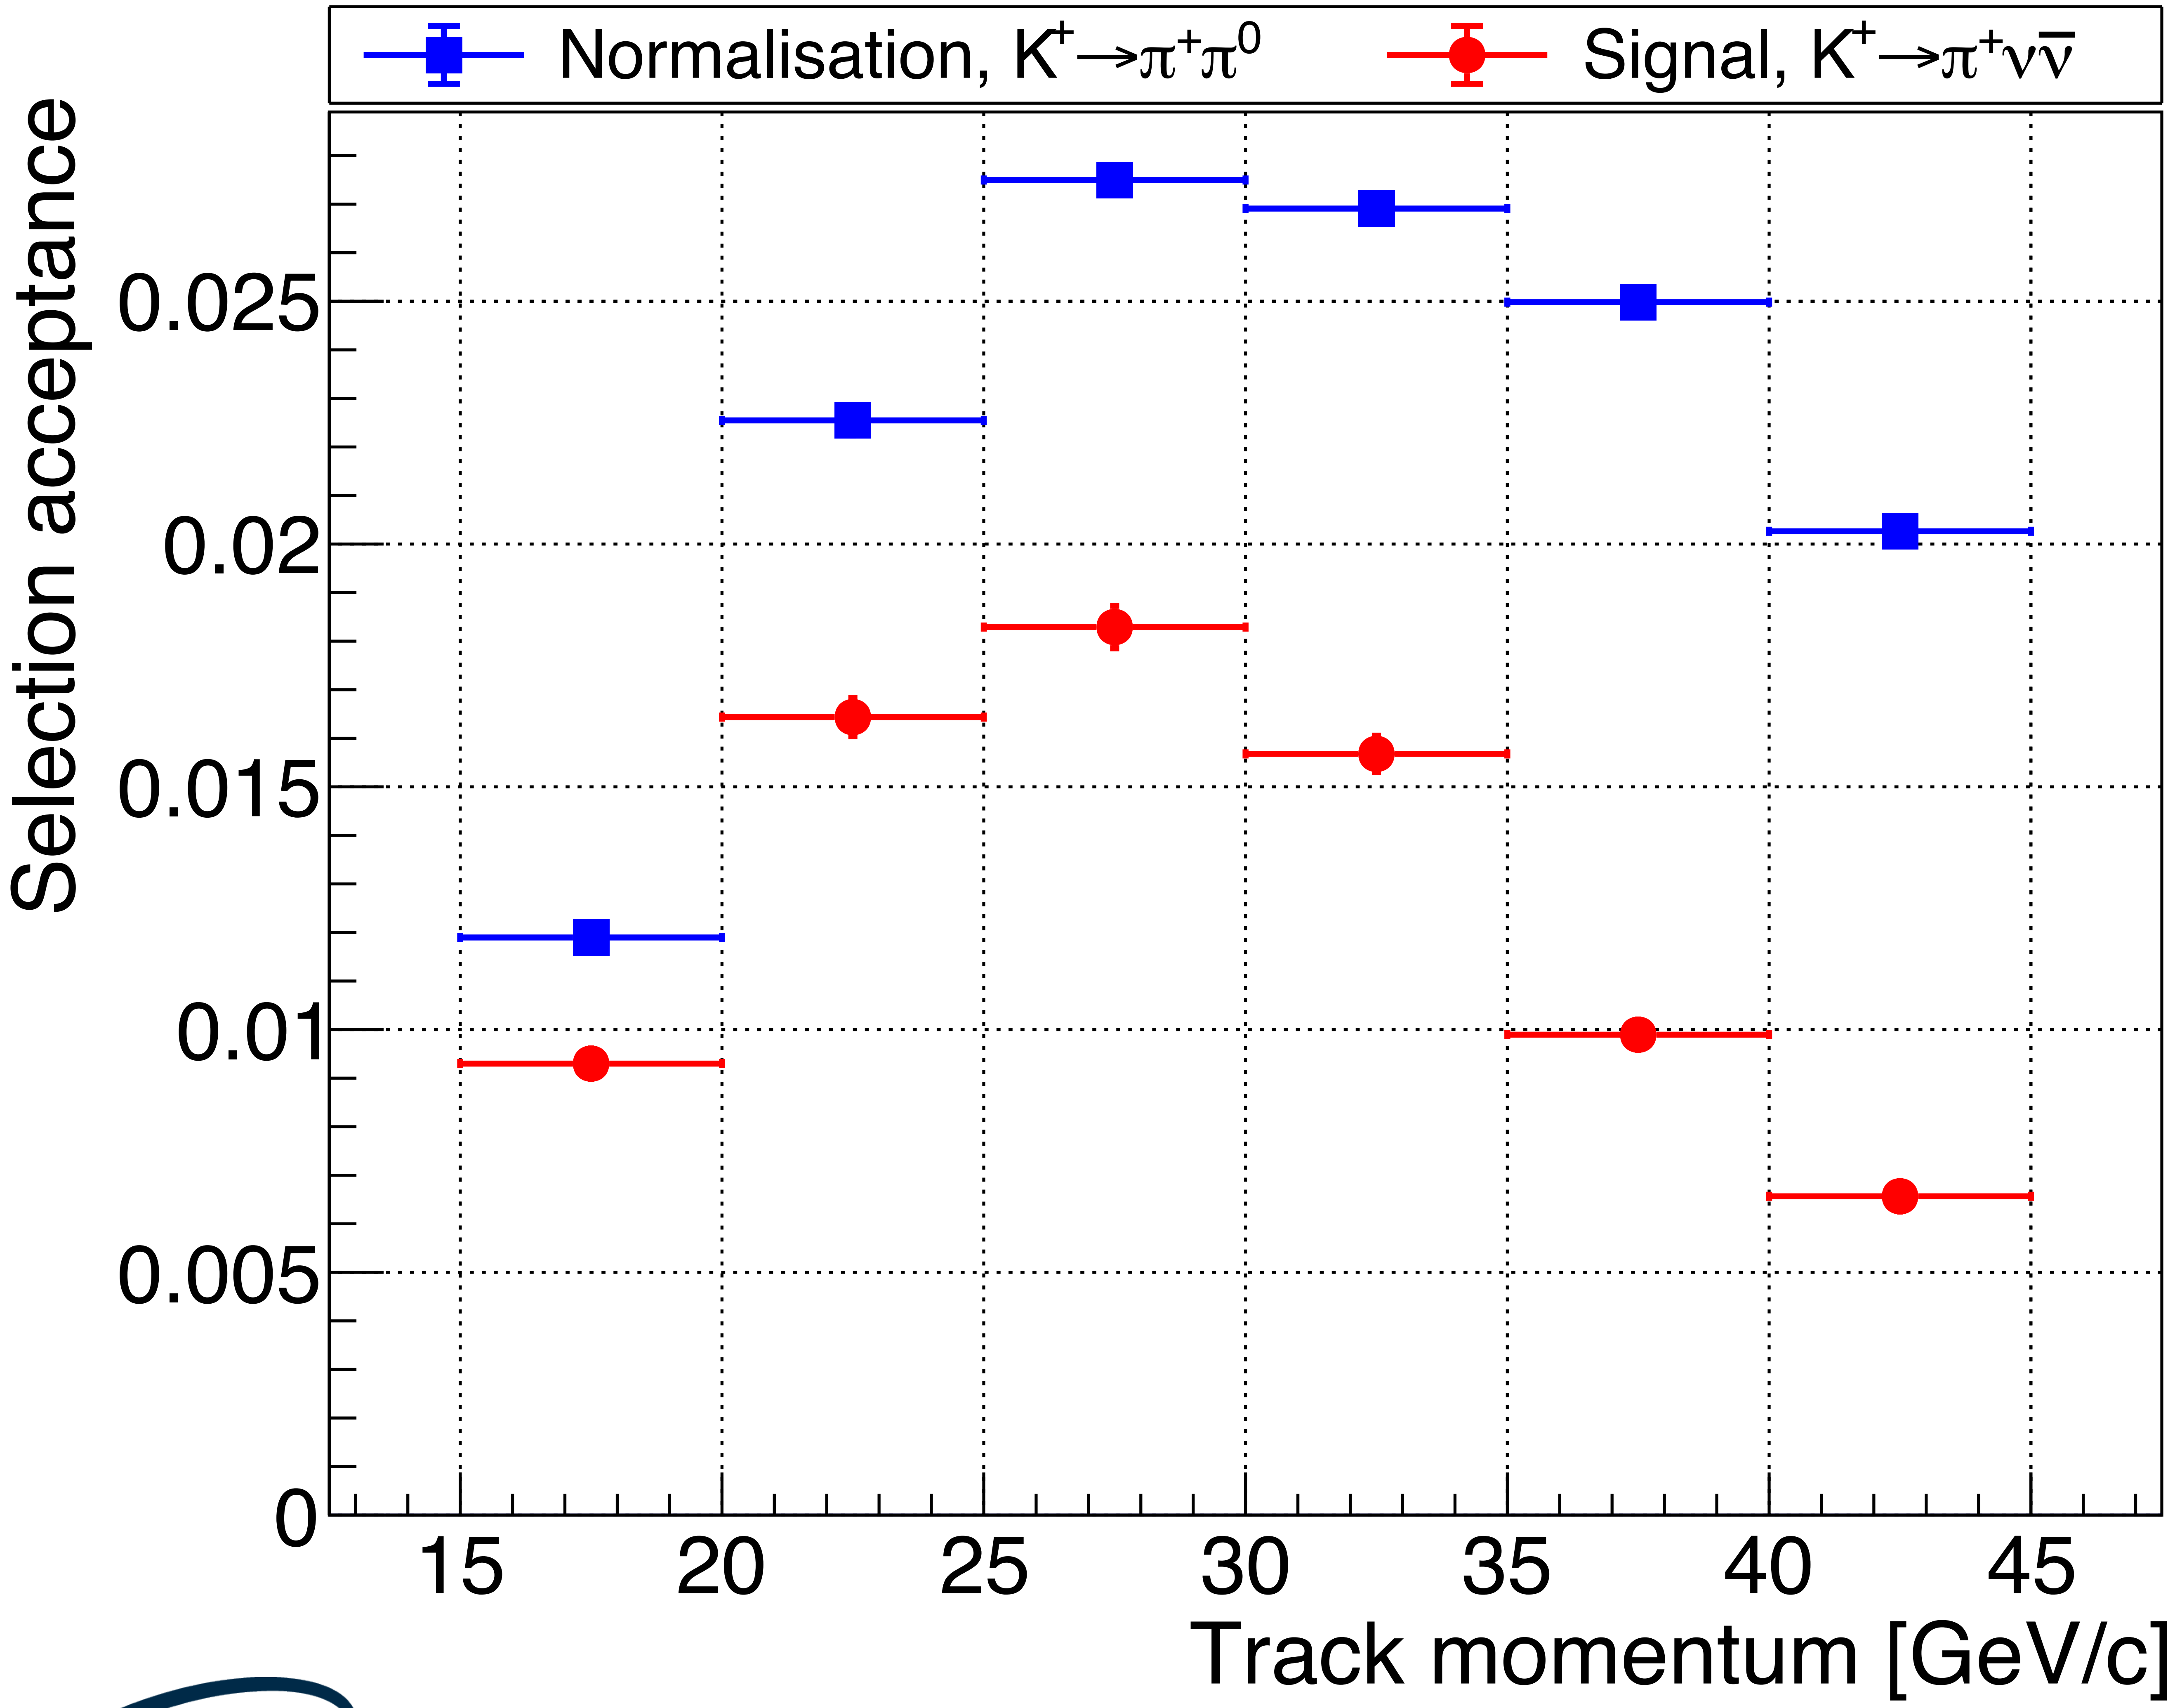
$$N^{SM}_{\pi\nu\bar{\nu}} = \frac{\mathcal{B}^{SM}_{\pi\nu\bar{\nu}}}{\mathcal{B}_{SES}}$$

Acceptances

Analysis is performed in (5 GeV/c) bins of momentum:

Acceptances

$$N^{exp}_{\pi\nu\bar{\nu}}(p_i) = \frac{\mathcal{B}^{SM}_{\pi\nu\bar{\nu}}}{\mathcal{B}_{SES}(p_i)} = \frac{\mathcal{B}^{SM}_{\pi\nu\bar{\nu}}}{\mathcal{B}_{\pi\pi}} \boxed{\frac{A_{\pi\nu\bar{\nu}}(p_i)}{A_{\pi\pi}(p_i)}} D_0 N_{\pi\pi}(p_i)\varepsilon_{trig}(p_i)\varepsilon_{RV}$$



Case	OLD 2018 (S2)	NEW 2021–22	
Norm.	11.8%	13.4%	+15%
Signal	(6.37±0.64)%	(7.61±0.18)%	+20%

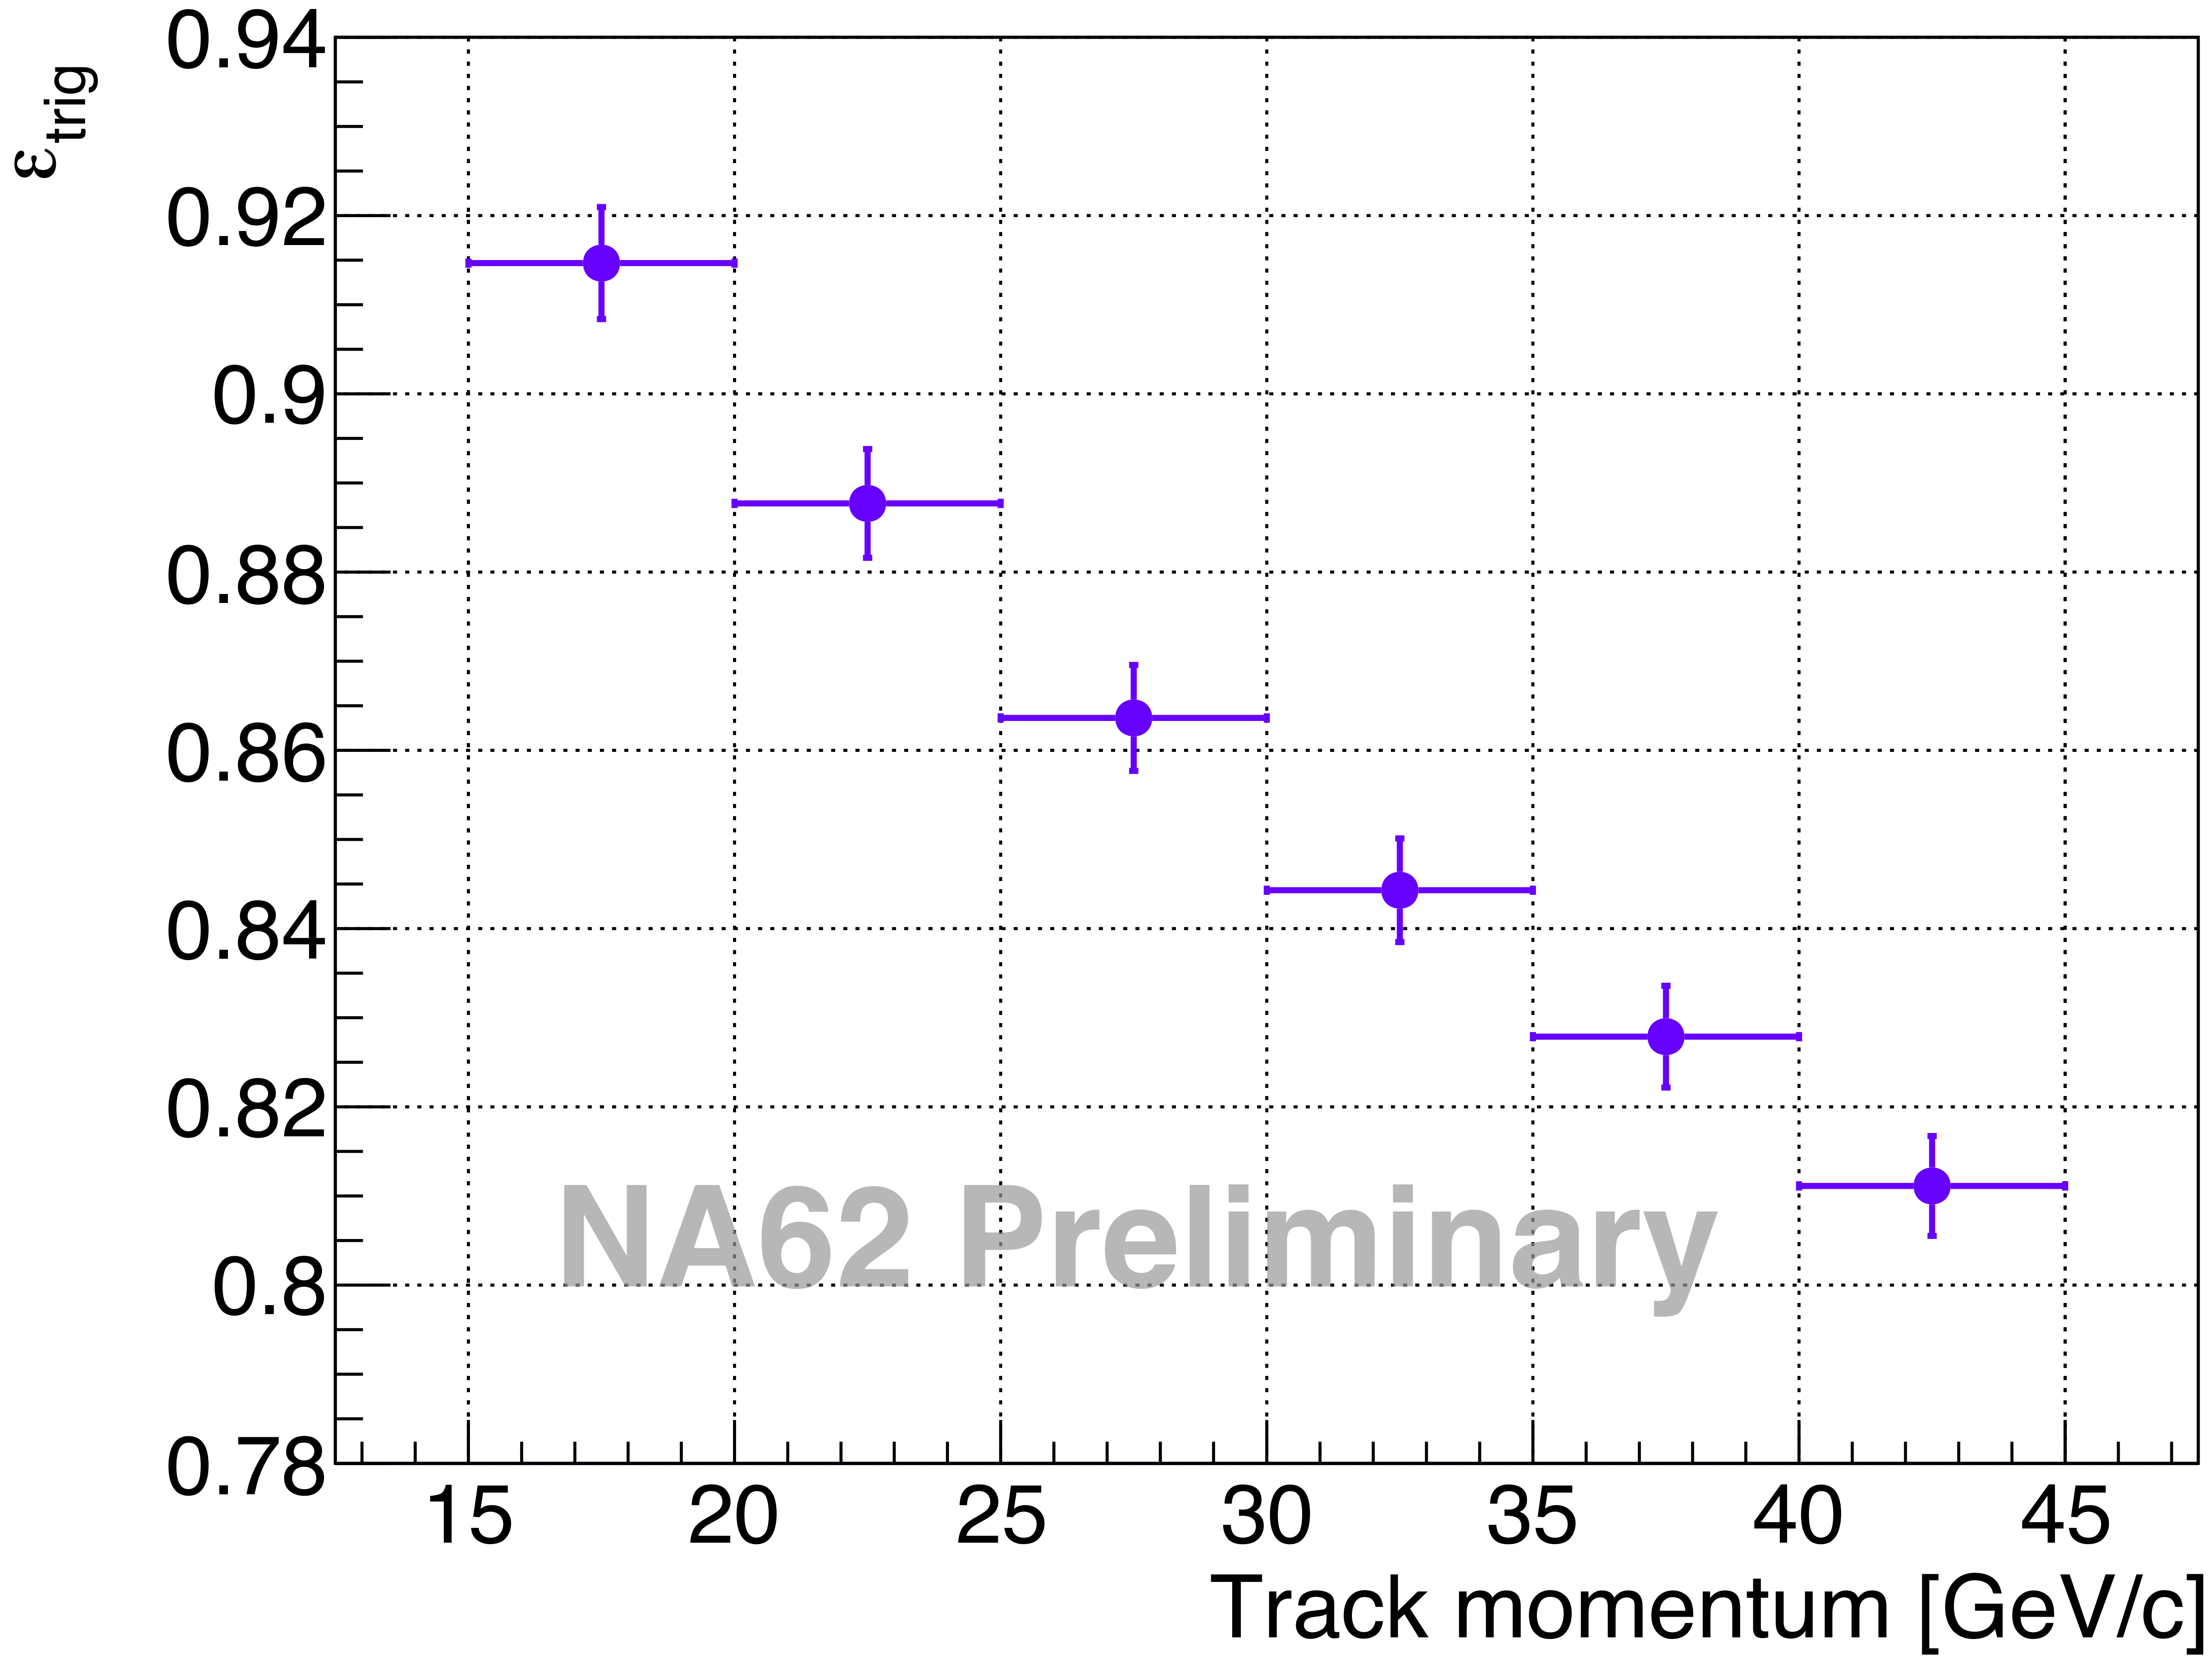
- Increased selection efficiencies.
  - New K-pi matching technique.
  - Re-tuned vertex conditions.
  - Relaxation of some vetos.
- Improved precision (plus improved systematic uncertainty evaluation).

Acceptances evaluated at 0 intensity.
Intensity dependence captured in ε_{RV}

Trigger efficiencies

Analysis is performed in (5 GeV/c) bins of momentum:

$$N^{exp}_{\pi\nu\bar{\nu}}(p_i) = \frac{\mathcal{B}^{SM}_{\pi\nu\bar{\nu}}}{\mathcal{B}_{SES}(p_i)} = \frac{\mathcal{B}^{SM}_{\pi\nu\bar{\nu}}}{\mathcal{B}_{\pi\pi}} \frac{A_{\pi\nu\bar{\nu}}(p_i)}{A_{\pi\pi}(p_i)} D_0 N_{\pi\pi}(p_i) \varepsilon_{trig}(p_i) \varepsilon_{RV}$$



$$\varepsilon_{trig} = \frac{\varepsilon_{sig}}{\varepsilon_{norm}}$$

$\varepsilon_{trig}(new) = (85.9 \pm 1.4)\,\%$

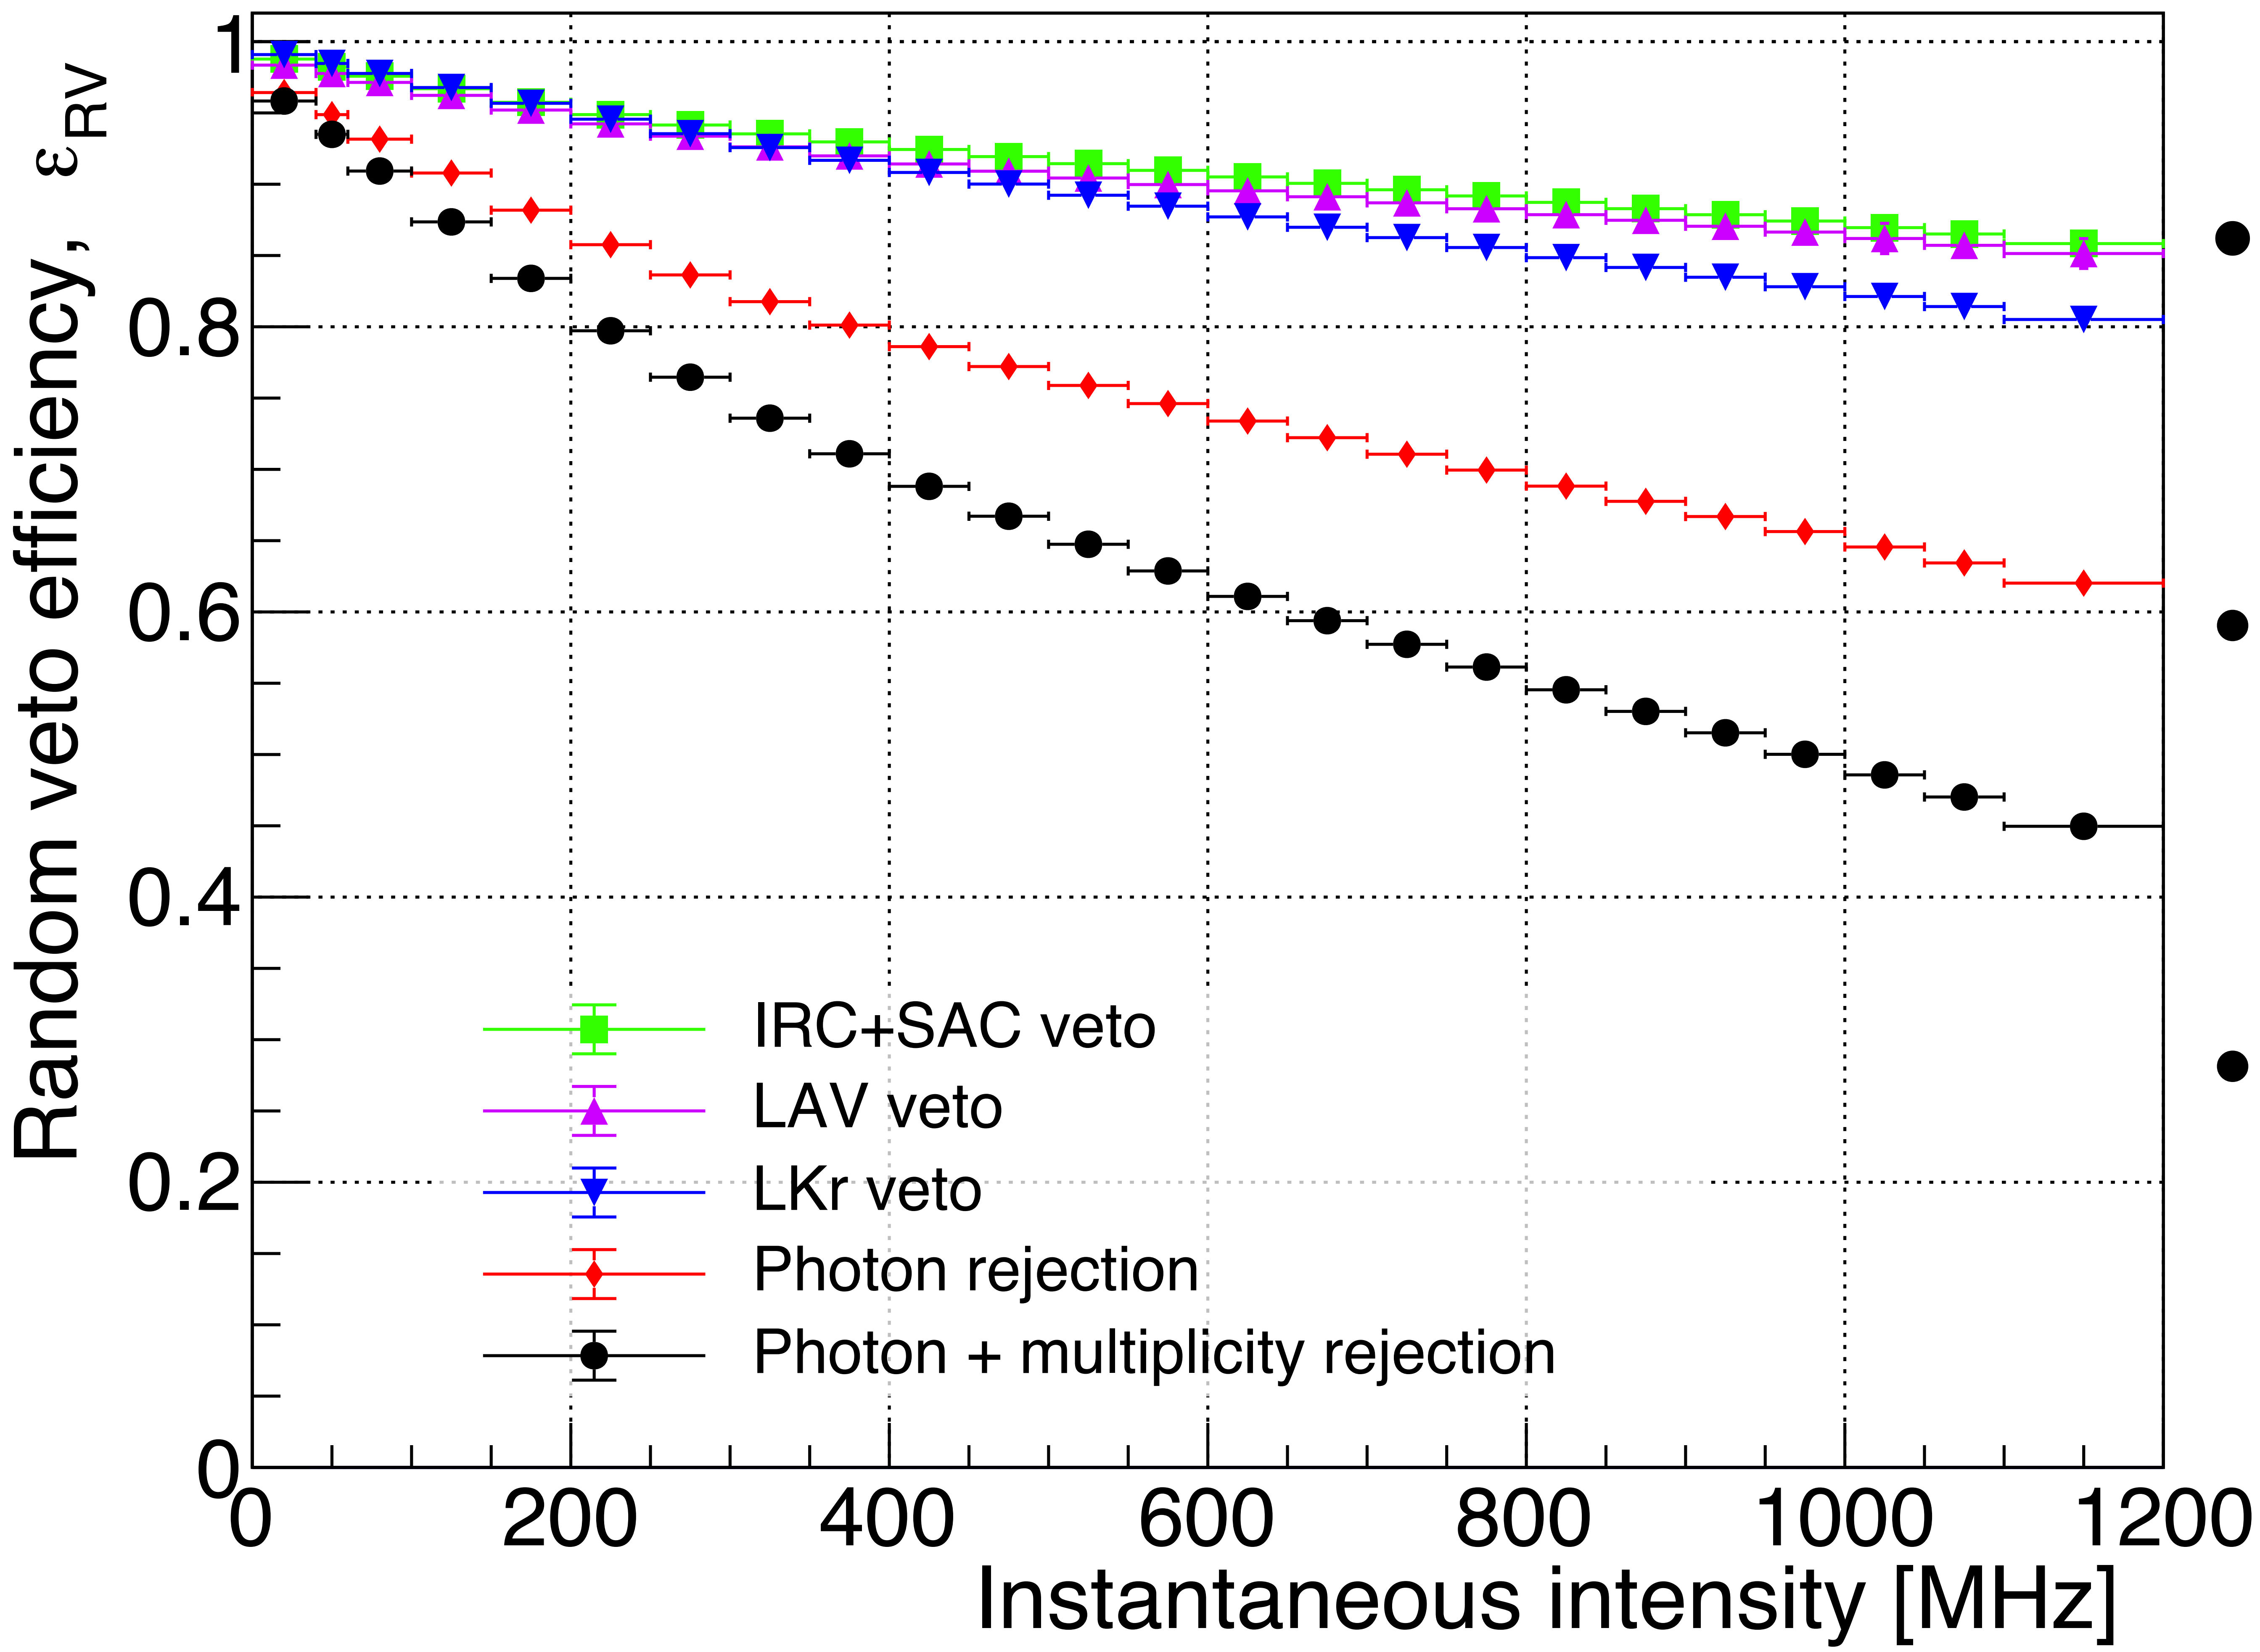
$\varepsilon_{trig}(2018) = (89 \pm 5)\,\%$

- Trigger efficiency ratio:
  - **New:** several components in both normalisation & signal triggers: **partial cancellation**.
  - **Old:** in 2016—18 data normalise with fully independent min bias trigger (**no cancellation**).
- Improved precision by factor 3 with reduced systematic uncertainty.

Random veto

ε_{RV} **is independent of track momentum (related to additional activity only)**

$$N^{exp}_{\pi\nu\bar{\nu}}(p_i) = \frac{\mathcal{B}^{SM}_{\pi\nu\bar{\nu}}}{\mathcal{B}_{SES}(p_i)} = \frac{\mathcal{B}^{SM}_{\pi\nu\bar{\nu}}}{\mathcal{B}_{\pi\pi}} \frac{A_{\pi\nu\bar{\nu}}(p_i)}{A_{\pi\pi}(p_i)} D_0 N_{\pi\pi}(p_i)\varepsilon_{trig}(p_i)\varepsilon_{RV}$$



- ε_{RV} **= Random Veto Efficiency:**
  - $1 - \varepsilon_{RV}$ **= Probability of rejecting a signal event due to additional activity.**
- Balance:
  - Strict vetos ⇒ lower efficiency
  - Loose vetos ⇒ higher background
- **Operational intensity higher** but re-tuning vetos means ε_{RV} **is comparable:**

$$\varepsilon_{RV}(\text{new}, \overline{\lambda_{21-22}} \approx 600\,\text{MHz}) = (63.6 \pm 0.6)\,\%$$

$$\varepsilon_{RV}(\text{old}, \overline{\lambda_{2018}} \approx 400\,\text{MHz}) = (66 \pm 1)\,\%$$

Signal sensitivity results

$$N_K = \frac{N_{\pi\pi} D_0}{\mathcal{B}_{\pi\pi} A_{\pi\pi}} \qquad \mathcal{B}_{SES} = \frac{1}{N_K \varepsilon_{RV} \varepsilon_{trig} A_{\pi\nu\bar{\nu}}}$$

- Display integrals (15—45 GeV/c, 2021+22) for summary tables.

* Acceptances evaluated at 0 intensity.

$N_{\pi\pi}$	Normalisation $K^+ \to \pi^+\pi^0$	2.0×10^8
$A_{\pi\pi}$	Normalisation acceptance	$(13.410 \pm 0.005)\%$
N_K	Effective K^+ decays	2.9×10^{12}
$A_{\pi\nu\bar{\nu}}$	Signal acceptance	$(7.6 \pm 0.2)\%$
ε_{trig}	Trigger efficiency	$(85.9 \pm 1.4)\%$
ε_{RV}	Random veto efficiency	$(63.6 \pm 0.6)\%$
$\mathcal{B}_{SES}$	Single event sensitivity	$(0.84 \pm 0.03) \times 10^{-11}$

$$N^{exp}_{\pi\nu\bar{\nu}} = \frac{\mathcal{B}^{SM}_{\pi\nu\bar{\nu}}}{\mathcal{B}_{SES}}$$

Assuming $\mathcal{B}^{SM}_{\pi\nu\bar{\nu}} = 8.4 \times 10^{-11}$:

2021—22: $N_{\pi\nu\bar{\nu}} = 10.00 \pm 0.34$

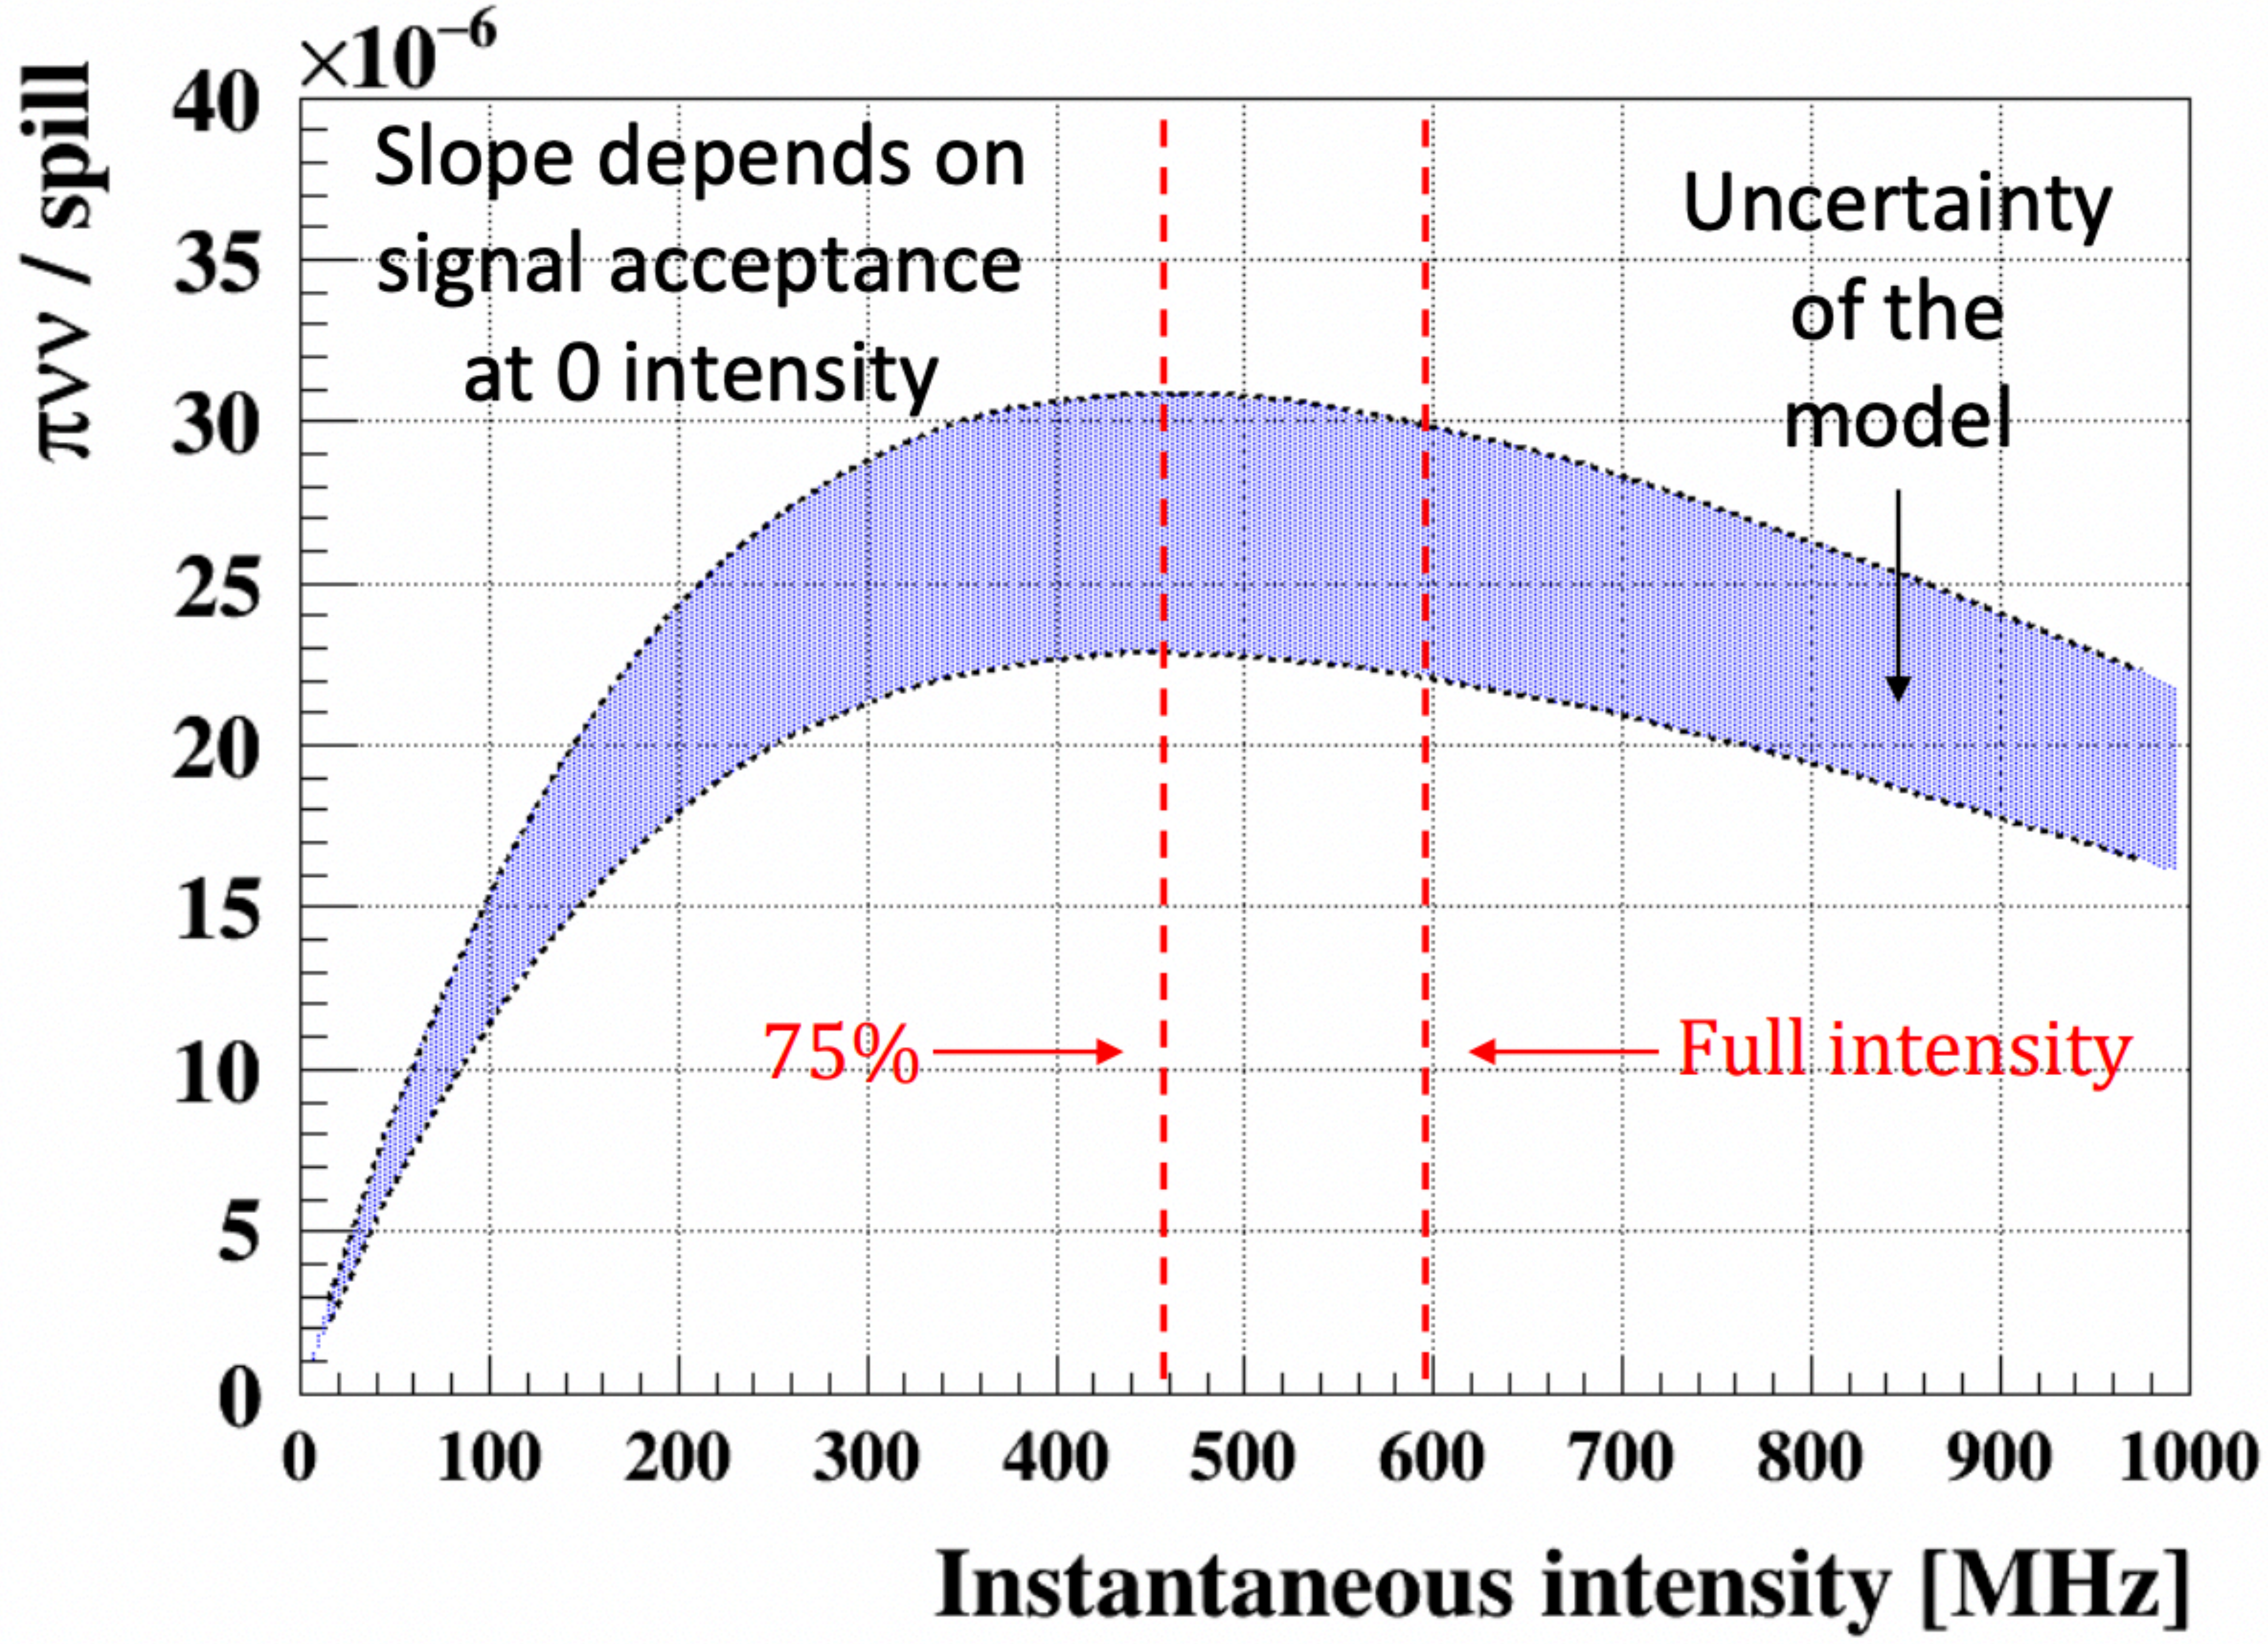
c.f. 2016—18 : $N_{\pi\nu\bar{\nu}} = 10.01 \pm 0.42$

Double expected signal by including 21—22 data.

- **Significant improvement in SES uncertainty:**
  - old: 6.3% —> new: 3.5%. Due to:
    - trigger efficiency cancellations
    - improved procedures for evaluation of acceptances and ε_{RV}

Optimum NA62 intensity

Selected signal yield vs intensity

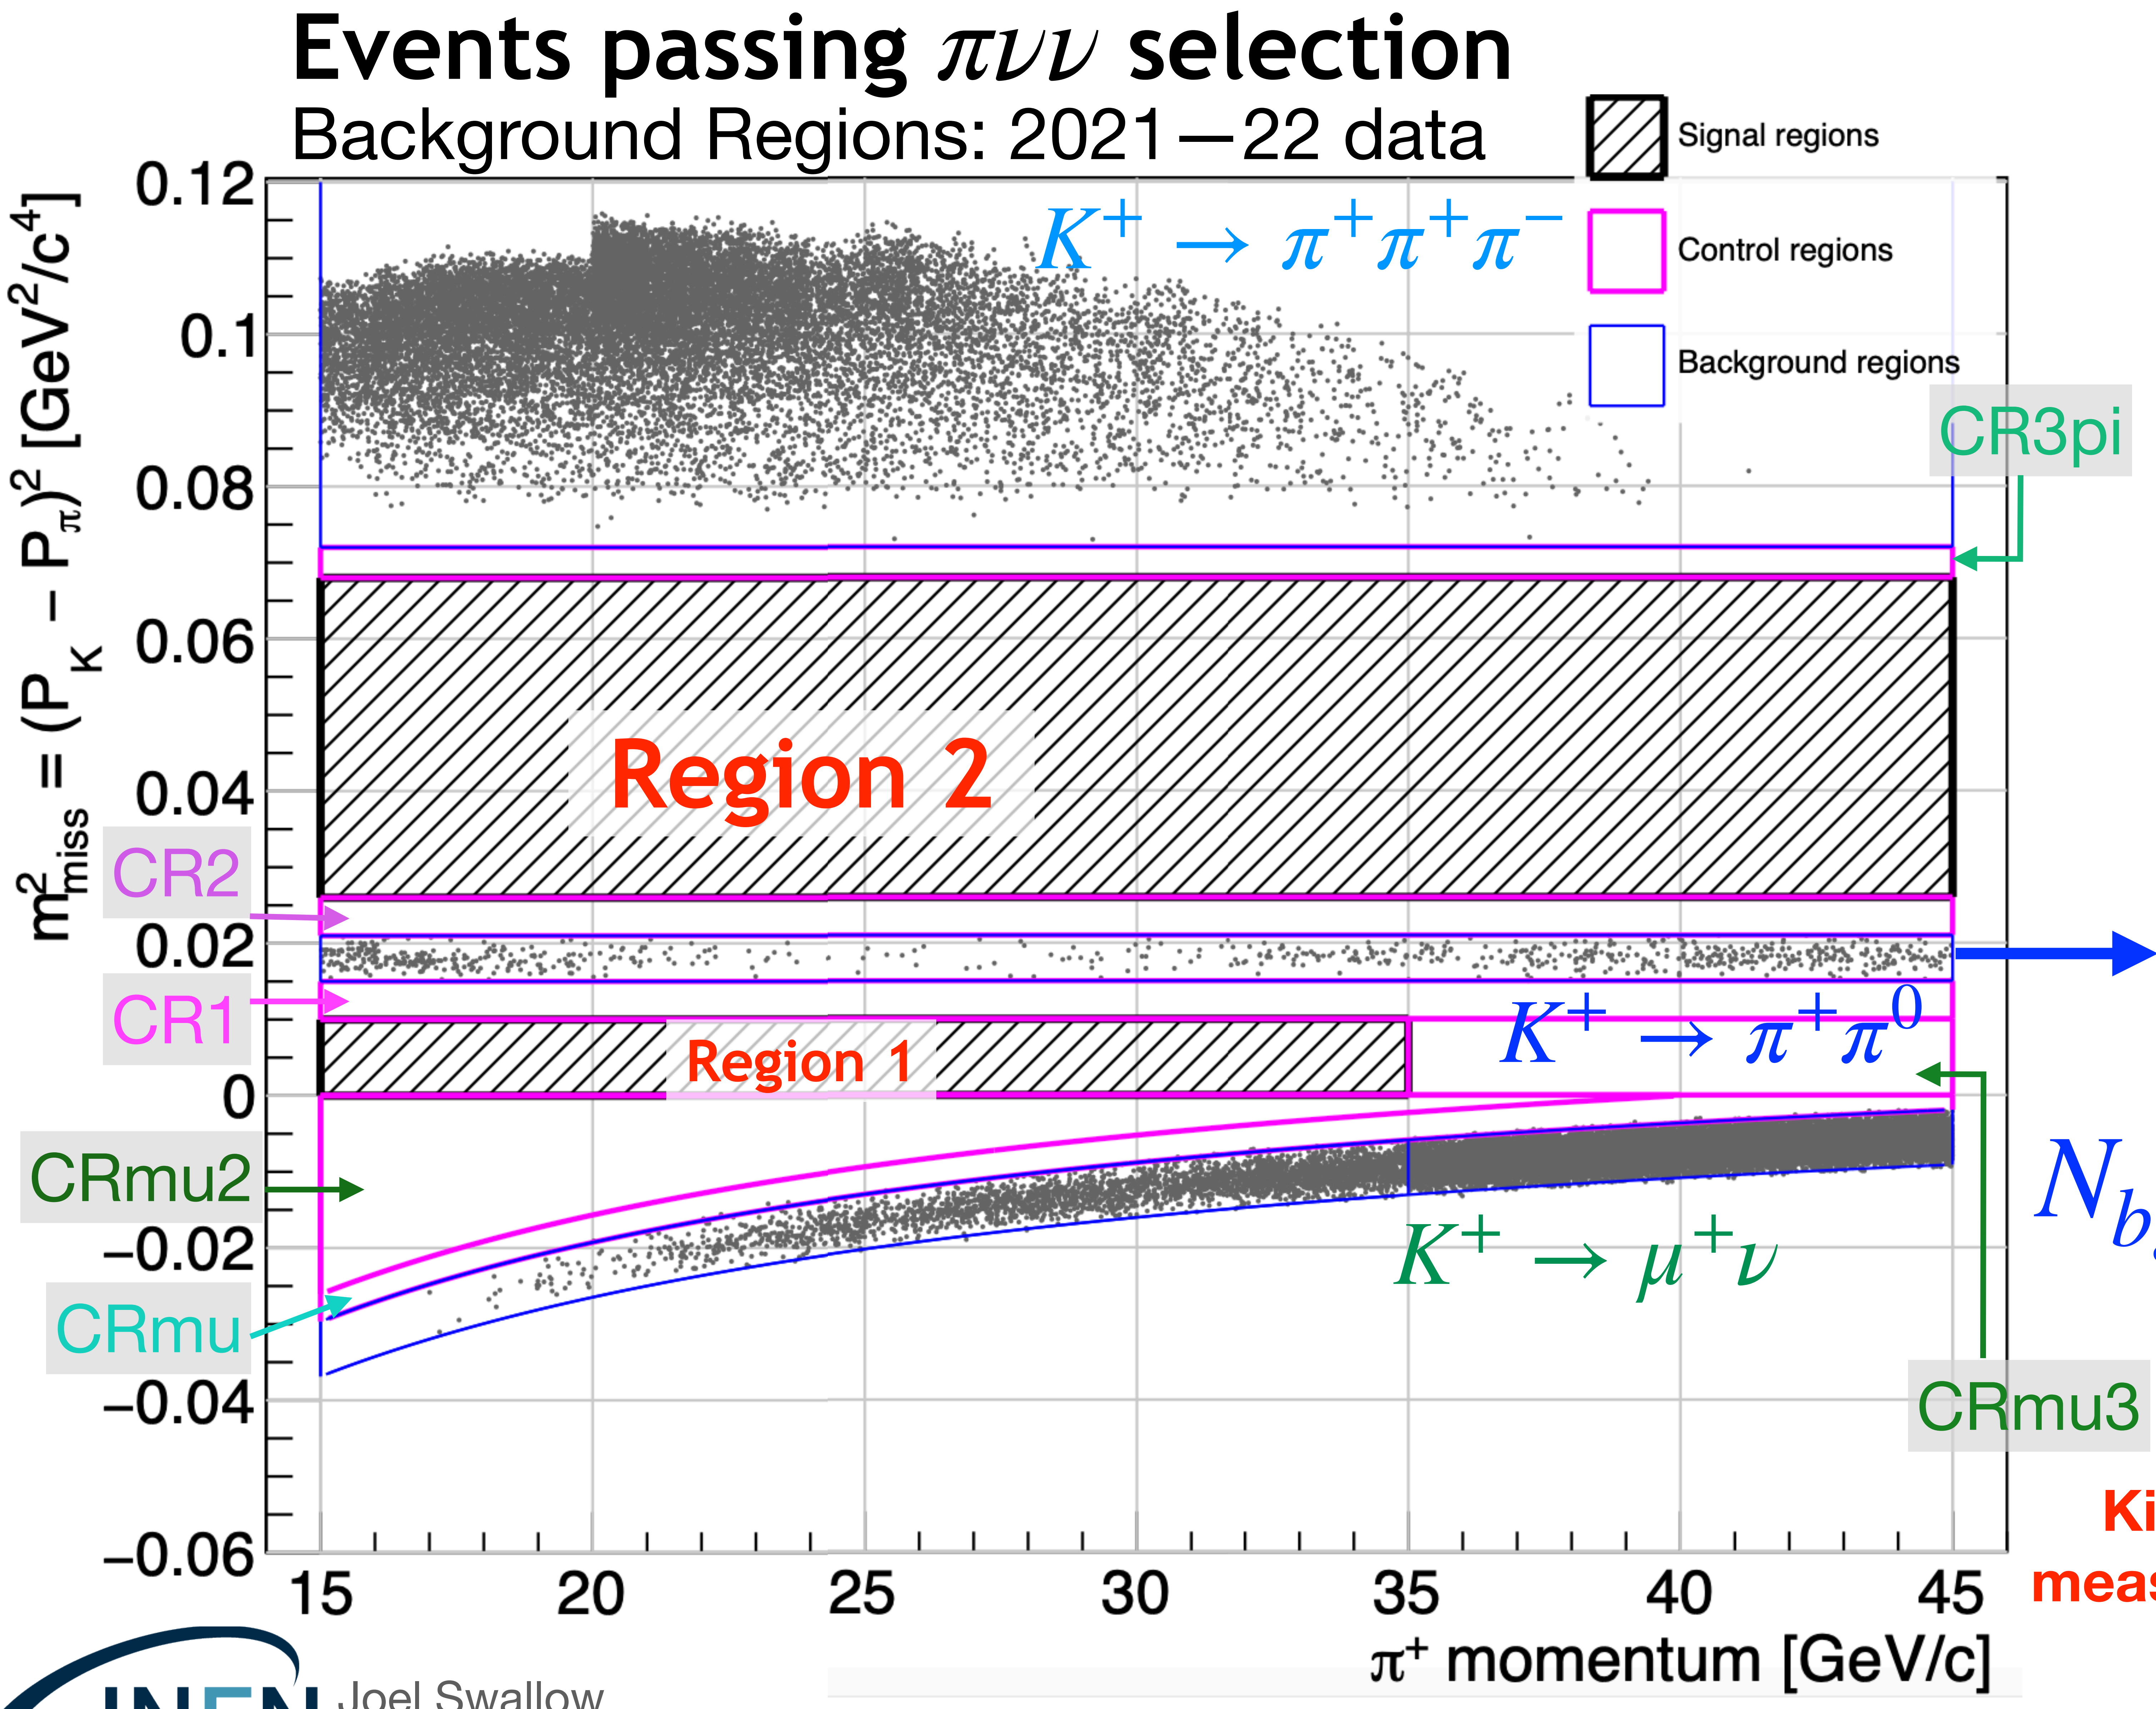


- Saturation of expected signal yield with intensity. Mainly due to:
  - Paralyzable effects from TDAQ dead time and trigger veto windows.
  - Offline selection, due to veto conditions.
- Main sources of uncertainty for model:
  - Online time-dependent mis-calibrations.
  - Fit uncertainty.
- **From August 2023 operate at optimal intensity** (~75% of full) to maximise $\pi\nu\nu$ sensitivity
  - Maximise signal yield
  - lower expected background
  - Higher DAQ efficiency
- Studies of **2021—22 data** at high intensity **were crucial** to establish optimal intensity.

$K^+ \rightarrow \pi^+ \nu \bar{\nu}$: Analysis of new data

2021—2022 data : Background Evaluation

Background regions & background estimations



- Backgrounds from kinematic misconstruction tails in m^2_{miss}

$$N_{bg} = N_{bkgR} \cdot f_{tail} = N_{bkgR} \cdot \frac{N^{CS}_{SR}}{N^{CS}_{bkgR}}$$

Number of events passing signal selection in background region (N_{bkgR})

Kinematic tail fraction: measured in control sample (f_{tail})

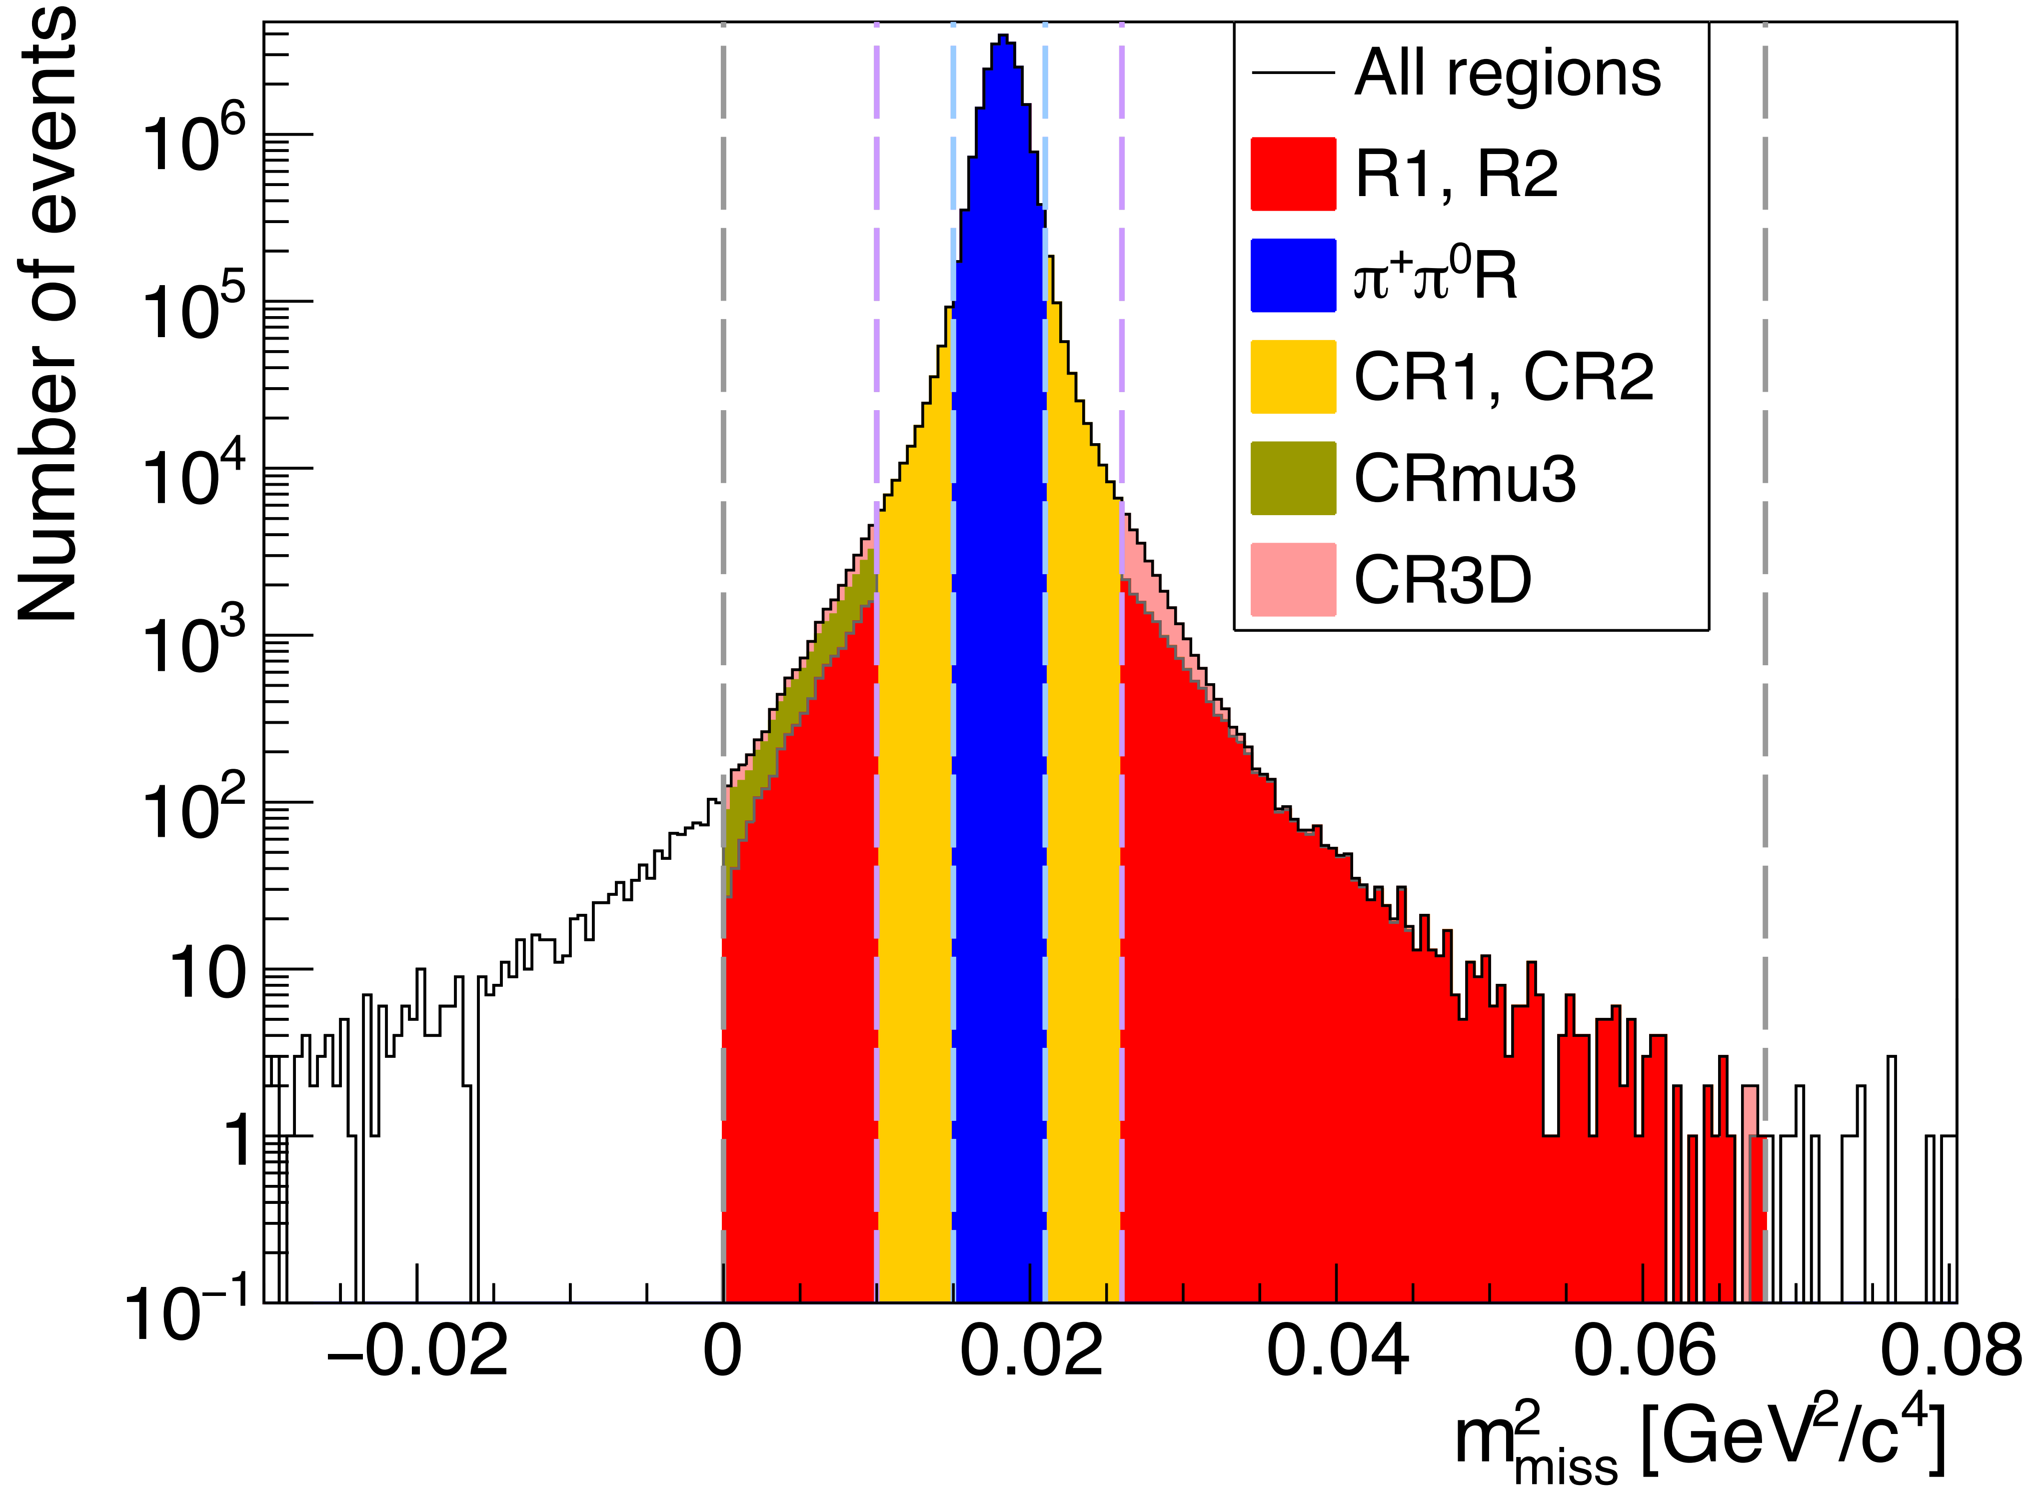
Control sample events in Signal Regions (N^{CS}_{SR})

Control sample events in Background Region (N^{CS}_{bkgR})

Backgrounds from kinematic tails

$K^+ \to \pi^+\pi^0(\gamma)$

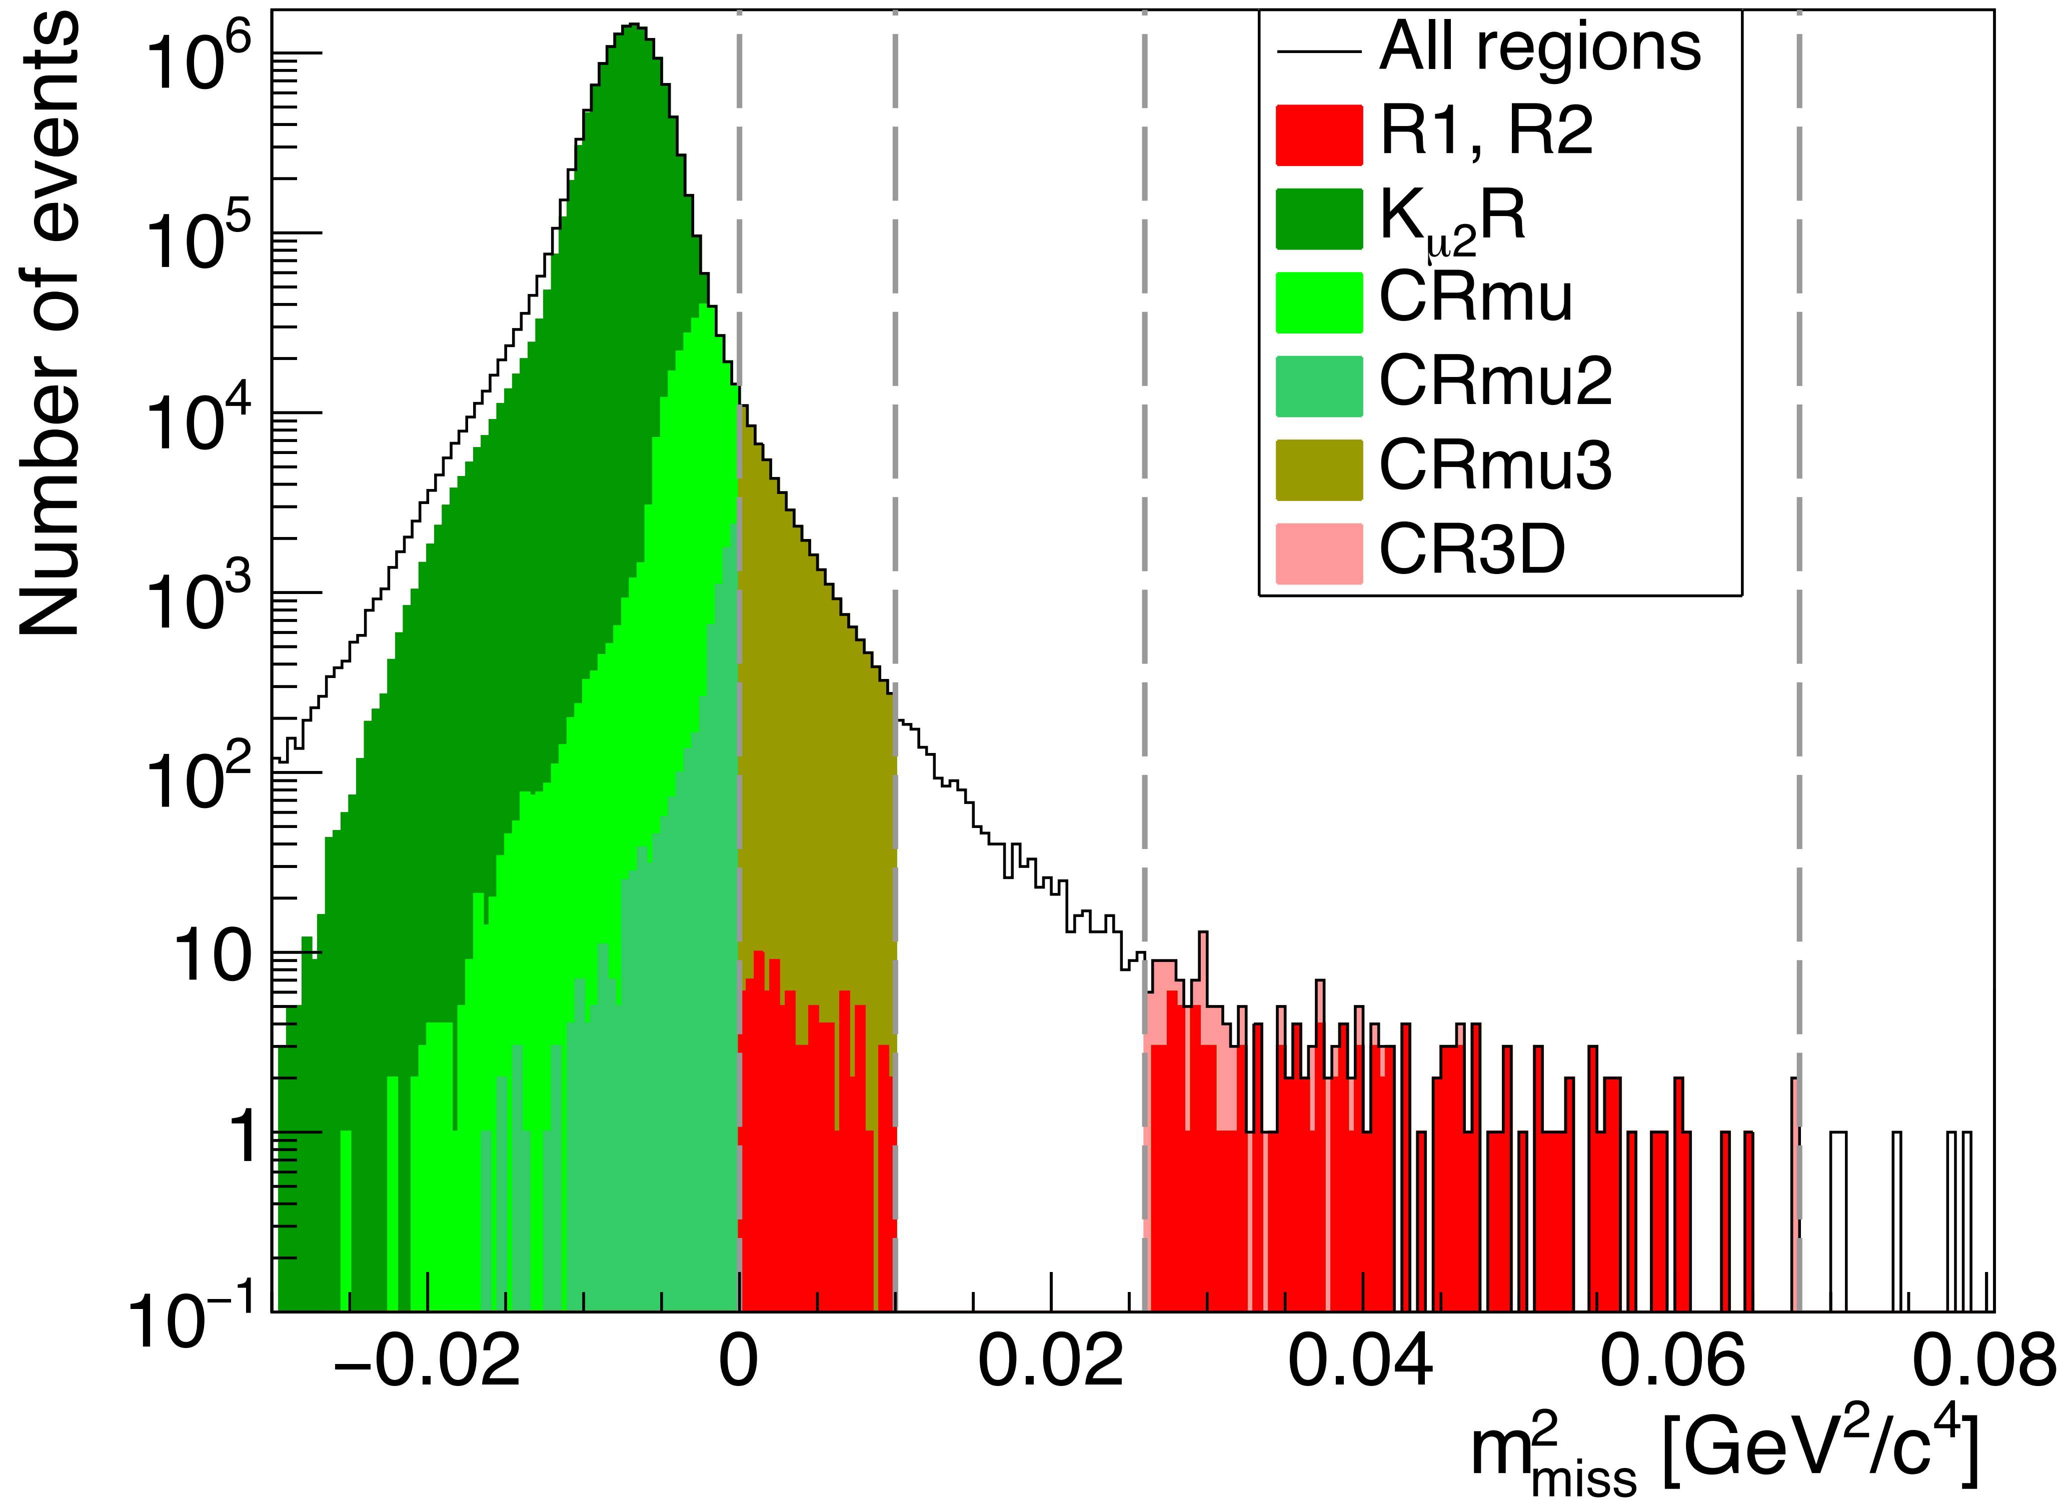
control sample of $K^+ \to \pi^+\pi^0$ events with $\pi^0 \to \gamma\gamma$ and 2 photons detected in LKr:



$$N_{bg}(K^+ \to \pi^+\pi^0(\gamma)) = 0.83 \pm 0.05$$

$K^+ \to \mu^+\nu$

control sample of $K^+ \to \mu^+\nu$ events with RICH PID=π^+ and Calo PID=μ^+:



- <1% contribution from $K^+ \to \mu^+\nu$ followed by $\mu^+ \to e^+\nu\nu$.

$$N_{bg}(K^+ \to \mu^+\nu) = 0.9 \pm 0.2$$

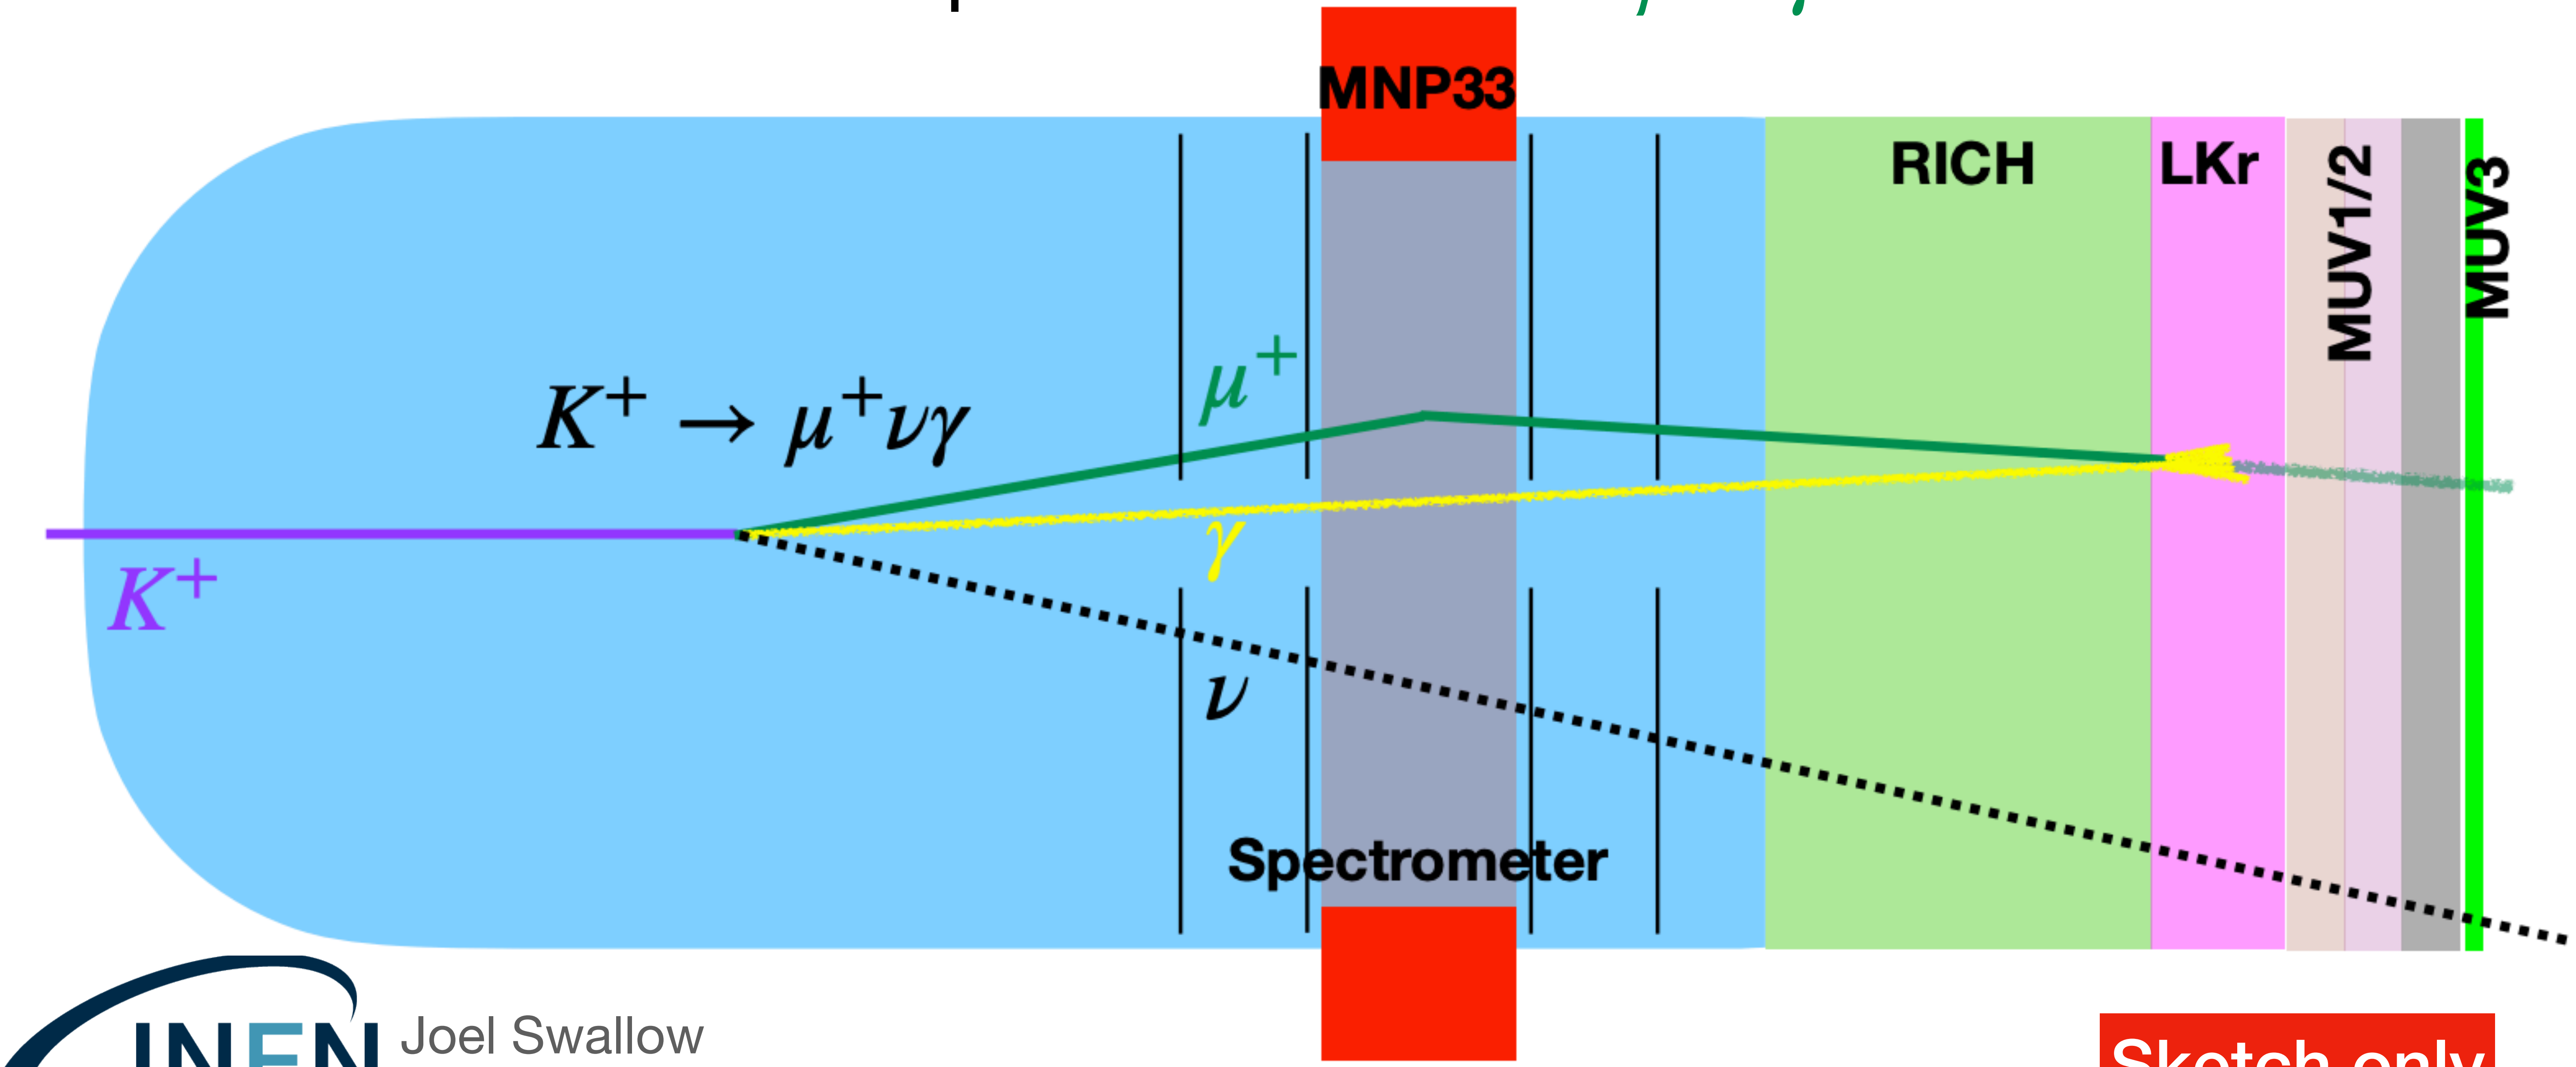
$K^+ \to \pi^+\pi^+\pi^-$

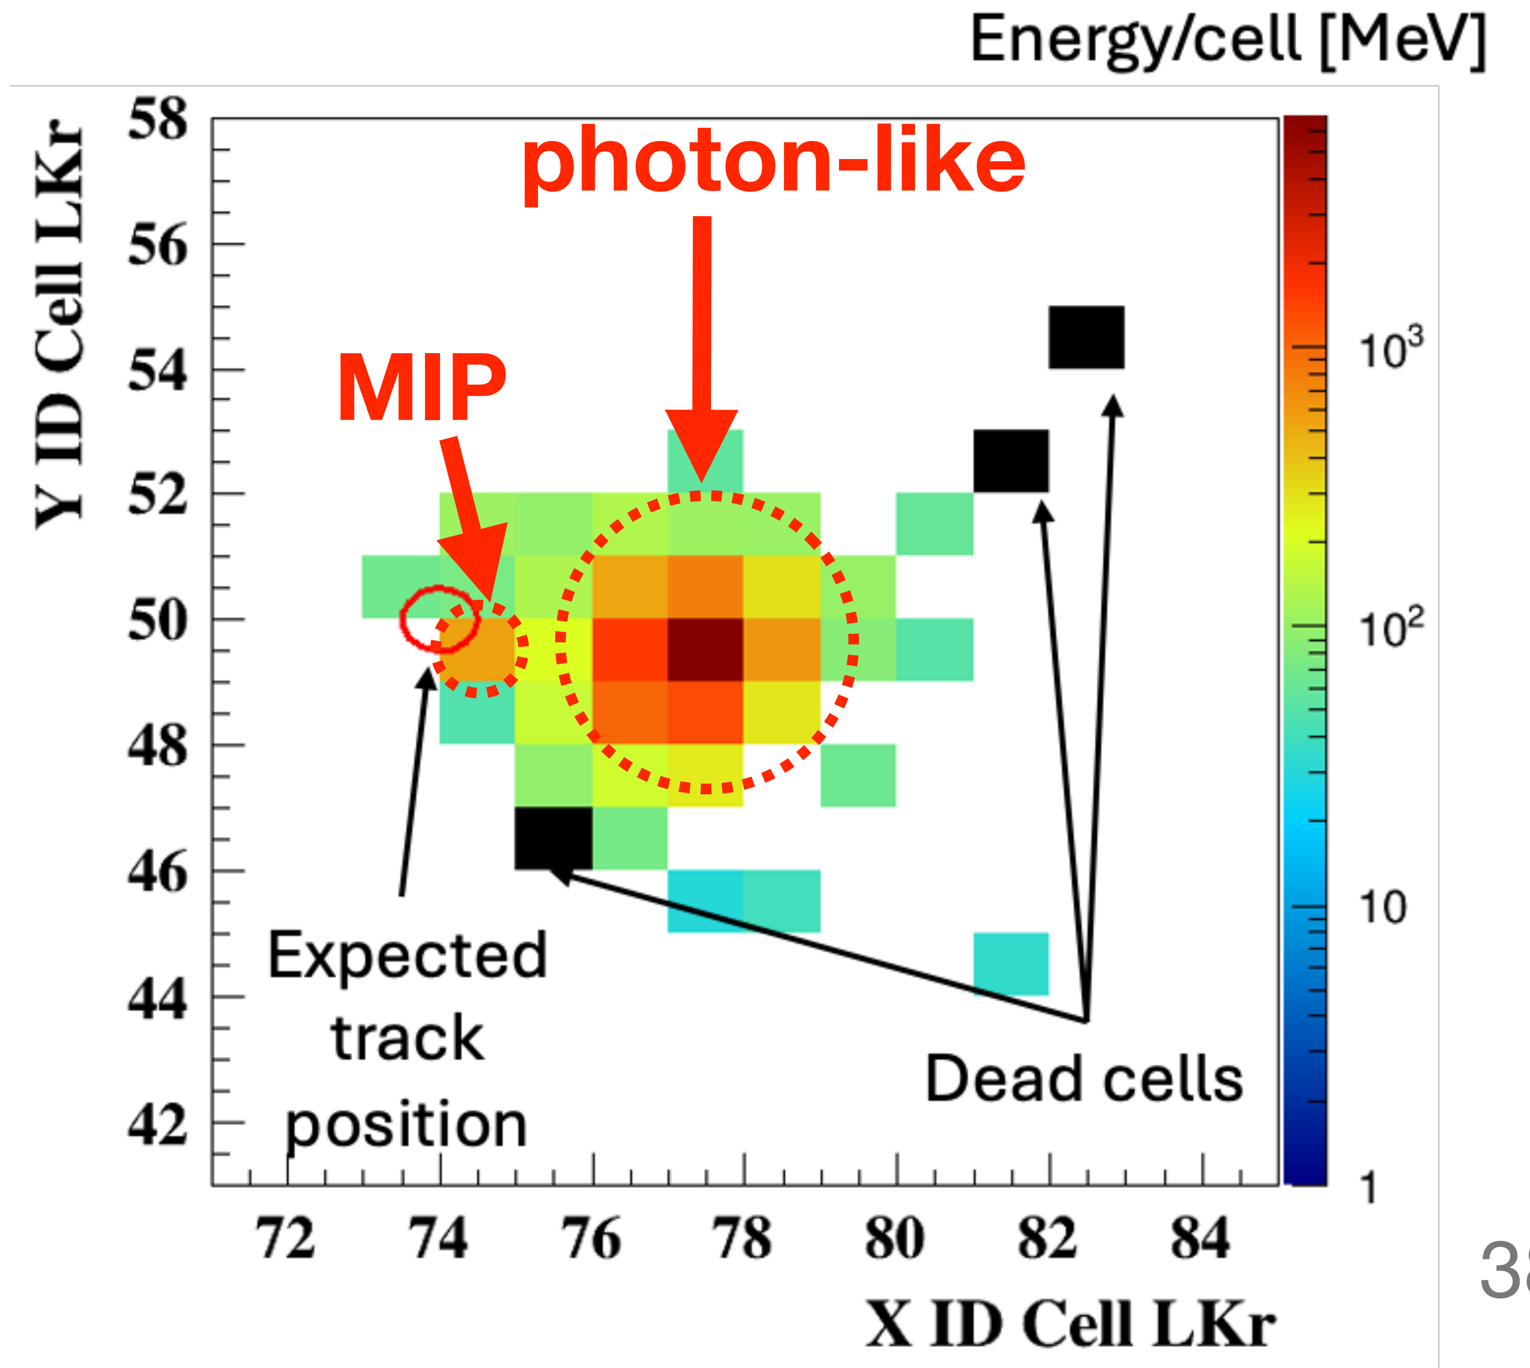
- Use MC to measure f_{tail}:

$$N_{bg}(K^+ \to \pi^+\pi^+\pi^-) = 0.11 \pm 0.03$$

Radiative decays: $K^+ \to \pi^+\pi^0\gamma$ & $K^+ \to \mu^+\nu\gamma$

- $K^+ \to \pi^+\pi^0\gamma$ **: included with "kinematic tails" estimation.**
  - Suppression: photon vetos, rejection with additional γ is 30x stronger.
  - Estimation: MC + measured single photon rejection efficiency : $N_{bg}(K^+ \to \pi^+\pi^0\gamma) = 0.07 \pm 0.01$
  - Validation: m^2_{miss} control regions (CR1,2 - see later)
- $K^+ \to \mu^+\nu\gamma$ **: not included in "kinematic tails" estimation if γ overlaps μ^+ at LKr (leading to misID as π^+)**
  - Suppression: based on $(P_K - P_\mu - P_\gamma)^2$ and E_γ with γ = LKr cluster (mis)associated to muon.
    - Necessary for 2021—22 data, since Calorimetric PID degraded at higher intensities.
  - Estimation: min. Bias data control sample with signal in MUV3 : $N_{bg}(K^+ \to \mu^+\nu\gamma) = 0.8 \pm 0.4$
  - Validation: data sample without $K^+ \to \mu^+\nu\gamma$ veto and PID = "less pion-like" (Calo BDT bins below π^+ bin).

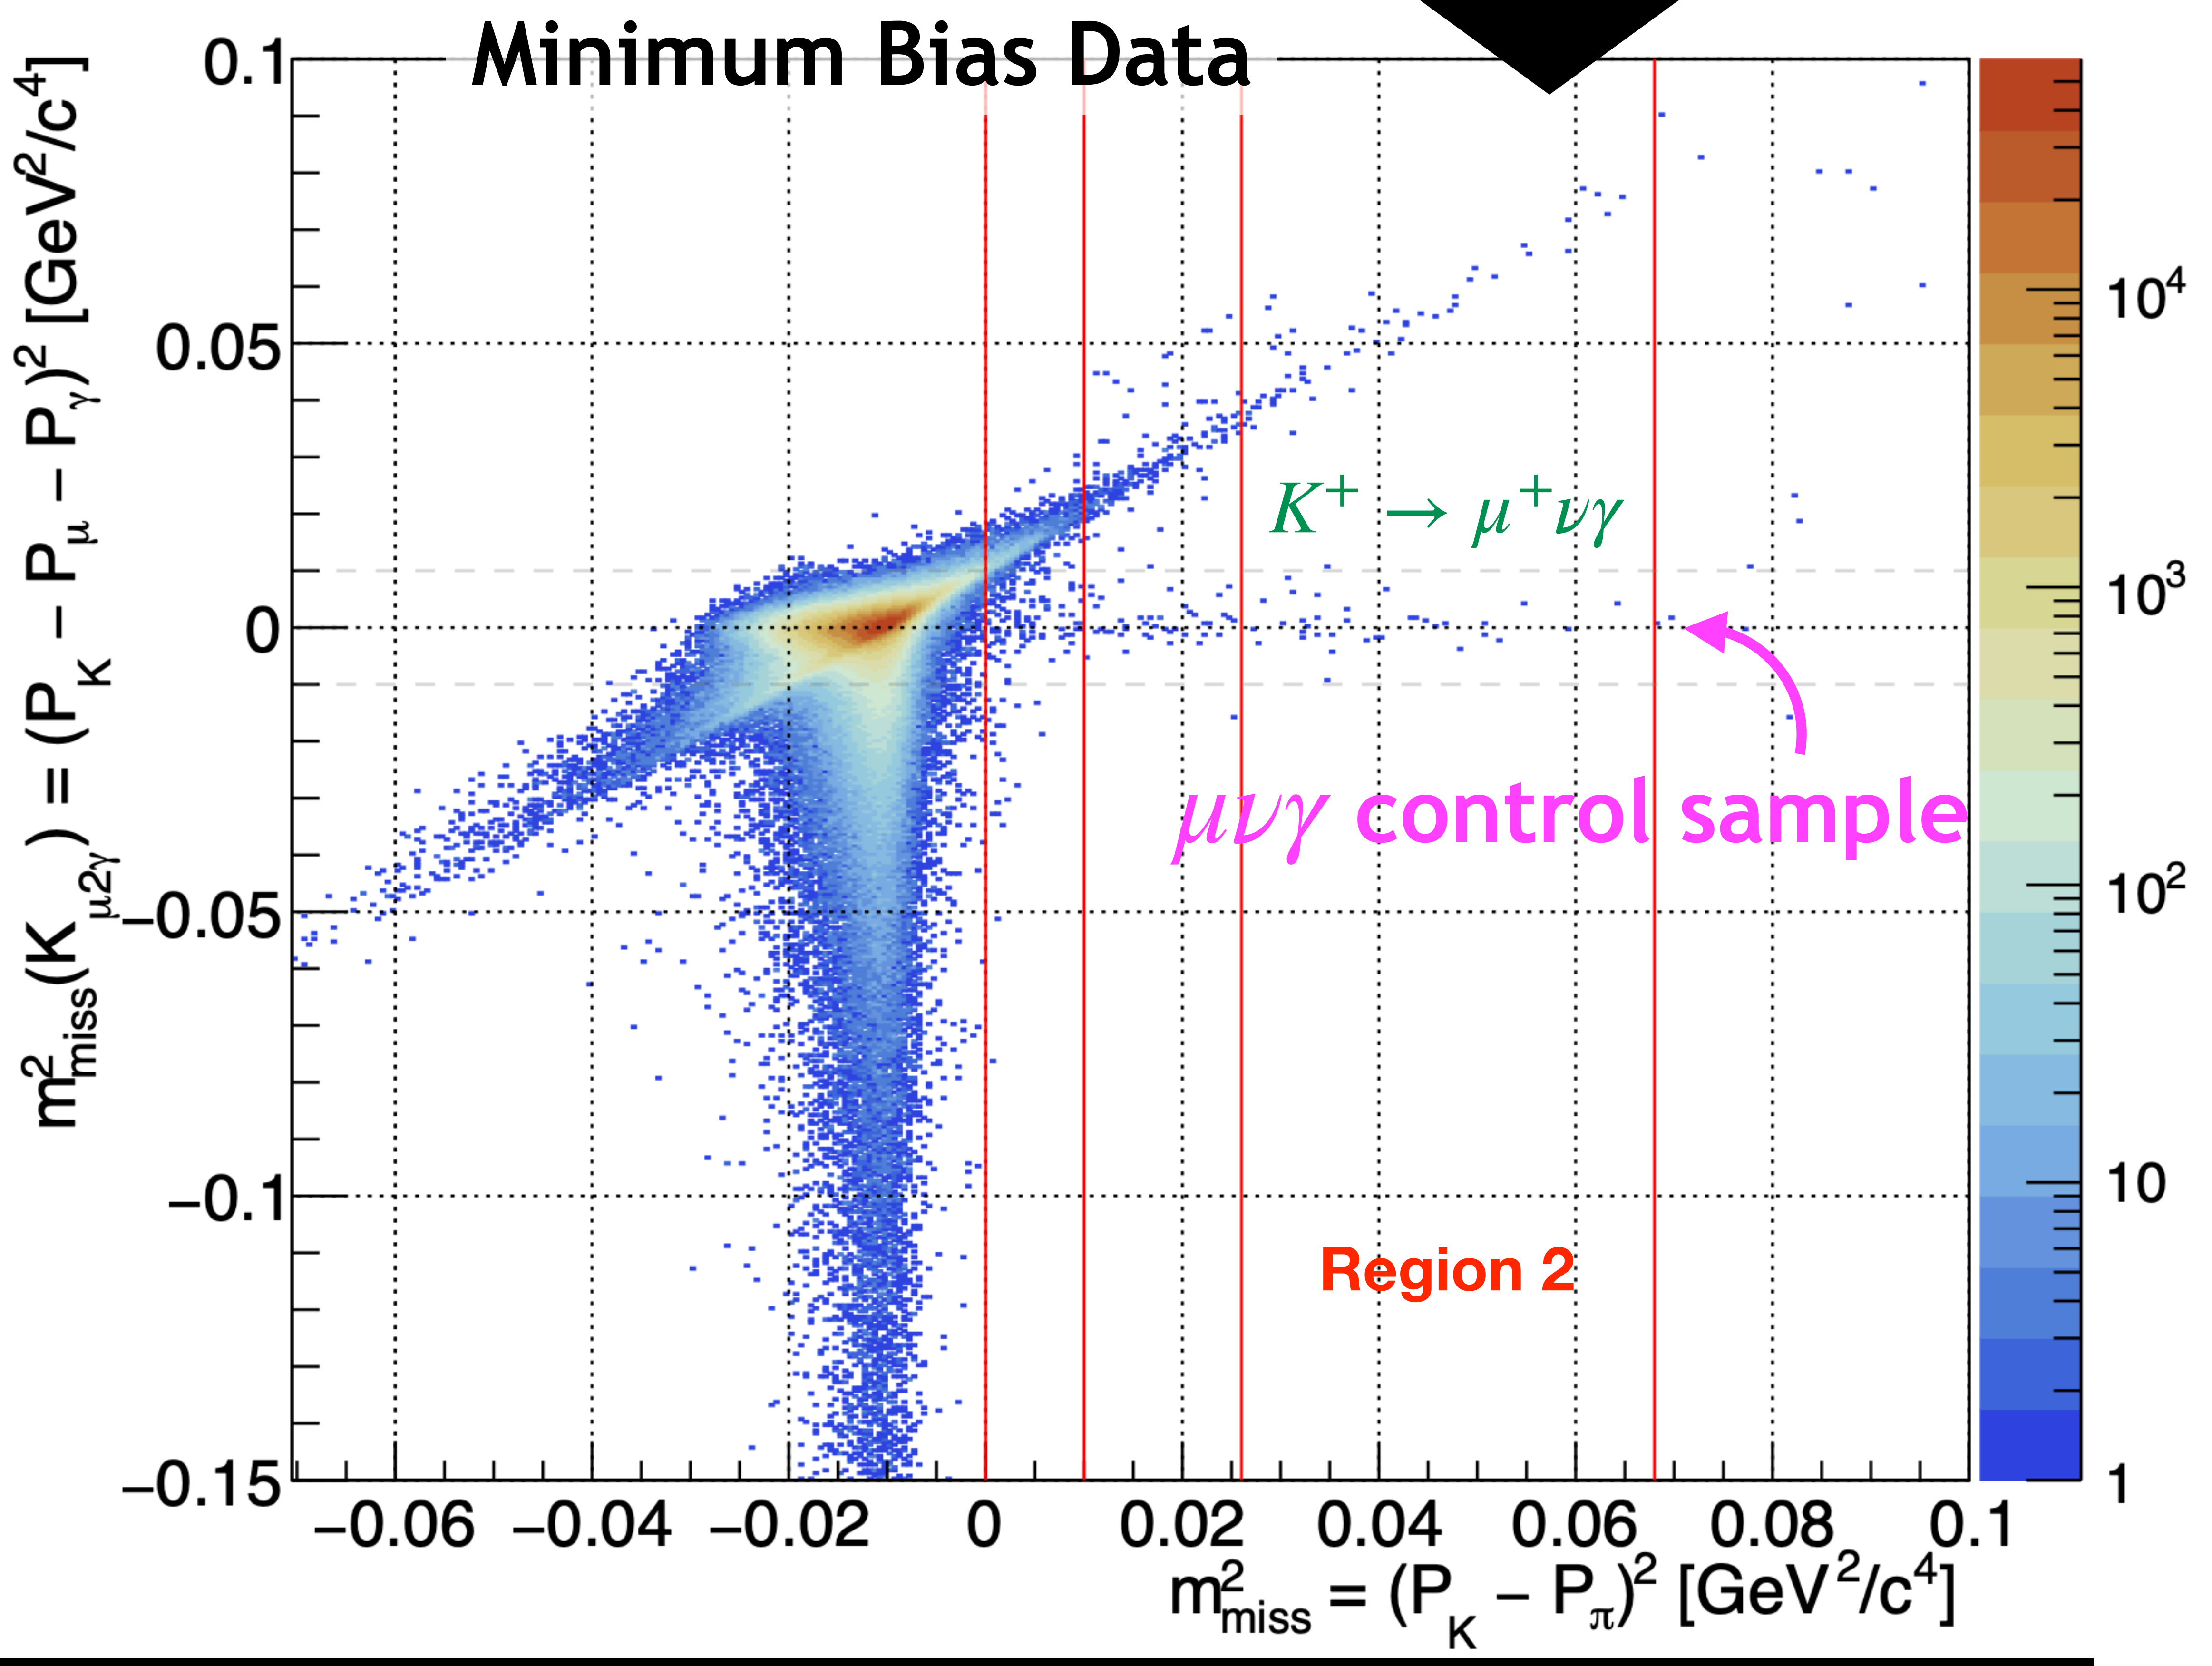




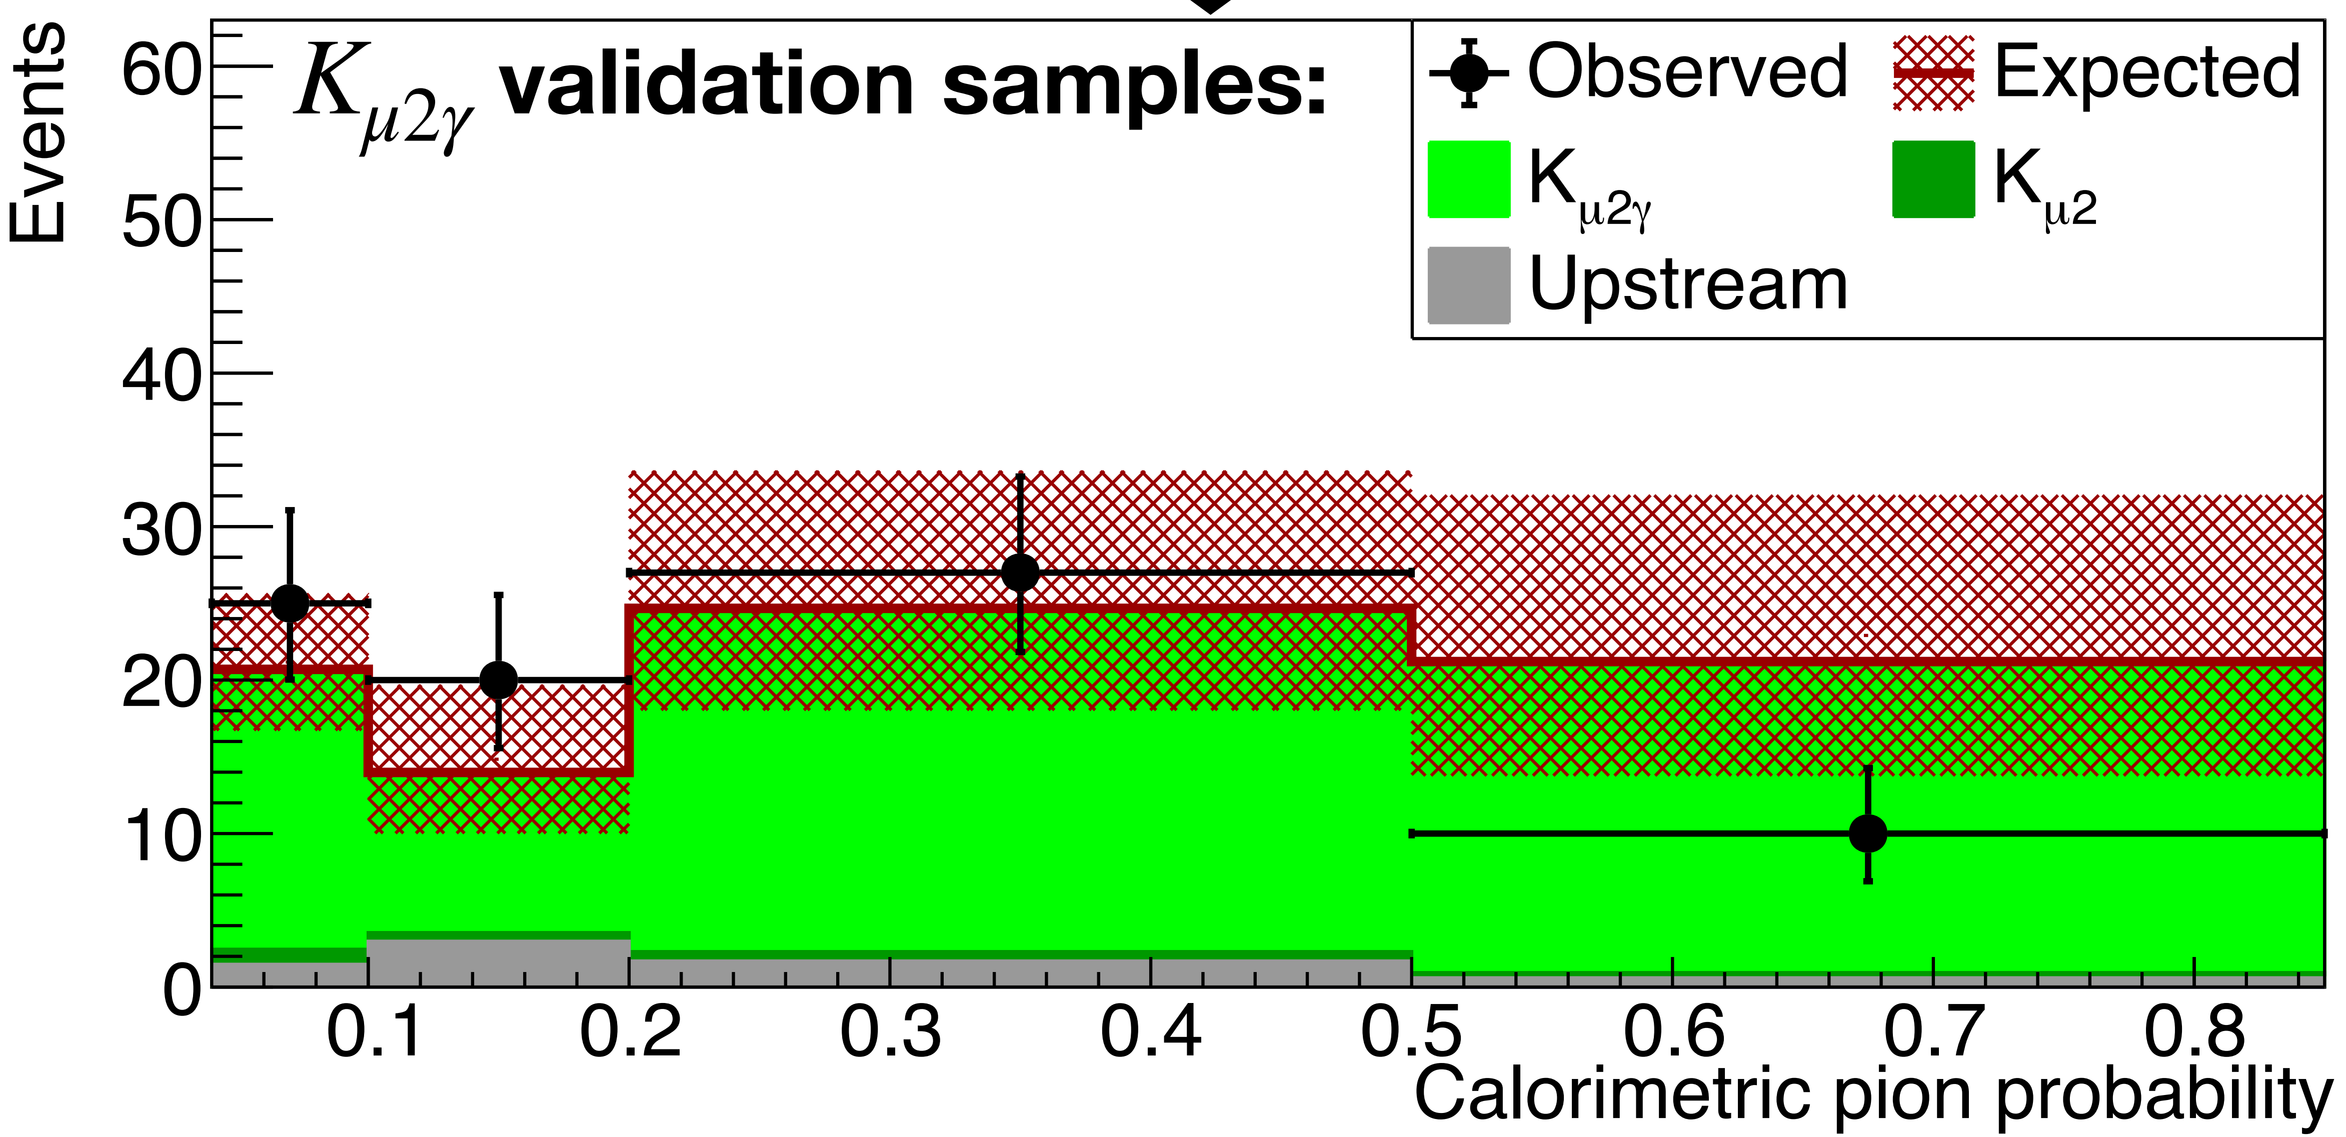
$K^+ \to \mu^+\nu\gamma$ Background

- Kinematically select $K^+ \to \mu^+\nu\gamma$ events:
  $m^2_{miss}(K_{\mu2\gamma}) = (P_K - P_\mu - P_\gamma)^2$
  - P_K : 4-momentum of K^+ from GTK (as normal)
  - P_μ : 4-momentum of track with μ^+ mass hypothesis.
  - P_γ : reconstructed from energy and position of LKr cluster (and position of K^+-μ^+ vertex).

Evaluate background expectation using $\mu\nu\gamma$ control sample from MinimumBias trigger, not applying Calorimetric BDT classifier and MUV3 signal:



Validation: data sample with PID = “less pion-like” (Calo BDT bins below π^+ bin).



- Before $K^+ \to \mu^+\nu\gamma$ veto: found excess of events at $p > 35$ GeV/c in Region 2 relative to 2016–18 data.
- Additional background identified and studied in data control samples & MC.
- $K^+ \to \mu^+\nu\gamma$ veto added to selection criteria for final analysis.

Other backgrounds

- $K^+ \to \pi^+\pi^- e^+\nu$ (K_{e4})
  - No clean control samples for K_{e4} in data: use 2×10^9 simulated decays.

Effective # of K+ — Random veto & trigger efficiencies — Acceptance : $A_{K_{e4}} = \frac{N_{MC}^{sel}}{N_{MC}^{gen}} = (1.3 \pm 0.3_{\text{stat}}) \times 10^{-8}$

$$N_{bg}(K^+ \to \pi^+\pi^- e^+\nu) = N_K \varepsilon_{RV} \varepsilon_{trig} \mathscr{B}_{K_{e4}} A_{K_{e4}}$$

Branching ratio of K_{e4} (from PDG)

$$N_{bg}(K^+ \to \pi^+\pi^- e^+\nu) = 0.89^{+0.34}_{-0.28}$$

- $K^+ \to \pi^0 \ell^+ \nu$ and $K^+ \to \pi^+ \gamma\gamma$:
  - Evaluated with simulations.
  - **Negligible contributions to total background.**

$$N_{bg}(K^+ \to \pi^0 \ell^+ \nu) < 1 \times 10^{-3}$$

$$N_{bg}(K^+ \to \pi^+ \gamma\gamma) = 0.01 \pm 0.01$$

Upstream background evaluation

$$N_{bg} = \sum_i N_i f_{cda} P_i^{match}$$

N Upstream Reference Sample: signal selection but invert CDA cut (CDA>4mm)

f_{cda} Scaling factor : bad cda —> good cda

P_{match} Probability to pass $K^+ - \pi^+$ matching

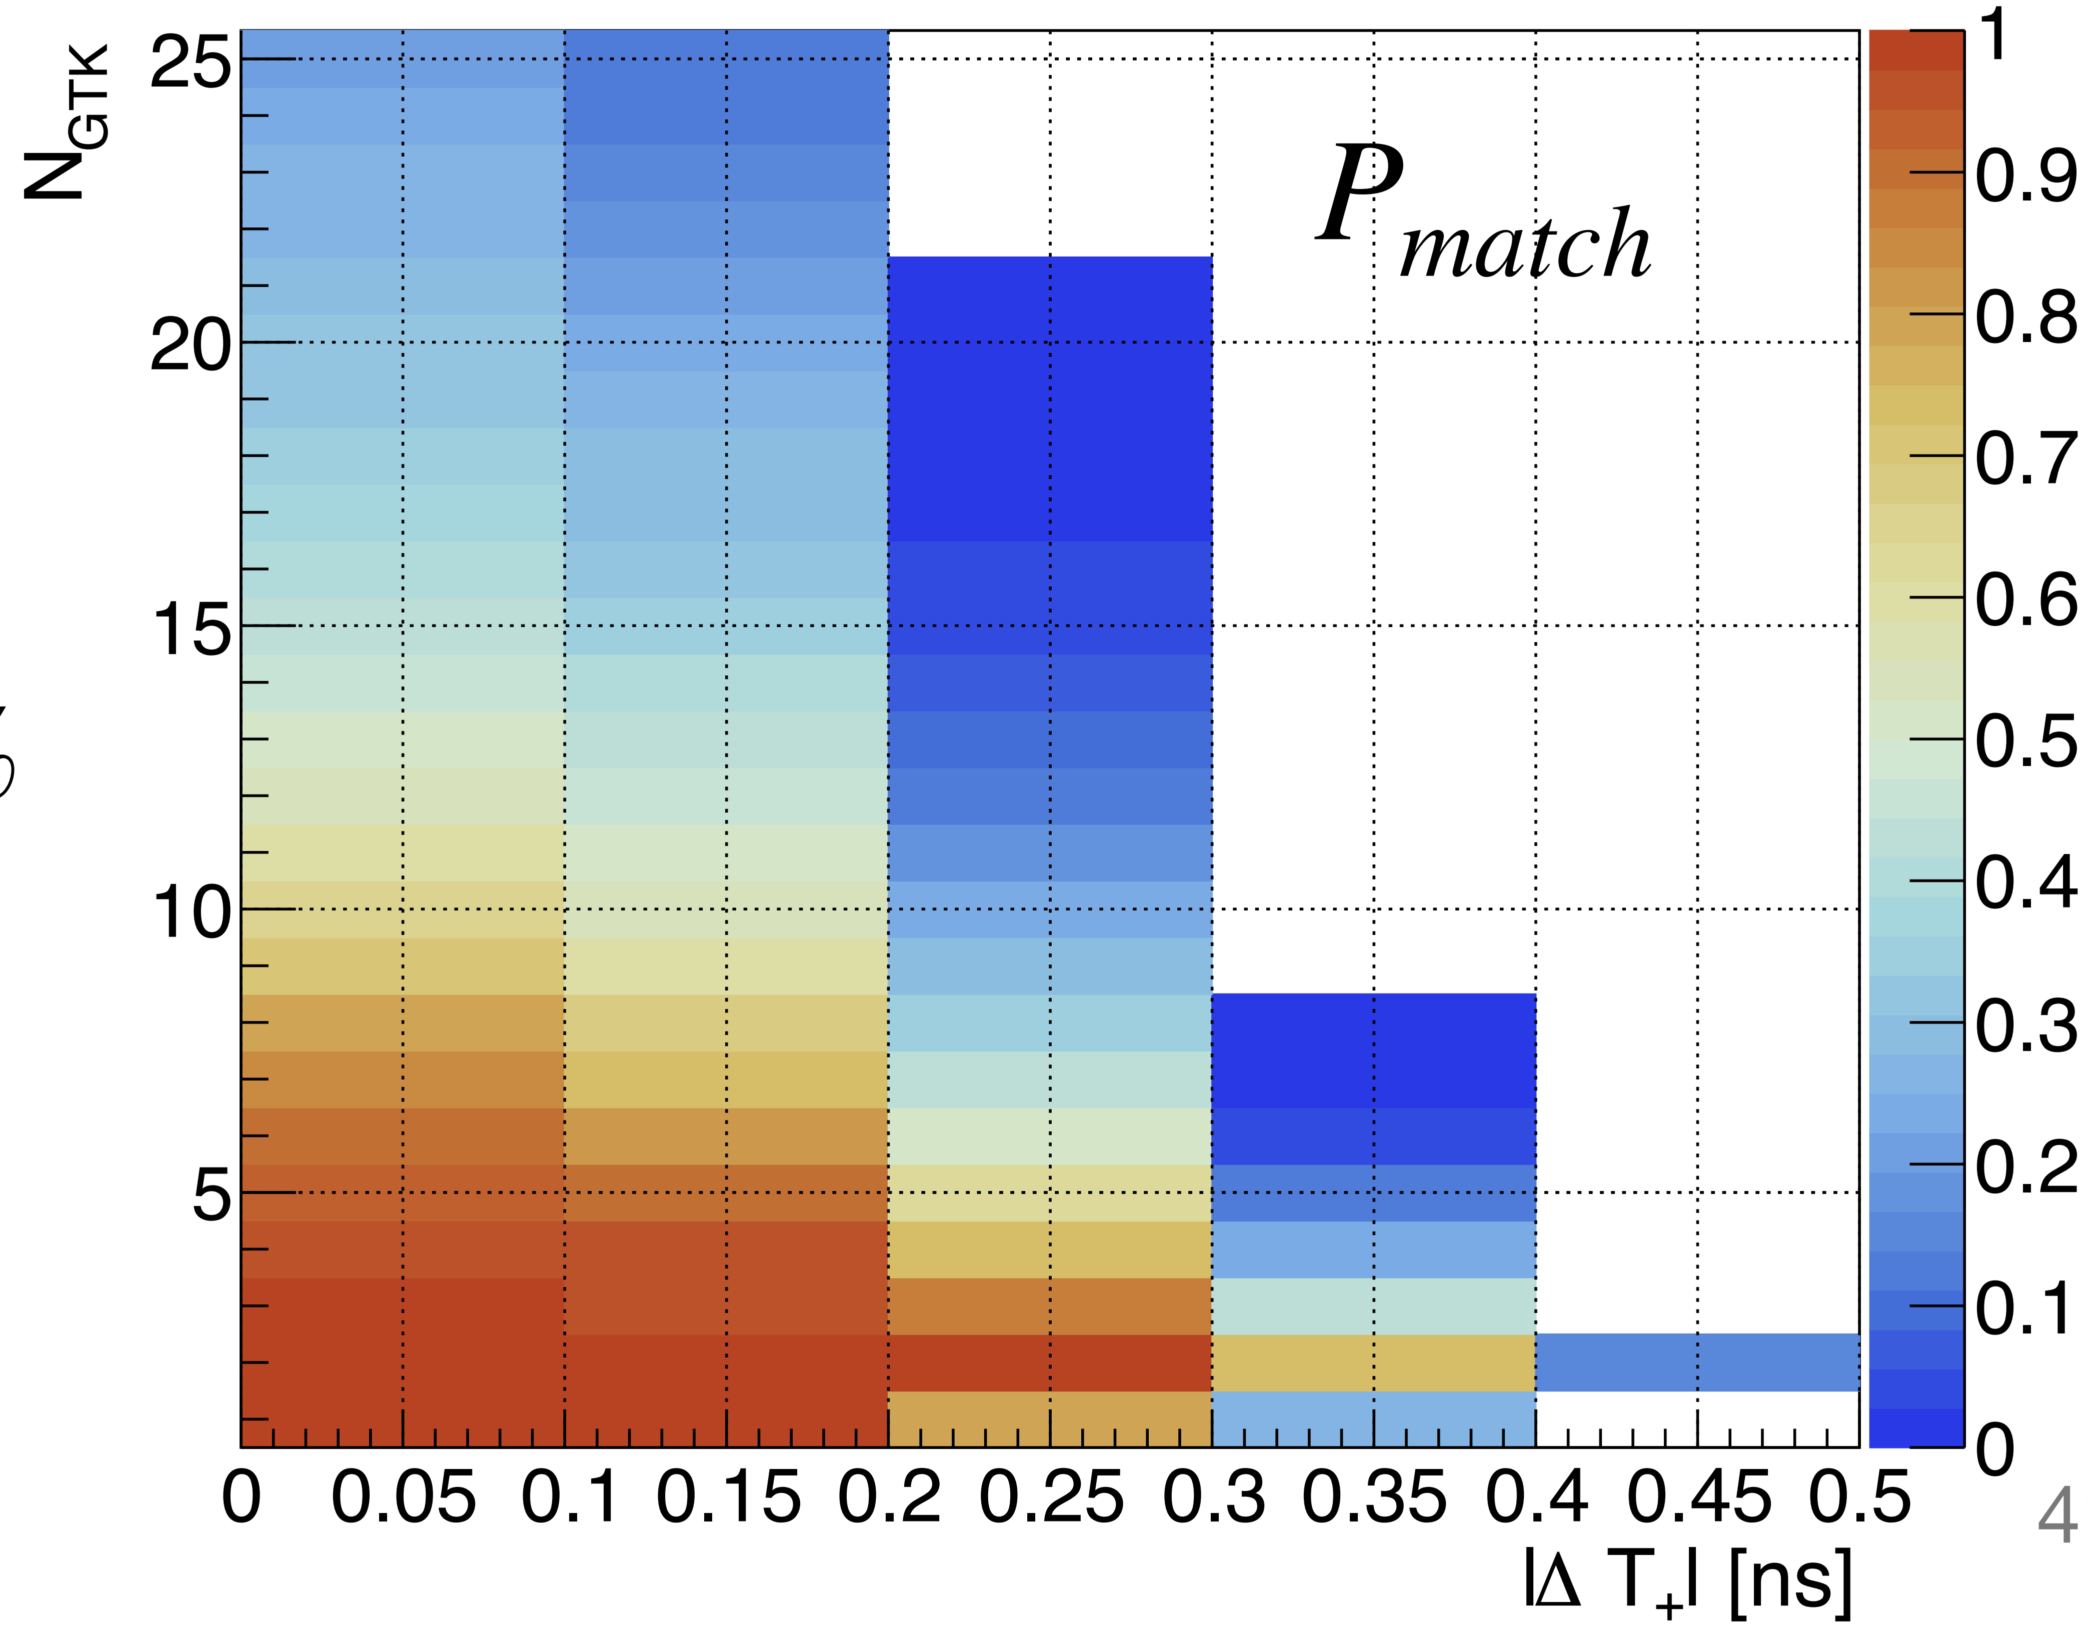
Calculate using bins (i) of $(\Delta T_+, N_{GTK})$

[Updated to fully data-driven procedure]

$N = 51$ $f_{CDA} = 0.20 \pm 0.03$ $< P_{match} > = 73\,\%$

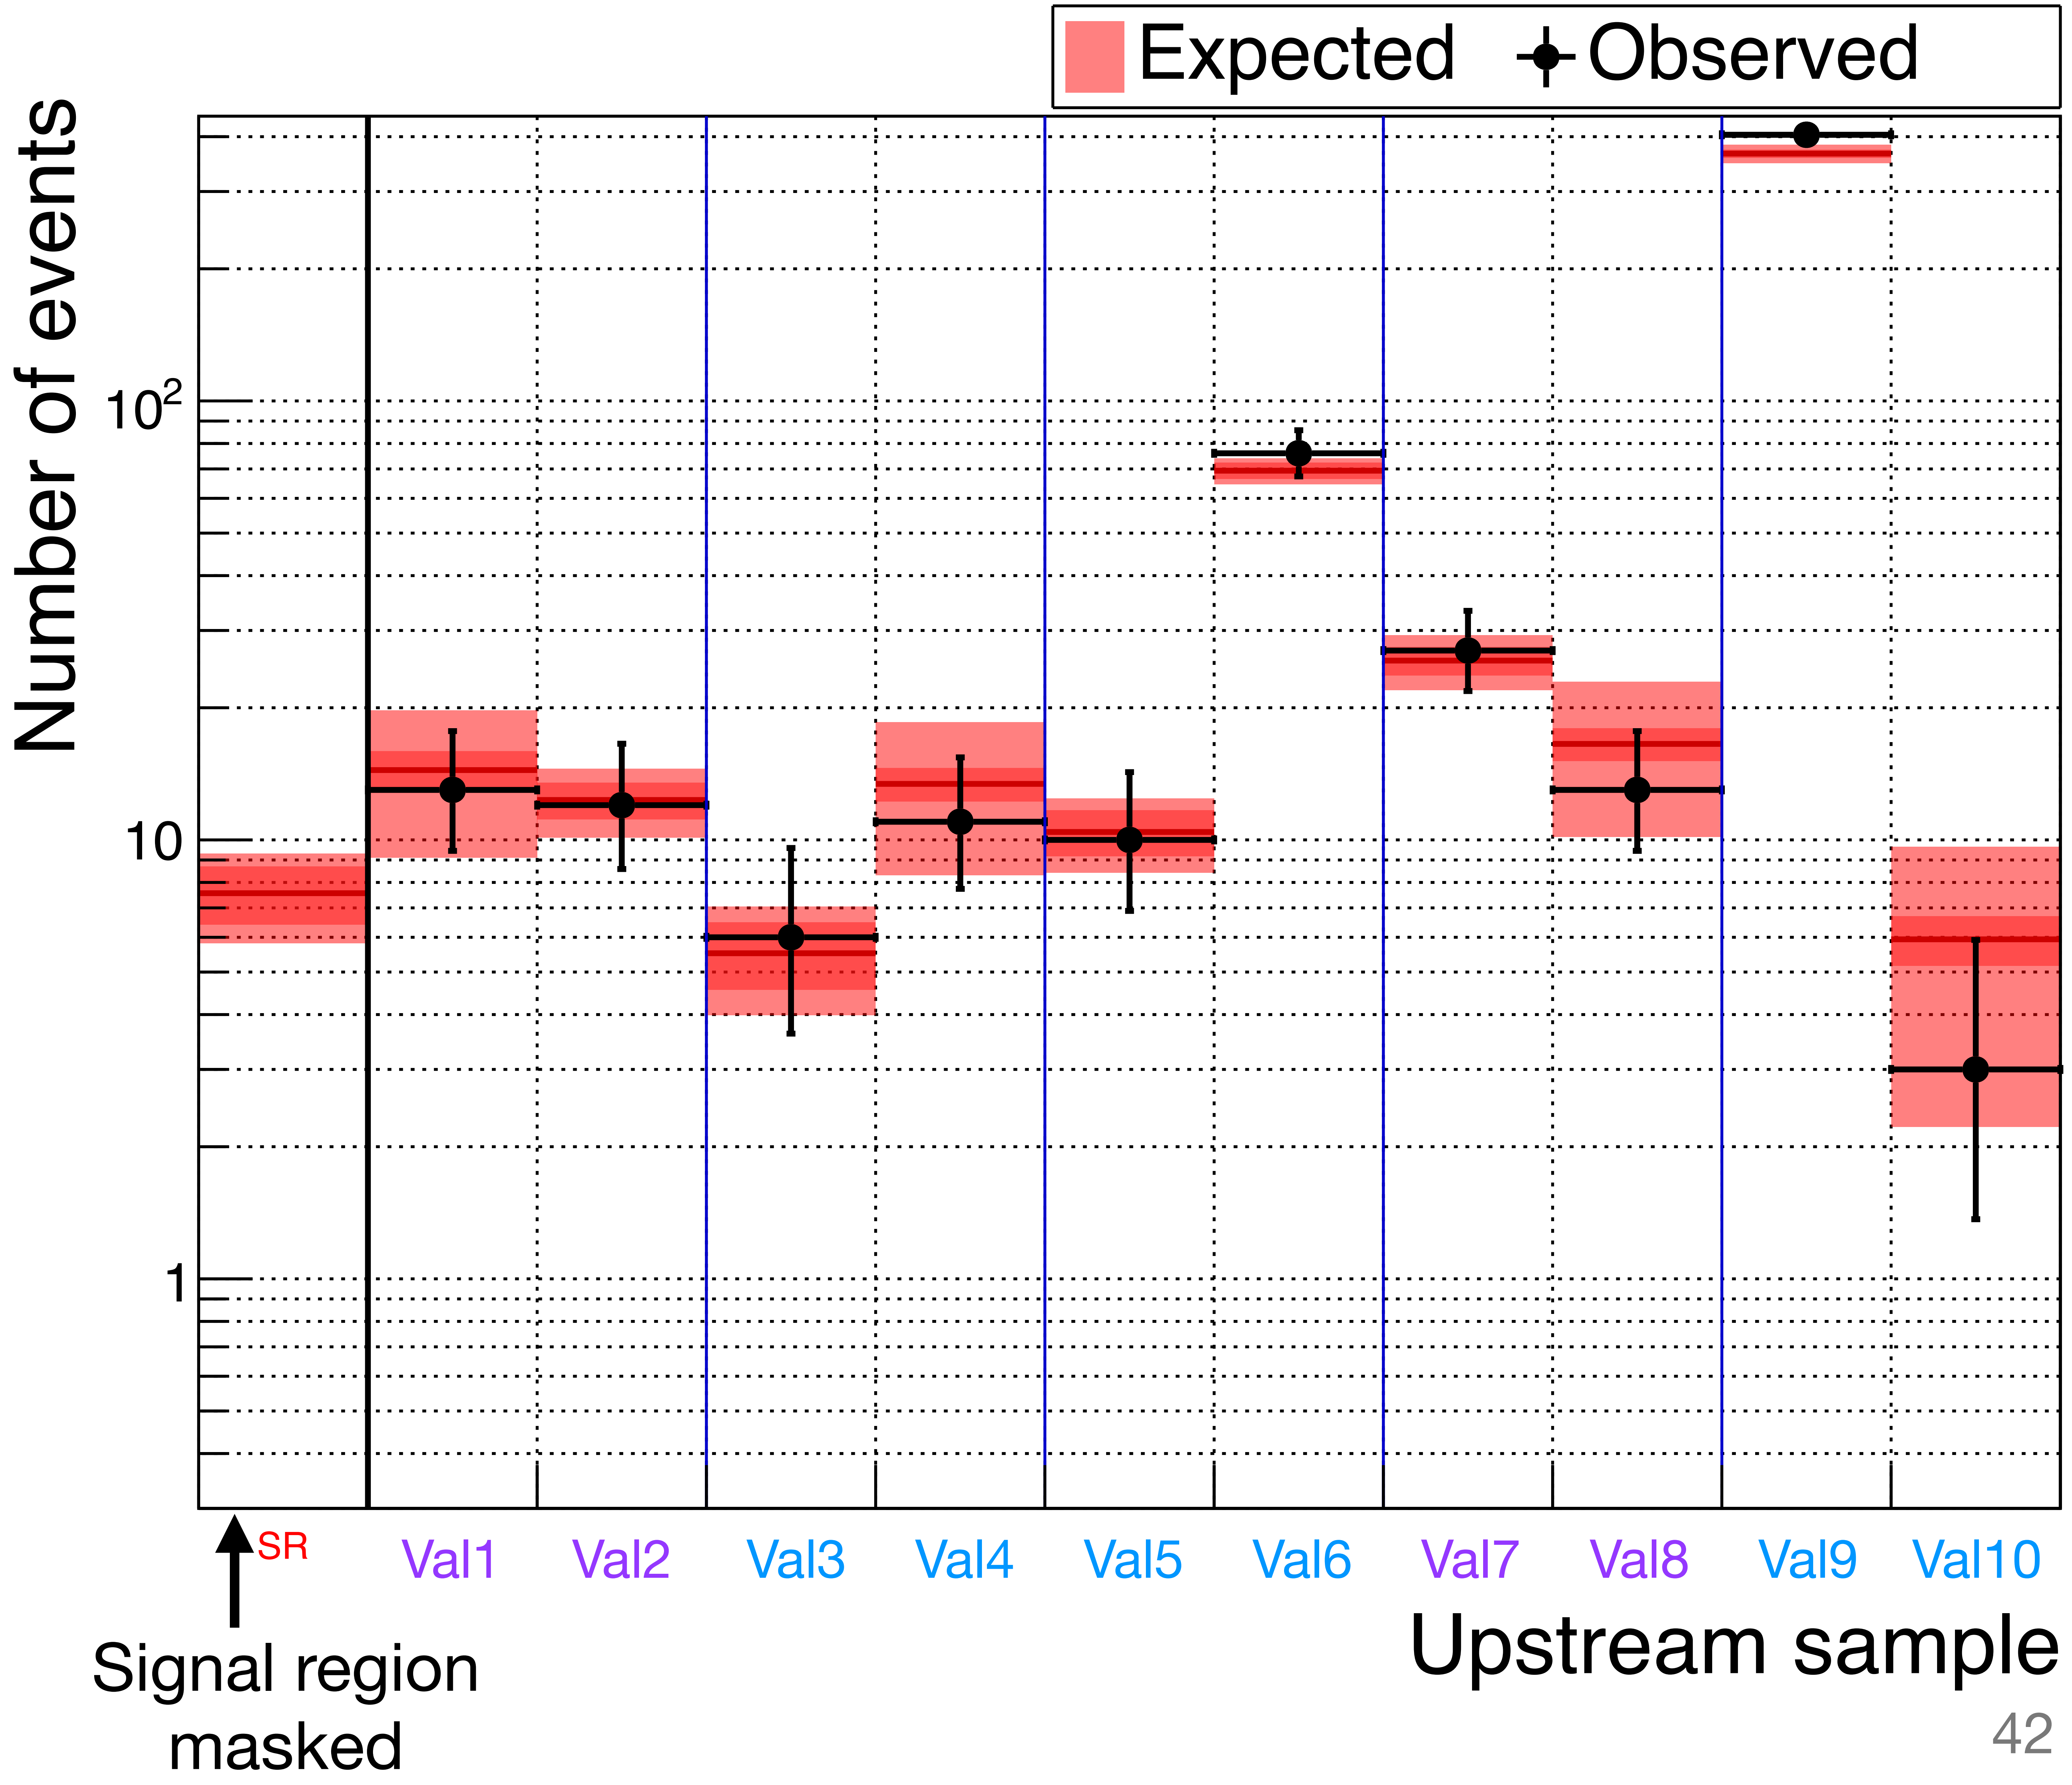
$$N_{bg}(\text{Upstream}) = 7.4^{+2.1}_{-1.8}$$

- **Upstream reference sample contains all known upstream mechanisms.**
  - N provides normalisation.
- f_{CDA} **depends only on geometry.**
- P_{match} **depends on** $(\Delta T_+, N_{GTK})$.



Upstream background validation

- **Invert & loosen upstream vetos to enrich with different mechanisms:**
  - Interaction-enriched: Val1,2,7,8
  - Accidental-enriched: Val3,4,5,6,9,10.
  - **All independent.**
- Expectations and observations are in good agreement.
- Number of events rejected by VetoCounter:
  - (i.e. events in signal region with associated VC signal)
  - $N_{exp}^{VC\,rej.} = 6.9 \pm 1.4$, $N_{obs}^{VC\,rej.} = 9$
- **VetoCounter is essential to control upstream background.**



Summary of expectations

Backgrounds

$K^+ \to \pi^+\pi^0(\gamma)$	0.83 ± 0.05
$K^+ \to \pi^+\pi^0$	0.76 ± 0.04
$K^+ \to \pi^+\pi^0\gamma$	0.07 ± 0.01
$K^+ \to \mu^+\nu(\gamma)$	1.70 ± 0.47
$K^+ \to \mu^+\nu$	0.87 ± 0.19
$K^+ \to \mu^+\nu\gamma$	0.82 ± 0.43
$K^+ \to \pi^+\pi^+\pi^-$	0.11 ± 0.03
$K^+ \to \pi^+\pi^-e^+\nu$	$0.89^{+0.34}_{-0.28}$
$K^+ \to \pi^0\ell^+\nu$	< 0.001
$K^+ \to \pi^+\gamma\gamma$	0.01 ± 0.01
Upstream	$7.4^{+2.1}_{-1.8}$
Total	$11.0^{+2.1}_{-1.9}$

Signal Sensitivity

$$\mathcal{B}_{SES} = (0.84 \pm 0.03) \times 10^{-11}$$

$$N^{SM,exp}_{\pi\nu\bar{\nu}} = \frac{\mathcal{B}^{SM}_{\pi\nu\bar{\nu}}}{\mathcal{B}_{SES}}$$

Assuming $\mathcal{B}^{SM}_{\pi\nu\bar{\nu}} = 8.4 \times 10^{-11}$:

2021–22: $N_{\pi\nu\bar{\nu}} = 10.00 \pm 0.34$

c.f. 2016–18 : $N_{\pi\nu\bar{\nu}} = 10.01 \pm 0.42$

→ Expected signal doubled by including 2021–22 data

- $N^{SM}_{\pi\nu\bar{\nu}}$ per SPS spill: 2.5×10^{-5} in 2022
  - c.f. 1.7×10^{-5} in 2018. $\Rightarrow$ **signal yield increased by 50%.**
- Sensitivity for BR $\sim \sqrt{S+B}/S = 0.5$
  - **Similar but improved with respect to 2018 analysis for same amount of data.**

Control regions

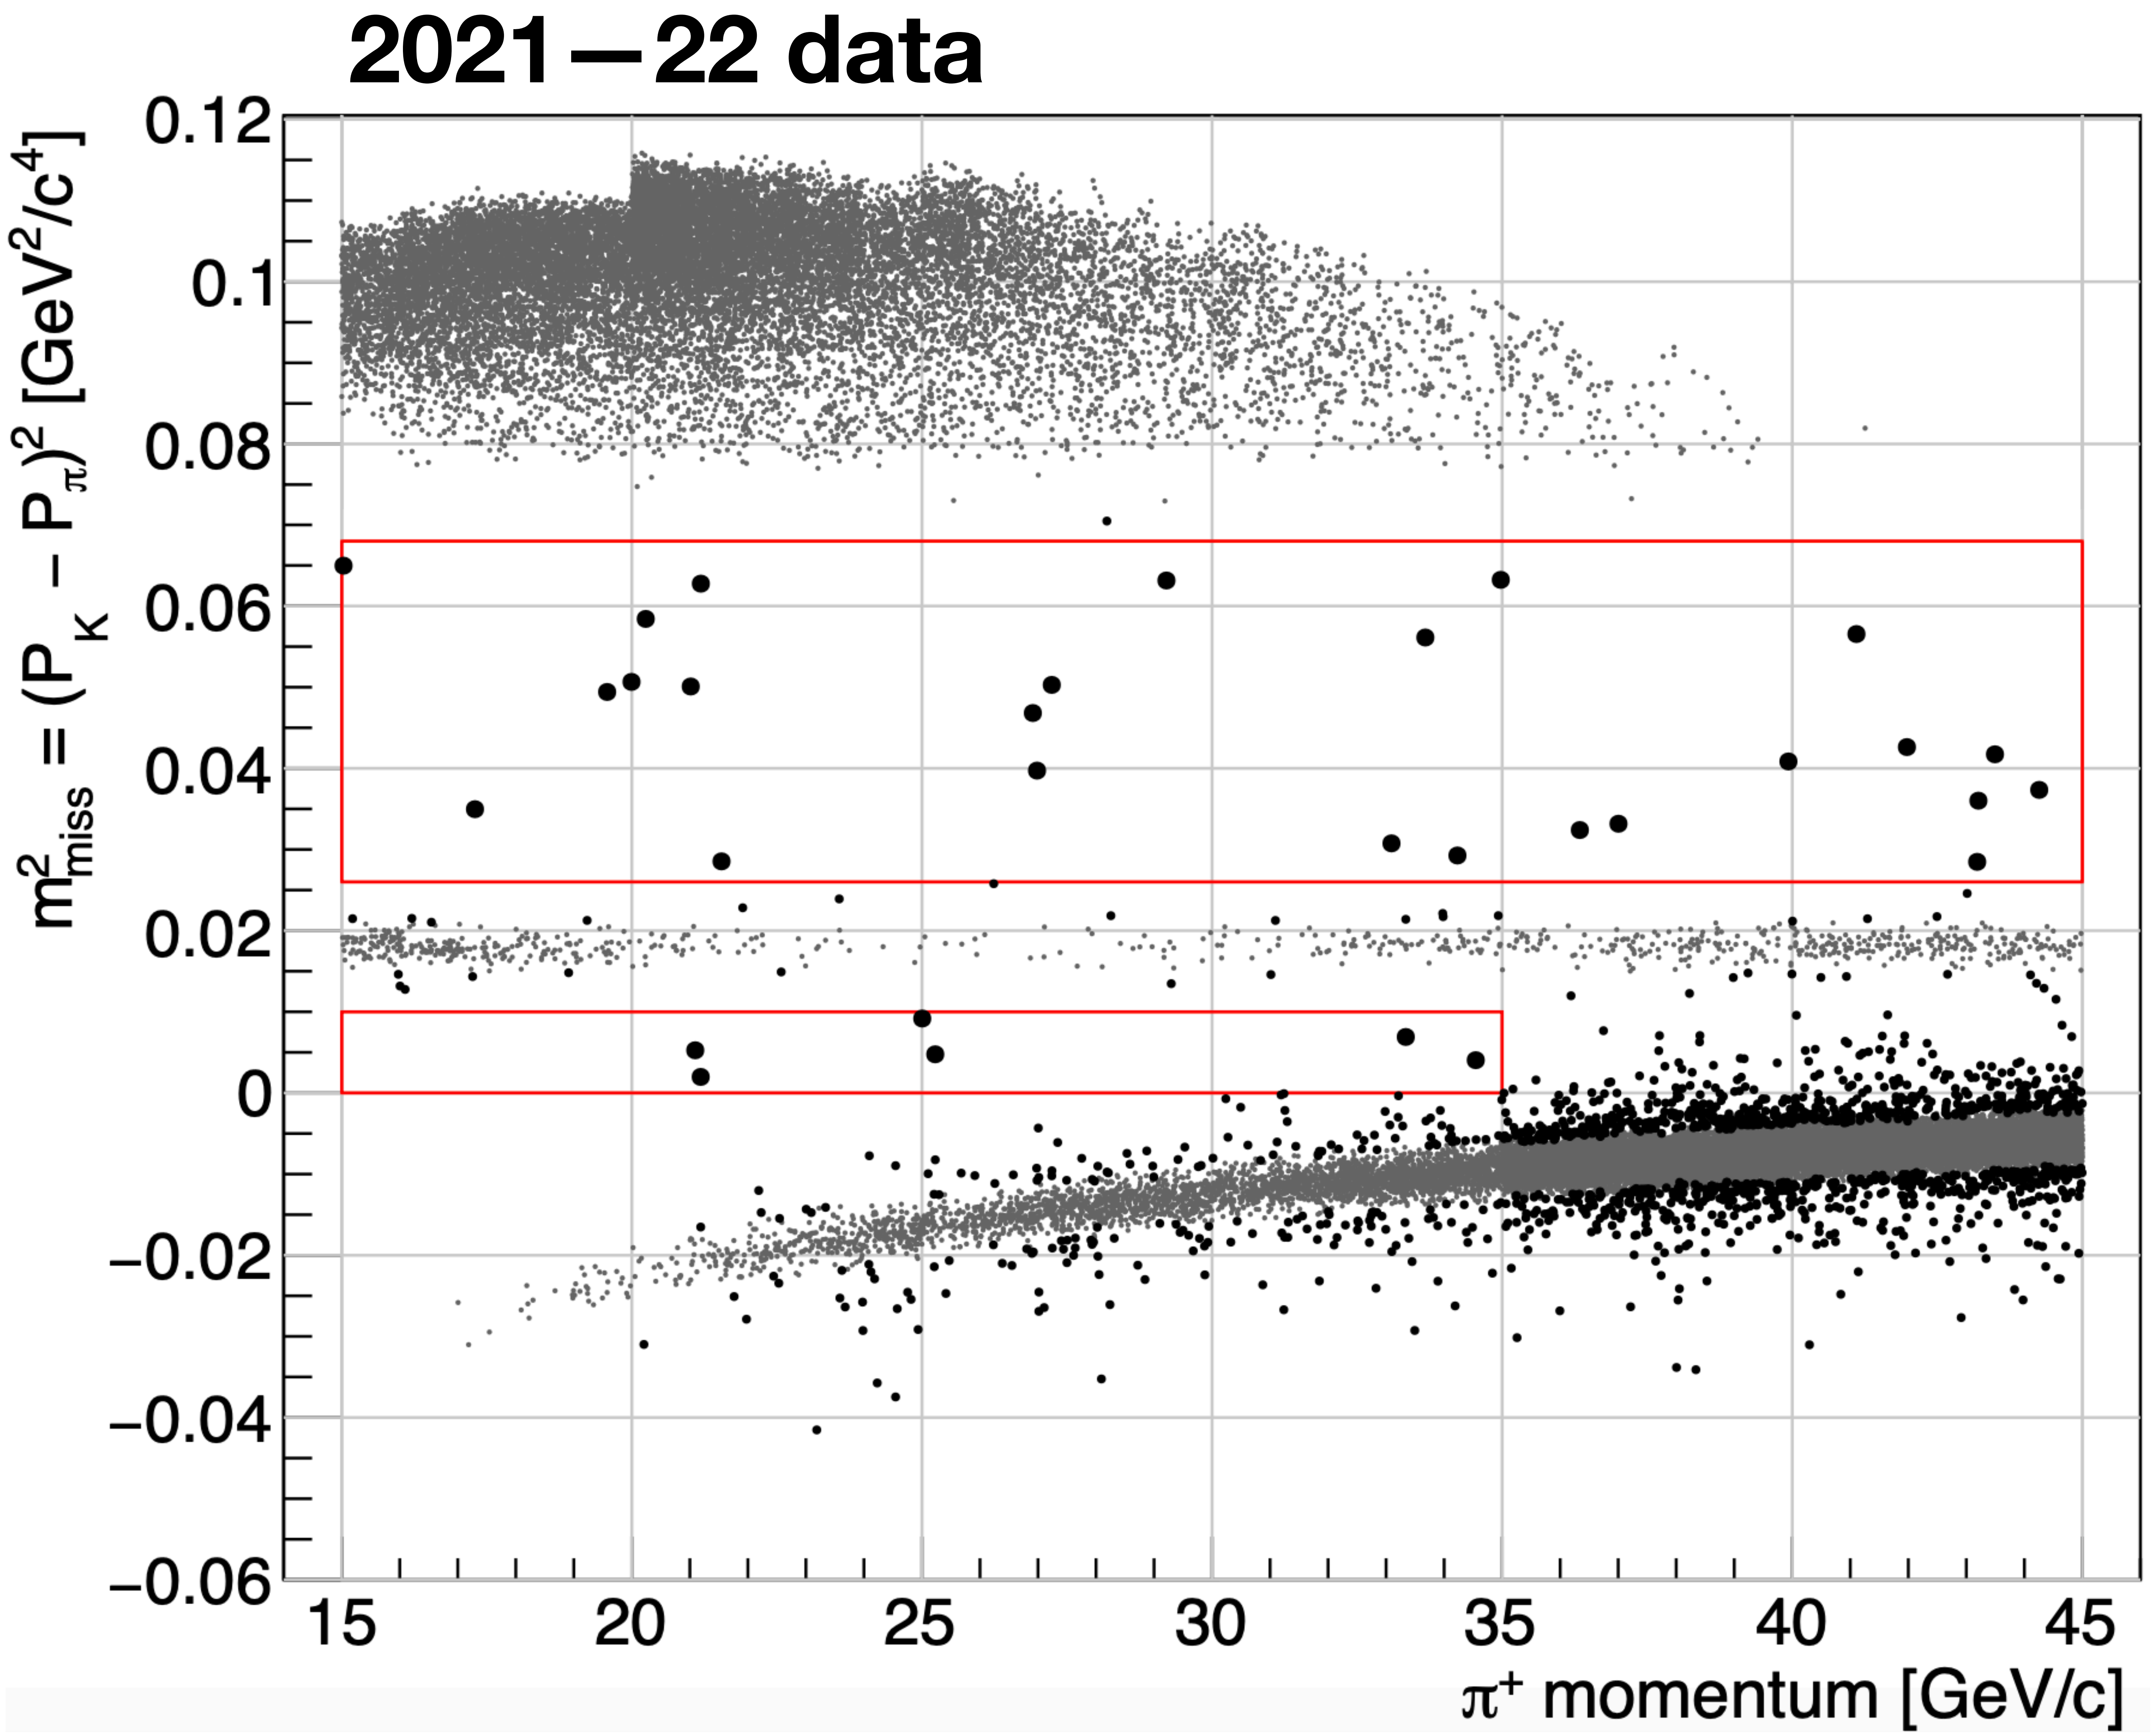
2021—22 data

- Good agreement in control regions validates background expectations.

$K^+ \to \pi^+ \nu \bar{\nu}$: New Results

2021—2022 data

Signal regions

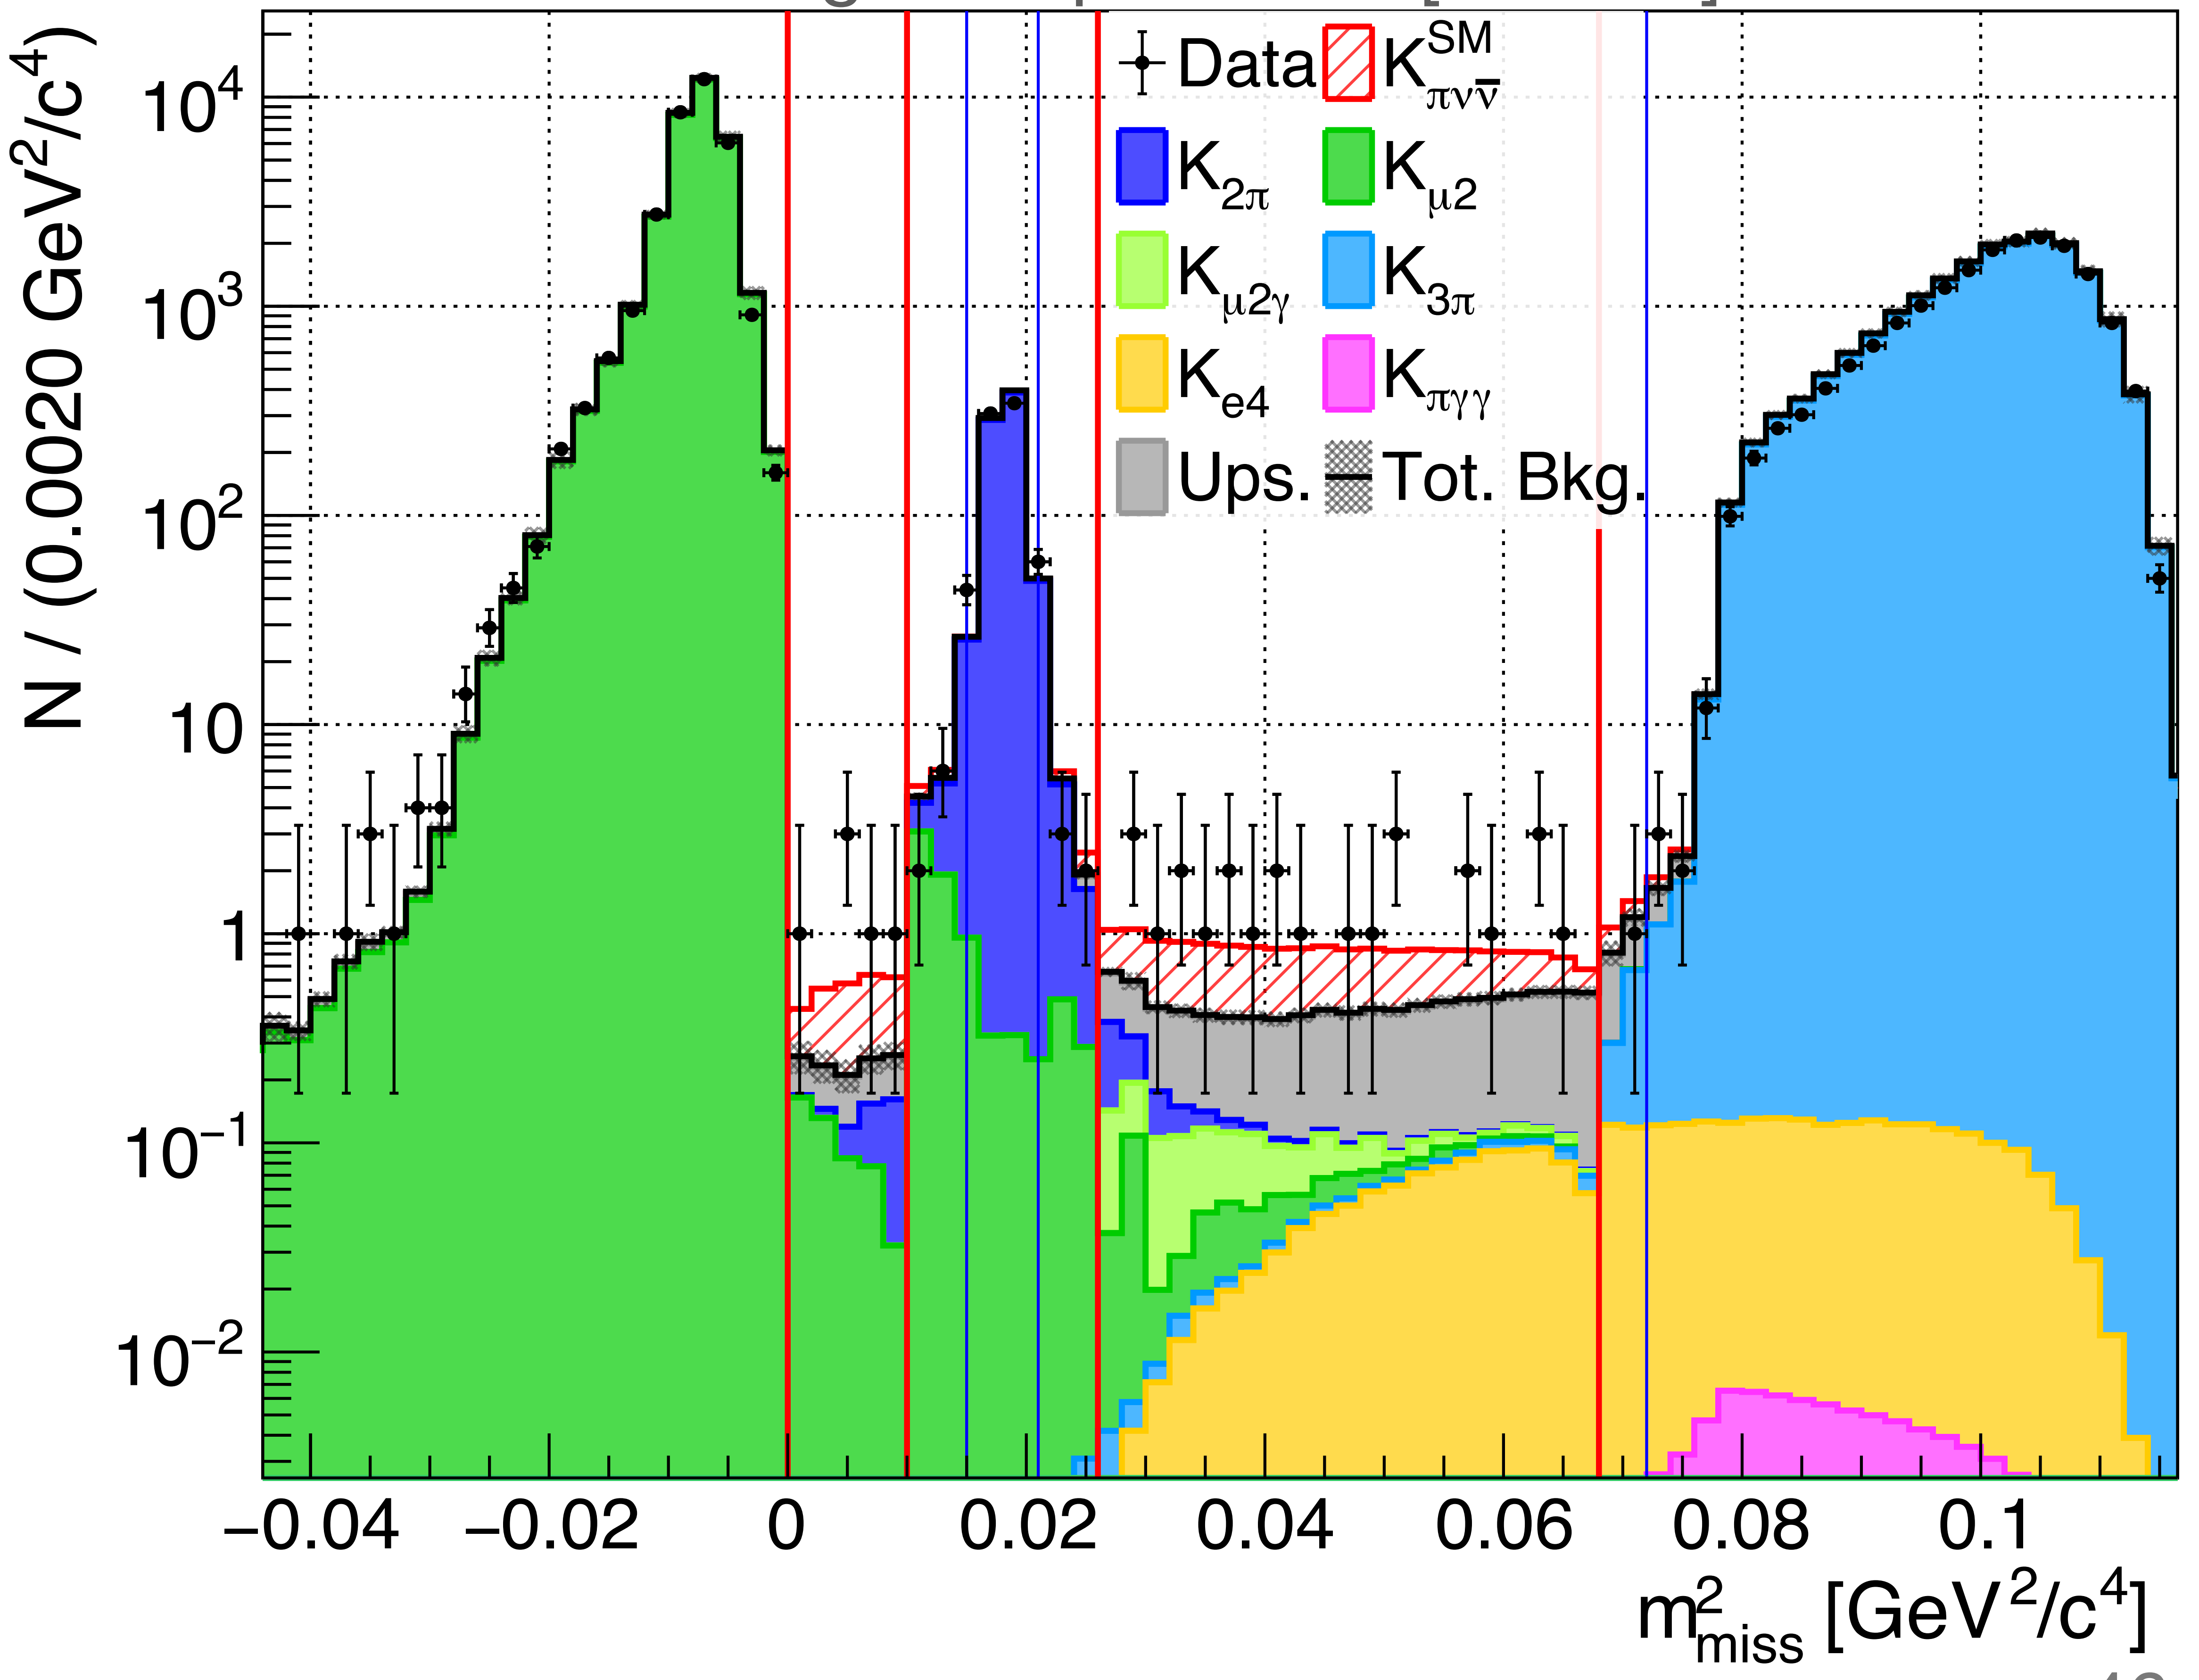


Expected SM signal, $N^{SM}_{\pi\nu\bar{\nu}} \approx 10$

Expected background, $N_{bg} = 11.0^{+2.1}_{-1.9}$

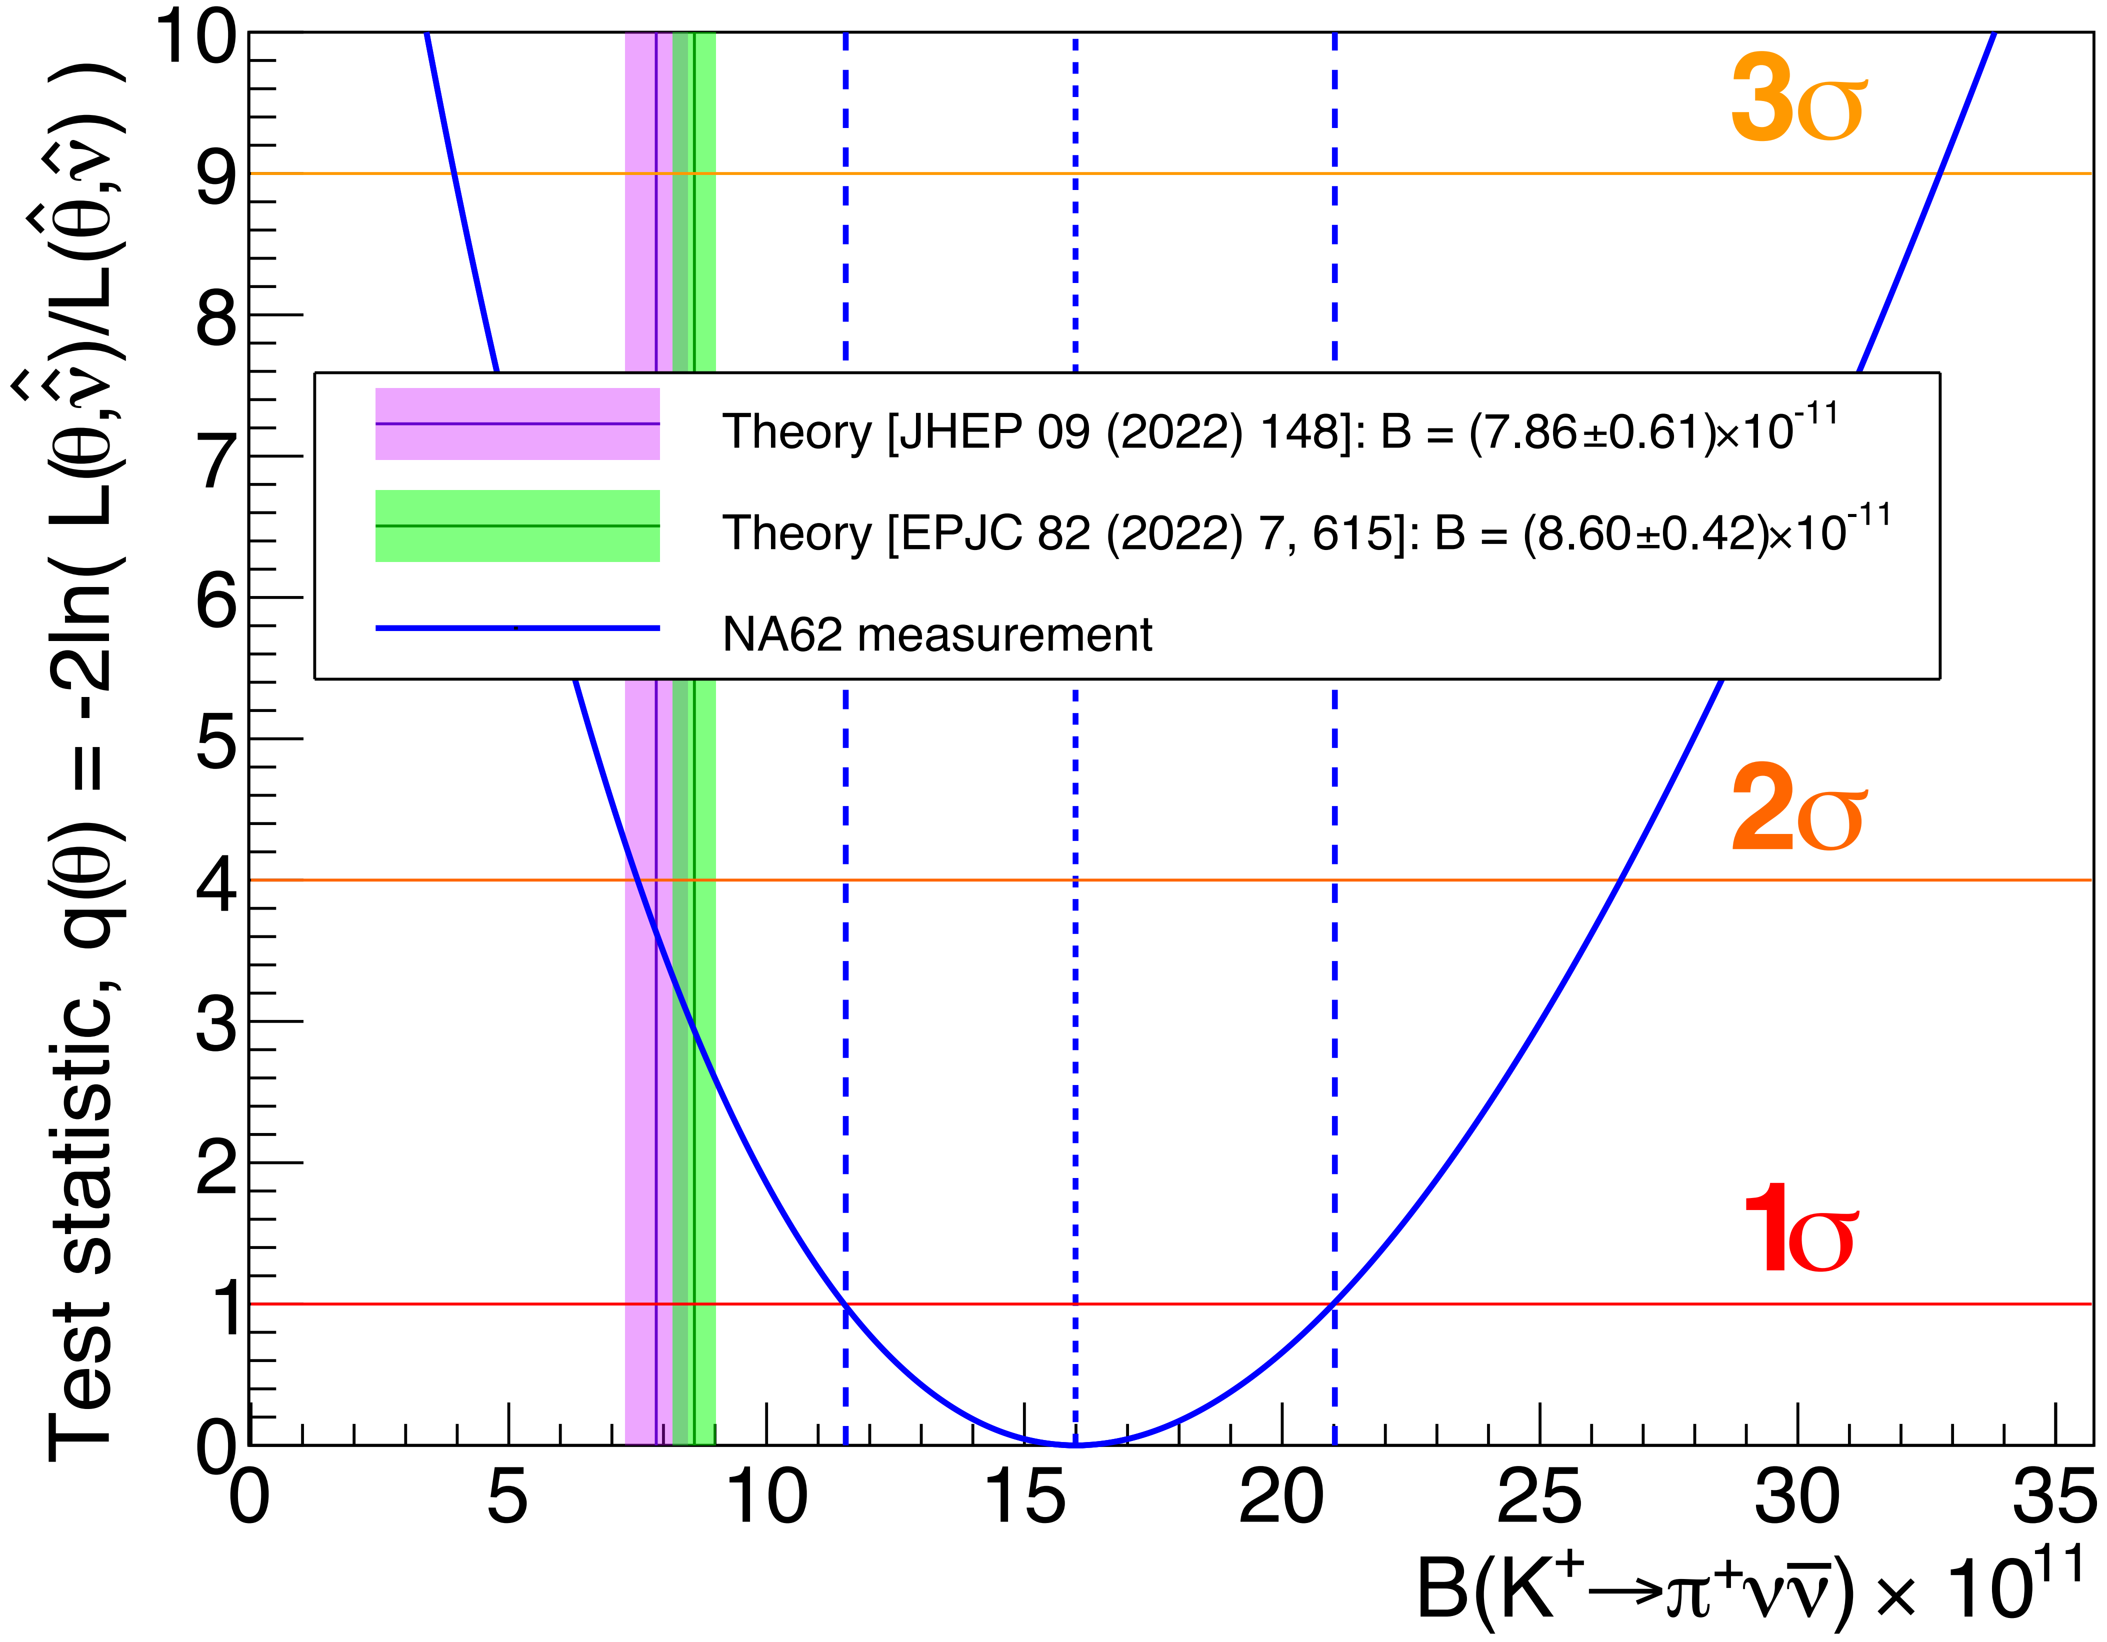
Observed, $N_{obs} = 31$

1D projection with differential background predictions & SM signal expectation [not a fit]:

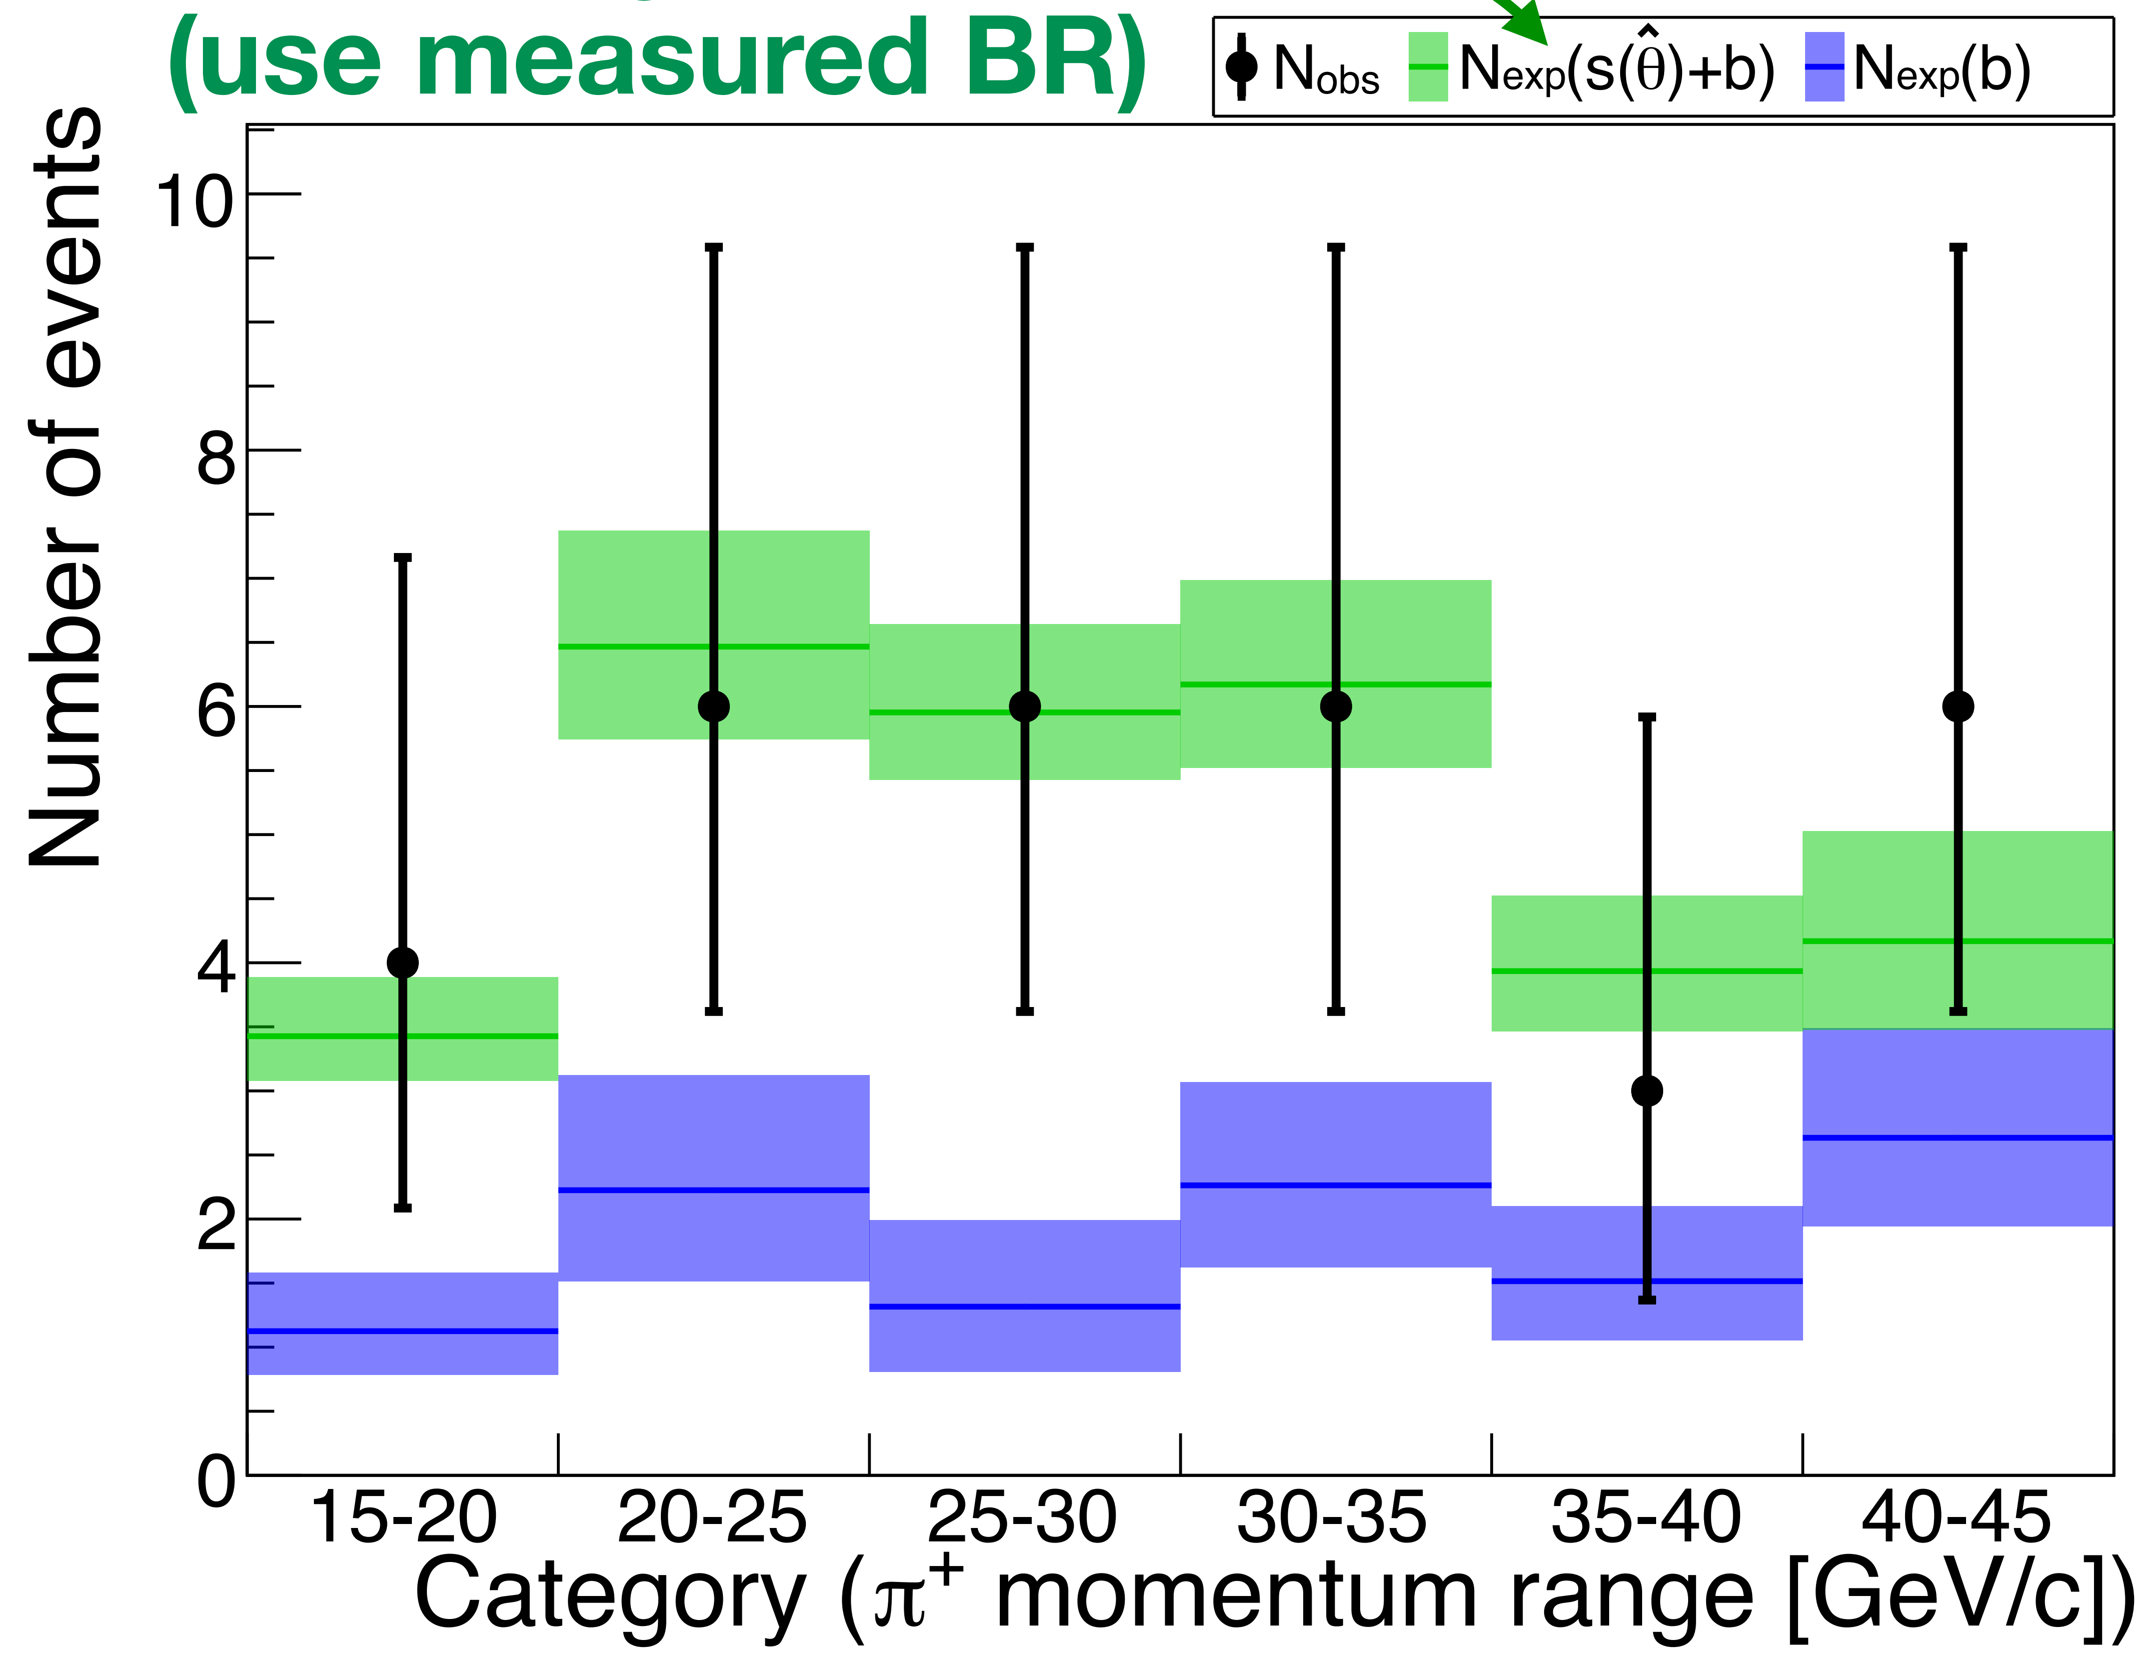


Results: 2021—22 Data

- Measure $\mathscr{B}_{\pi\nu\bar{\nu}}$ and 68% (1σ) confidence interval using a profile likelihood ratio test statistic $q(\theta)$.



- Use 6 (momentum bin) categories

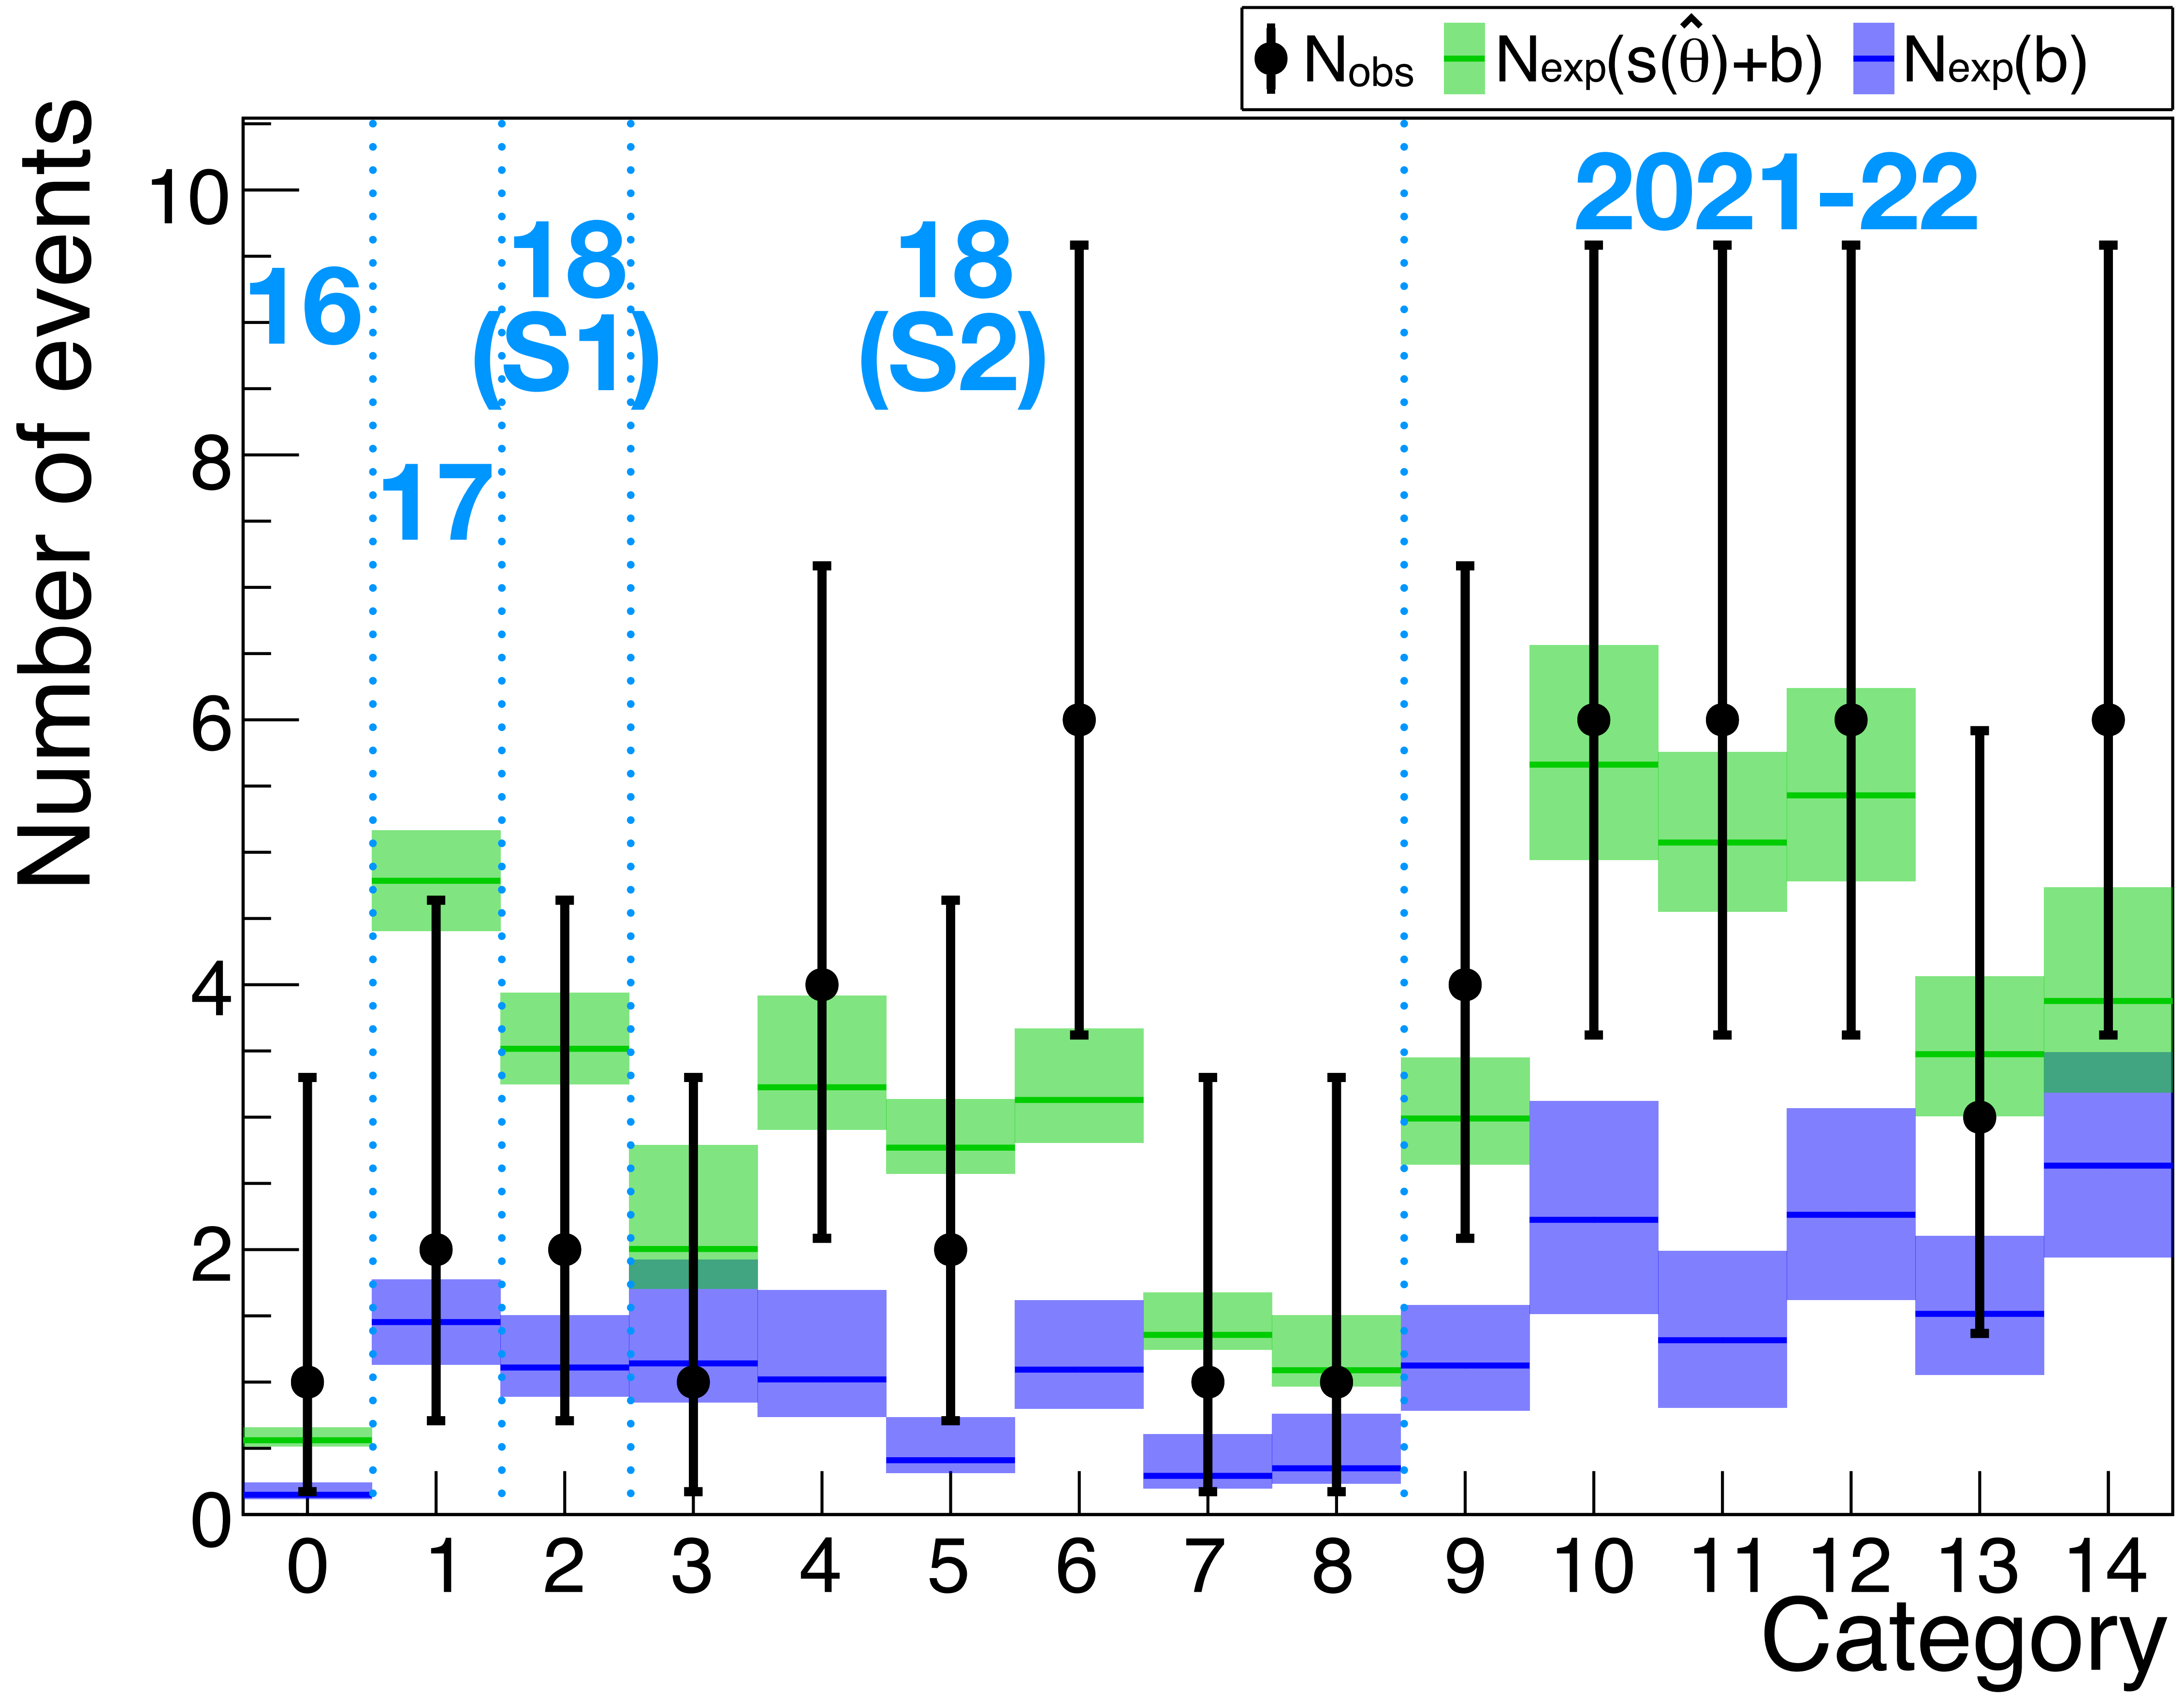


$$\mathscr{B}_{21-22}(K^+ \to \pi^+\nu\bar{\nu}) = \left(16.0^{+5.0}_{-4.5}\right) \times 10^{-11} = \left(16.0 \left(^{+4.8}_{-4.2}\right)_{\text{stat}} \left[^{+1.4}_{-1.3}\right]_{\text{syst}}\right) \times 10^{-11}$$

Evaluate statistical-only component by repeating procedure assuming exact knowledge of signal and background expectations.

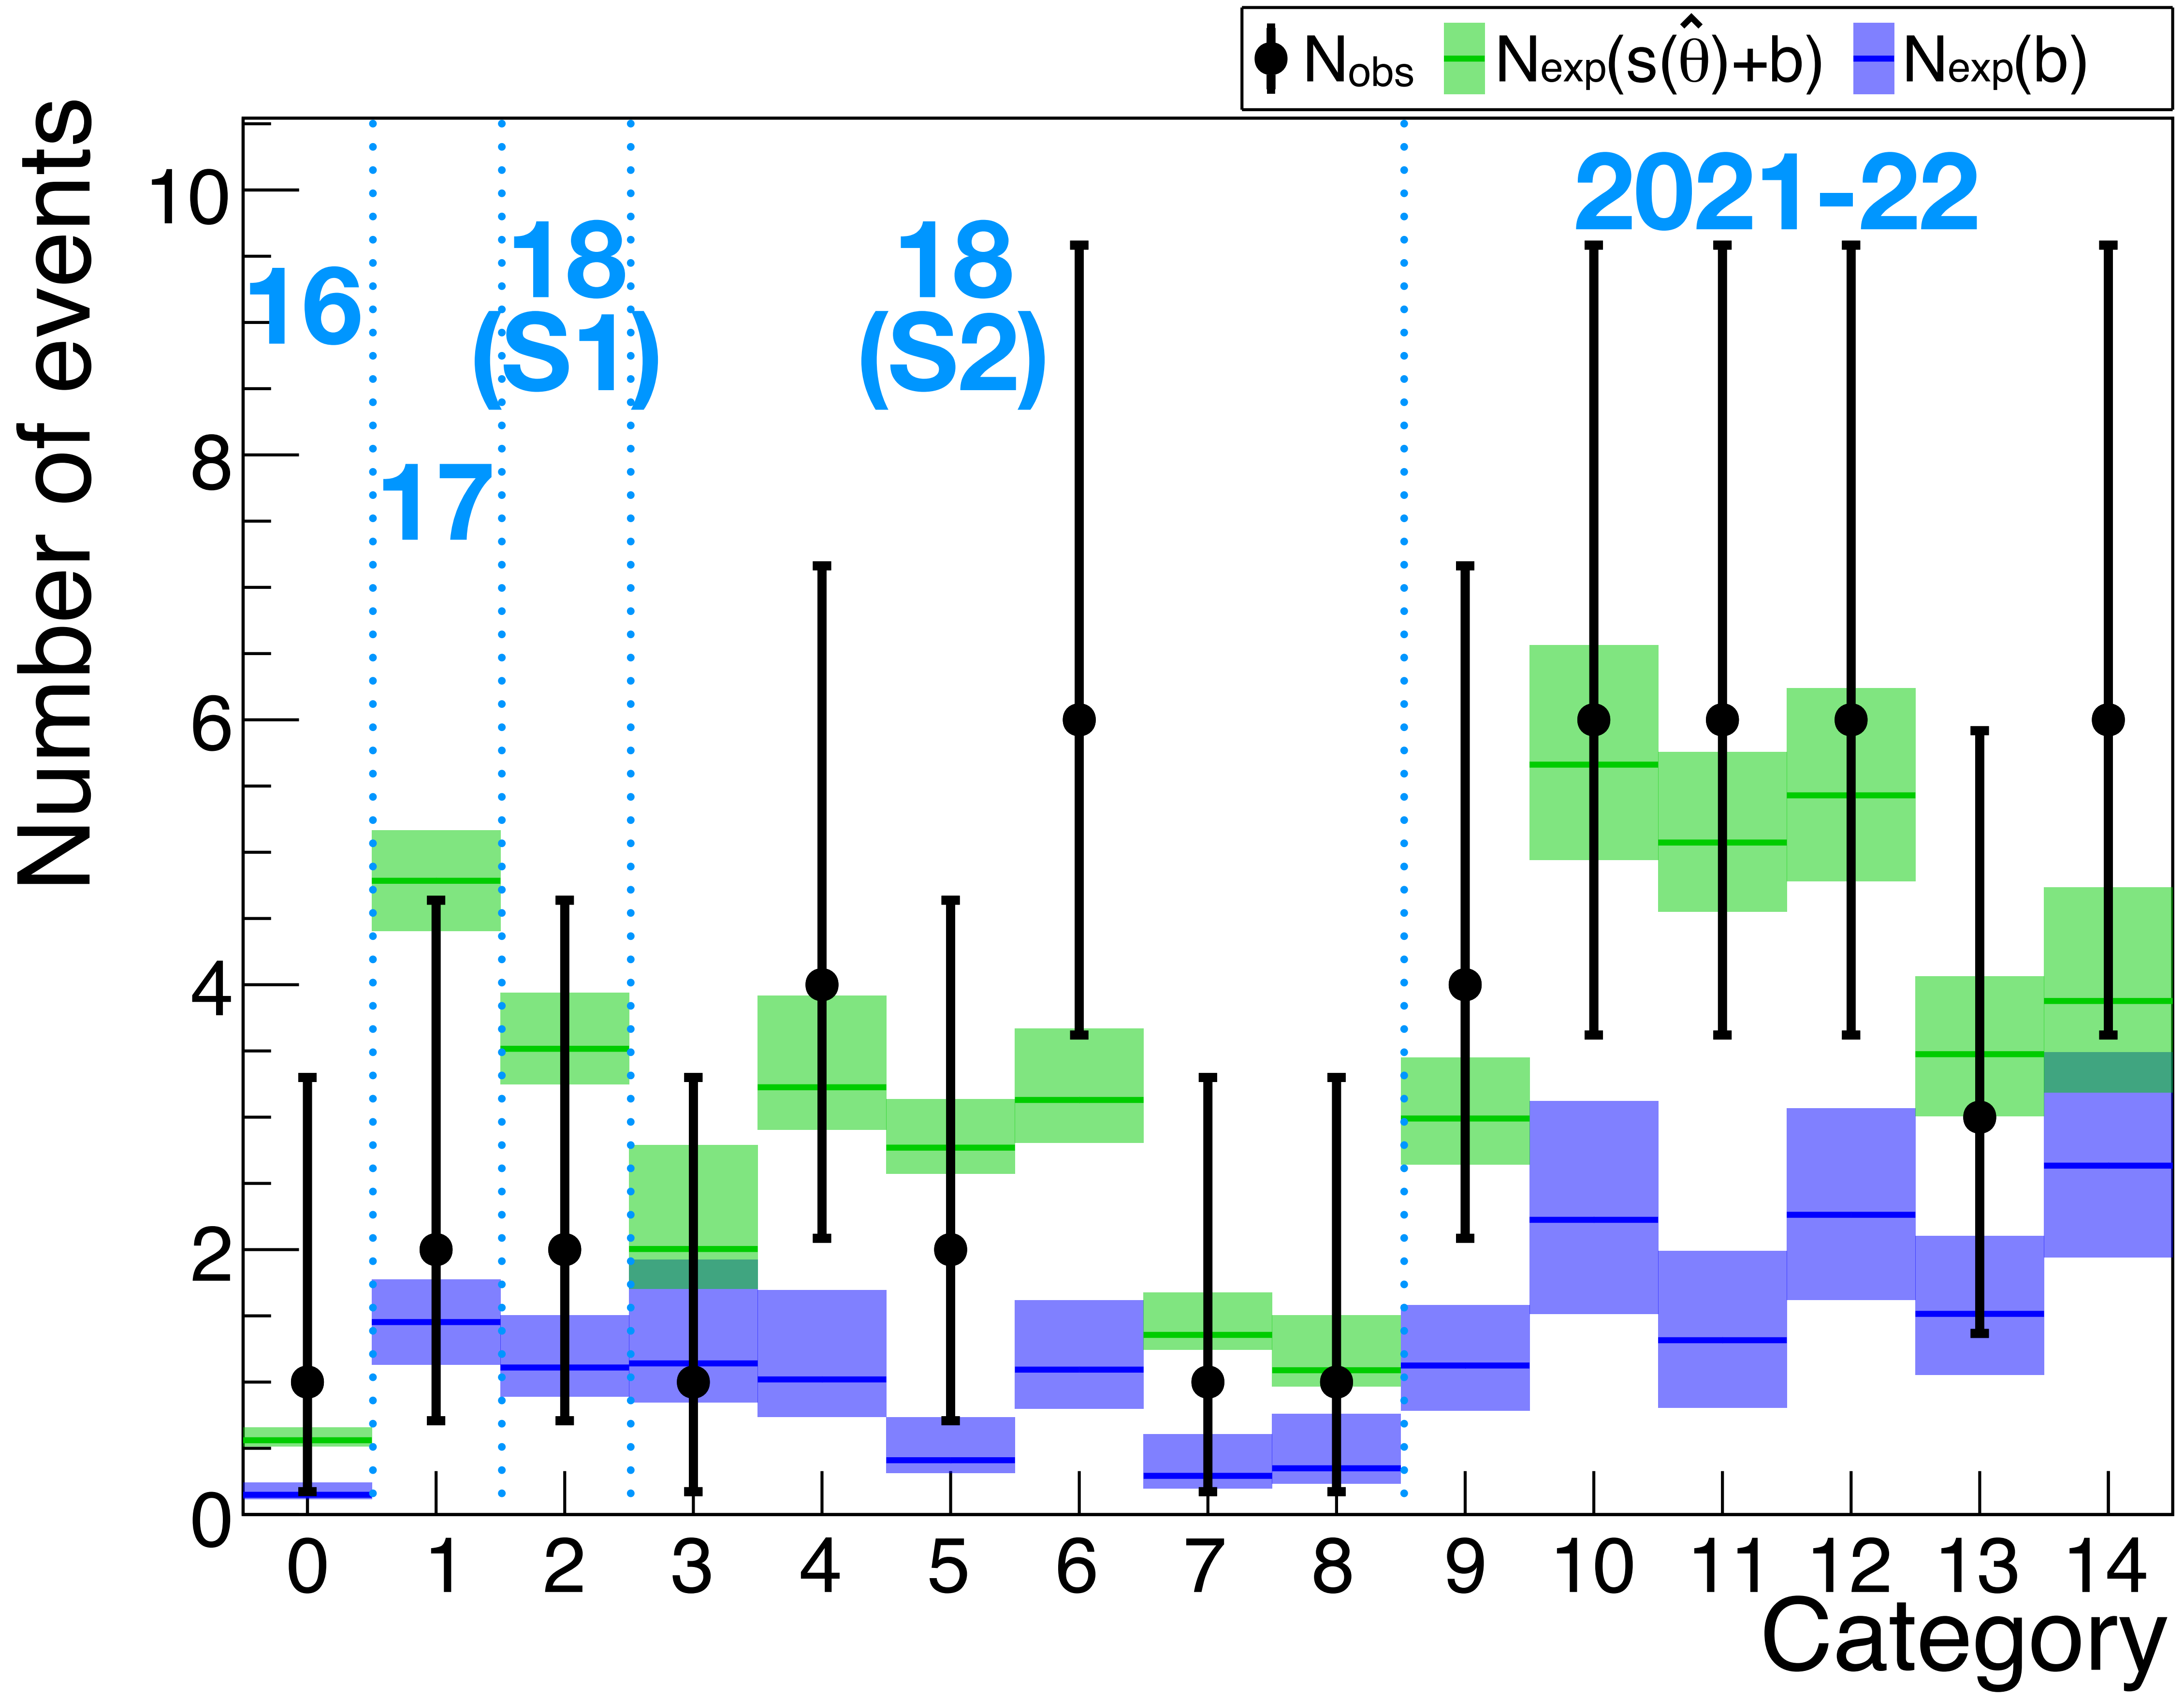
Combining NA62 results: 2016—22

- Integrating 2016—22 data: $N_{bg} = 18^{+3}_{-2}$, $N_{obs} = 51$.



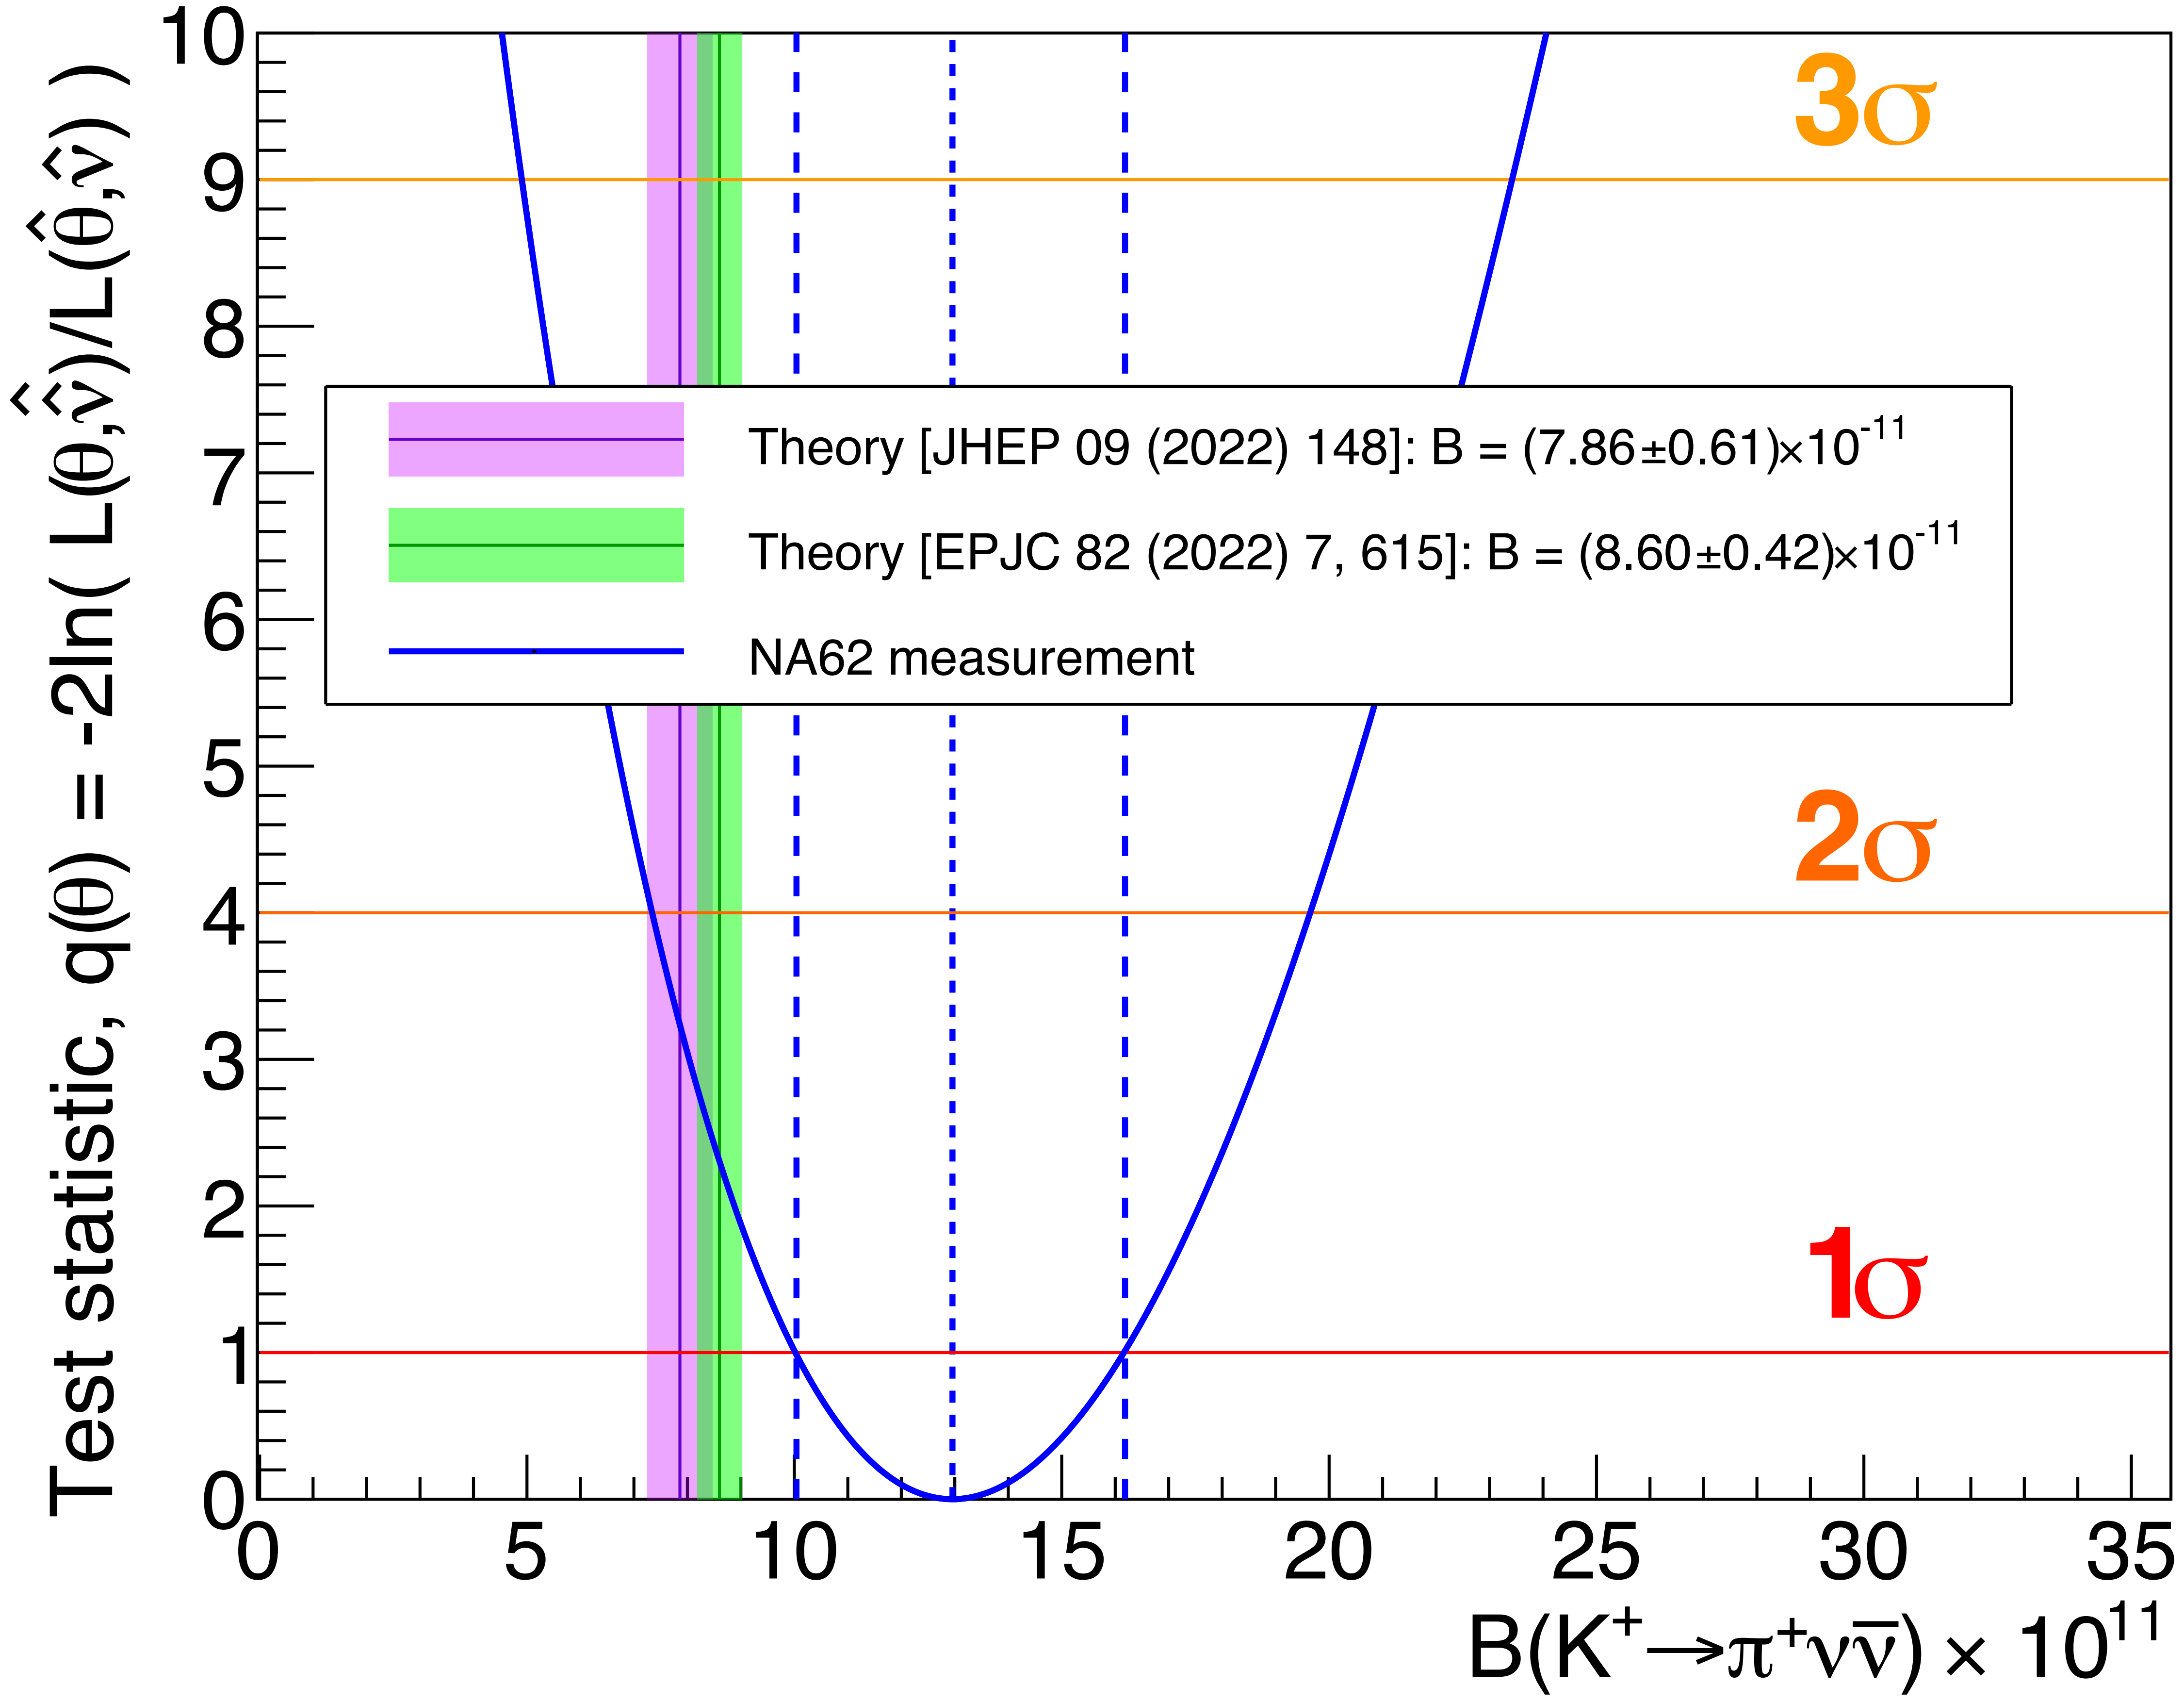
Combining NA62 results: 2016—22

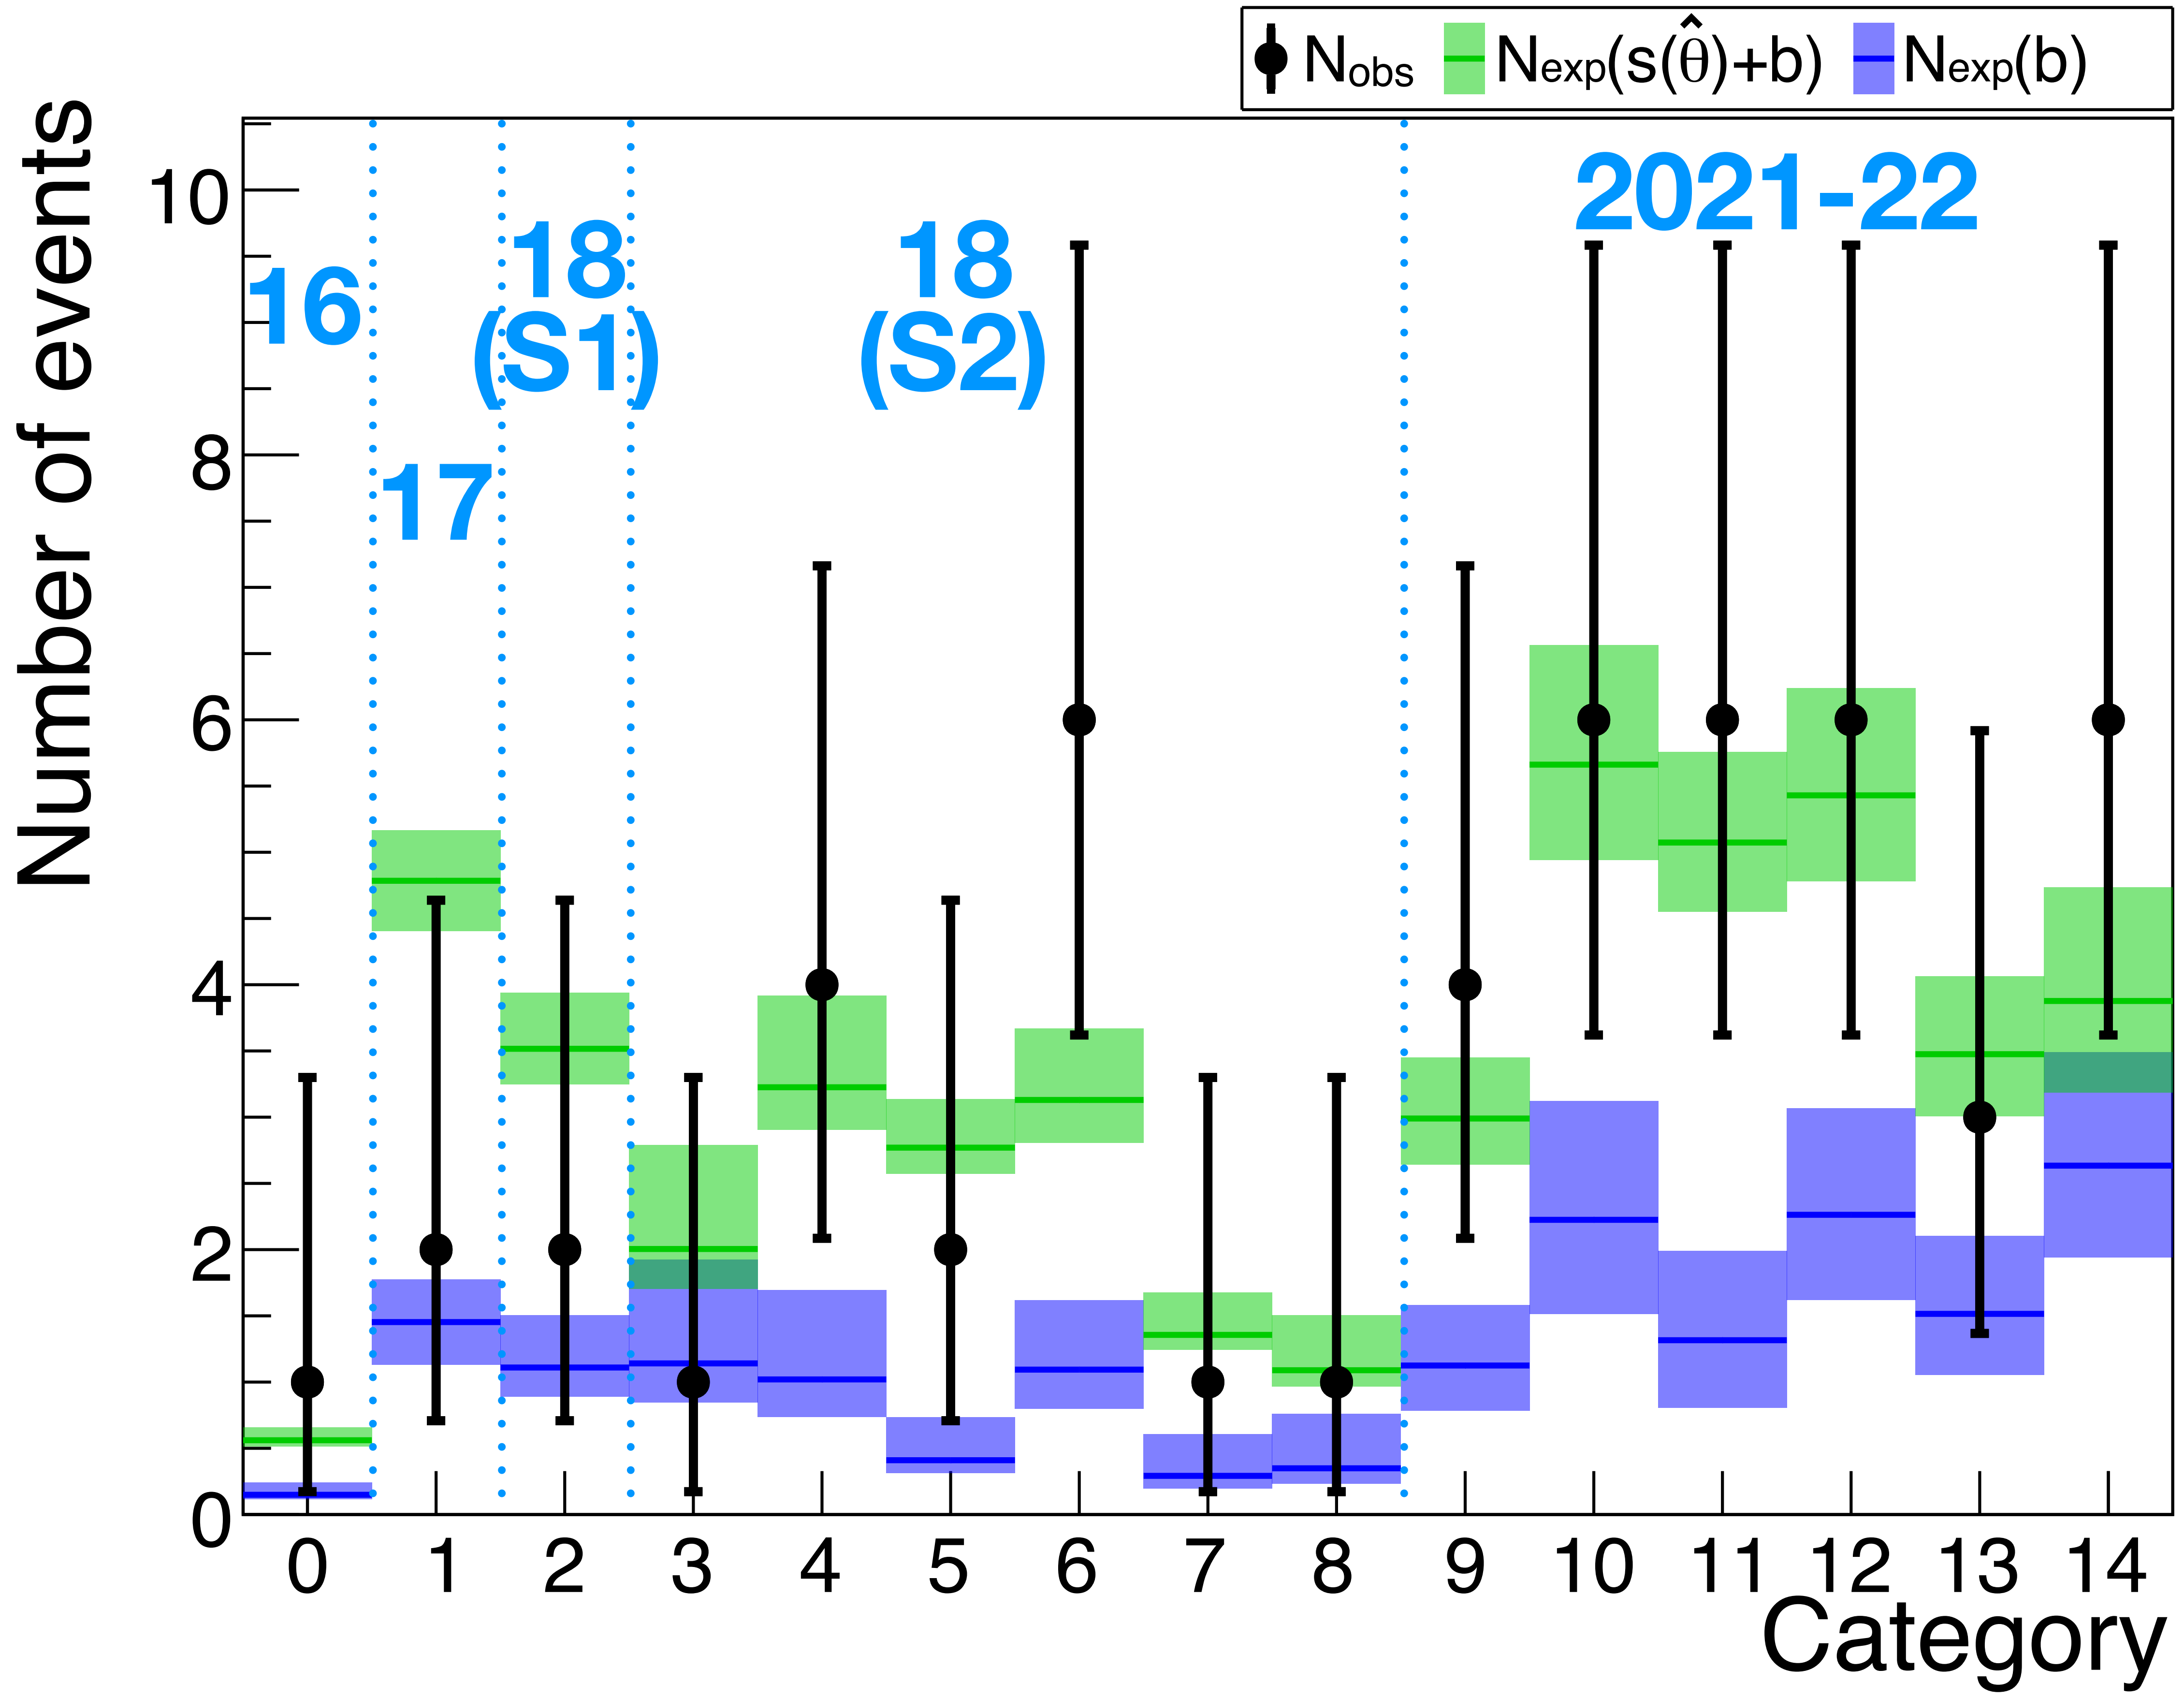
- Integrating 2016—22 data: $N_{bg} = 18^{+3}_{-2}$, $N_{obs} = 51$.
  - **Background-only hypothesis** p-value = 2×10^{-7} $\Rightarrow$ significance $Z > 5$



Combining NA62 results: 2016—22

- Integrating 2016—22 data: $N_{bg} = 18^{+3}_{-2}$, $N_{obs} = 51$.
  - **Background-only hypothesis** p-value = 2×10^{-7} ⇒ significance $Z > 5$





$$\mathscr{B}_{16-22}(K^+ \to \pi^+\nu\bar{\nu}) = \left(13.0^{+3.3}_{-2.9}\right) \times 10^{-11} = \left(13.0 \left(^{+3.0}_{-2.7}\right)_{\text{stat}} \left[^{+1.3}_{-1.2}\right]_{\text{syst}}\right) \times 10^{-11}$$

Results in context

BNL E787/E949 experiment

[Phys.Rev.D 79 (2009) 092004]

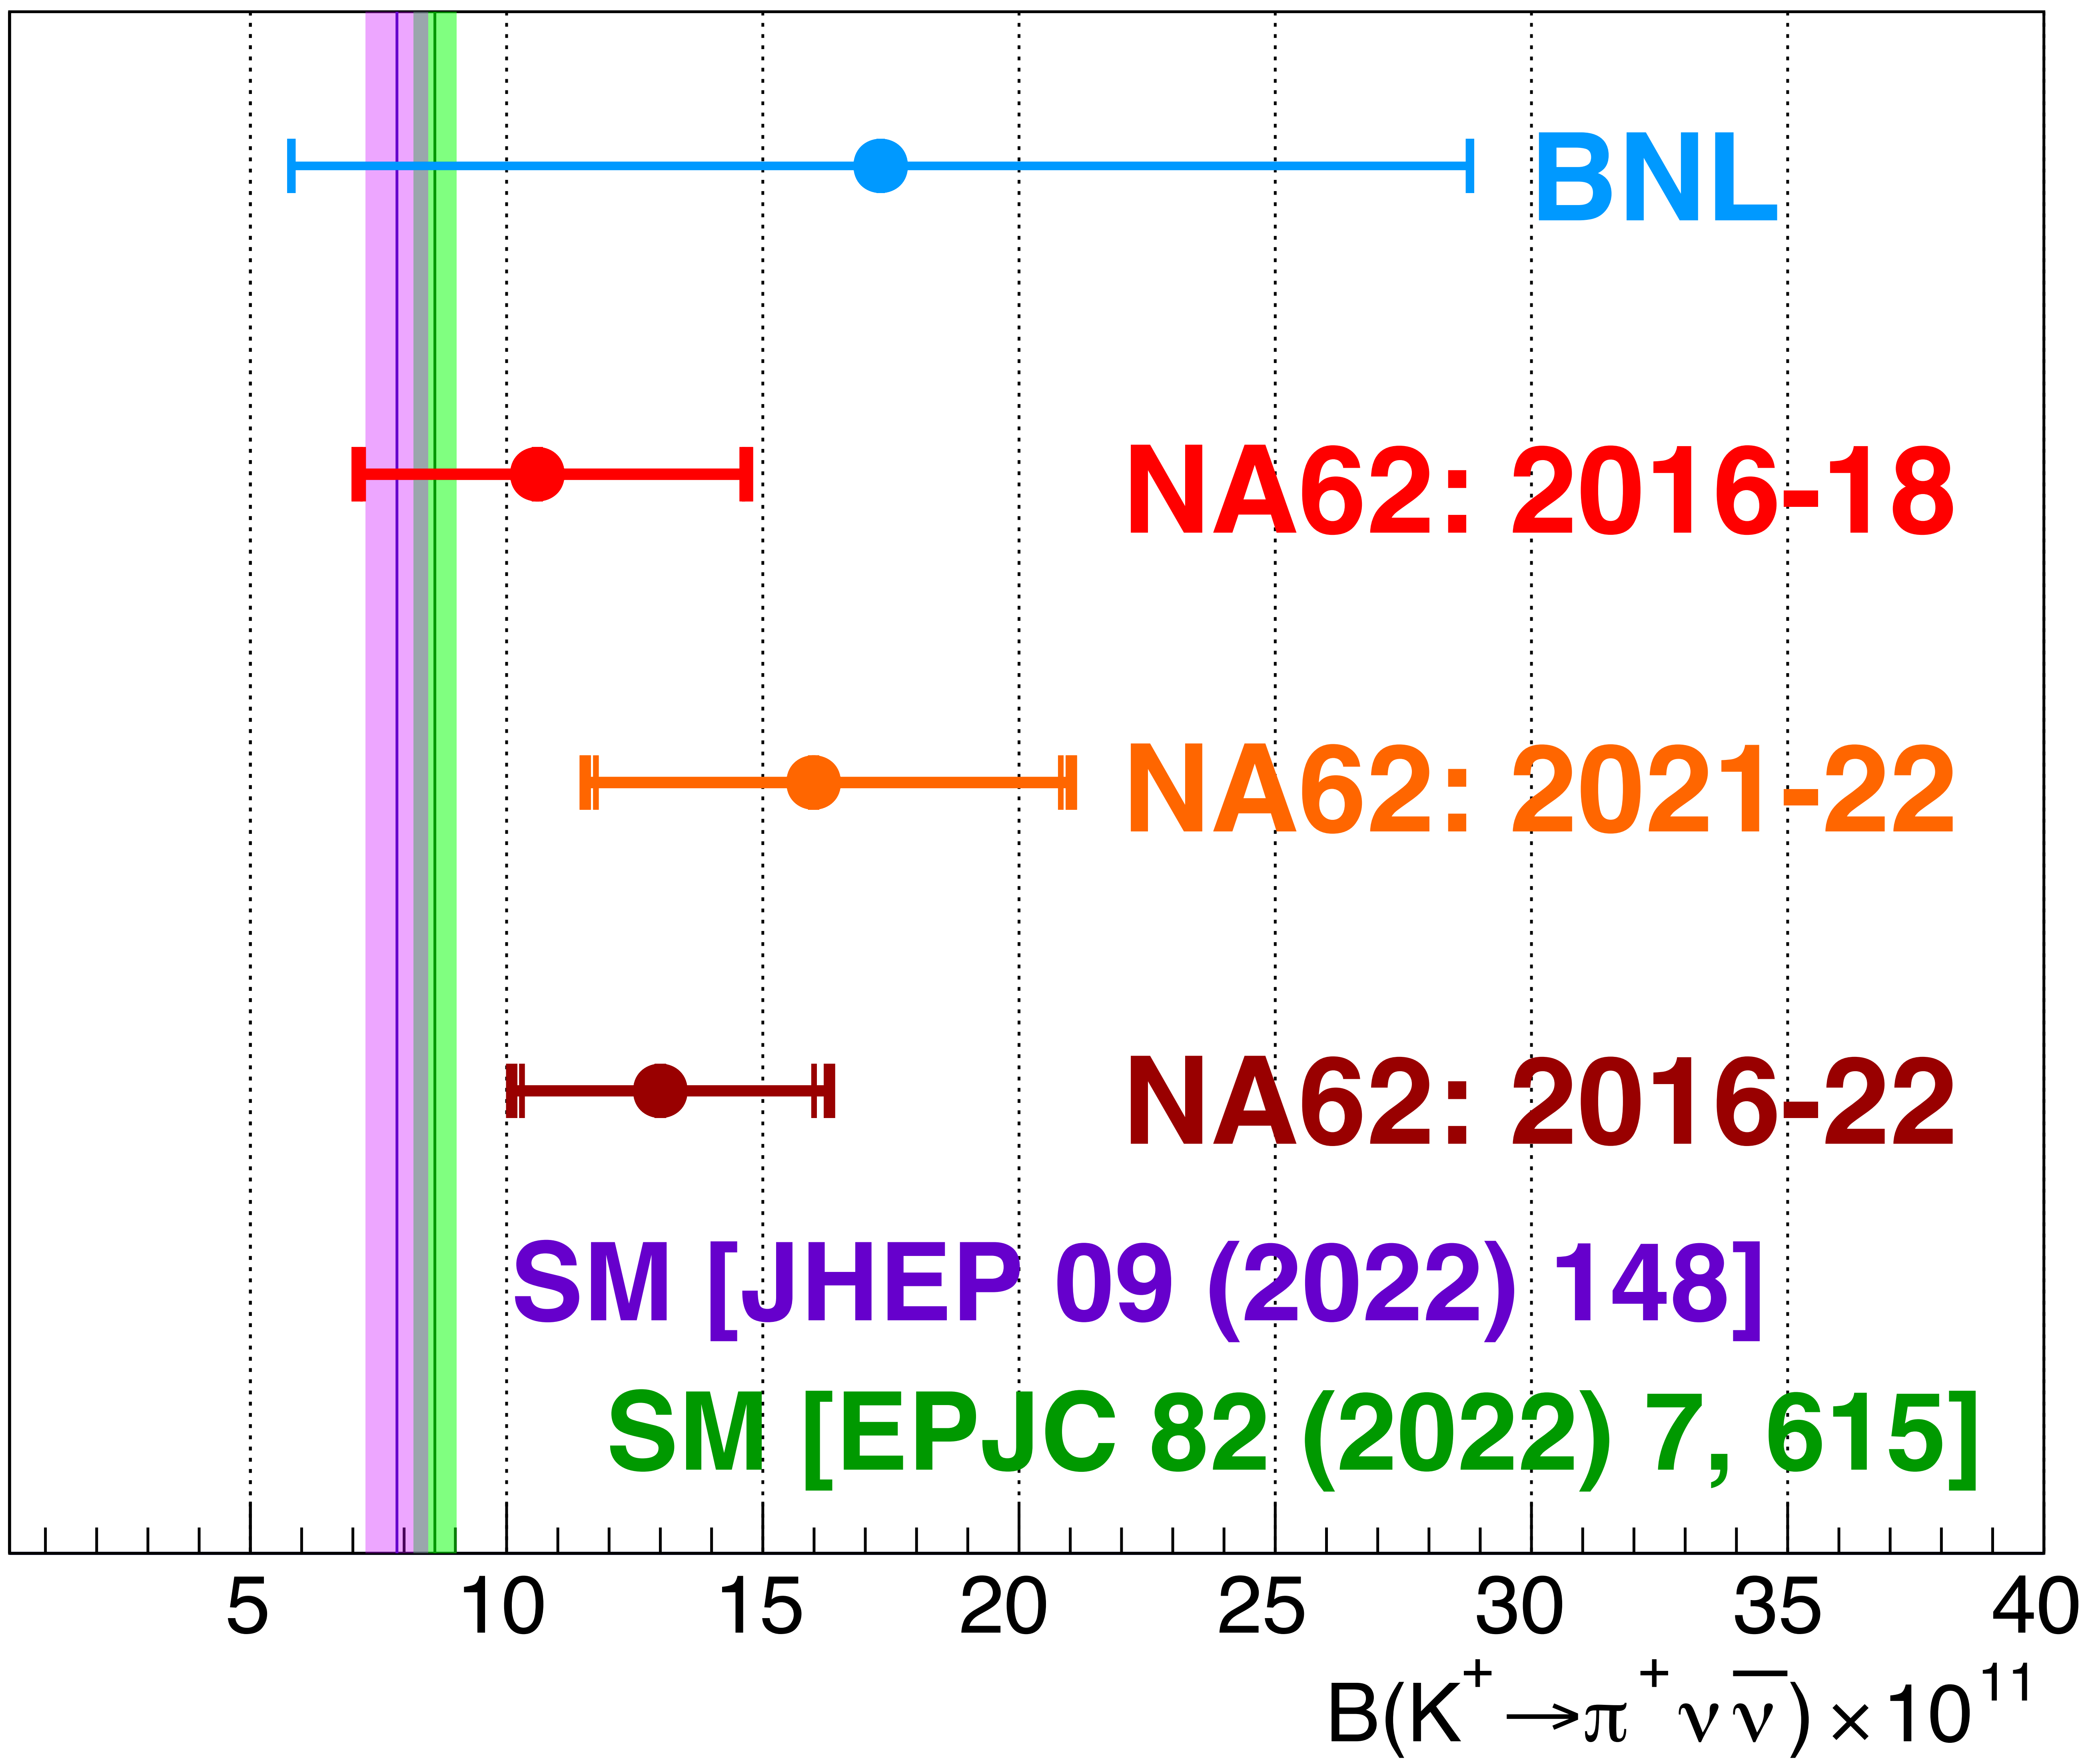
$$\mathcal{B}^{16-18}_{\pi\nu\bar{\nu}} = \left(10.6^{+4.1}_{-3.5}\right) \times 10^{-11}$$

[JHEP 06 (2021) 093]

$$\mathcal{B}^{21-22}_{\pi\nu\bar{\nu}} = \left(16.0^{+5.0}_{-4.5}\right) \times 10^{-11}$$

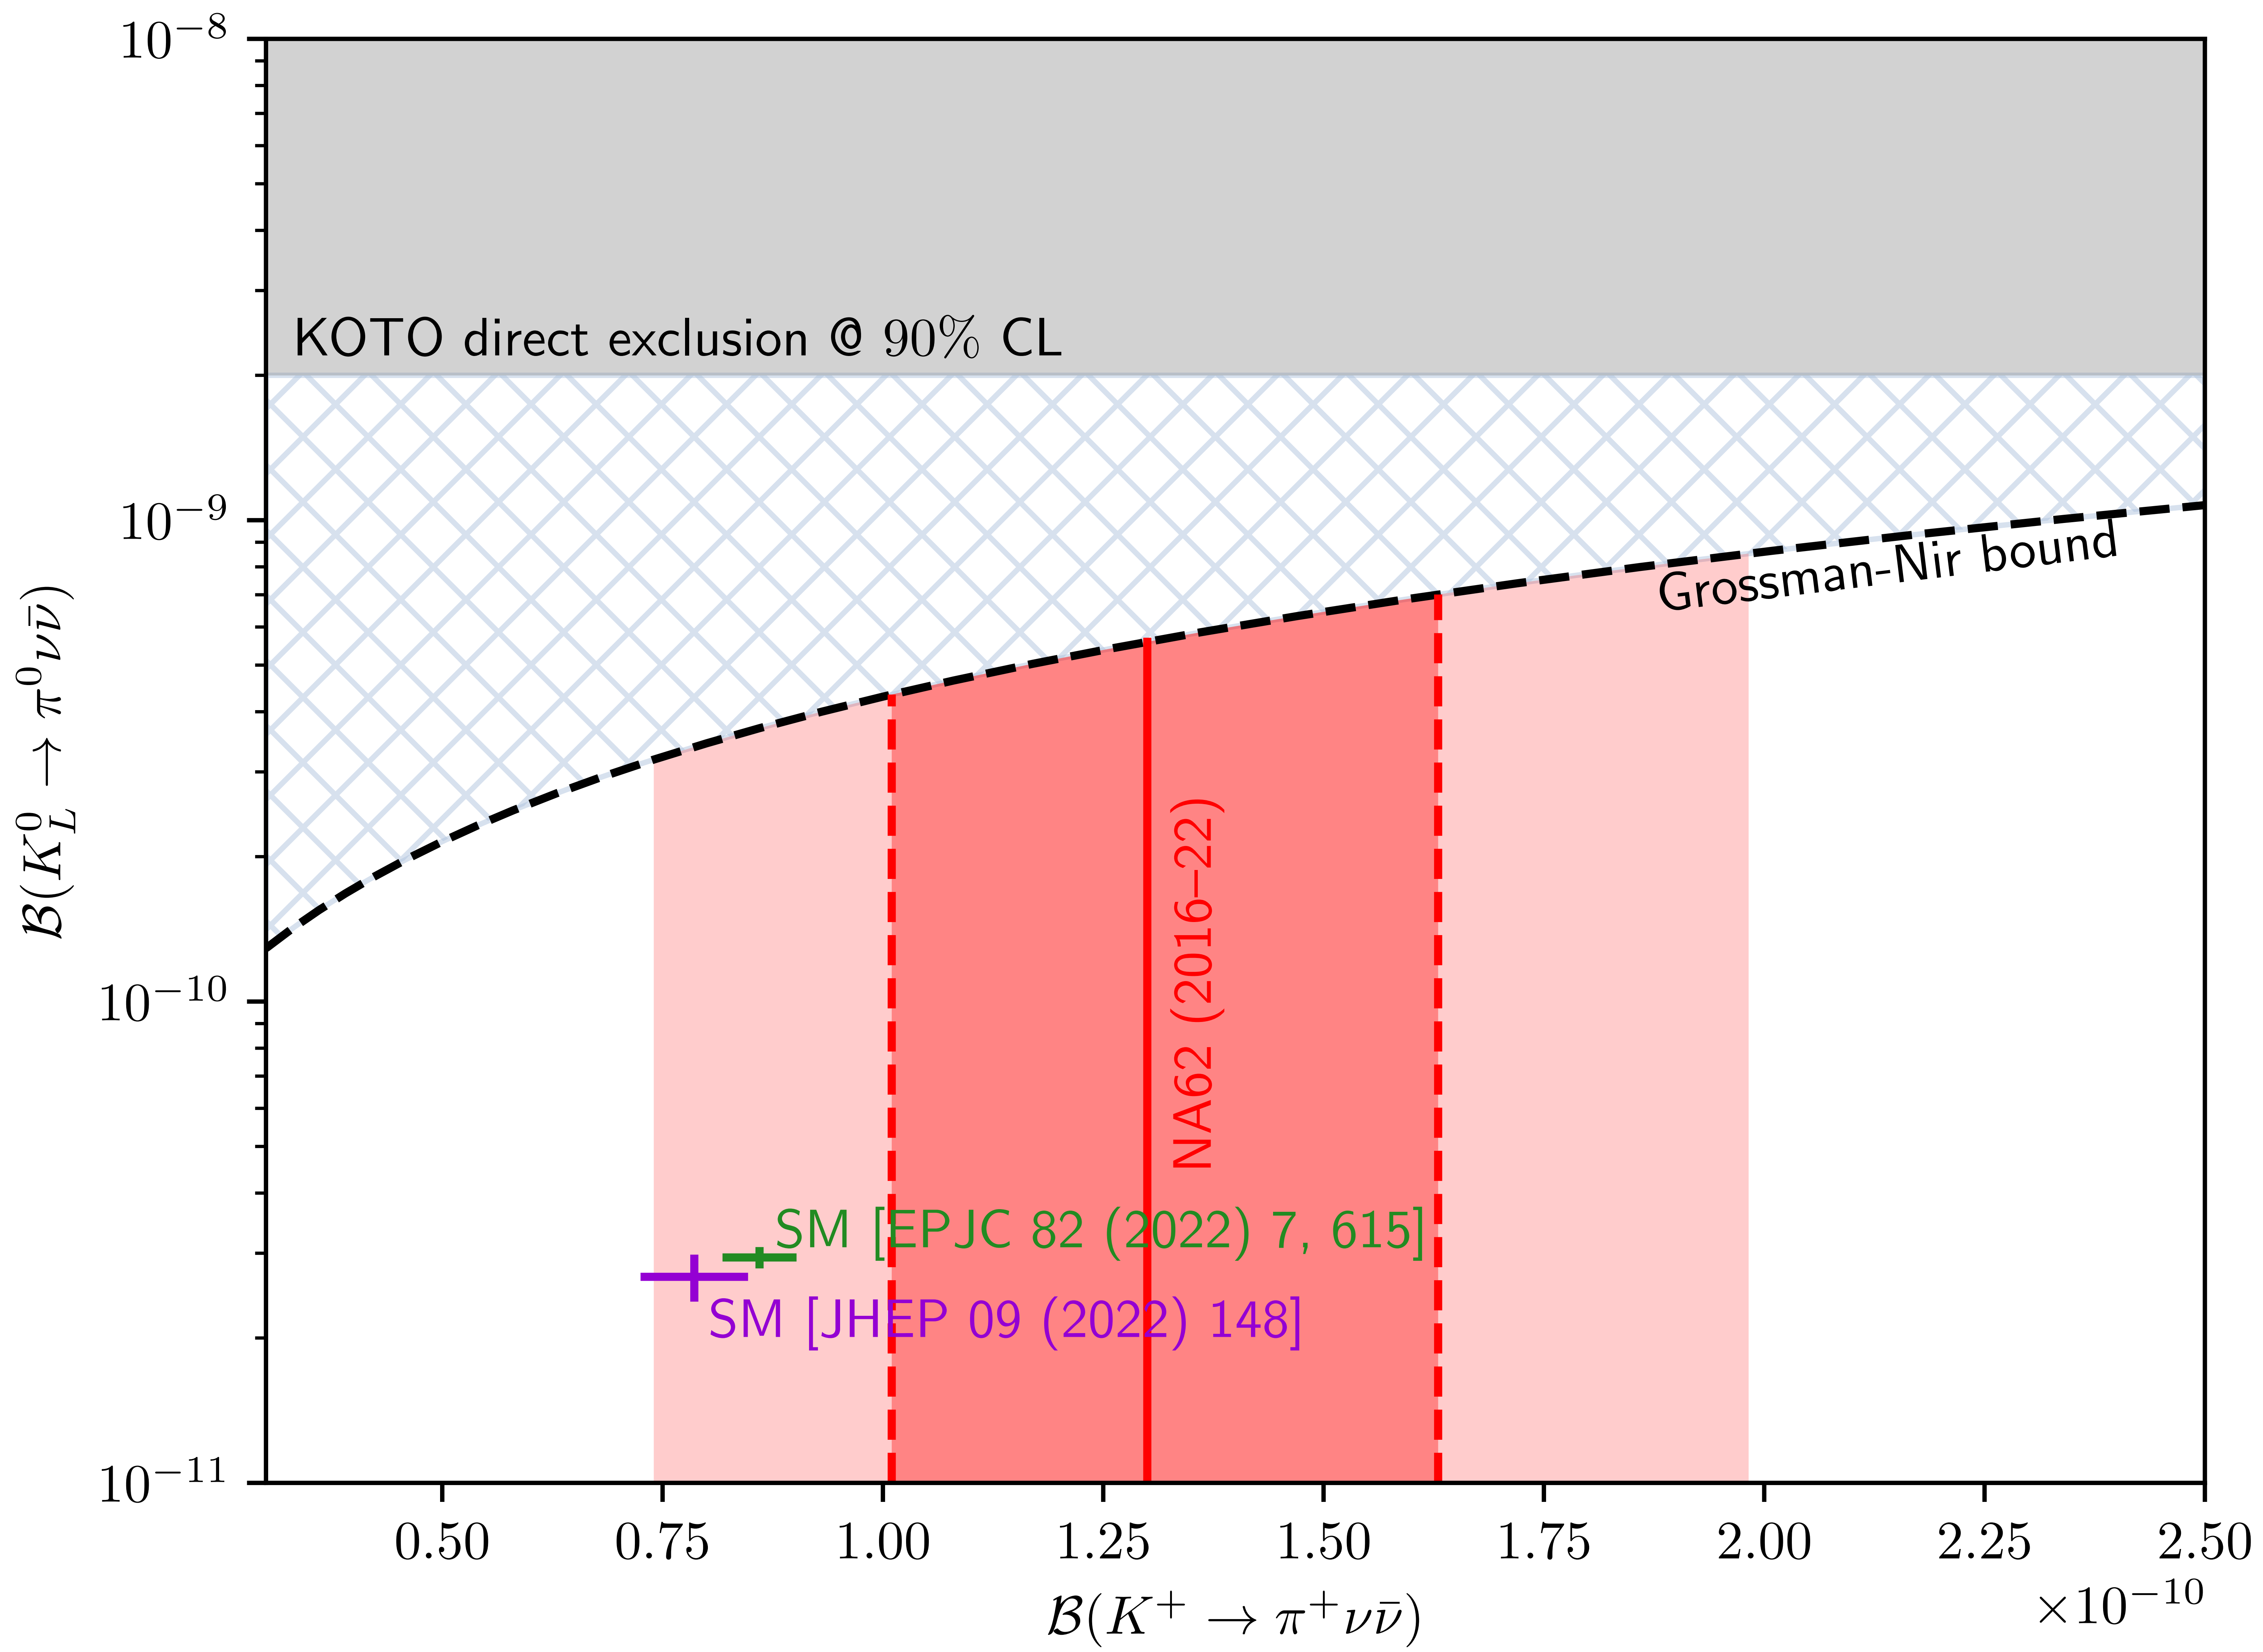
$$\mathcal{B}^{16-22}_{\pi\nu\bar{\nu}} = \left(13.0^{+3.3}_{-2.9}\right) \times 10^{-11}$$

- NA62 results are consistent
- Central value moved up (now 1.5—1.7σ above SM)
- Fractional uncertainty decreased: 40% to 25%
- Bkg-only hypothesis rejected with significance Z>5



Results in context

- Fractional uncertainty: 25%
- Bkg-only hypothesis rejected with significance Z>5
- **Observation of the $K^+ \to \pi^+ \nu\bar{\nu}$ decay with BR consistent with SM prediction, within 1.7σ**
  - **Need full NA62 data-set to clarify SM agreement or tension**



$$\mathscr{B}_{\pi\nu\bar{\nu}}^{16-22} = \left(13.0^{+3.3}_{-2.9}\right) \times 10^{-11}$$

2σ range : $[7.4 - 19.7] \times 10^{-11}$

A One-in-10-Billion Particle Decay Hints at Hidden Physics

Physicists have detected a long-sought particle process that may suggest new forces and particles exist in the universe

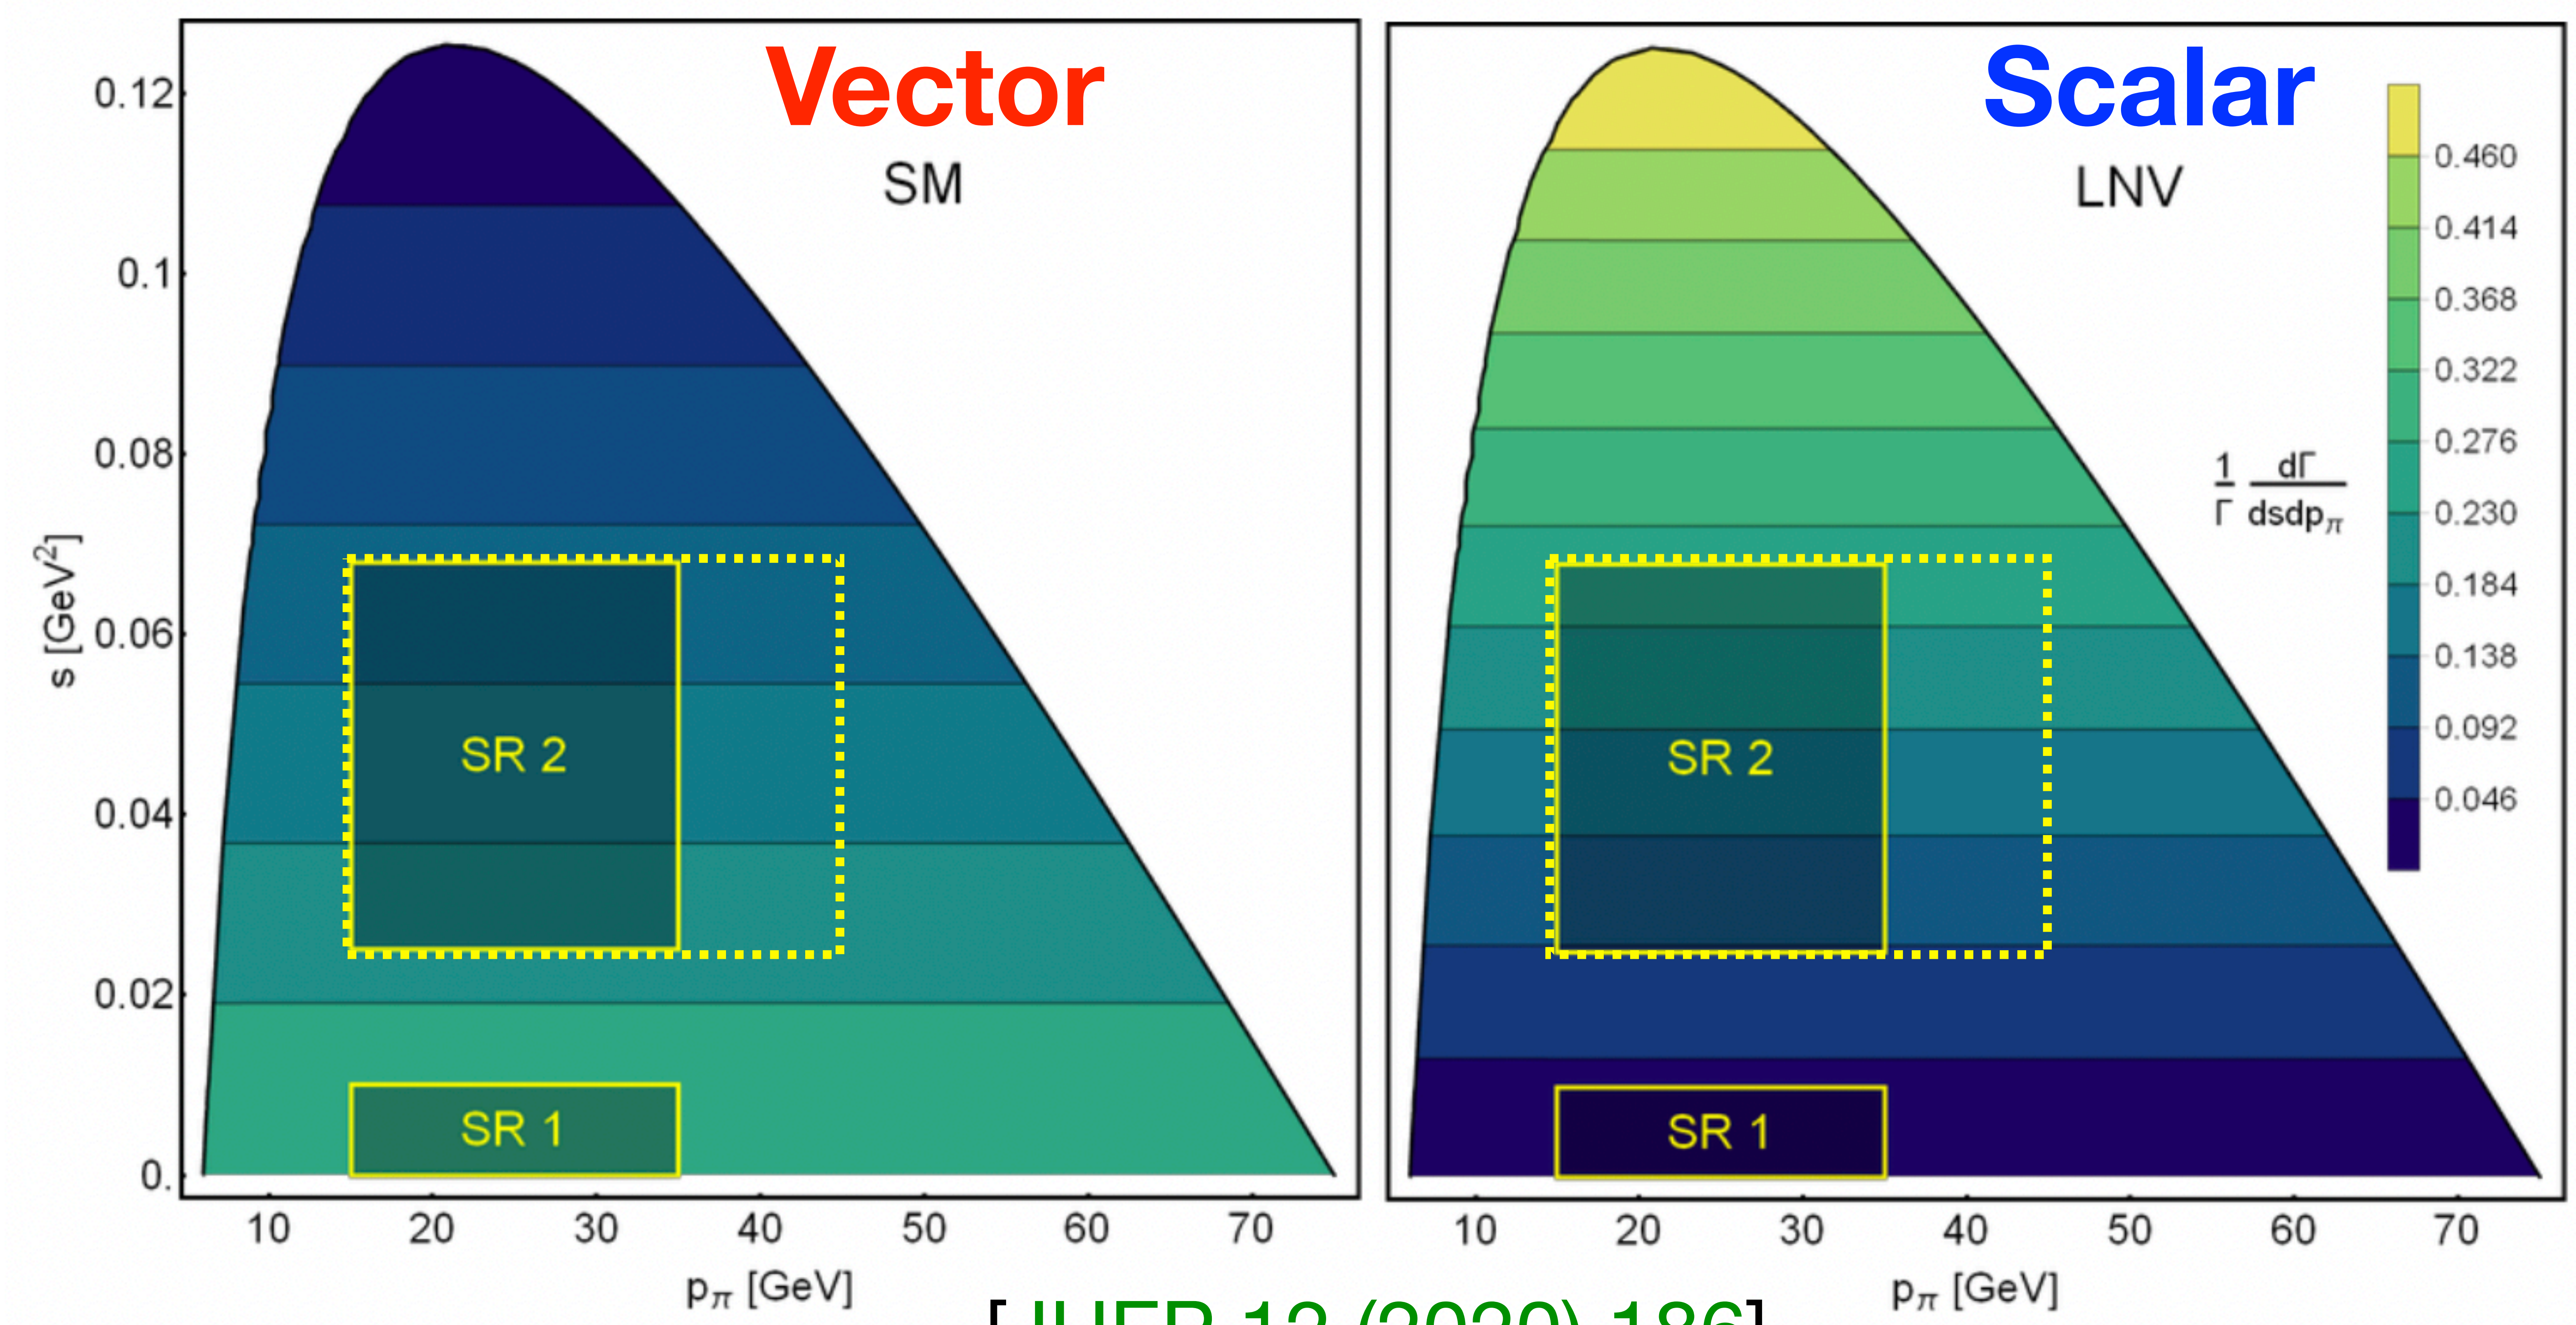
Conclusions

- New study of $K^+ \to \pi^+ \nu\bar{\nu}$ decay using NA62 2021—22 dataset:
  - Improved signal yield per SPS spill by 50%.
  - $N_{bg} = 11.0^{+2.1}_{-1.9}$, $N_{obs} = 31$
  - $\mathcal{B}_{21-22}(K^+ \to \pi^+ \nu\bar{\nu}) = \left(16.0^{+5.0}_{-4.5}\right) \times 10^{-11} = \left(16.0\left({}^{+4.8}_{-4.2}\right)_{\text{stat}}\left[{}^{+1.4}_{-1.3}\right]_{\text{syst}}\right) \times 10^{-11}$
- Combining with 2016—18 data for full 2016—22 results:
  - $N_{bg} = 18^{+3}_{-2}$, $N_{obs} = 51$ (using 9+6 categories for BR extraction)
  - $\mathcal{B}_{16-22}(K^+ \to \pi^+ \nu\bar{\nu}) = \left(13.0^{+3.3}_{-2.9}\right) \times 10^{-11} = \left(13.0\left({}^{+3.0}_{-2.7}\right)_{\text{stat}}\left[{}^{+1.3}_{-1.2}\right]_{\text{syst}}\right) \times 10^{-11}$
  - Background-only hypothesis rejected with significance Z>5.
- **First observation of $K^+ \to \pi^+ \nu\bar{\nu}$ decay: BR consistent with SM prediction within 1.7σ**
  - **Need full NA62 data-set to clarify SM agreement or tension.**

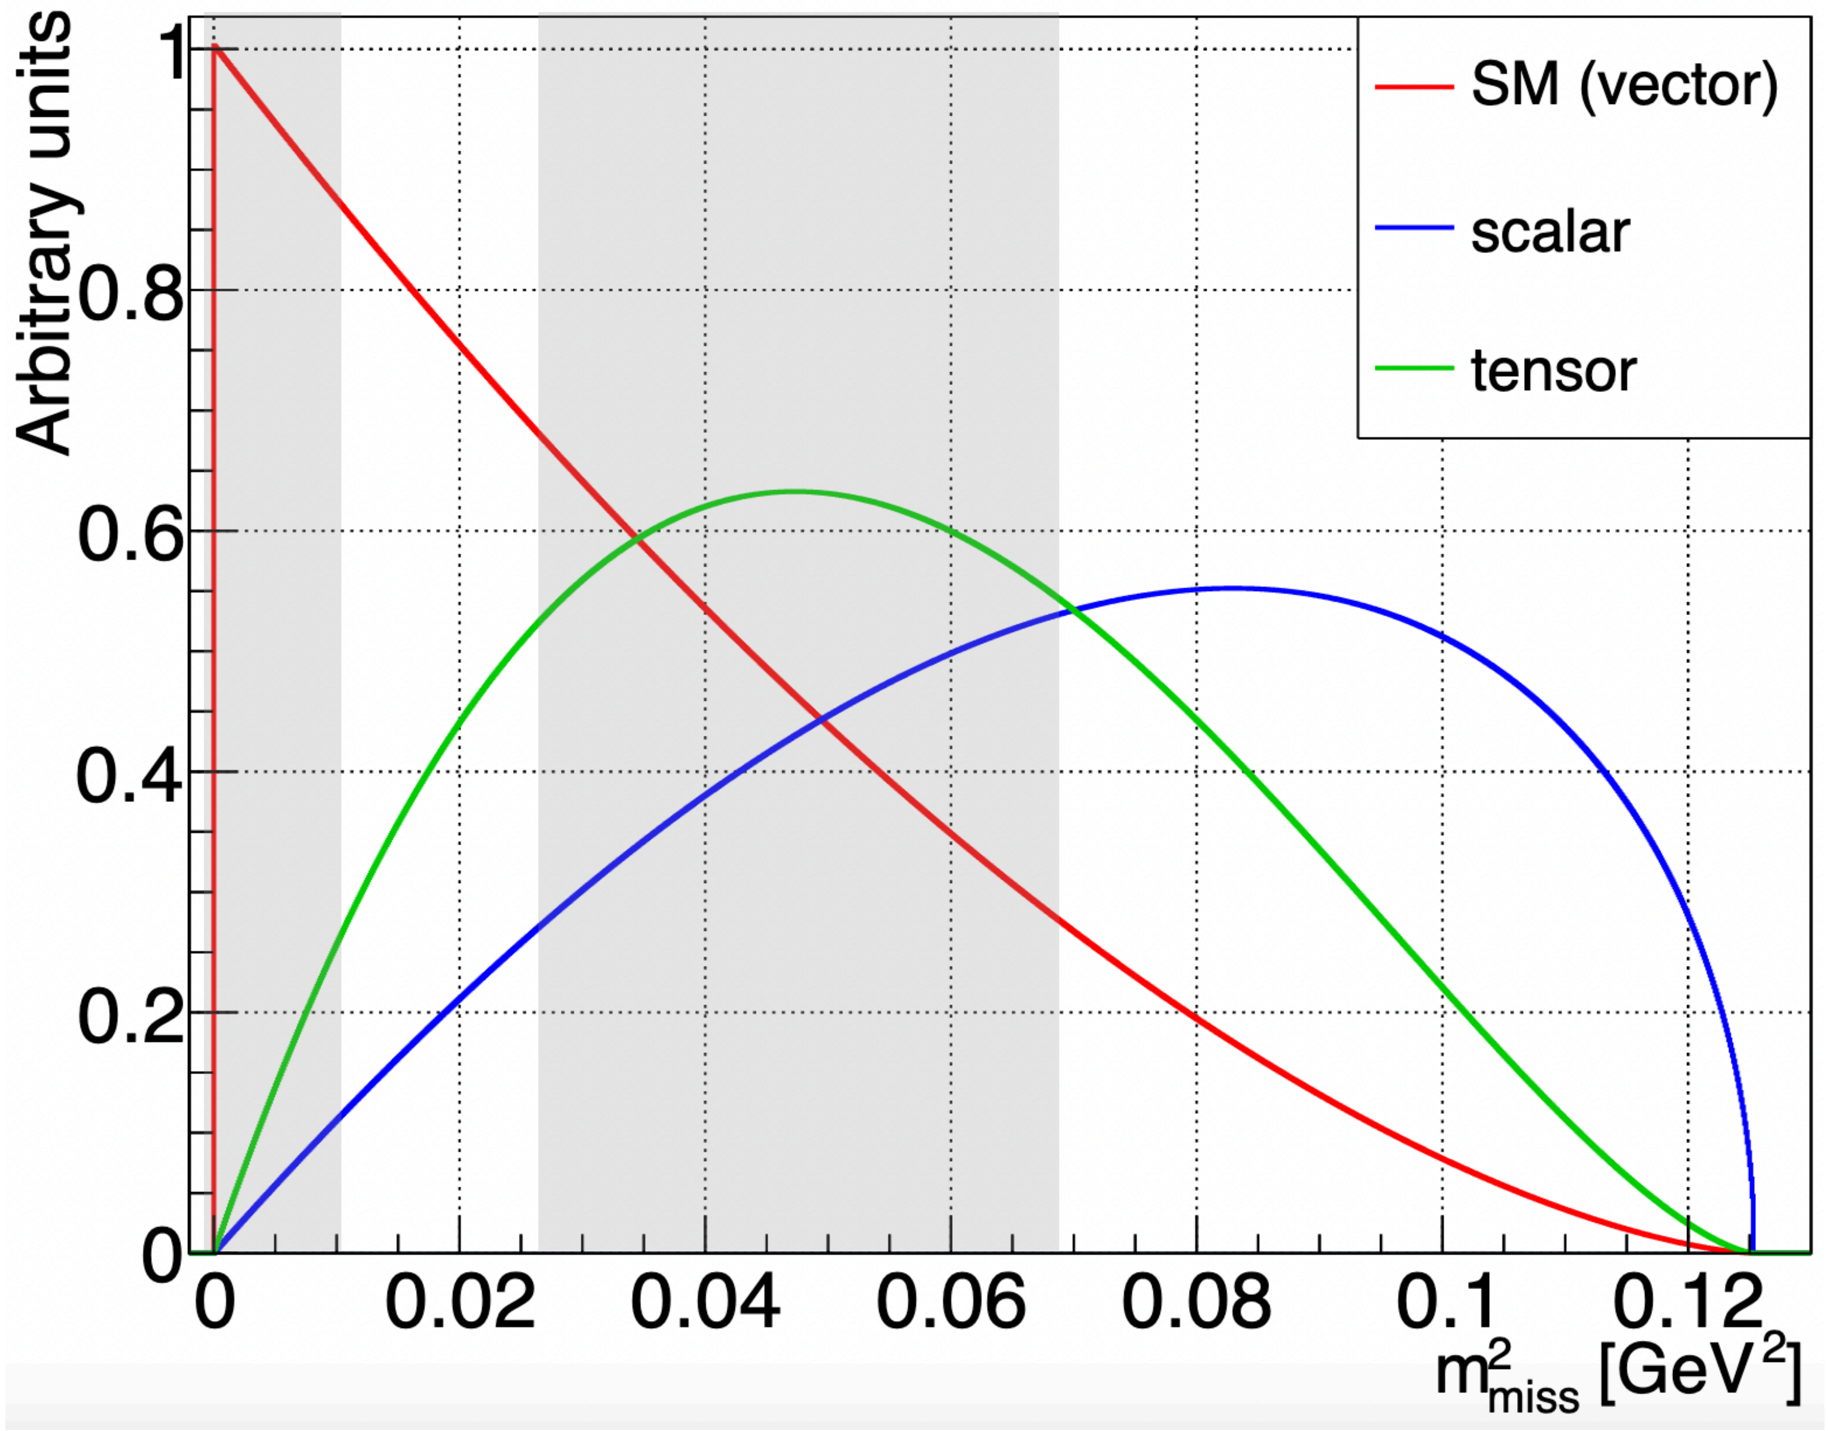
2023—LS3 data-set collection & analysis in progress…

Supplemental

What is the nature of the $K \to \pi\nu\bar{\nu}$ decay?

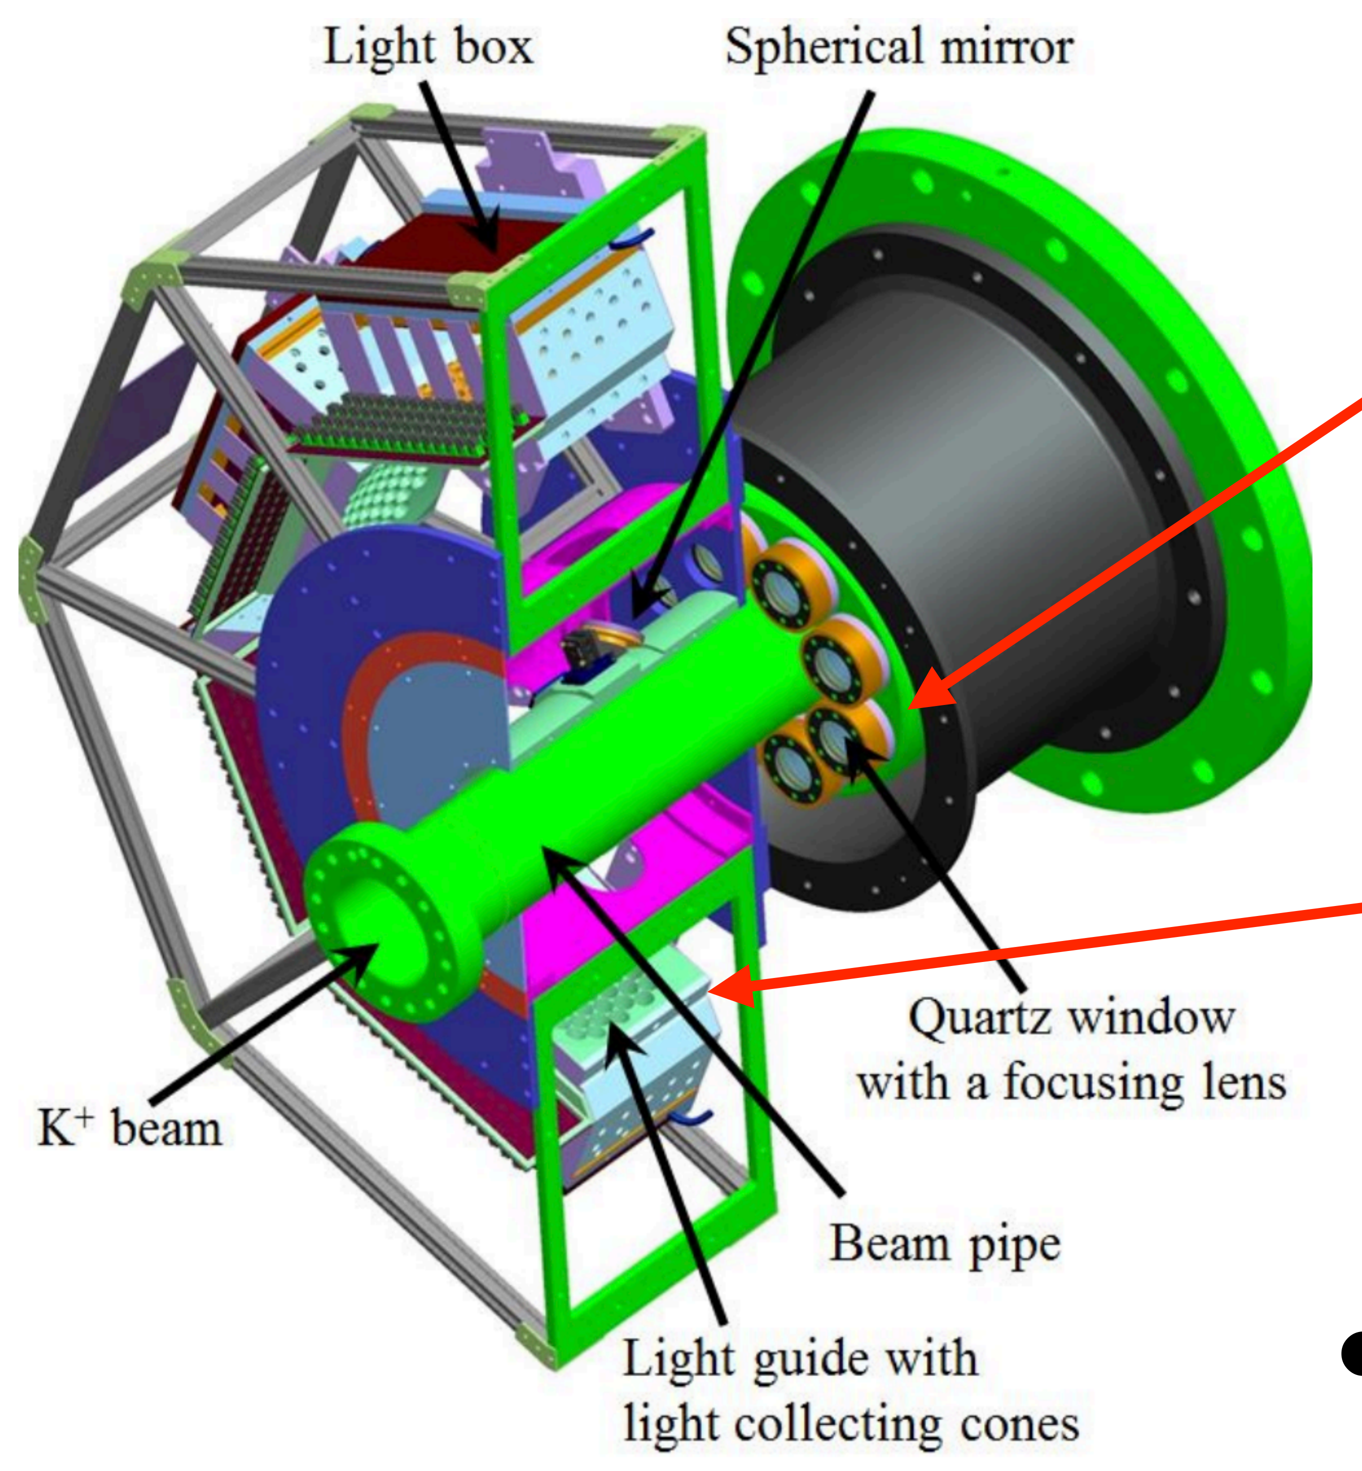


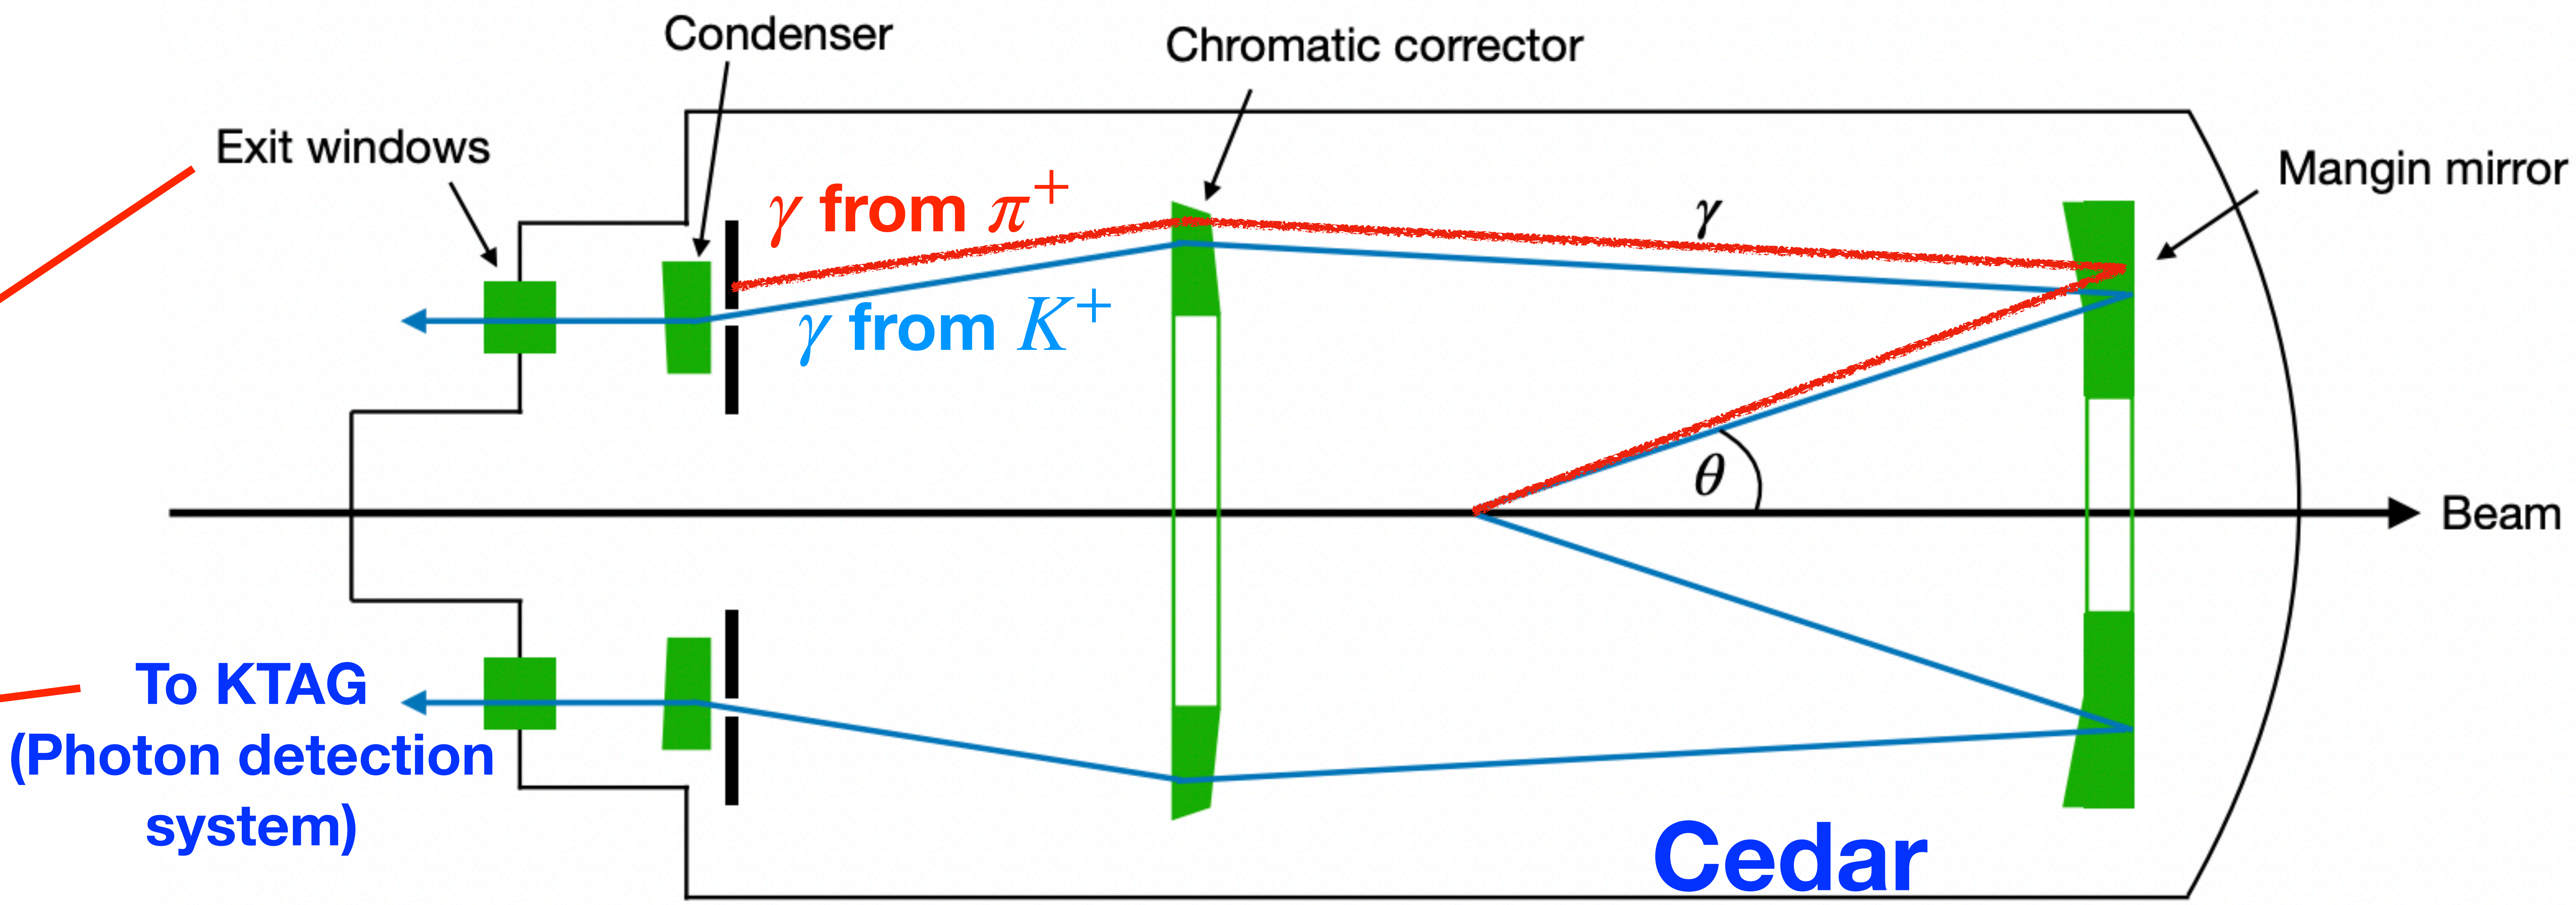
[JHEP 12 (2020) 186]



- In SM: vector form factor.
- BSM: possible vector, scalar, tensor contributions.
- Differential measurement could show presence of new physics.

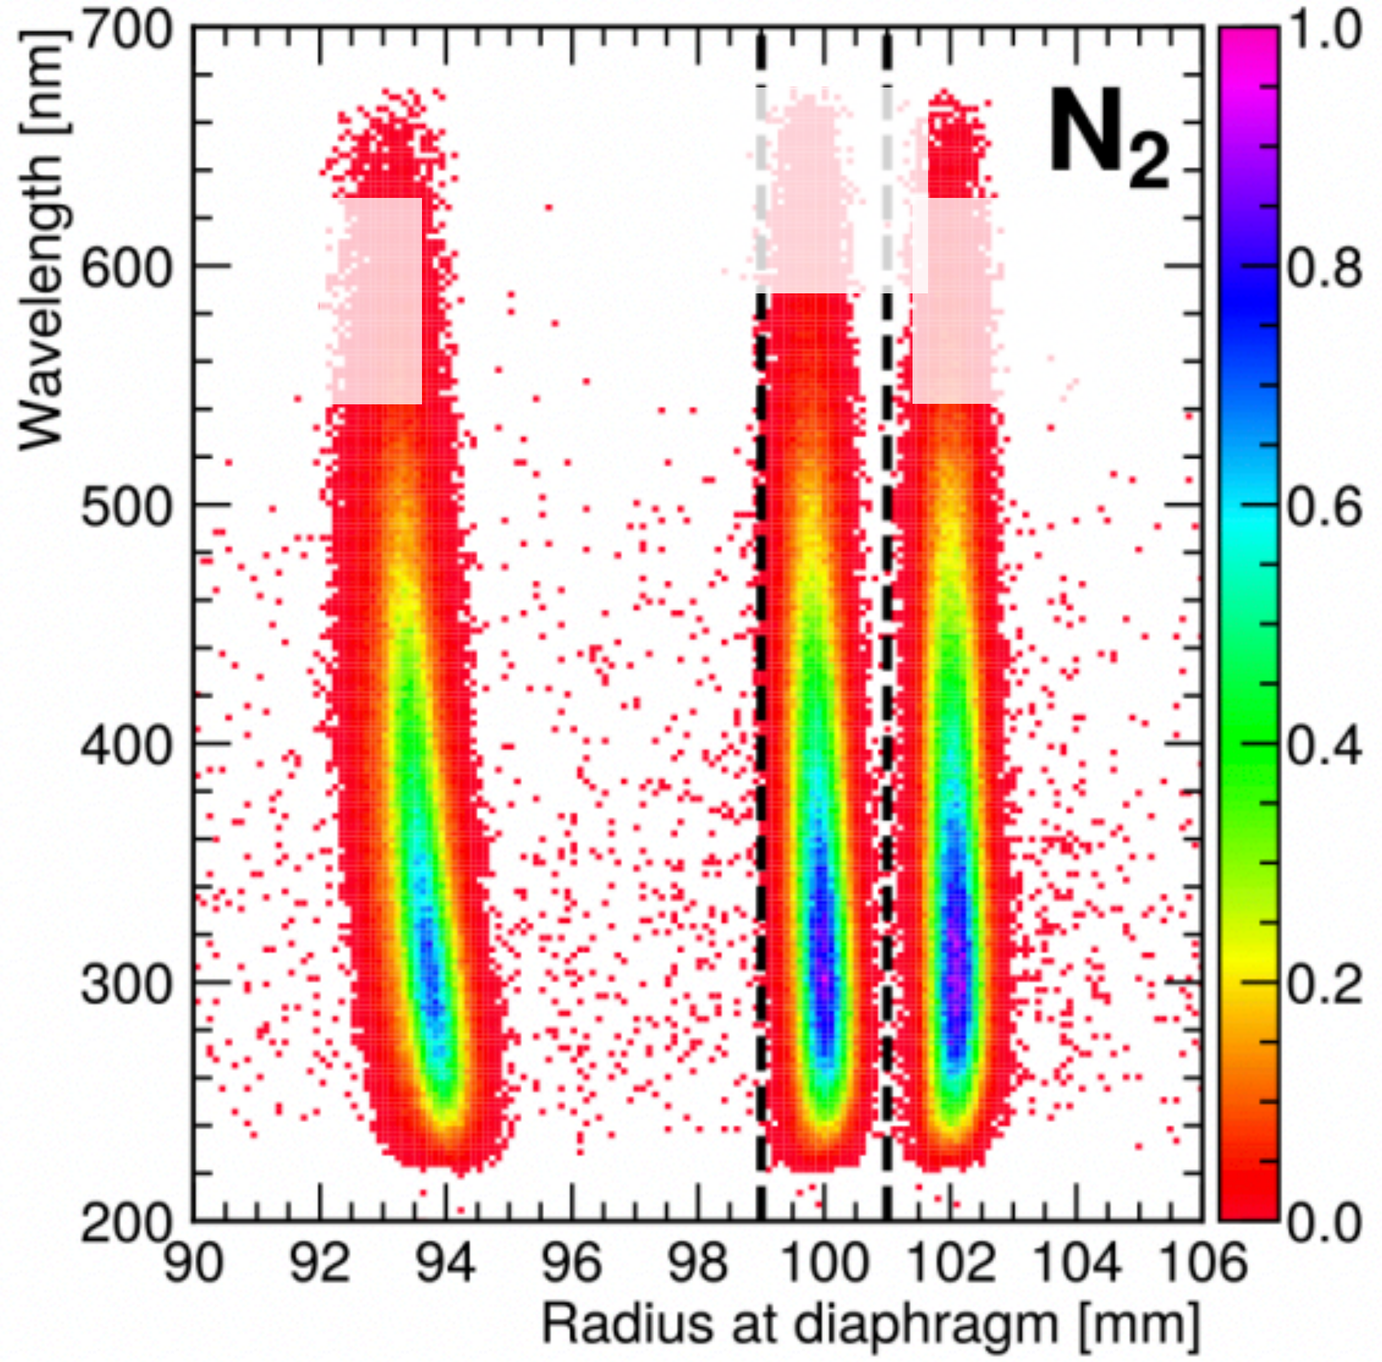
Cedar & KTAG : K^+ tagging with threshold Cherenkov counter





- 75 GeV Unseparated hadron beam $\pi^+ : 70\,\%\,, p : 23\,\%\,, K^+ : 6\,\%\,.$

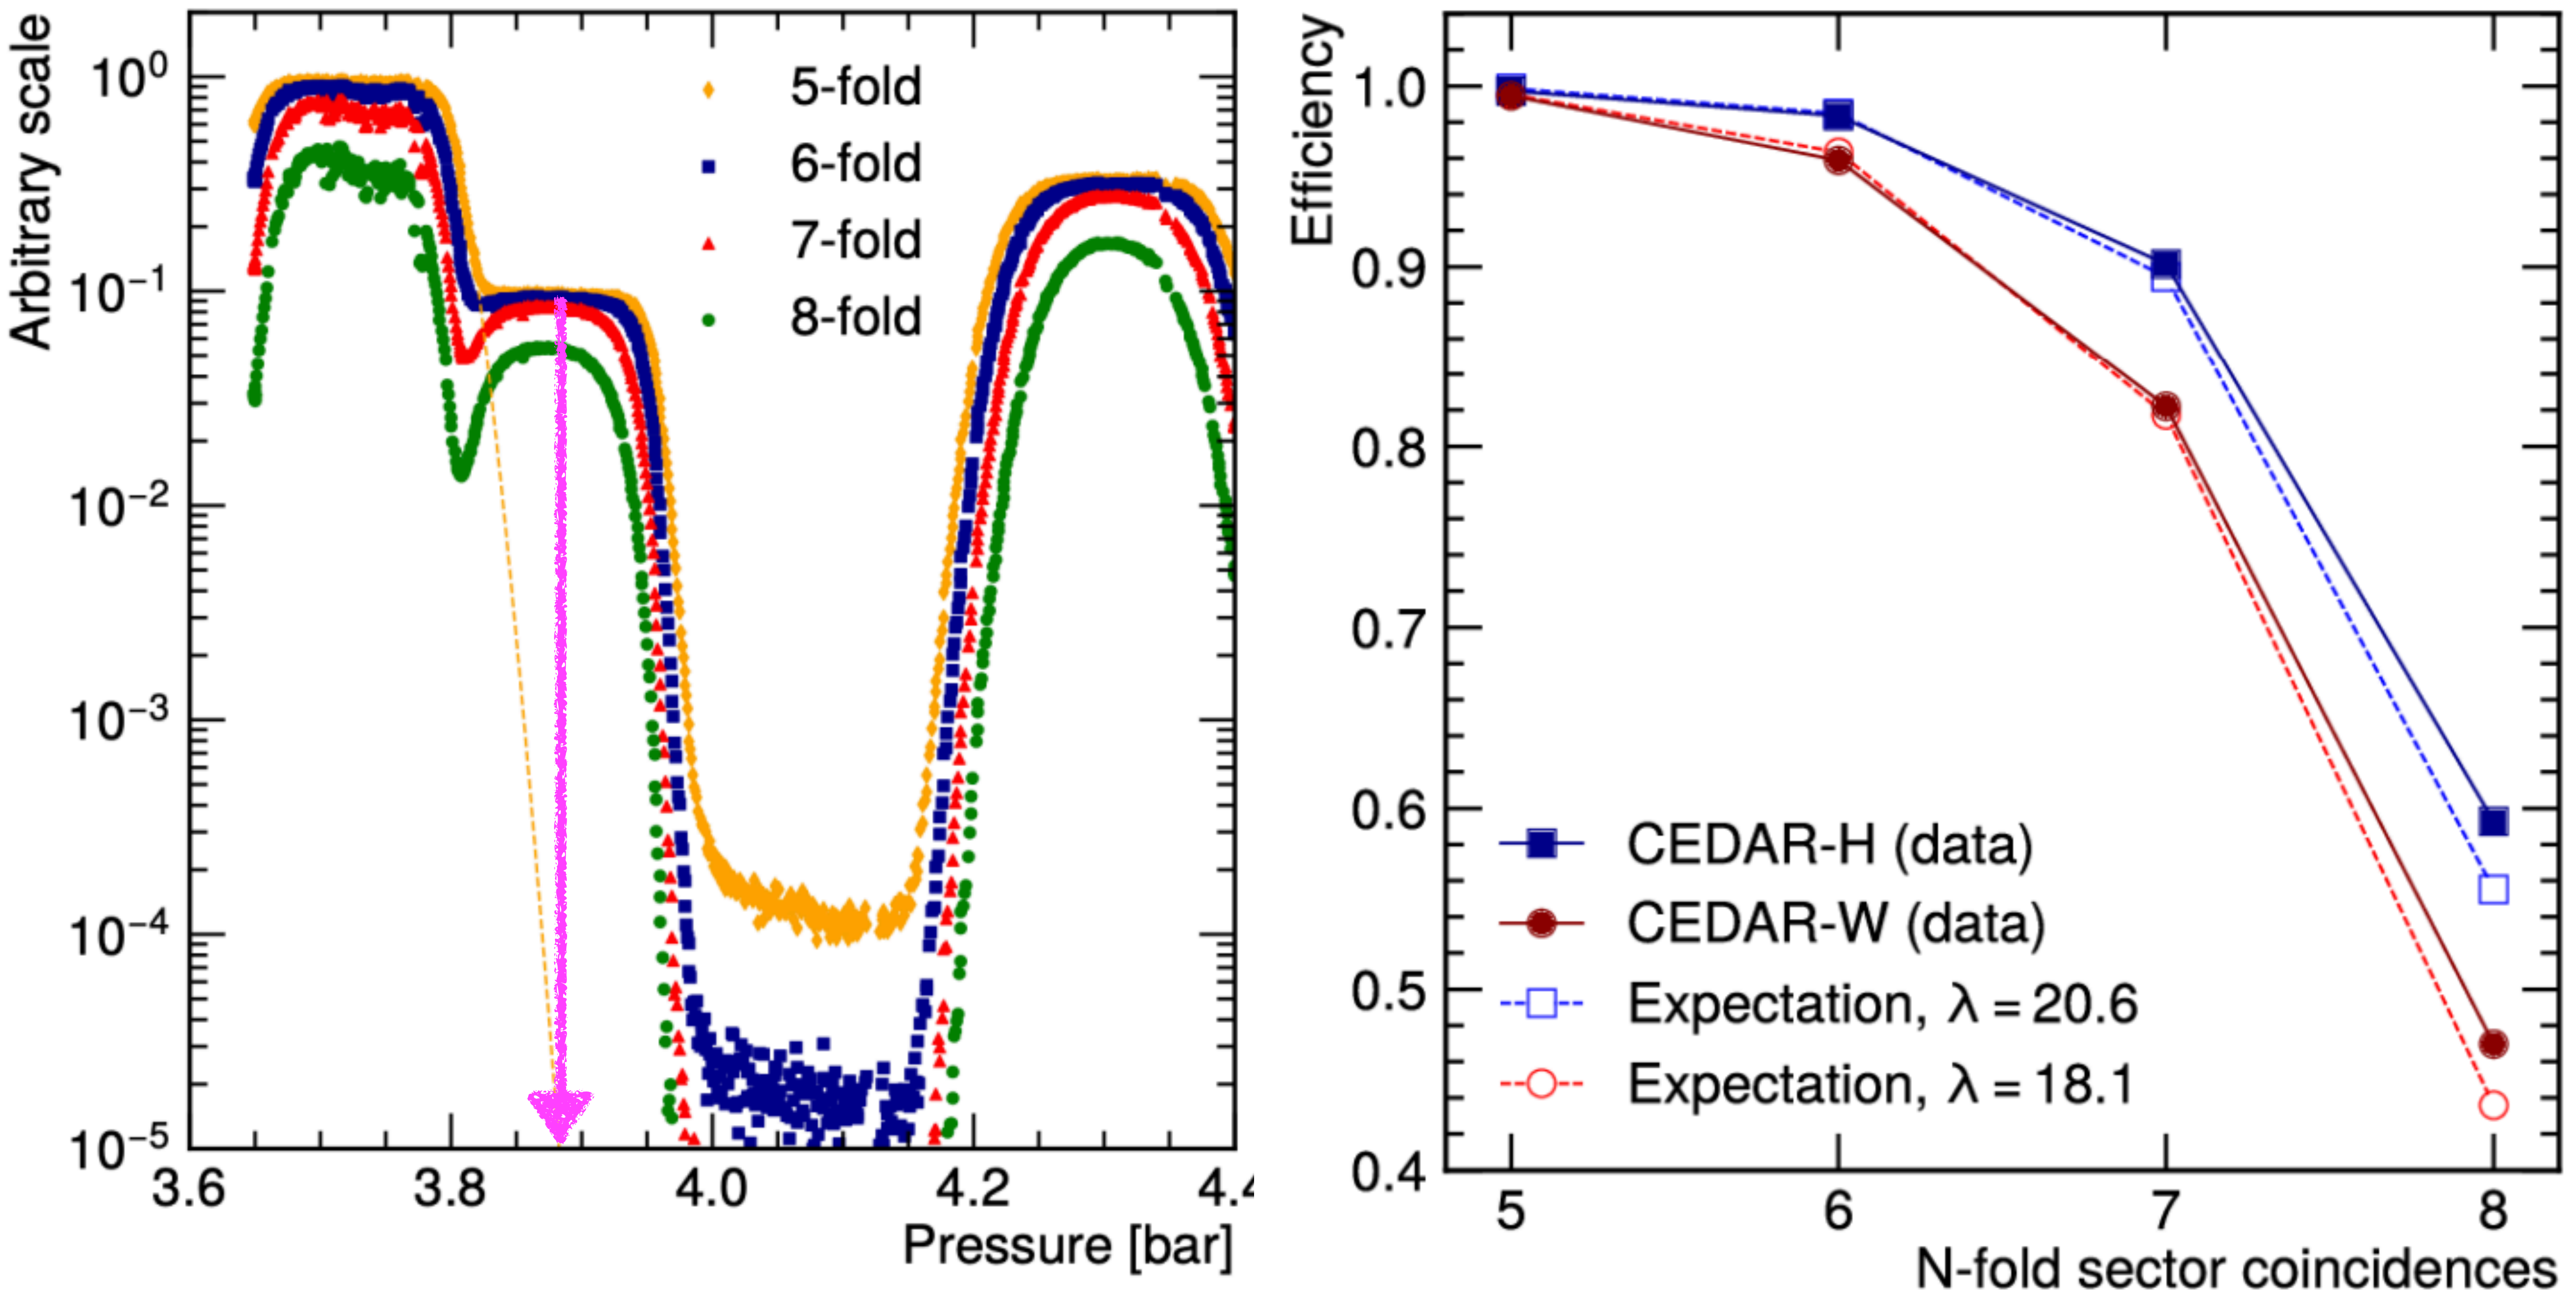
- Use fixed diaphragm to select ONLY Cherenkov light from K^+ (adjust diaphragm width and gas pressure in CEDAR to ensure powerful K^+/π^+ discrimination).



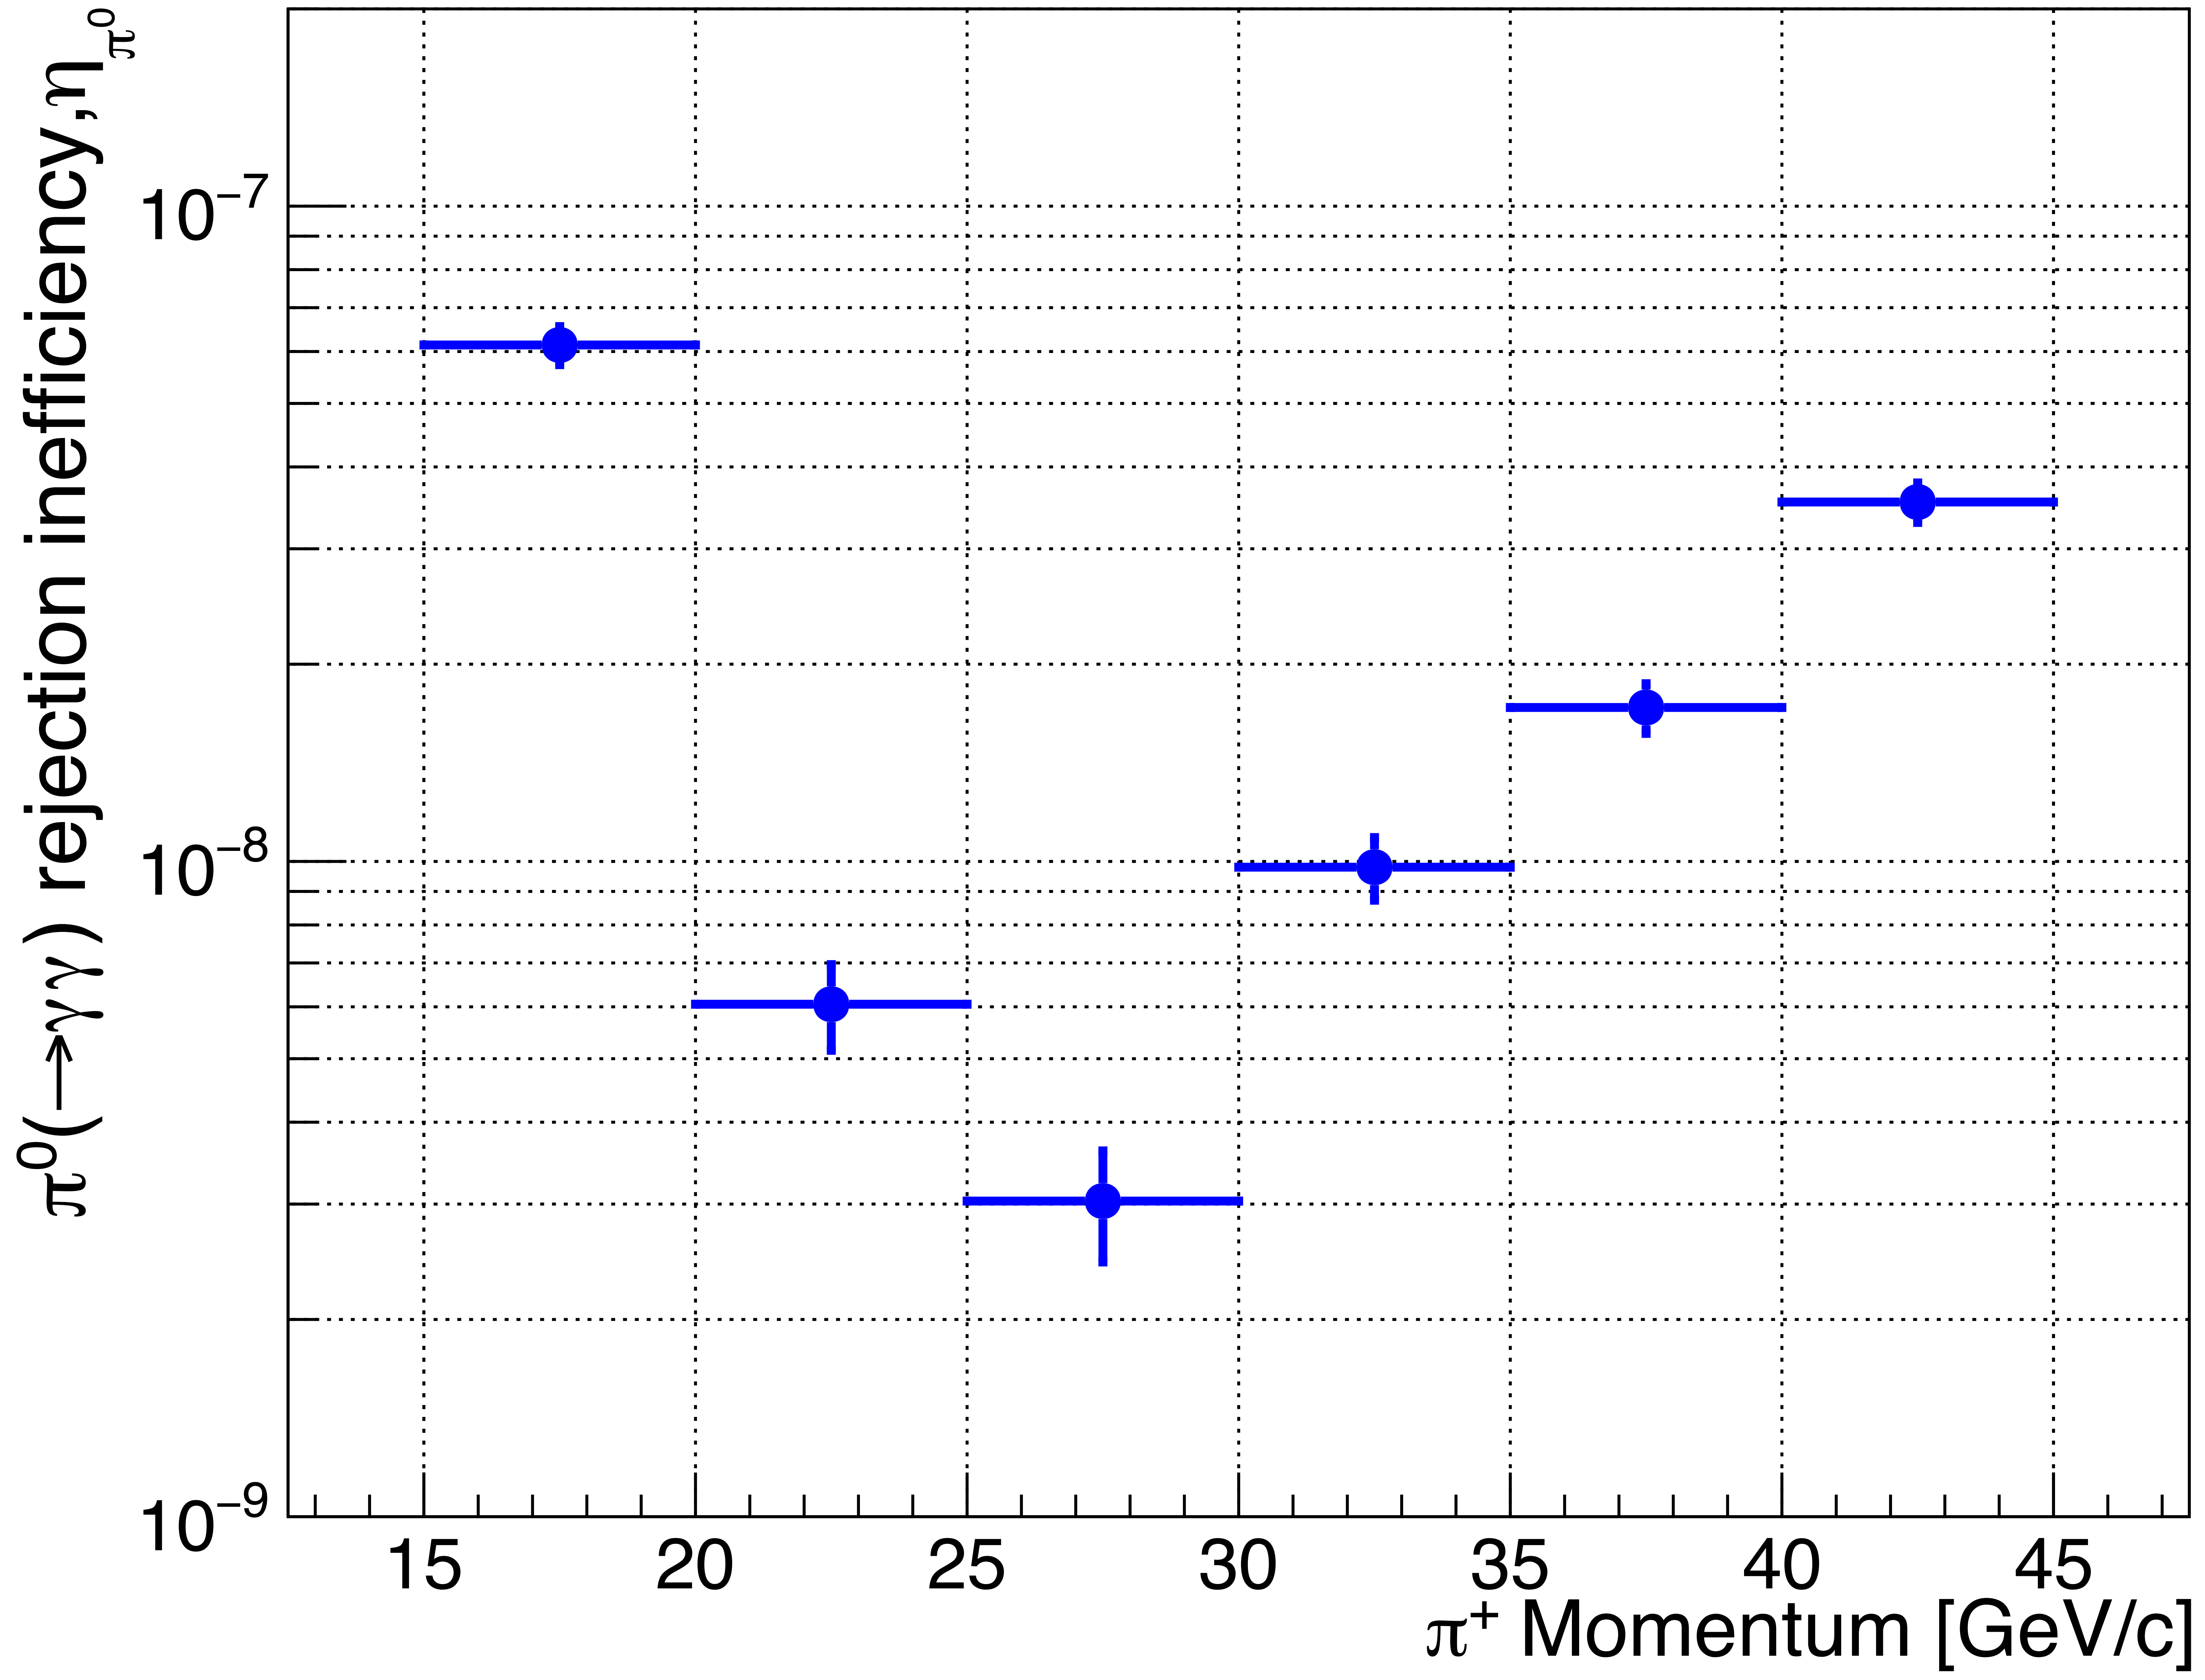
New Cedar-H : installed in 2023

- CEDAR-W filled with N_2 at 1.7 bar was biggest contributor to material in beam line $(39 \times 10^{-3} X_0)$.
- New CEDAR-H filled with H_2 at 3.8 bar:
  - Reduces material to $7.3 \times 10^{-3} X_0$: reducing multiple scattering.
  - But new optics required to account for different optical properties of H_2.
- Successful test beam in 2022 (at CERN,H6) and installation in NA62 in **early 2023**.

- **Cedar-H Performance at NA62:**
  - >99.5% efficiency for 5-fold coincidence.
  - π^+ mistag probability: 10^{-4}
  - ~65ps time resolution
  - 30% reduction in elastically scattered beam particles.



Photon veto performance



- Probability of $K^+ \to \pi^+\pi^0$ events with $\pi^0 \to \gamma\gamma$ passing full photon vetos:

$$\eta_{\pi^0} = \frac{N_{sel.}^{\pi^+\pi^0 R}}{N_{\pi\pi} D_0 \varepsilon_{trig} \varepsilon_{RV}}$$

Number of events passing full $\pi^+\nu\bar{\nu}$ selection in $\pi^+\pi^0$ region

Number of selected normalisation events

Normalisation trigger downscaling and efficiency

Random veto efficiency

$$\eta_{\pi^0} = (1.72 \pm 0.07) \times 10^{-8}$$

- **Combined γ/π^0 rejection of $\mathcal{O}(10^8)$.**

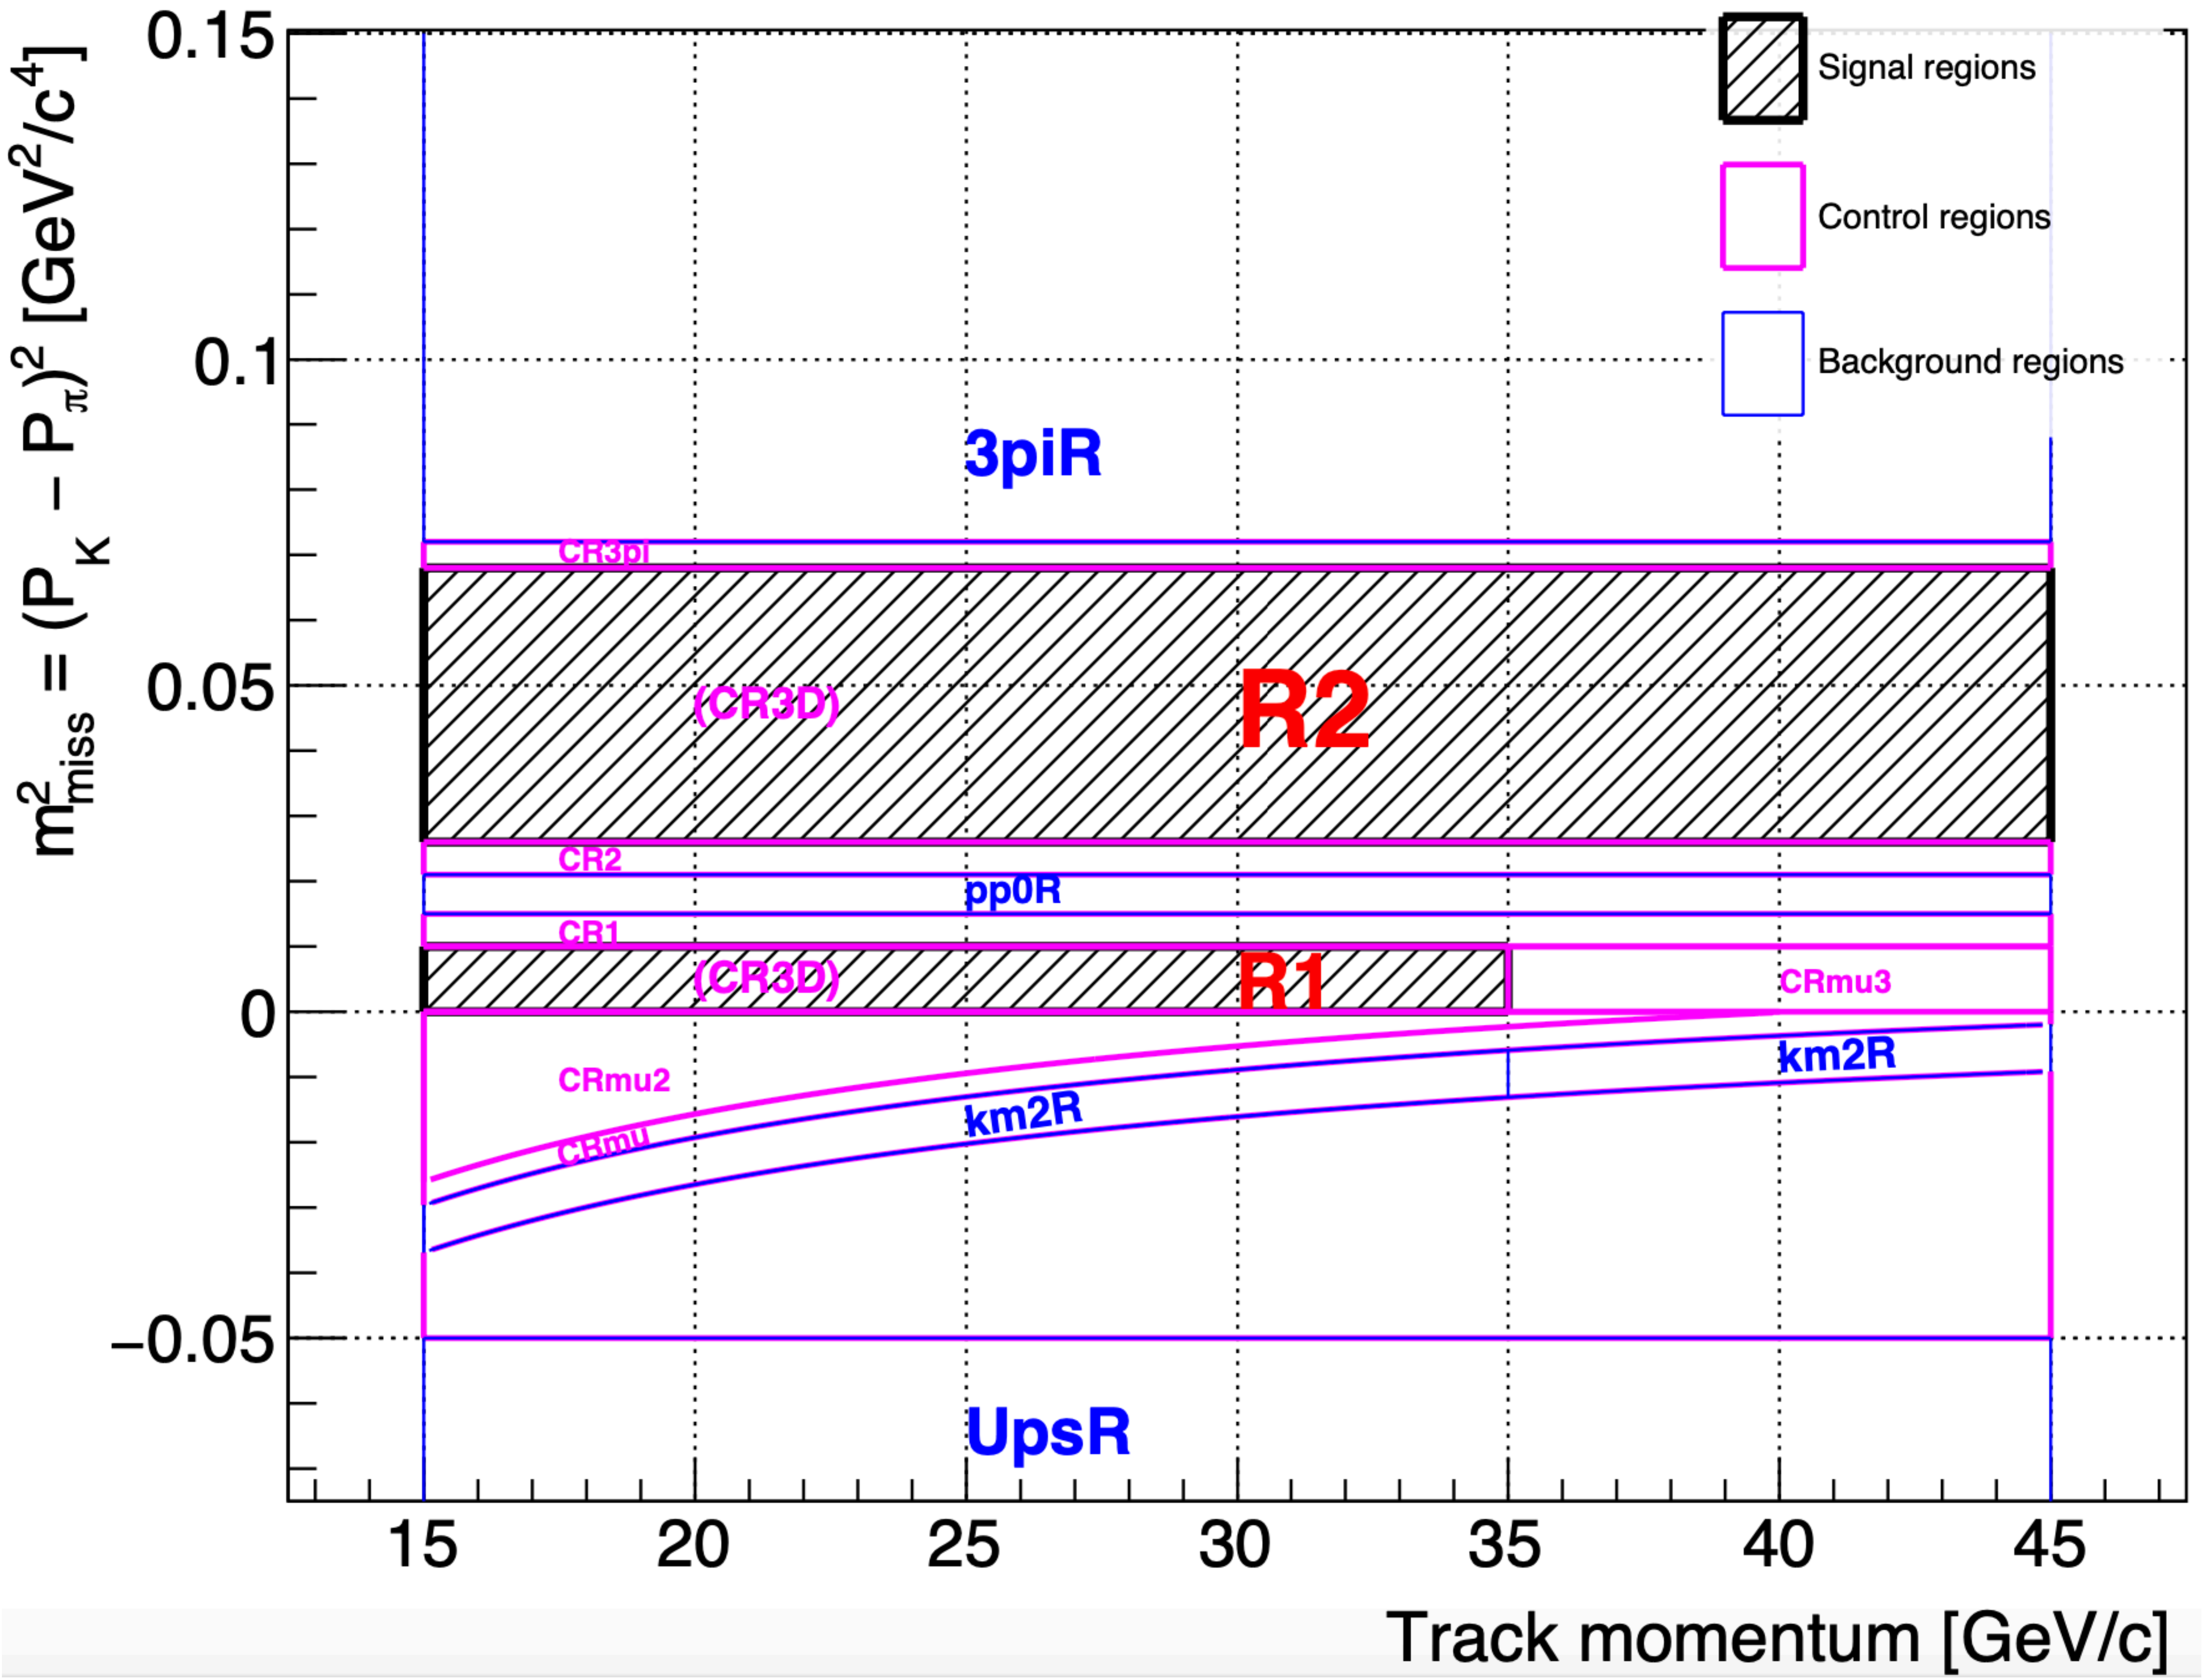
Bayesian classifier for $K^+ - \pi^+$ matching

- **Inputs:** spatial (CDA) & time (ΔT_+) matching, intensity/pileup (N_{GTK}) [prior]
  - Models for PDFs/Prior from $K^+ \rightarrow \pi^+\pi^+\pi^-$ data.

- **Output:** posterior probability of GTK track = true K^+
  - Use likelihoods of kaons (K) and pileup (P)
  - Likelihood ratio used to select true match when $N_{GTK} > 1$
- Efficiency improved (+10%) and mistagging probability maintained.

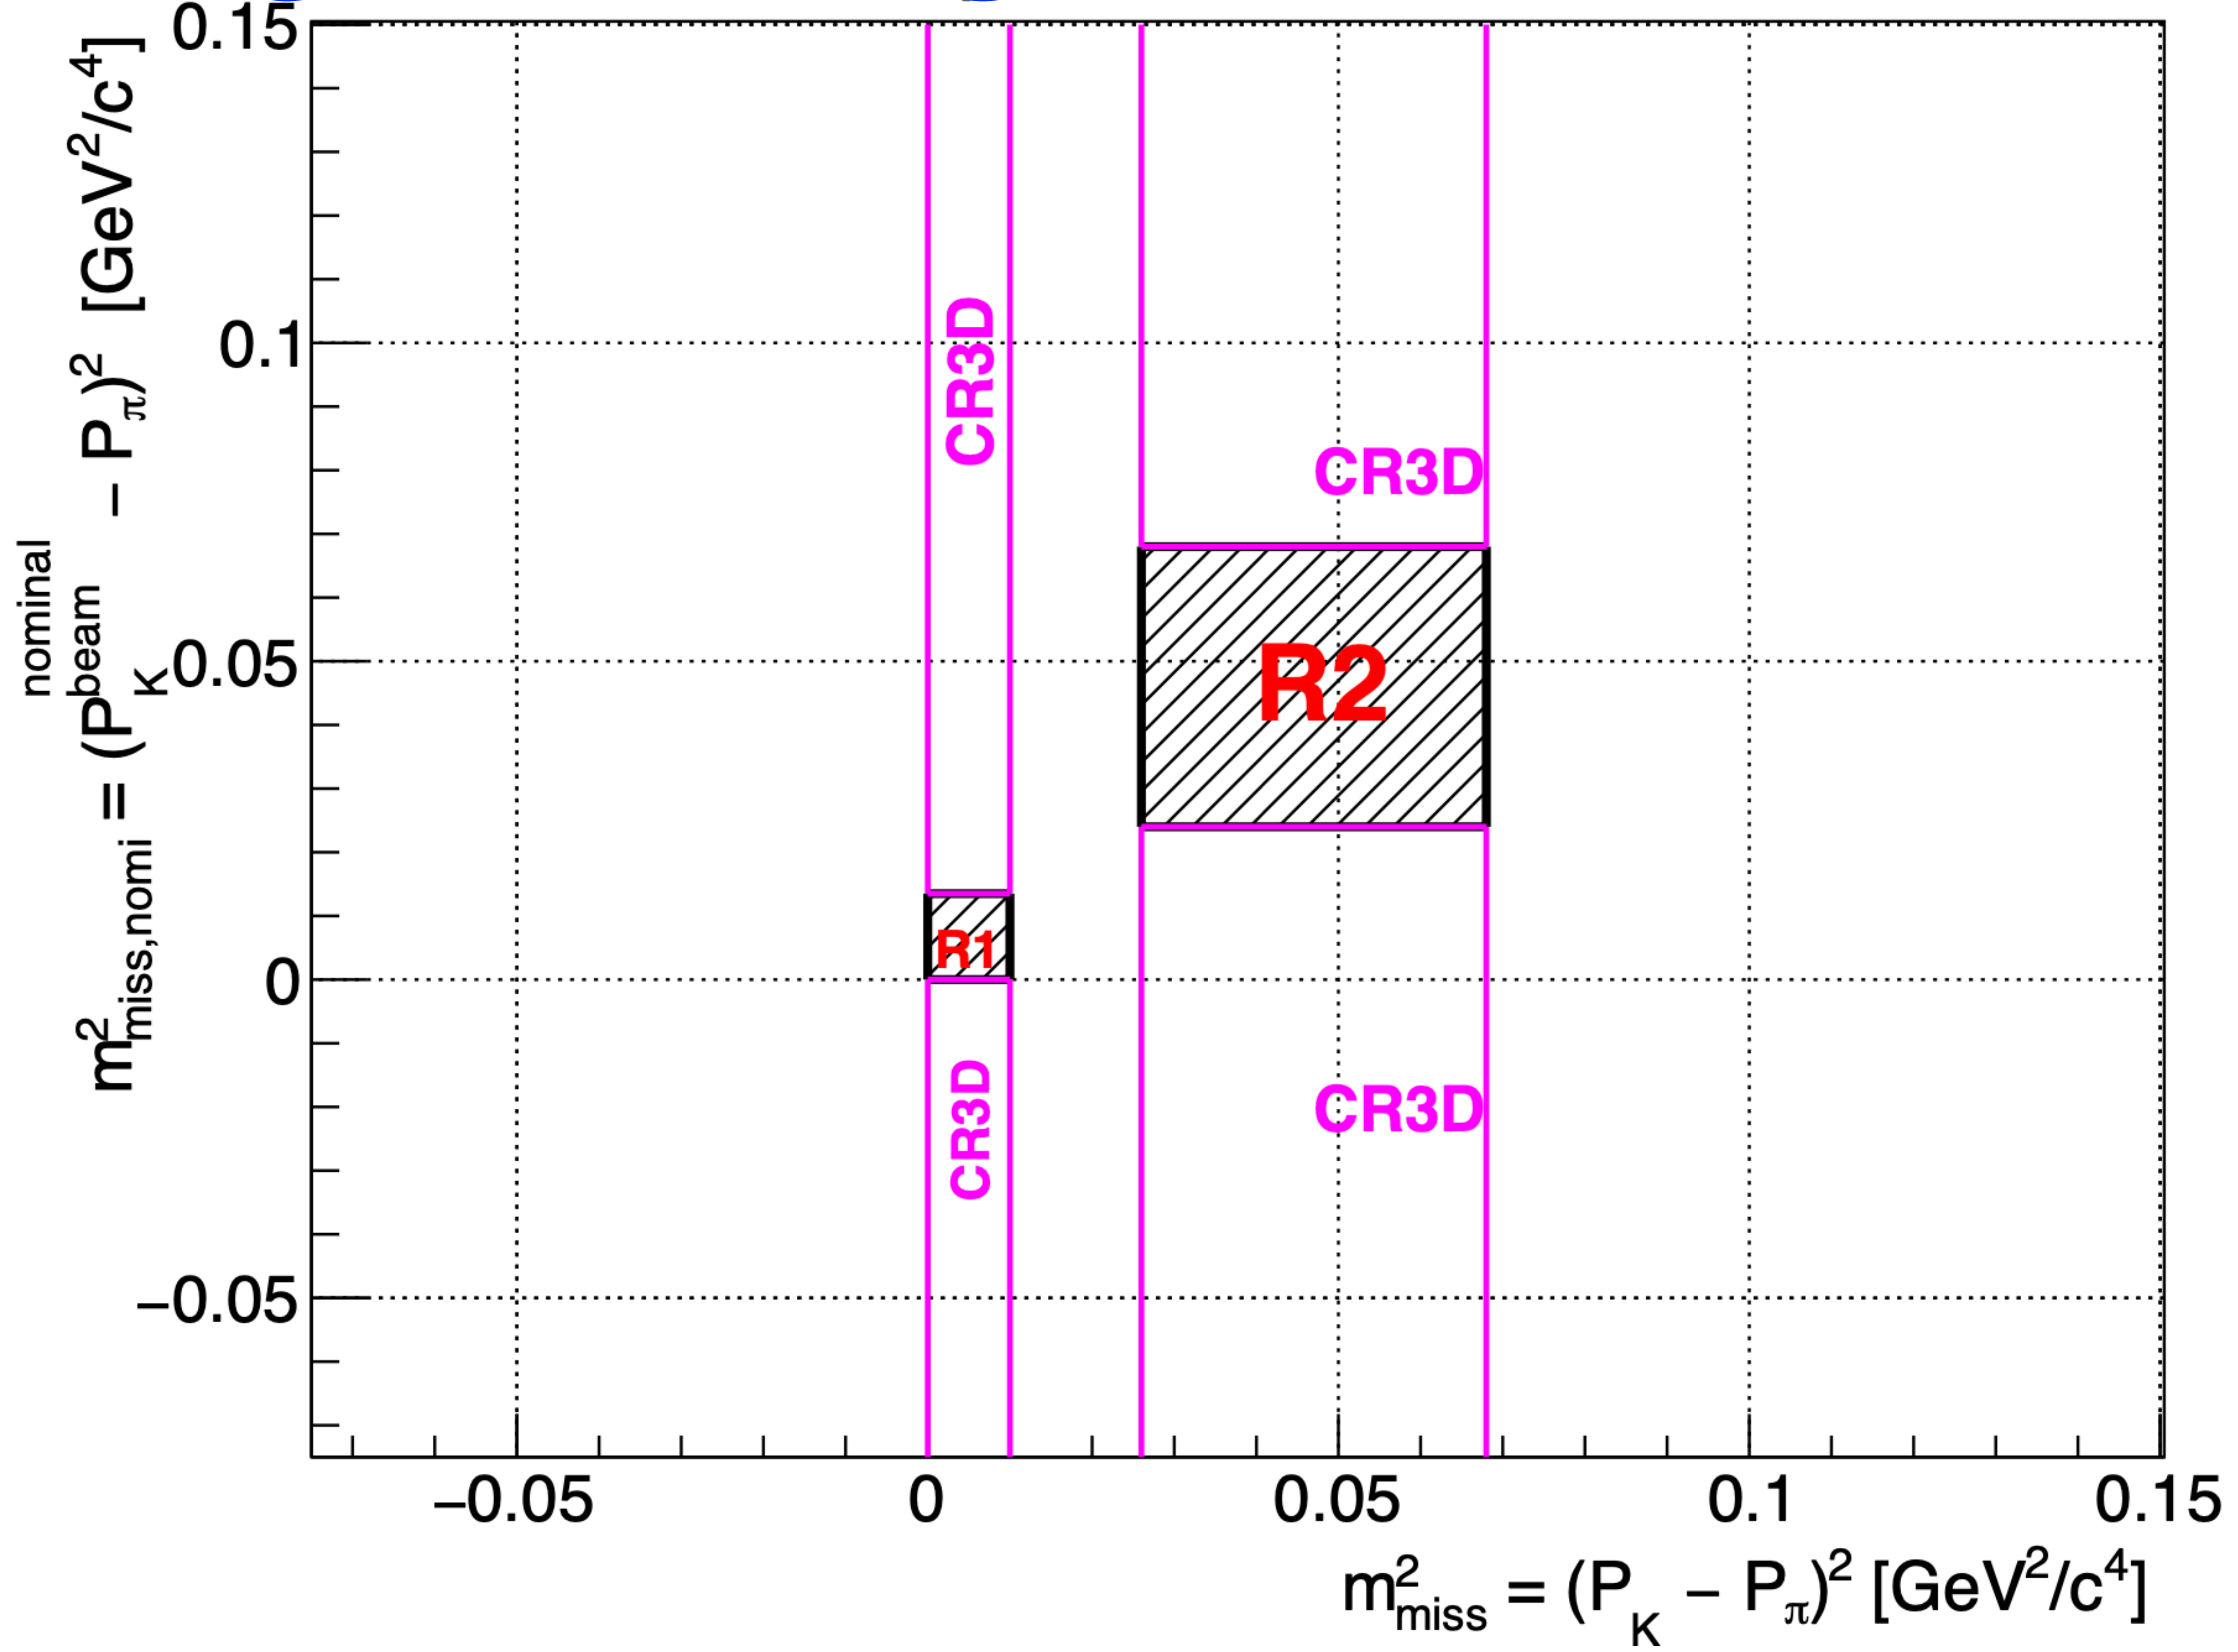
Example of selection update

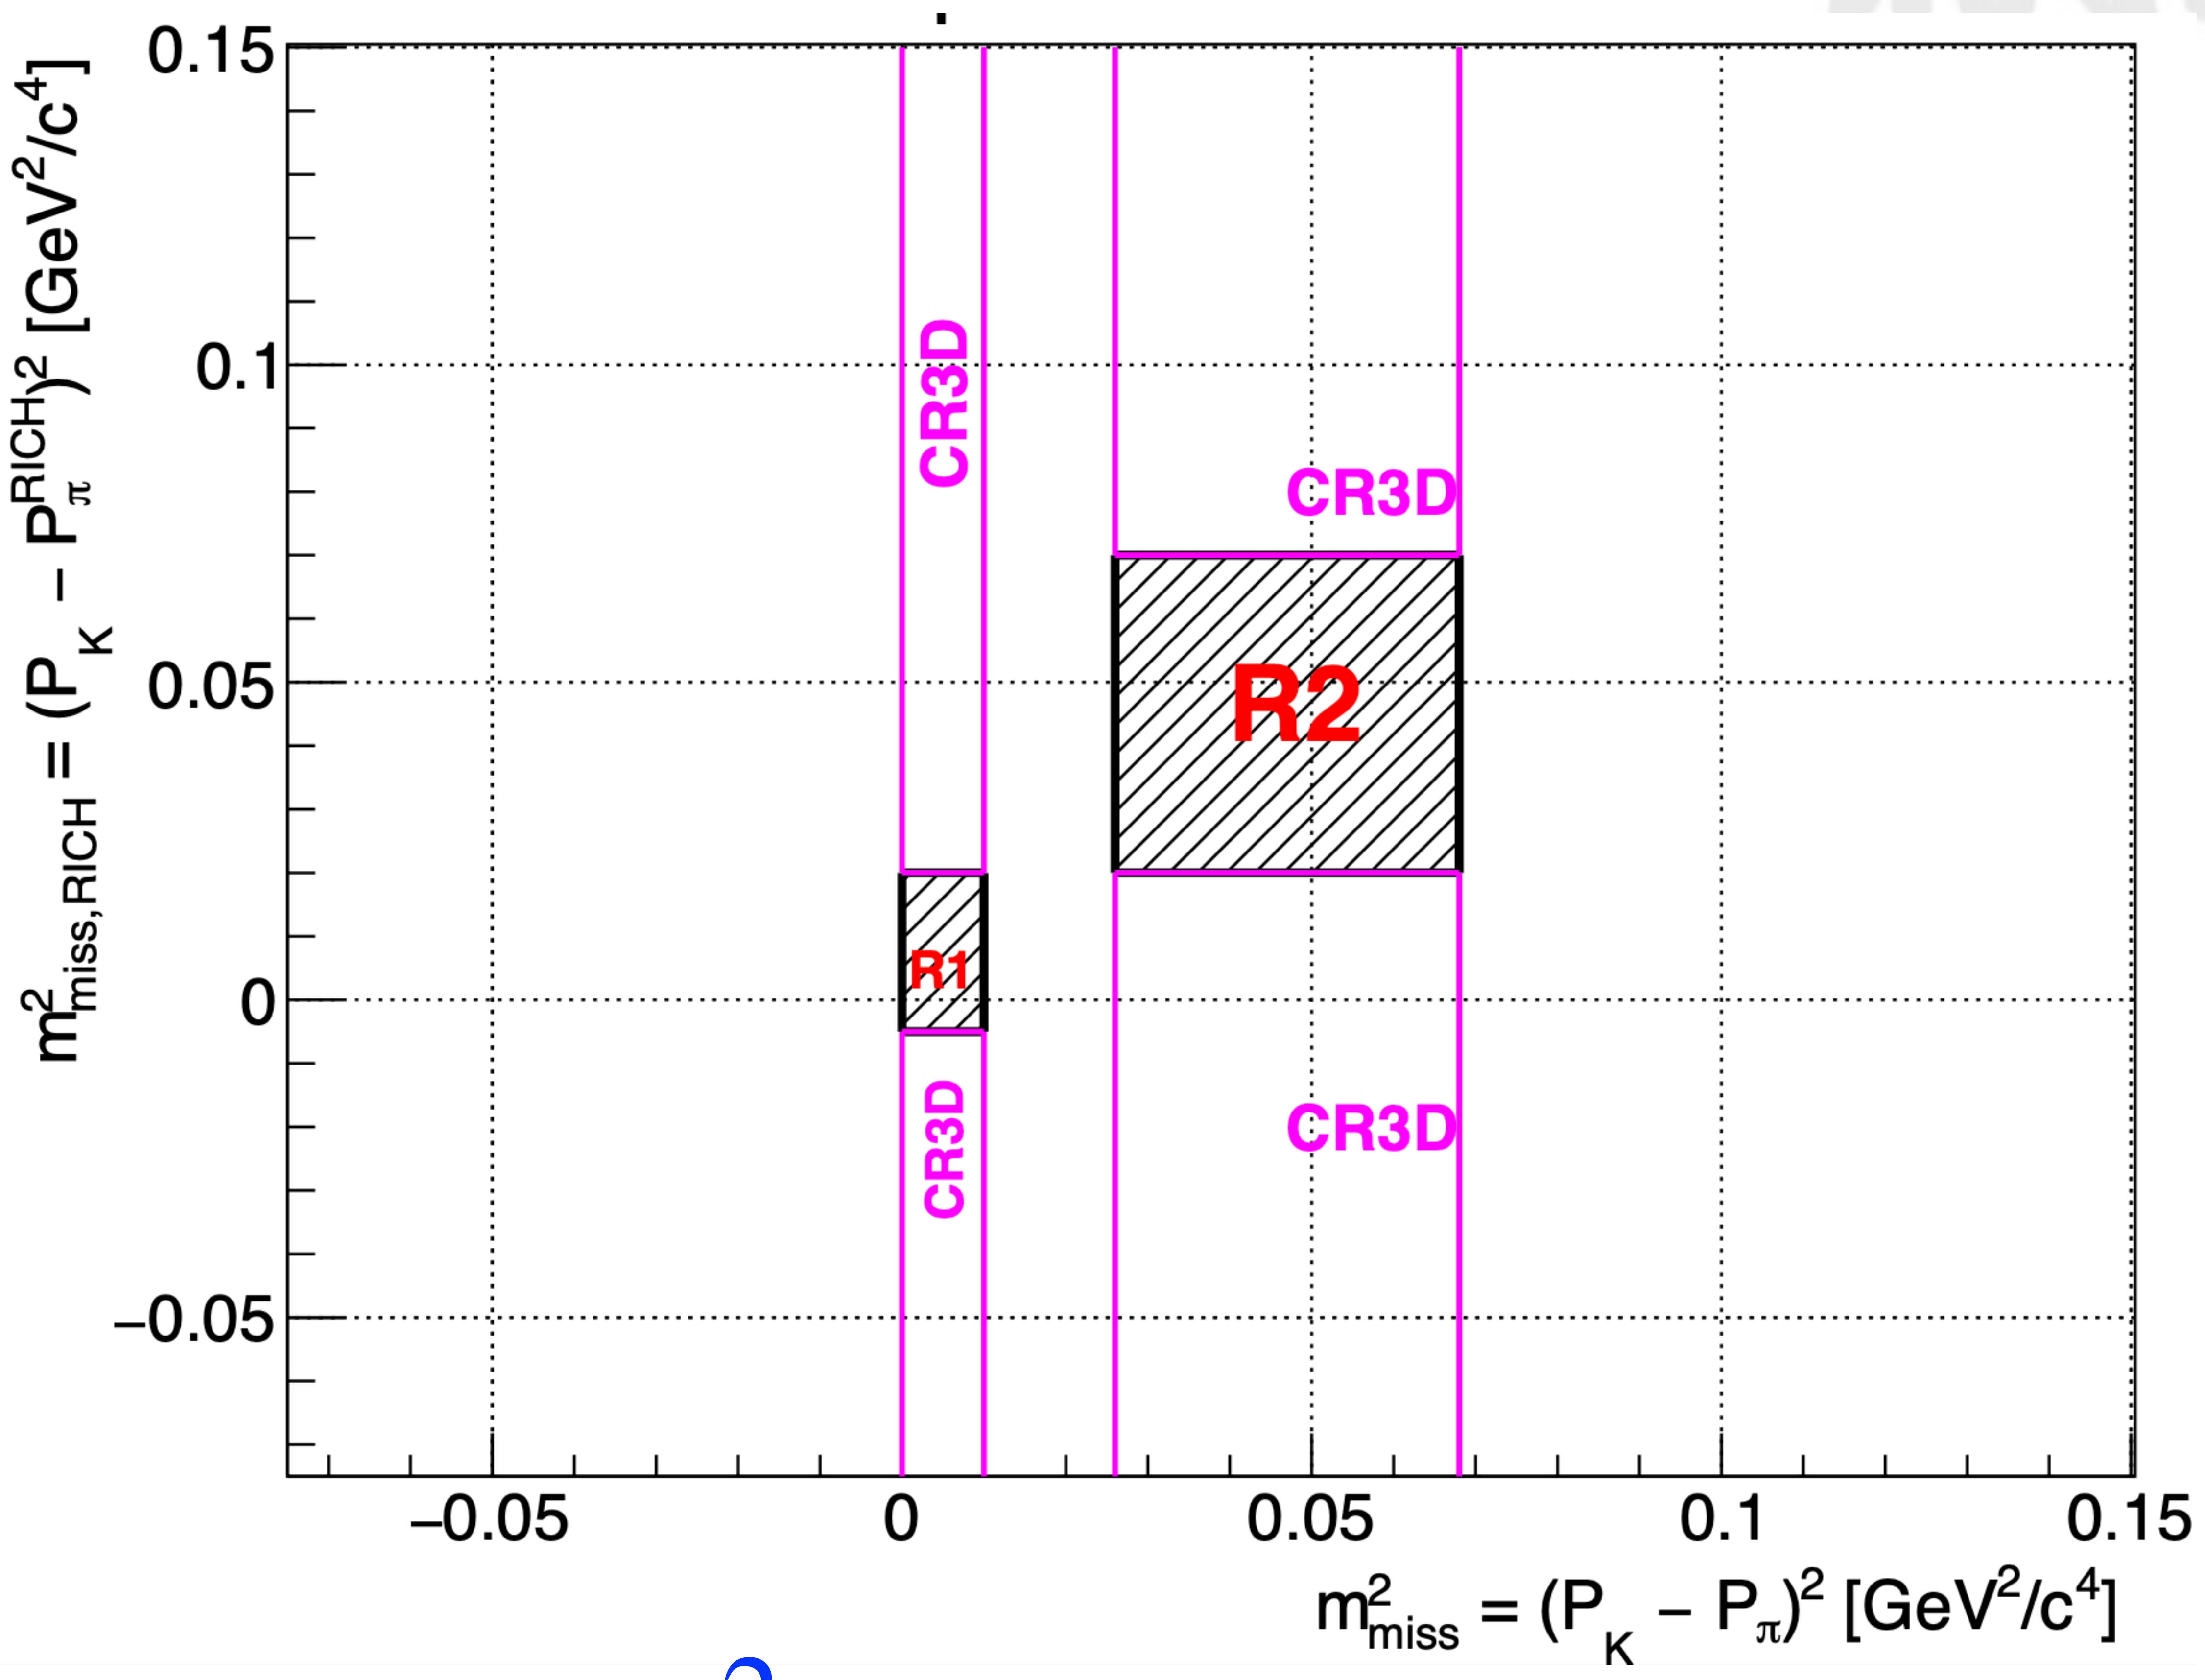
Kinematic regions



- **Signal regions:**
- **Control regions:**
  - Used to validate background predictions.
- **Background regions:**
  - Used as "reference samples" for some background estimates.

3D signal regions definition





CR3D: control region for events in SR in 2 out of 3 dimensions.

$$m^2_{miss} = (P_K - P_\pi)^2$$

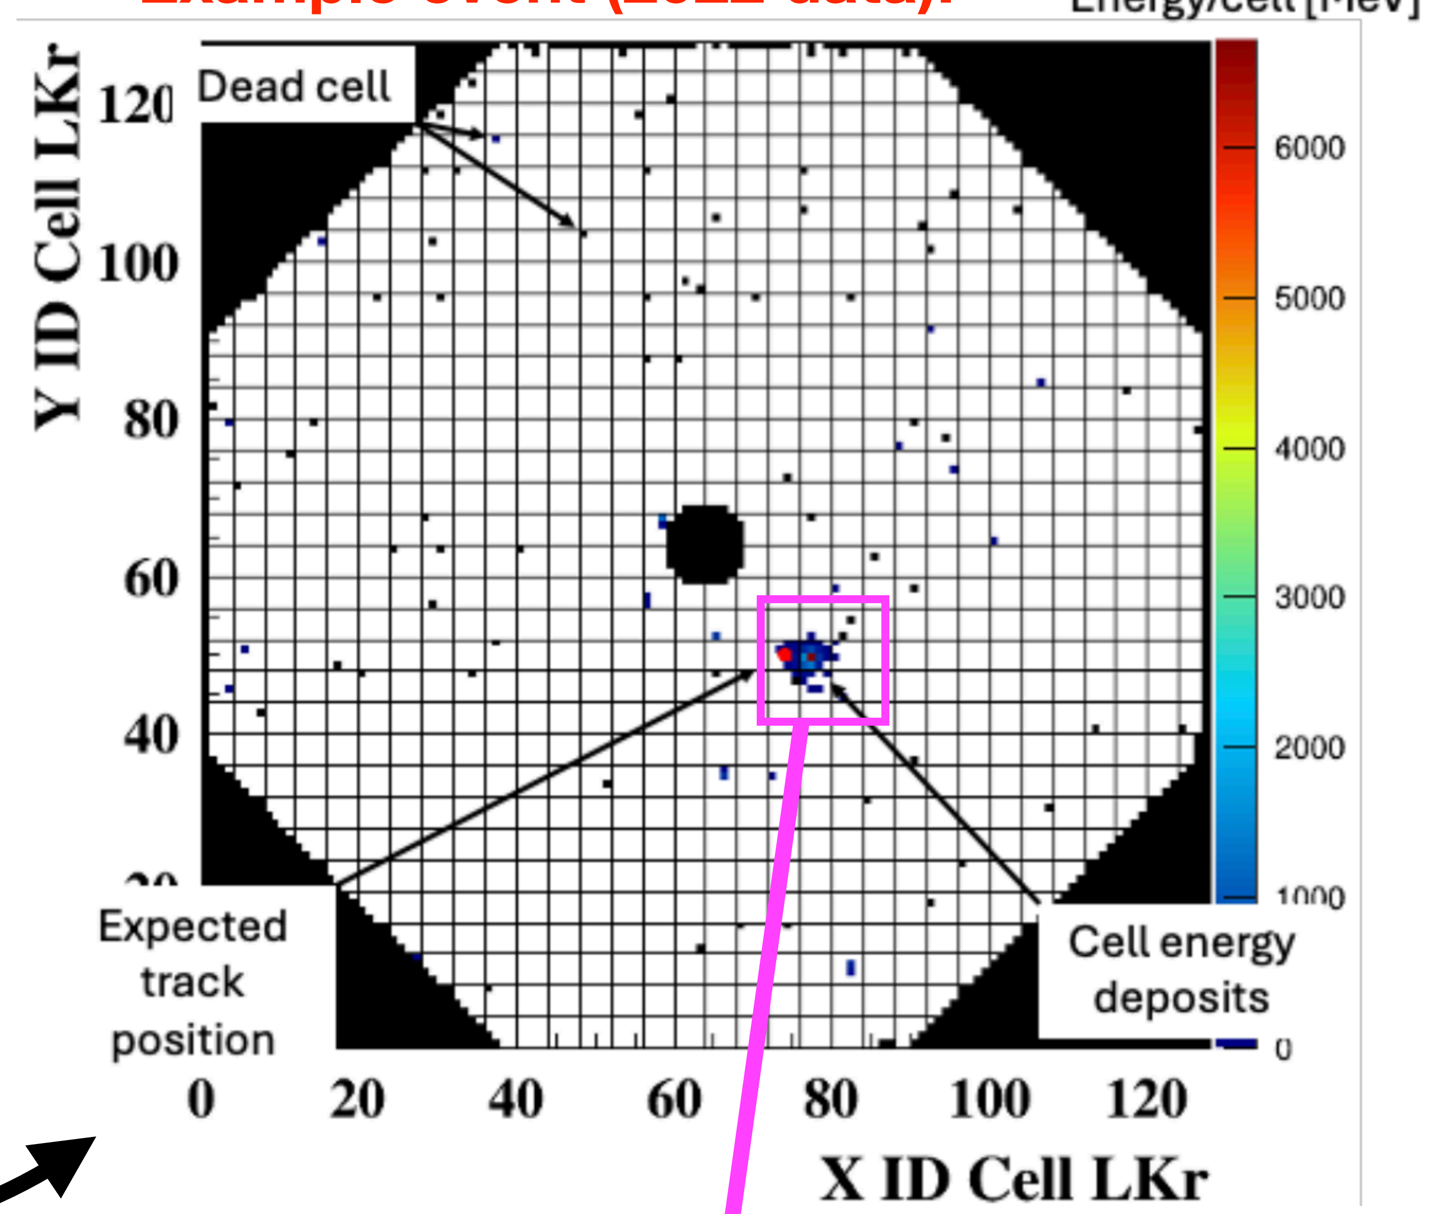
Default: GTK
Alternative: Nominal beam = $m^2_{miss,nom}$

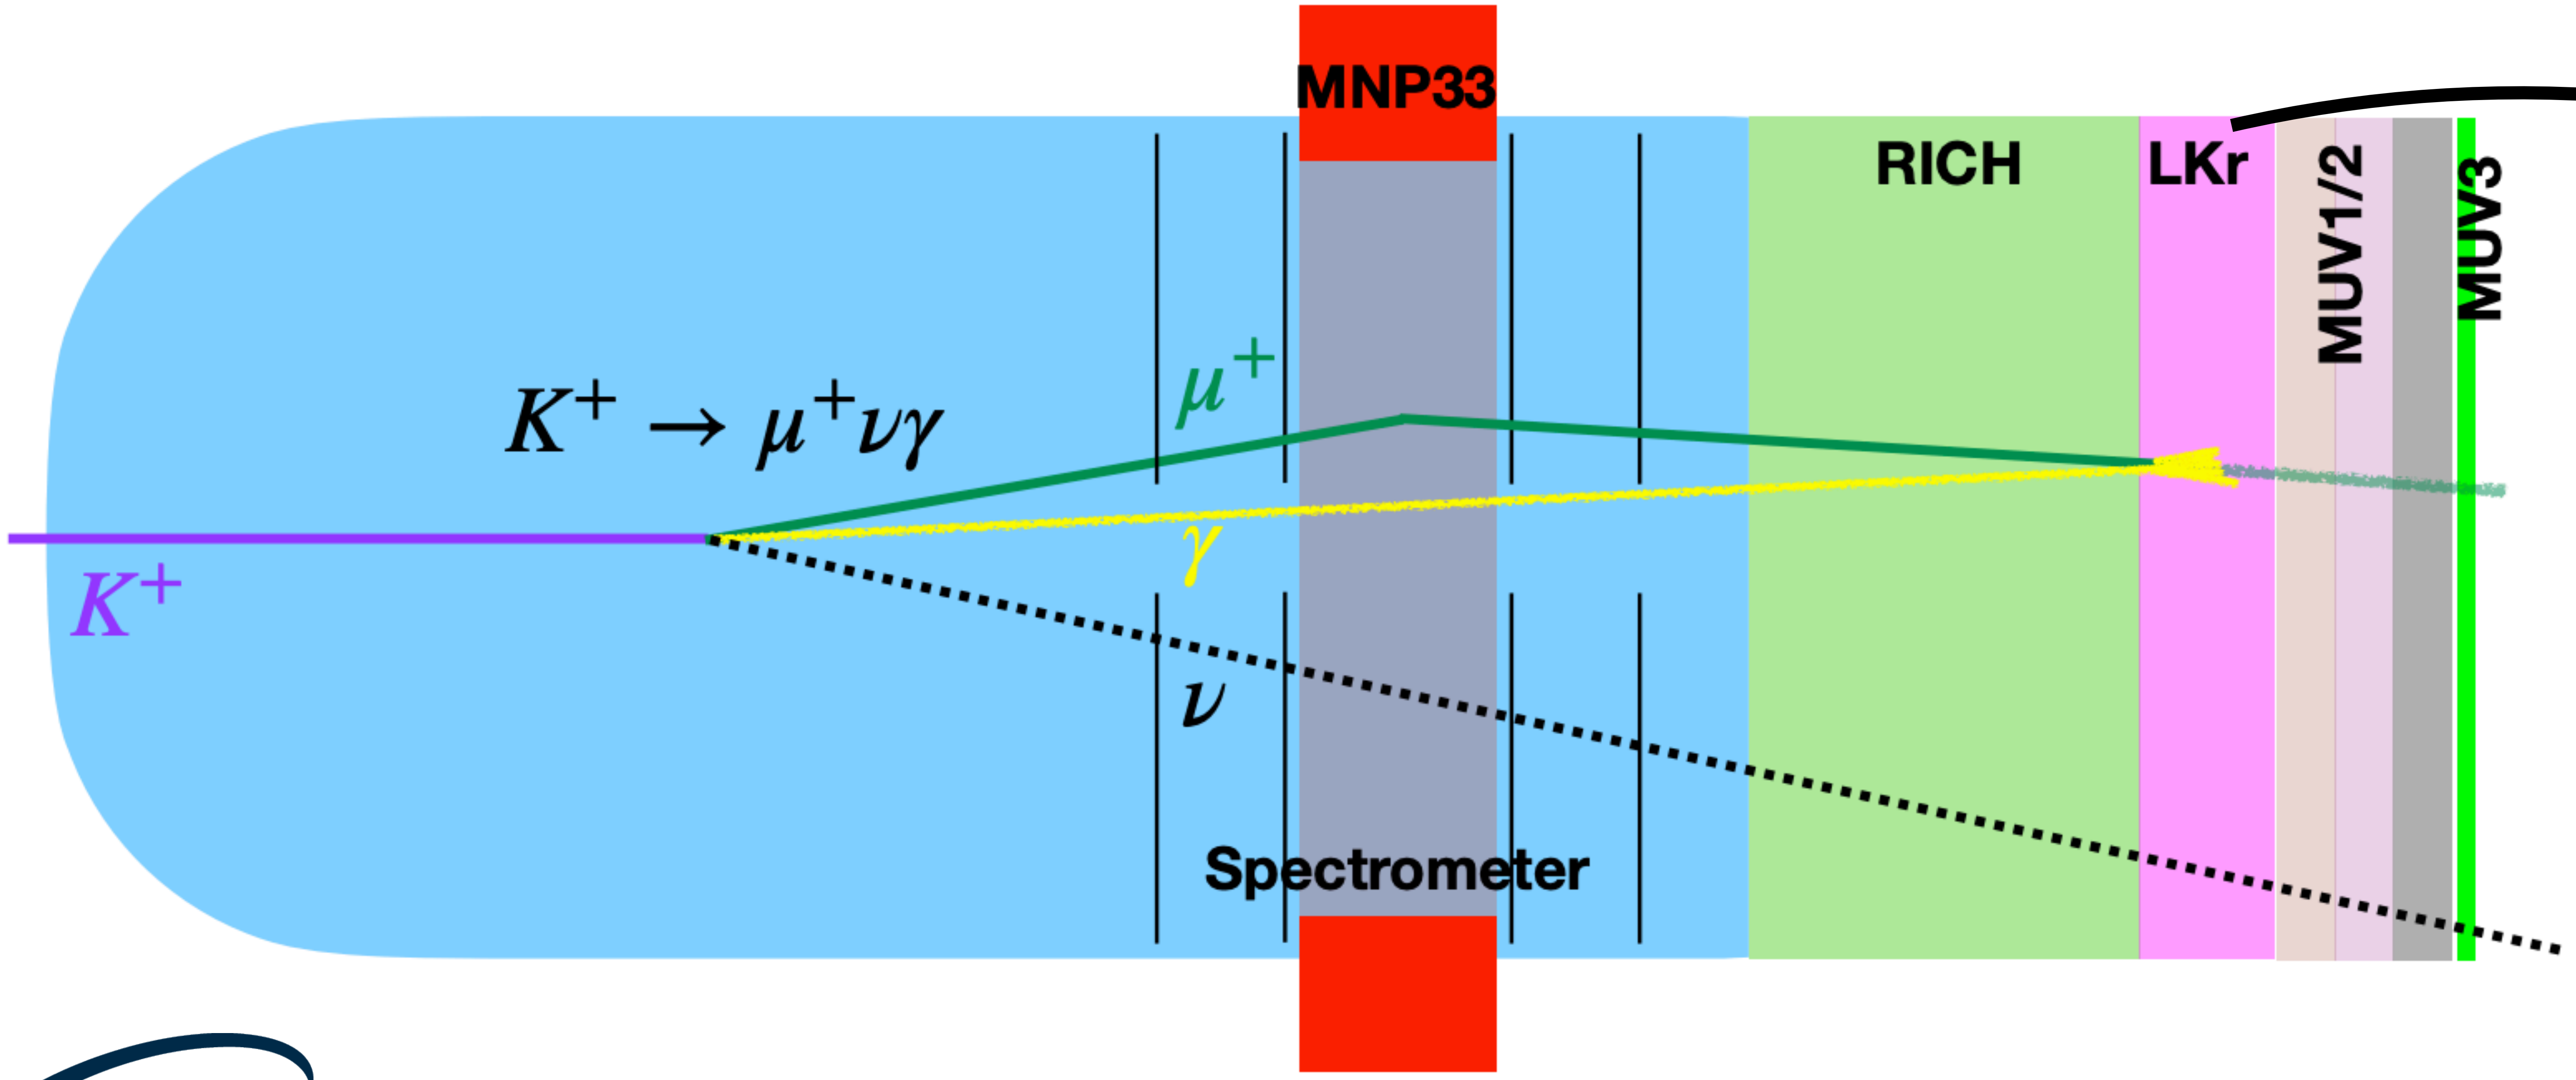
Default: STRAW
Alternative: $|p|$ **from RICH (use as a velocity spectrometer) =** $m^2_{miss,RICH}$

Background mechanism: $K^+ \to \mu^+\nu\gamma$

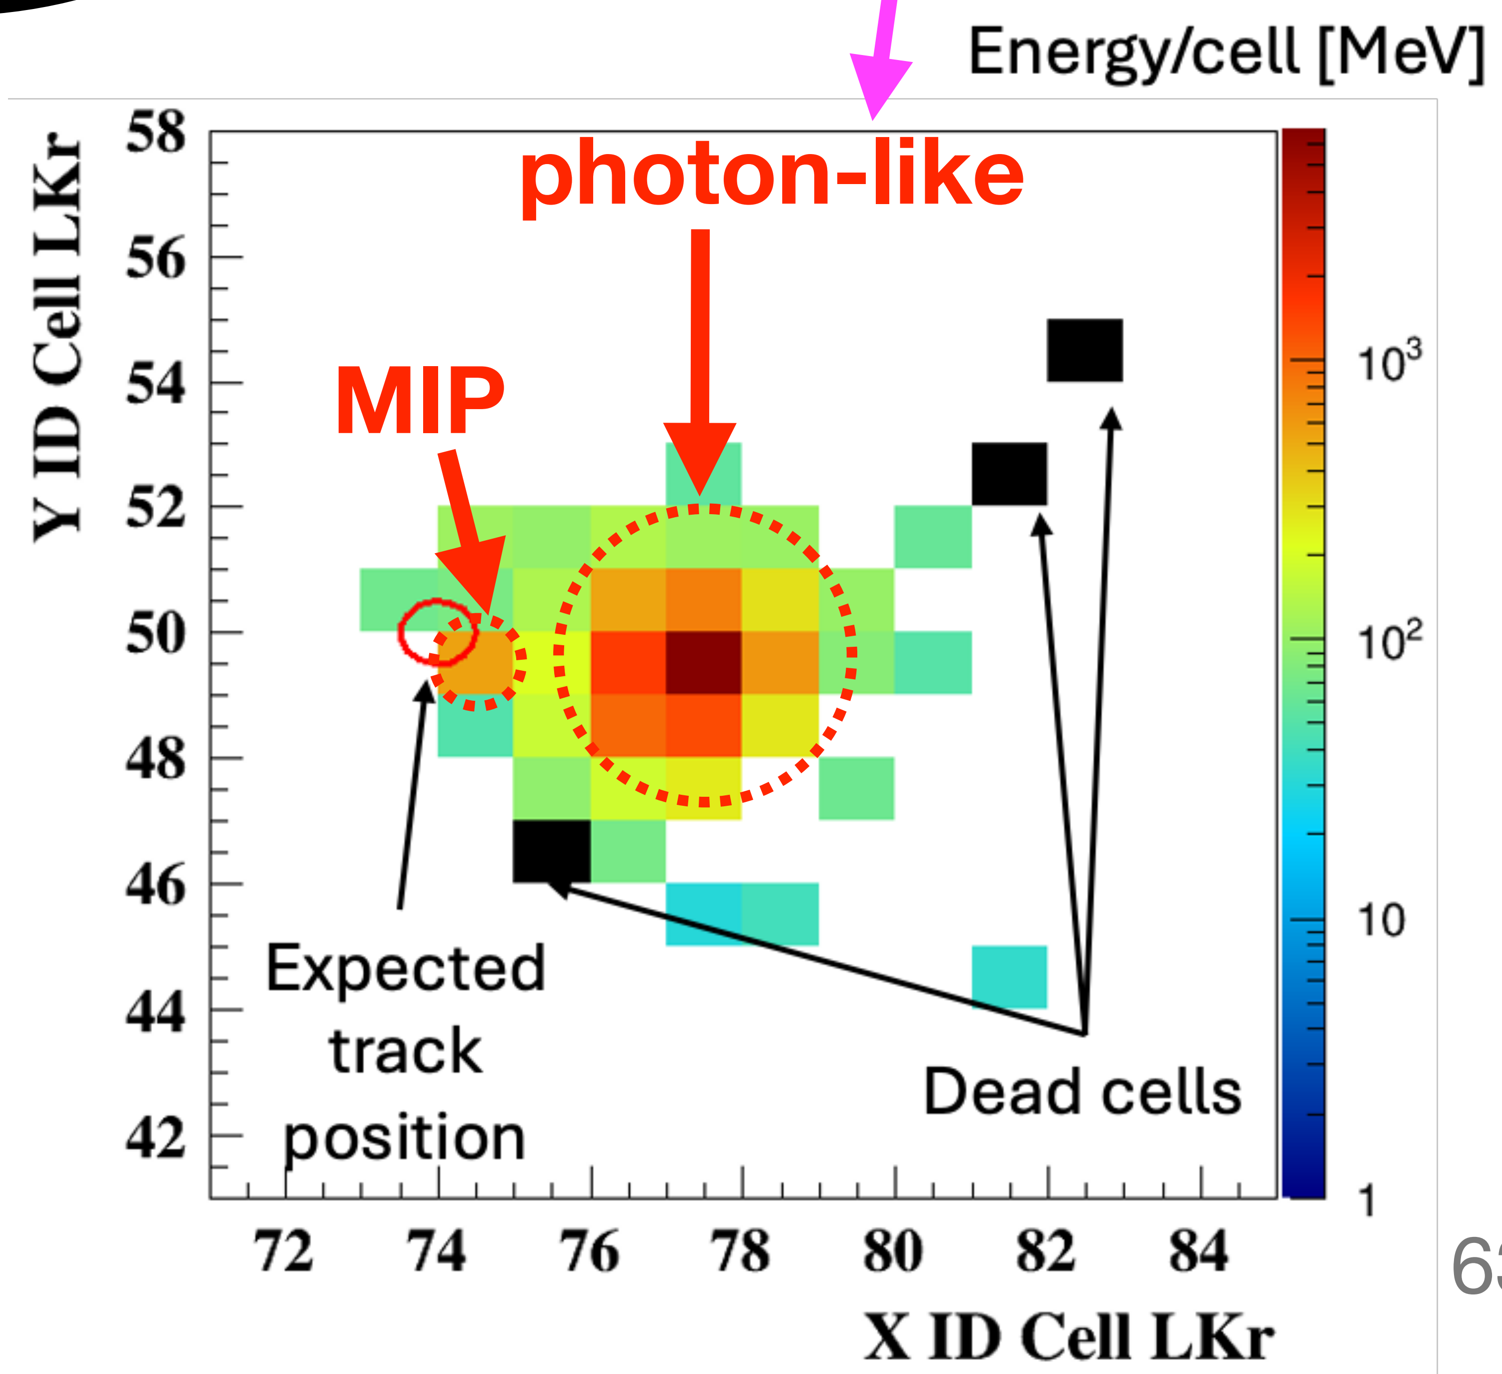
- $K^+ \to \mu^+\nu\gamma$ decay with fairly energetic photon ($E_\gamma > 5$ GeV) and high momentum μ^+ ($p \gtrsim 35$ GeV/c).
- γ and μ^+ hit LKr together and are misidentified as a π^+.
- No rejection power from photon vetos (LKr γ cluster associated to track).
- Additional γ naturally shifts $m^2_{miss} = (P_K - P_\pi)^2$ towards higher values (i.e. towards signal regions).

Example event (2022 data):



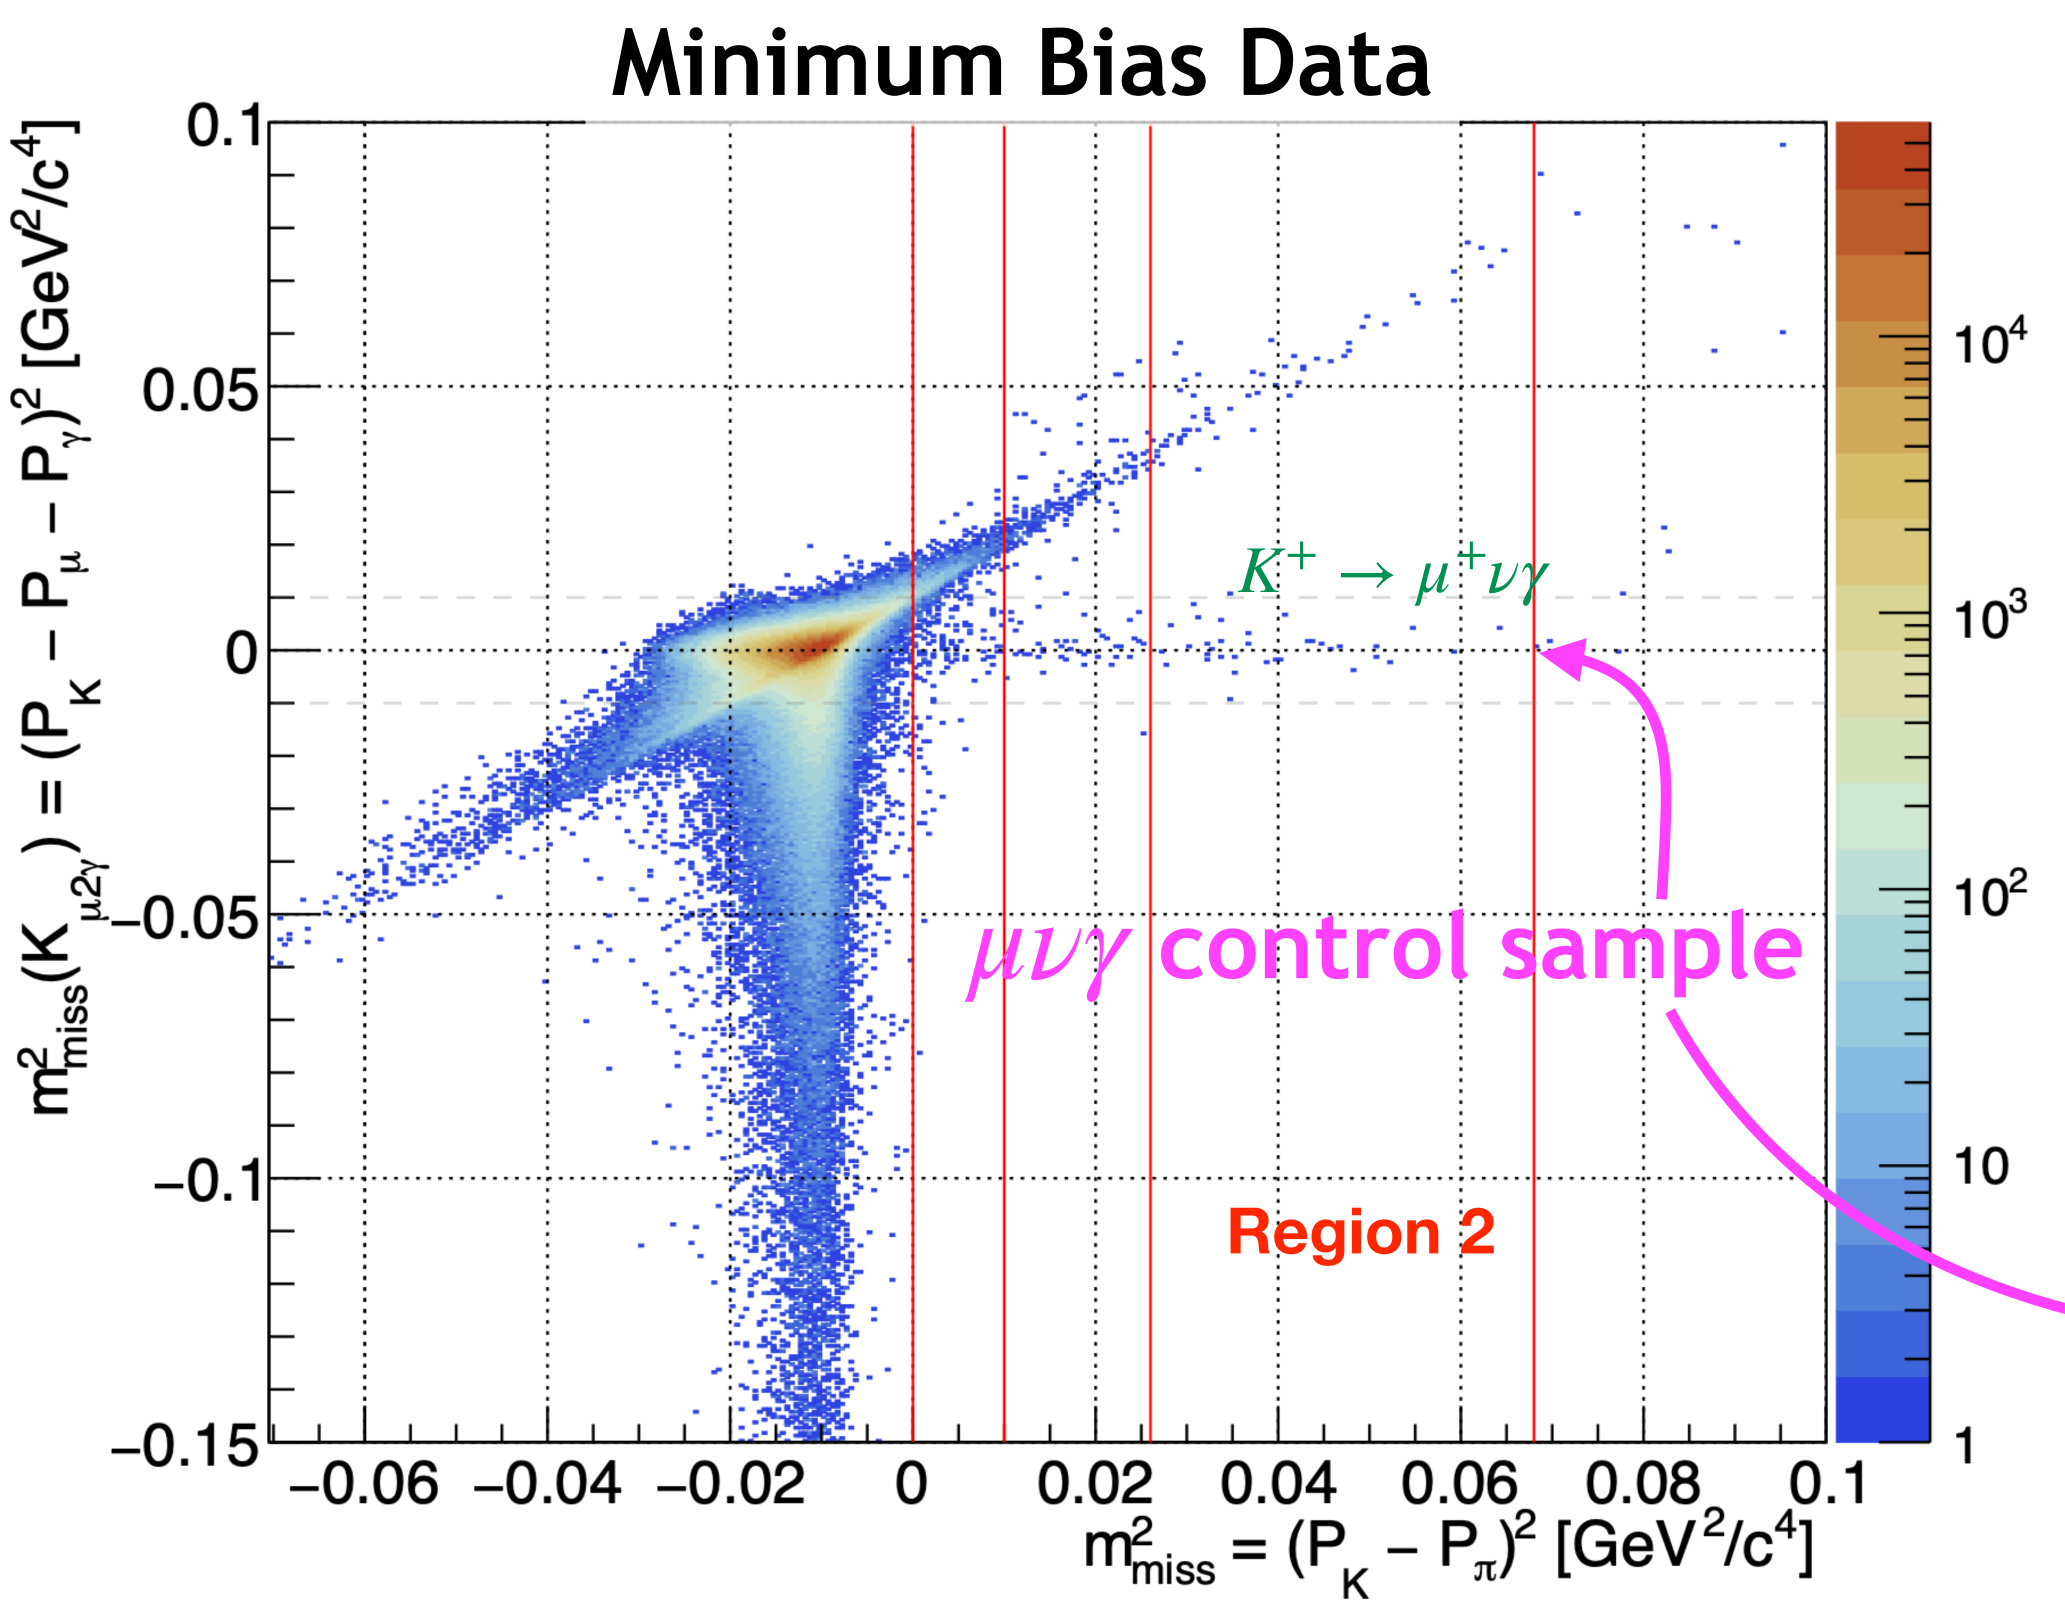


Sketch only



Background evaluation: $K^+ \to \mu^+\nu\gamma$

- Evaluate background expectation using $\mu\nu\gamma$ control sample from MinimumBias (MB) trigger.
  - Not applying Calorimetric BDT classifier and a signal in MUV3.



- Kinematically select $K^+ \to \mu^+\nu\gamma$ events:

$$m^2_{miss}(K_{\mu 2\gamma}) = (P_K - P_\mu - P_\gamma)^2$$

  - P_K : 4-momentum of K^+ from GTK (as normal)
  - P_μ : 4-momentum of track with μ^+ mass hypothesis.
  - P_γ : reconstructed from energy (subtracting MIP energy deposit) and position of LKr cluster (and position of K^+-μ^+ vertex).

$$N_{bg}(K^+ \to \mu^+\nu\gamma) = N^{MB}_{\mu\nu\gamma} D_{MB} \frac{\varepsilon_{signal}}{\varepsilon_{MB}} P_{misID}$$

Downscaling of MB trigger

Ratio of $\pi^+\nu\bar{\nu}$ and MB trigger efficiencies

probability of γ+μ^+ being misidentified as a π^+

Not included in kinematic tails calculation because the tails sample imposes Calorimetric PID=μ^+, while here there is misID of $\mu^+\gamma \Rightarrow \pi^+$.

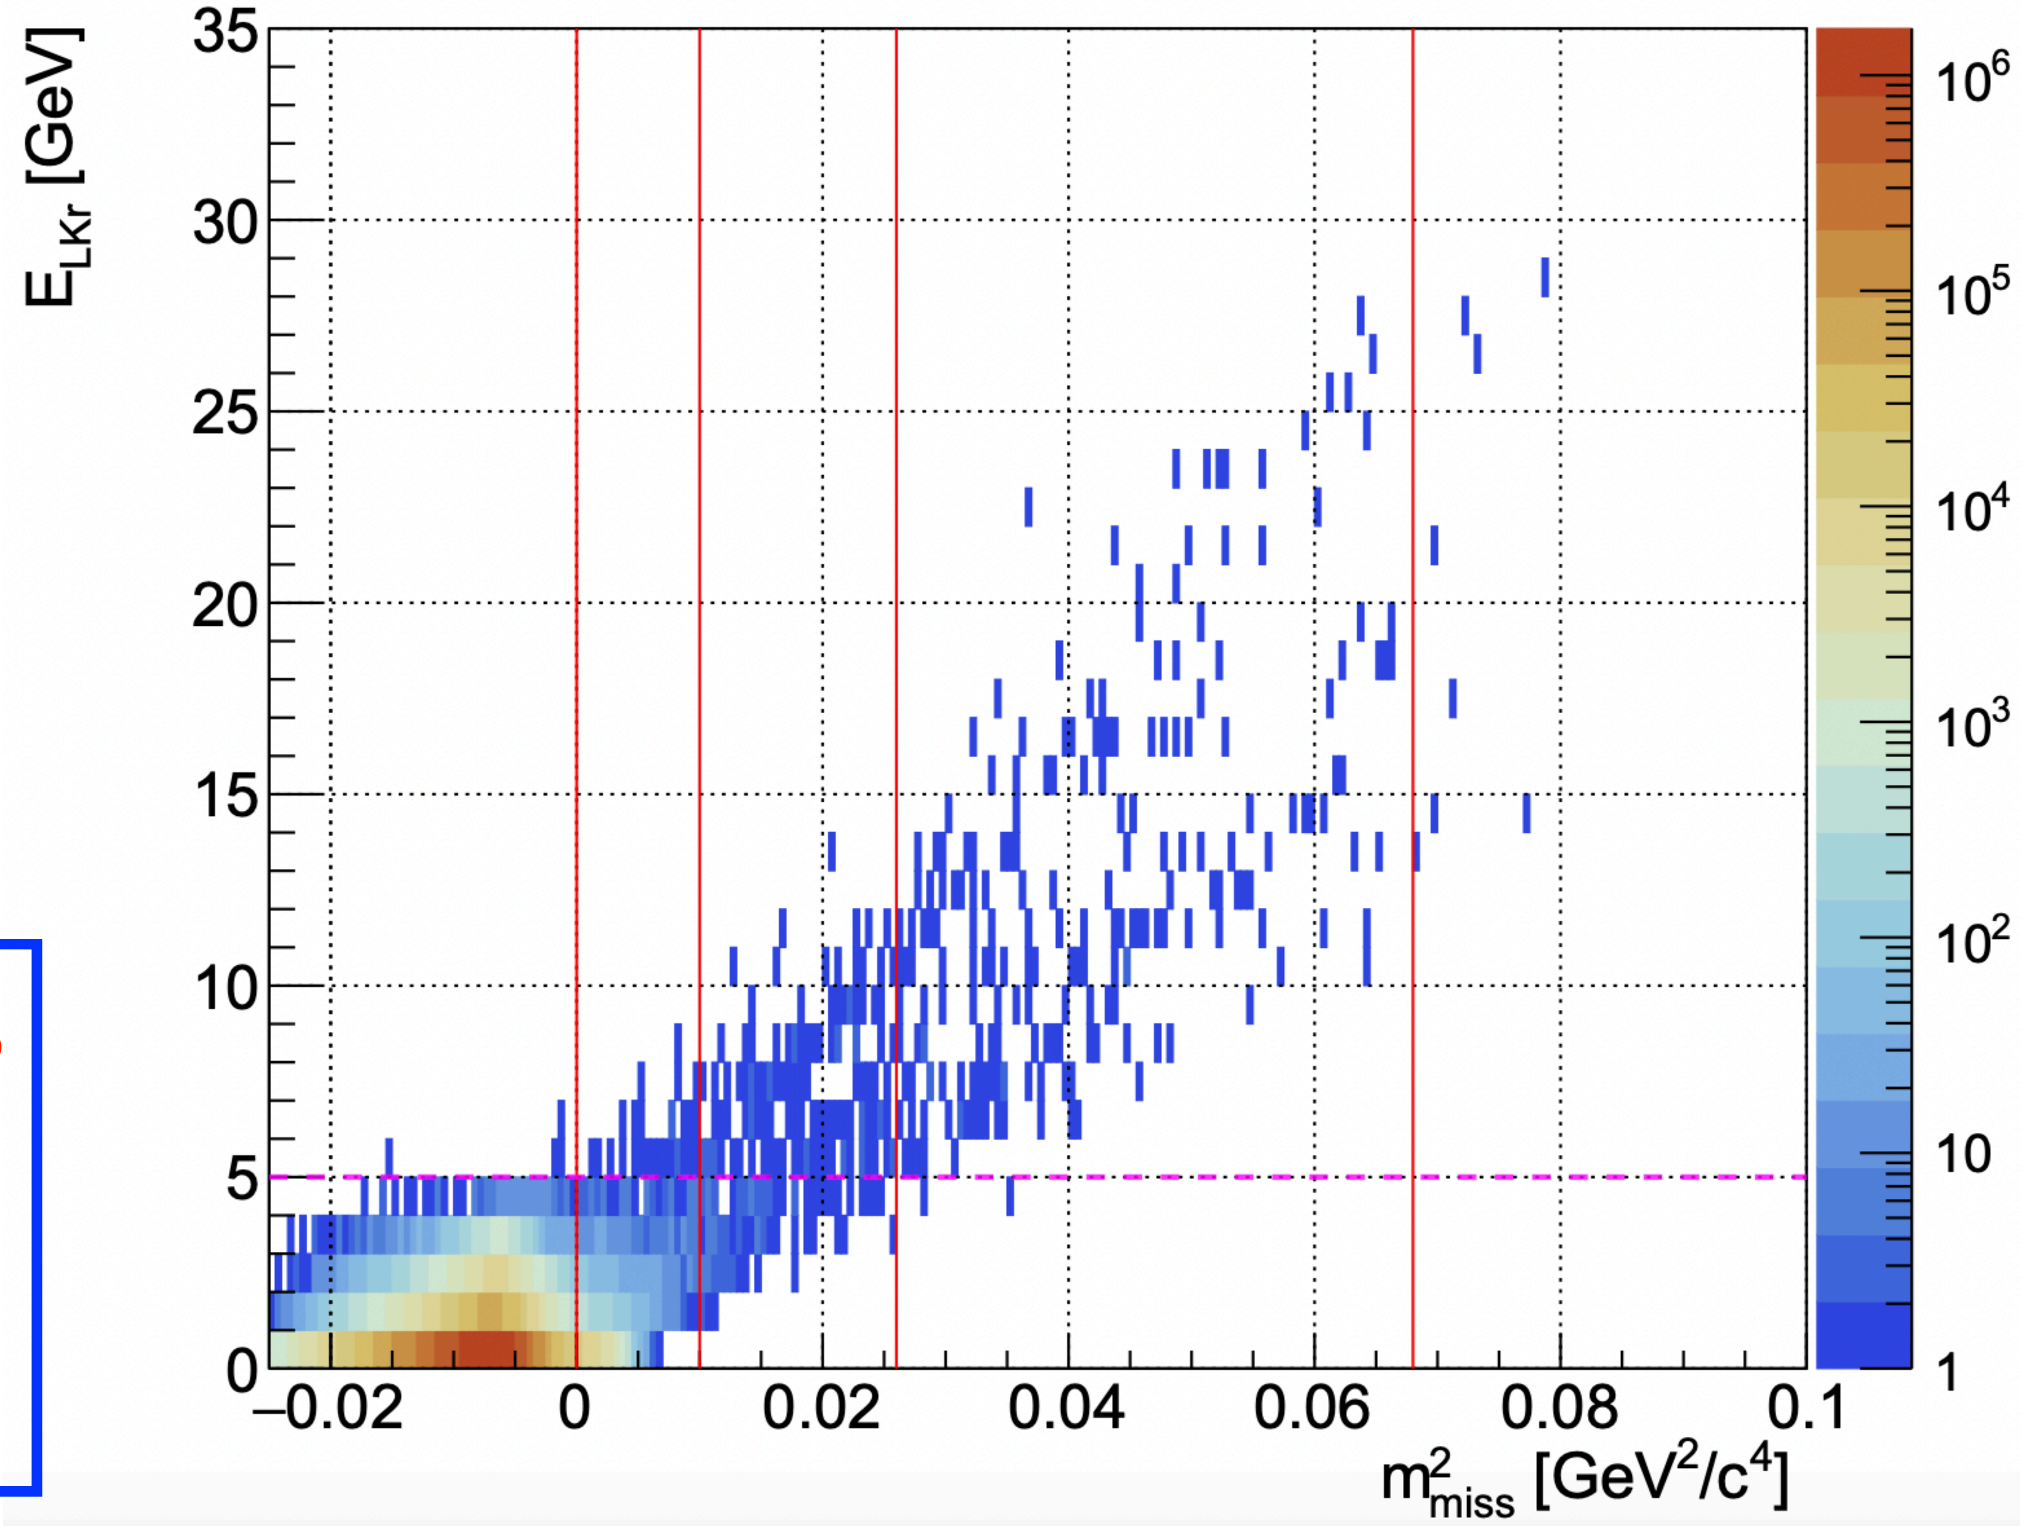
Background rejection: $K^+ \to \mu^+ \nu\gamma$

veto $K^+ \to \mu^+ \nu\gamma$ events with:

- $|m^2_{miss}(K_{\mu 2\gamma})|^2 < 0.01$ GeV$^2/c^4$ → c.f. resolution ~ 0.0025 GeV$^2/c^4$
- $E_\gamma > 5$ GeV
- μ^+-like RICH PID.

- **Veto conditions established using data control samples and MC.**
- $K^+ \to \mu^+ \nu\gamma$ Veto ⇒ 20x background suppression with 0.4% signal loss.

Minimum Bias Data
Events with MUV3 association and
$|m^2_{miss}(K_{\mu 2\gamma})|^2 < 0.01$ GeV$^2/c^4$



- **Why different to 2016—18 analysis?**
  - Calorimetric PID degraded:
    - Higher intensity in 2021—22 data (in particular, affects MUV1,2).
      - Training of BDT classifier.

Upstream background evaluation

$$N_{bg} = \sum_i N_i f_{cda} P_i^{match}$$

N Upstream Reference Sample: signal selection but invert CDA cut (CDA>4mm)

f_{cda} Scaling factor : bad cda —> good cda

P_{match} Probability to pass $K^+ - \pi^+$ matching

Calculate using bins (i) of $(\Delta T_+, N_{GTK})$

[Updated to fully data-driven procedure]

$N = 51$ $\quad f_{CDA} = 0.20 \pm 0.03 \quad < P_{match} > = 73\,\%$

$$N_{bg}(\text{Upstream}) = 7.4^{+2.1}_{-1.8}$$

- **Upstream reference sample contains all known upstream mechanisms.**
  - N provides normalisation.
- f_{CDA} **depends only on geometry.**
- P_{match} **depends on** $(\Delta T_+, N_{GTK})$.

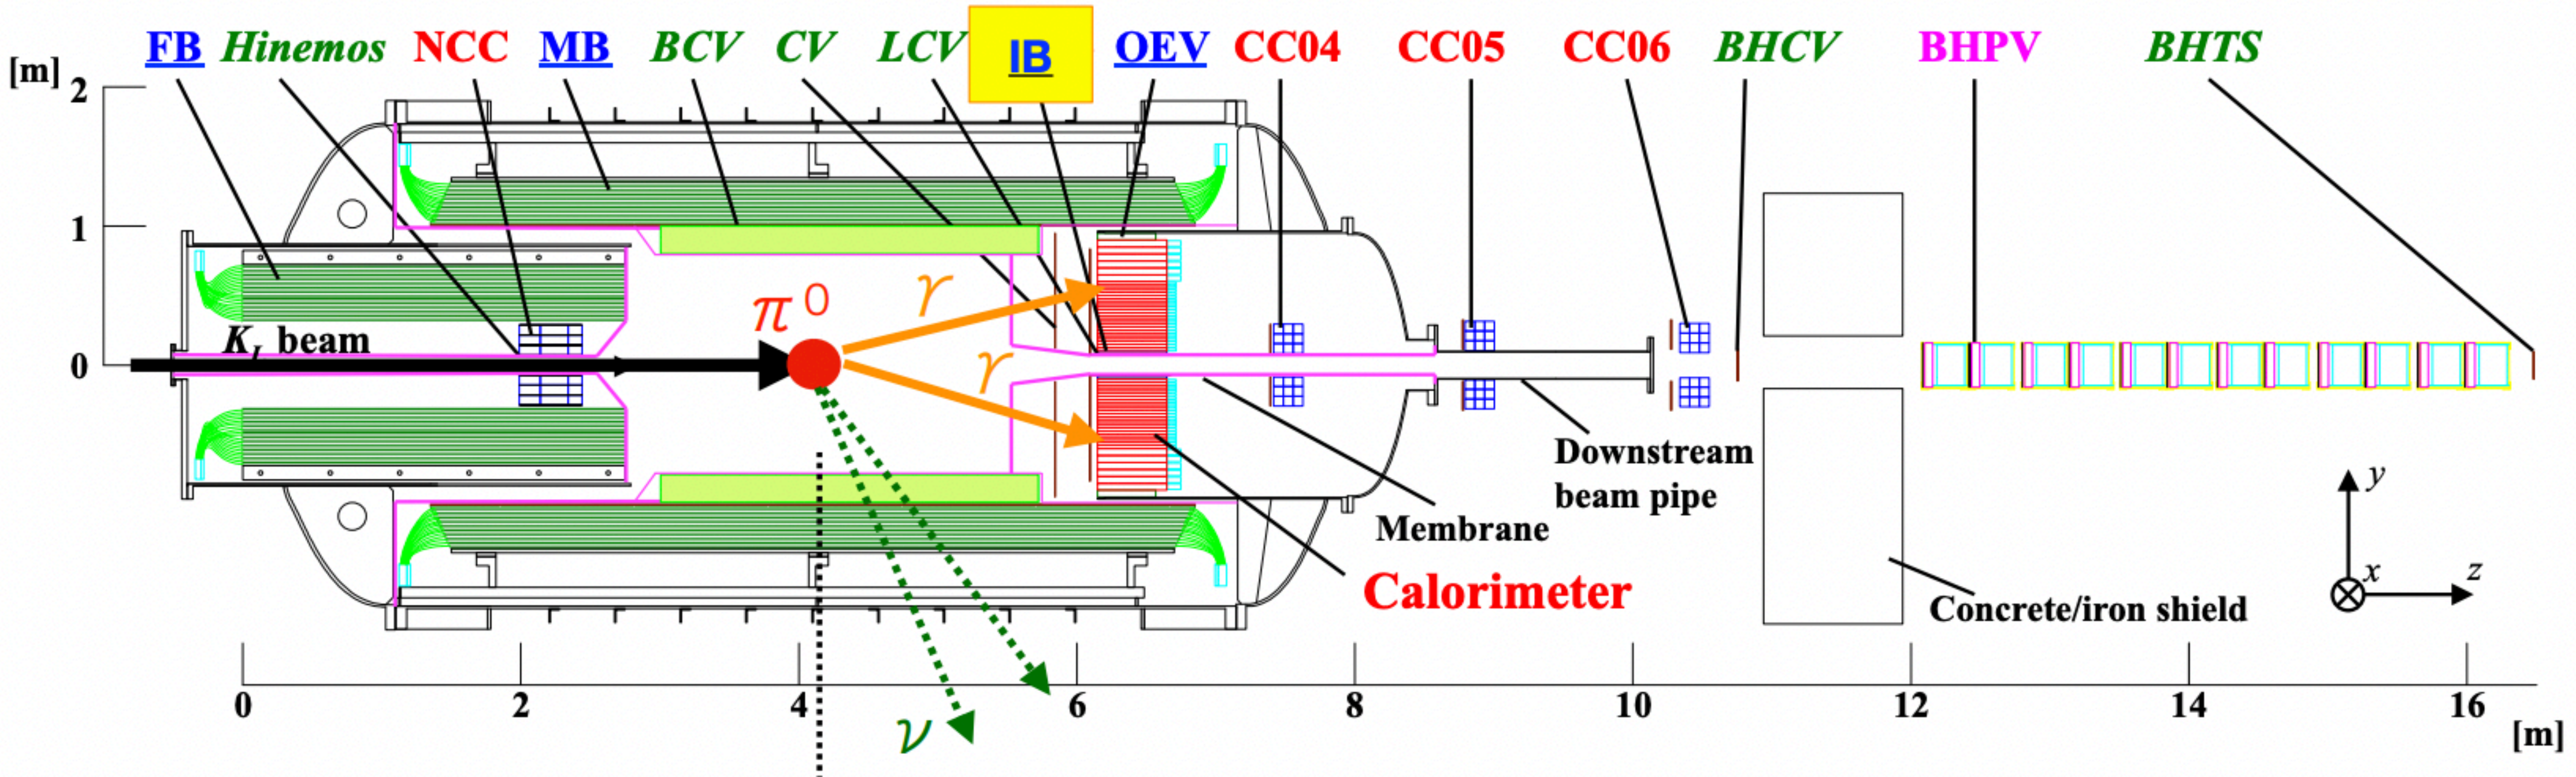
$K_L \to \pi^0 \nu\bar{\nu}$ at KOTO

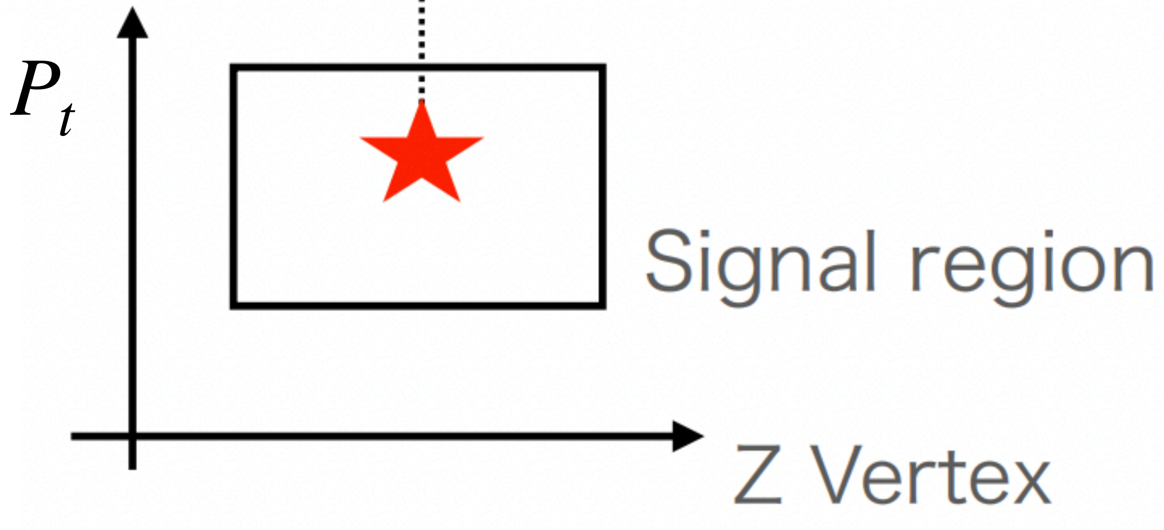
[K. shiomi : Kaons @ CERN 2023]

[T. Nomura : Kaons @ J-PARC 2024]

- Located at J-Park 30 GeV main ring.
- KOTO continues data-taking to reach sensitivity $<10^{-10}$
- Planned future program (KOTO-2) key part of high priority hadron hall extension plans at J-PARC.

Signature of $K_L \to \pi^0 \nu \nu$ = "2γ+Nothing+Pt"



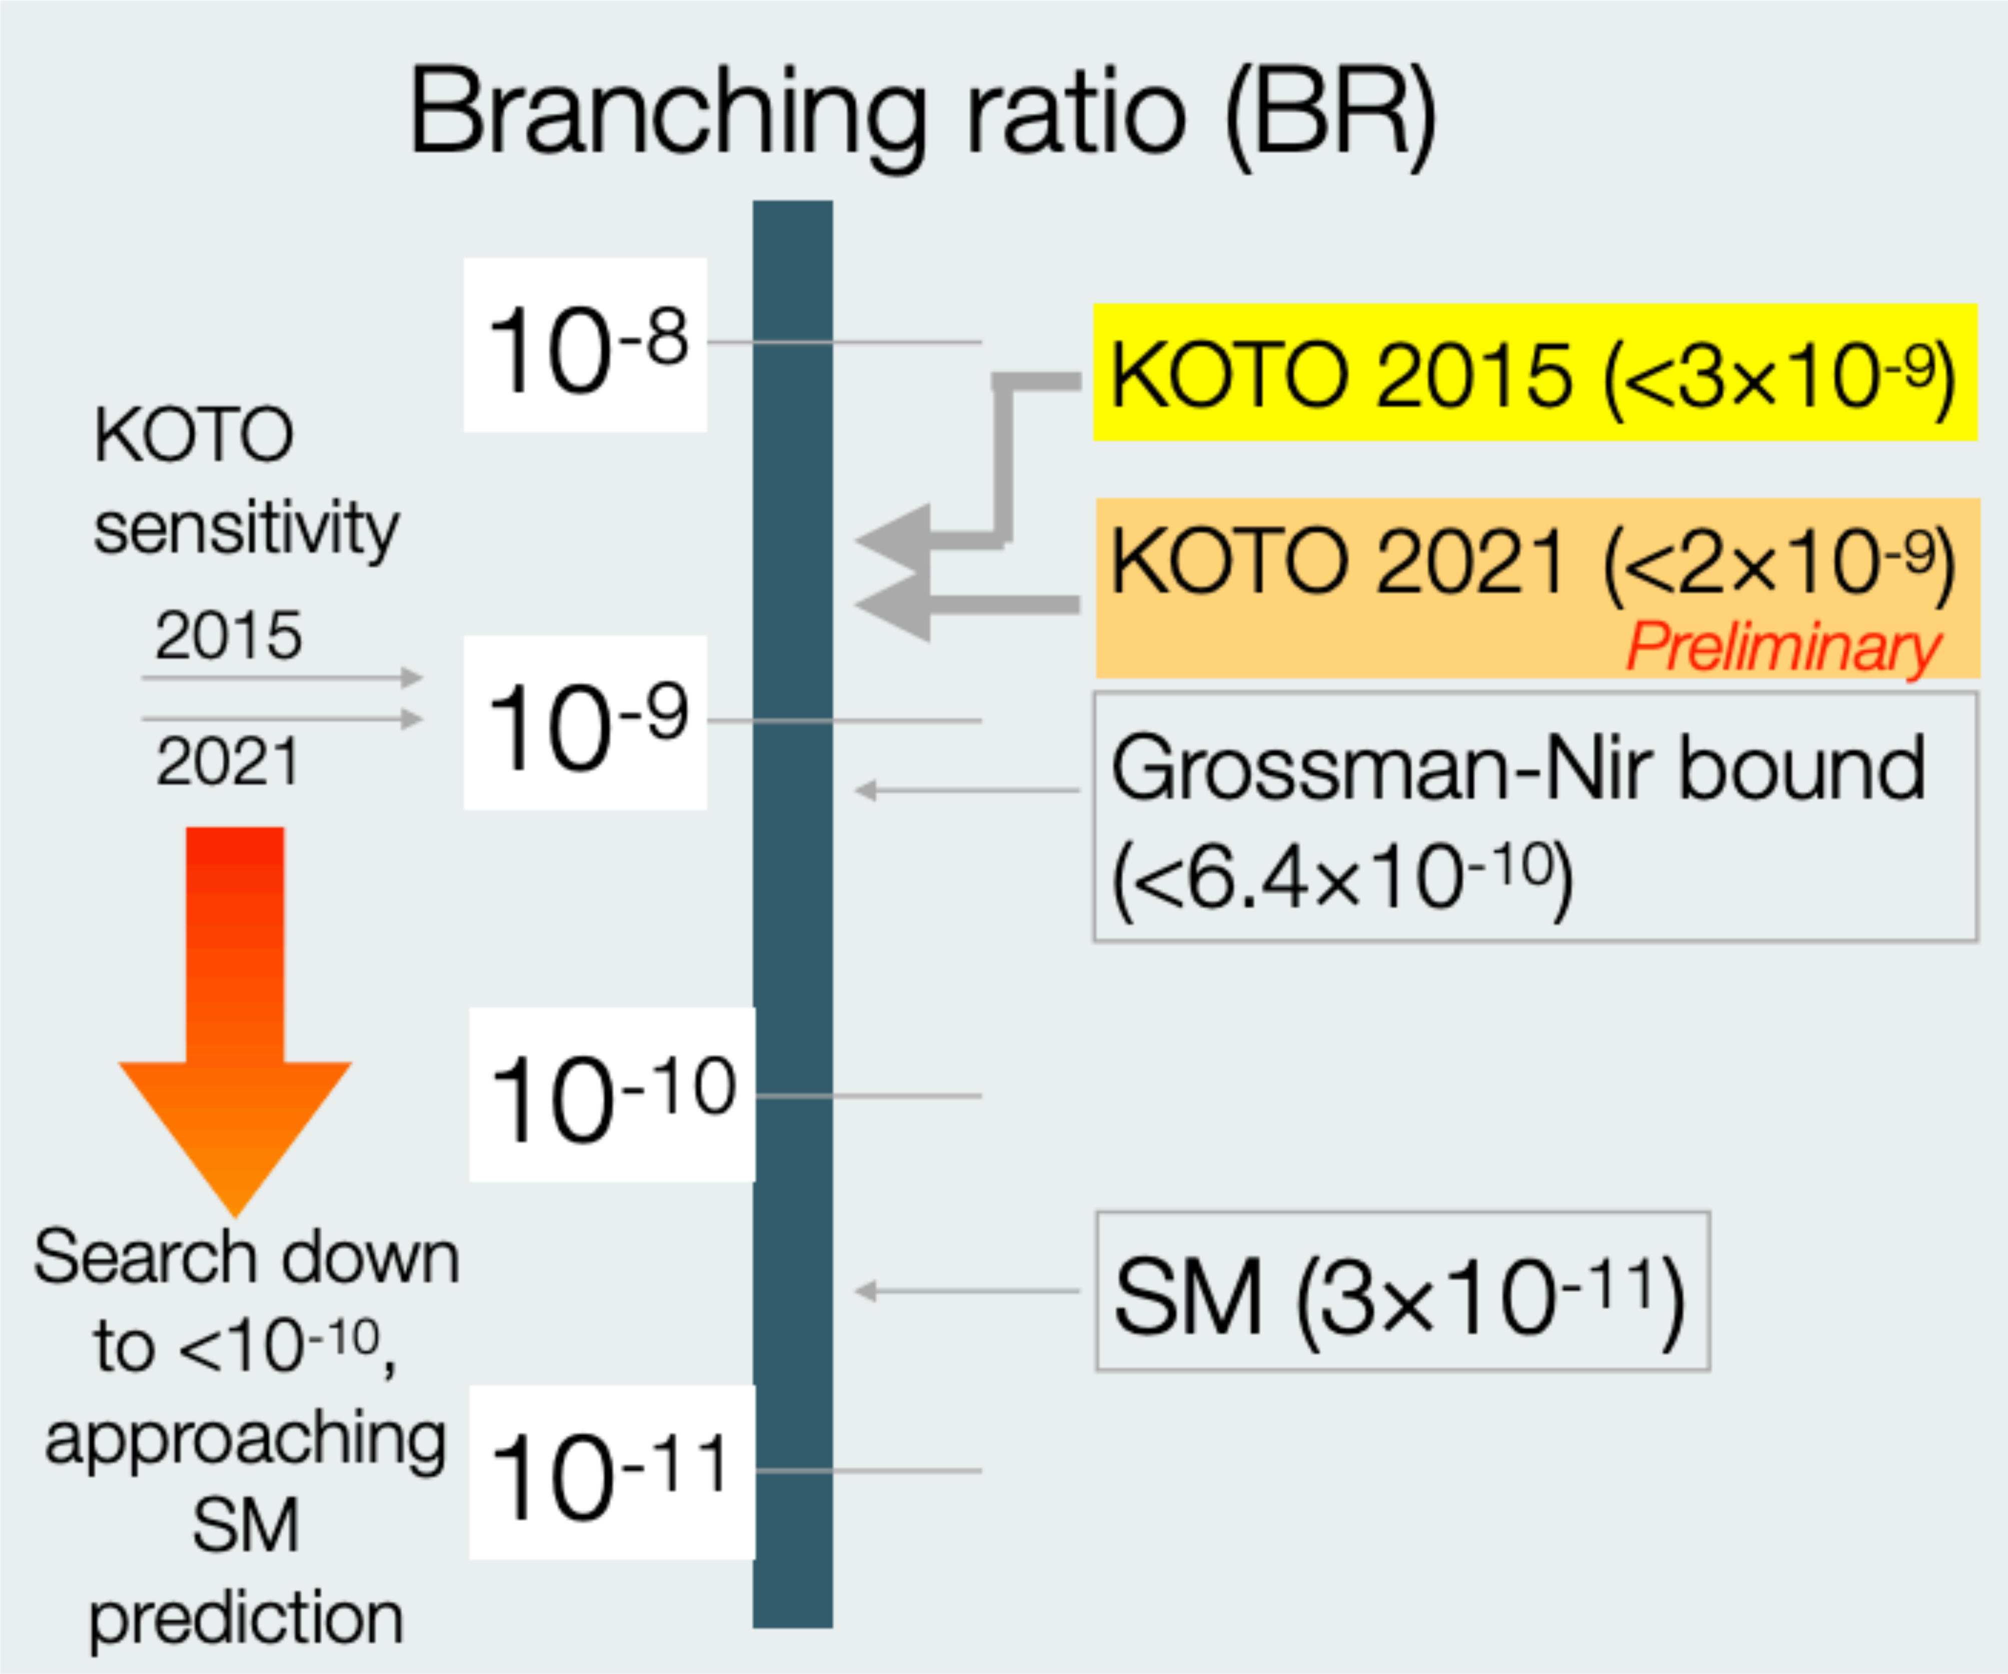


Assuming 2γ from π^0,

Calculate z vertex on the beam axis

$$M^2(\pi^0)=2E_1E_2(1-\cos\theta)$$

Calculate π^0 transverse momentum



Grossman-Nir bound:
indirect limit from relation to BR($K^+ \to \pi^+ \nu\nu$);
Calc'd from NA62 results (2021) with 1σ region

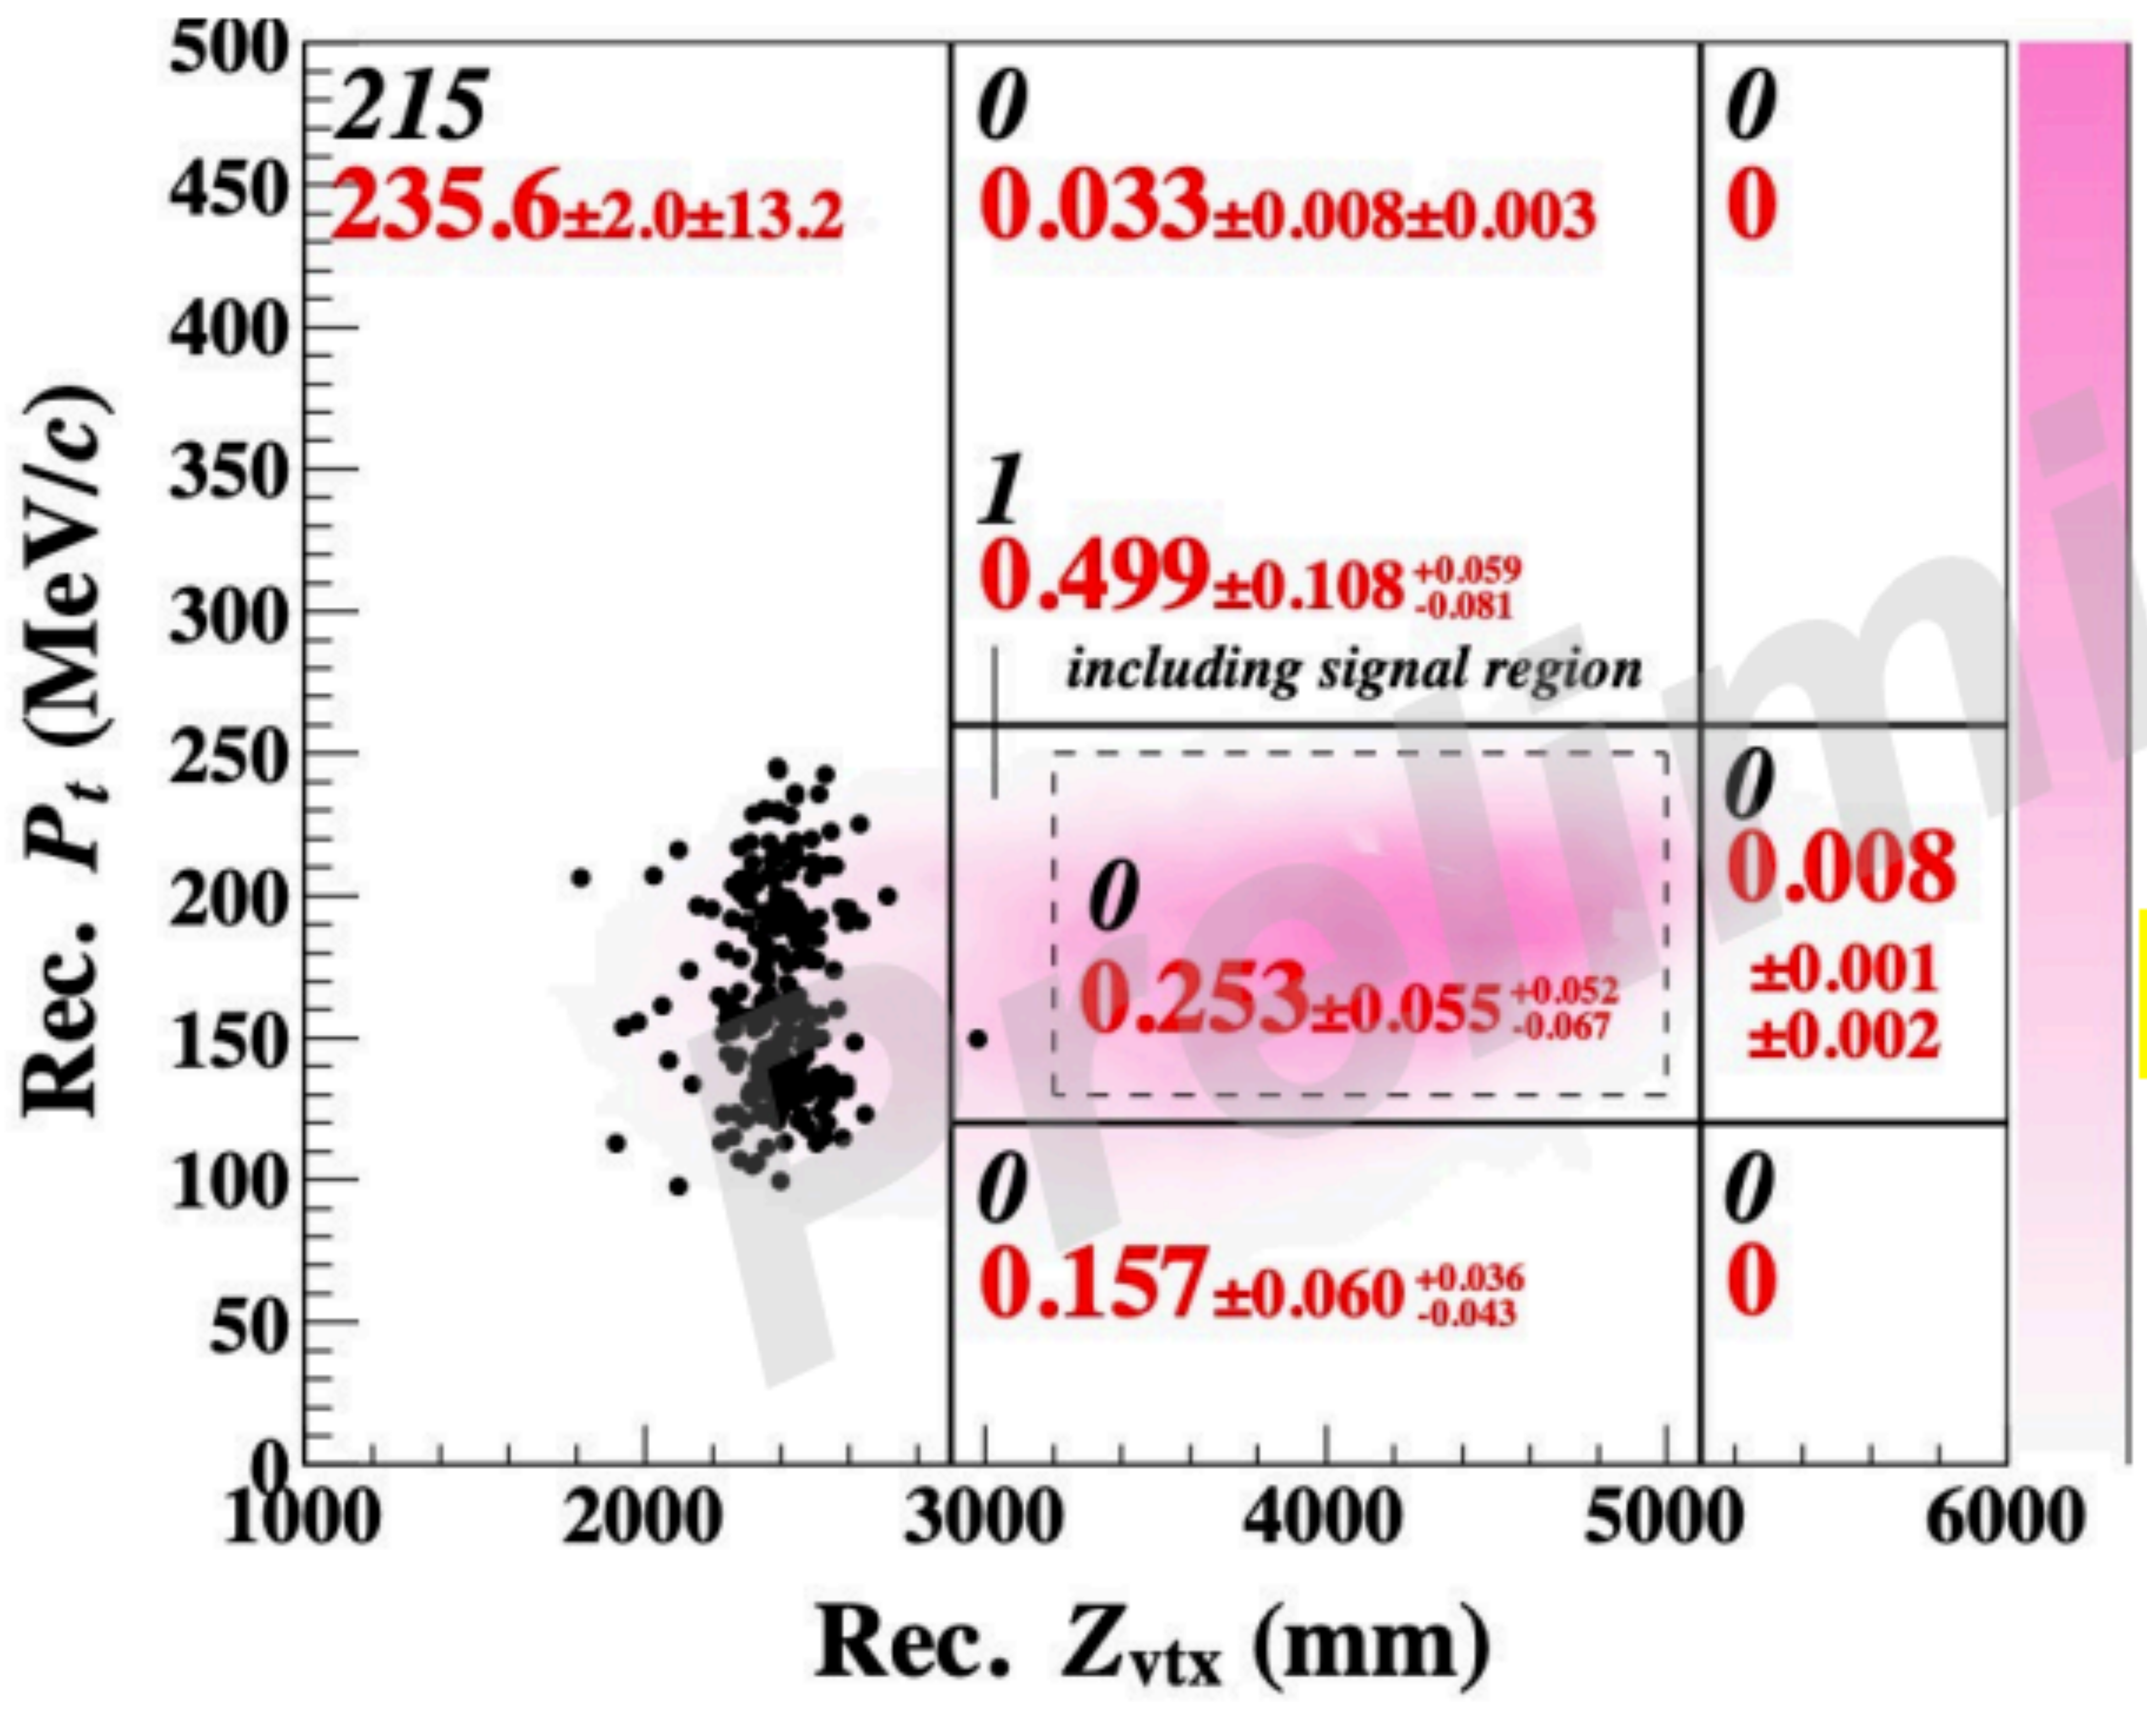
Latest results:

Results of the 2021 data analysis

Final PT vs Z plot

Black: observed
Red: expected BG
Contour: signal MC

Single Event Sensitivity = $(9.26 \pm 0.03_{stat} \pm 0.75_{syst}) \times 10^{-10}$



$N_{observed} = 0$

$BR(K_L \rightarrow \pi^0 \nu\bar{\nu}) < 2.1 \times 10^{-9}$ (90% C.L.)

Obtained the world best limit.

We will submit the paper on this result soon.
