This work has been carried out within the framework of the EUROfusion Consortium, funded by the European Union via the Euratom Research and Training Programme (Grant Agreement No 101052200 — EUROfusion). Views and opinions expressed are however those of the author(s) only and do not necessarily reflect those of the European Union or the European Commission. Neither the European Union nor the European Commission can be held responsible for them.

# Fast particle physics

- P-NBIs @ 85 keV & N-NBIs at 500 keV resulting in two different FI populations driving different EPs (FBs), BAEs, TAEs, GAEs and CAEs;
- Super-Alfvénic velocity of the N-NBI driving TAEs, GAEs and CAEs; impact on current drive efficiency.
- Orbits of MeV D (from NNB) comparable to  $\alpha$ -particle orbits in ITER and DEMO;
- Triton burn-up as a proxy for (DT neutrons) to study the transport of 1 MeV tritons which have a Larmor radius similar to that of 3.5 MeV  $\alpha$ -particles.
- Verification & validation (V&V) activities of theory-based transport codes for energetic ions through neutron experimental measurements
- ELMs and RMPs impact on fast ions confinement (neutron emissivity profiles).
- Scenarios 2 and 5 used in this study.

# NDs for physics studies

**Table 3.11-1 Diagnostic systems and plasma parameters to be measured.**

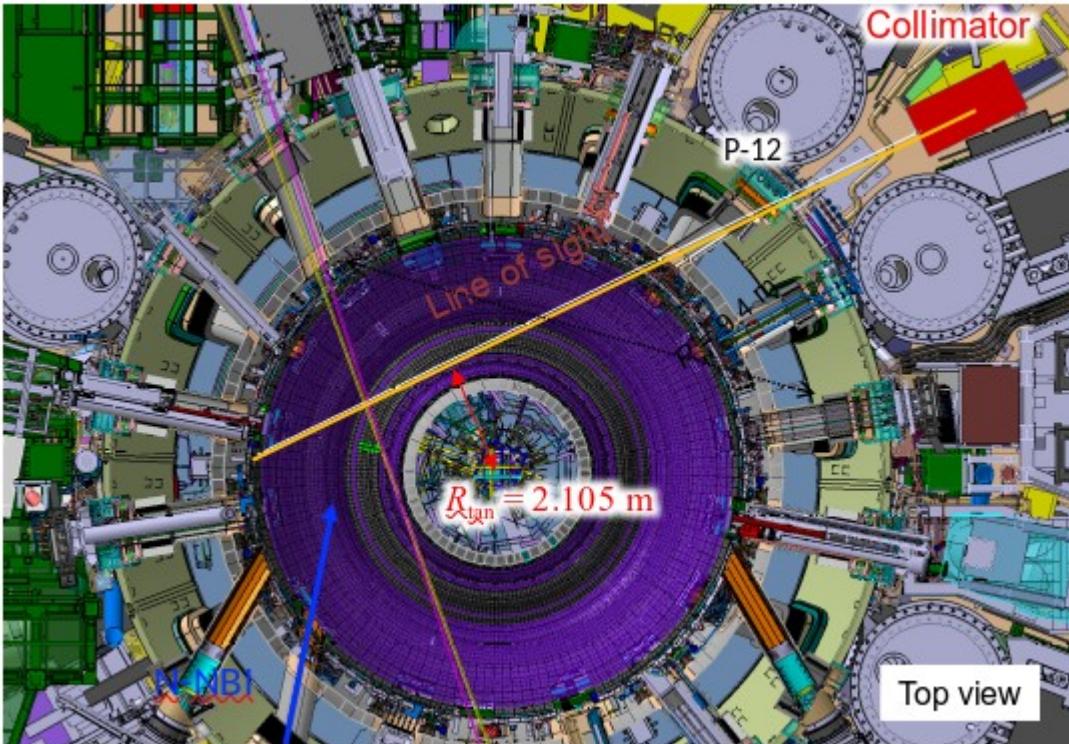

<b>For Machine Protection and Operation</b>	
Neutron monitor	Neutrons
Neutron activation measurement	Neutrons
Visible TV camera	Plasma-wall interaction
D $\alpha$ emission monitor	Particle recycling
Divertor Langmuir probe	Plasma Configuration, Electron density and temperature
Infrared TV camera (divertor)	Heat load
<b>For Fundamental Parameter Measurement</b>	
YAG laser Thomson scattering system	Electron density and temperature
CO <sub>2</sub> laser interferometer / polarimeter (tangential and vertical)	Electron density
Electron cyclotron emission diagnostics (Fourier transform spectrometer, Grating polychromator, Heterodyne radiometer)	Electron temperature
Charge exchange recombination spectroscopy	Ion temperature, Plasma rotation, Impurity
Z <sub>eff</sub> monitor (Visible bremsstrahlung emission)	Impurity
VUV spectrometer	Impurity
Motional Stark effect polarimeter	Plasma current profile
Bolometer (main, divertor)	Radiation loss power
<b>For Physics Understanding</b>	
Soft X-ray detector array	Soft X-ray emission
Neutron emission profile monitor	High-energy ions
14 MeV neutron detectors	High-energy ions
Neutron spectrometers	High-energy ions
Infrared TV camera (first wall)	High-energy ions
Li-beam probe	Plasma current profile in the edge
Reflectometer	Perturbations
Reciprocating Mach probe	Plasma flow
Visible spectrometer for the divertor	Electron temperature and density in the SOL
VUV spectrometer for the divertor	Impurity, Recycling
Neutral gas pressure gauge (Penning gauge, Fast response ionization gauge)	Impurity Neutral gas pressure

# Vertical Neutron Camera

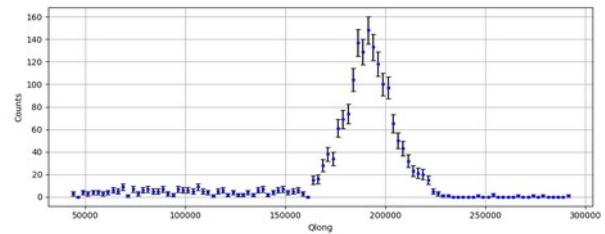

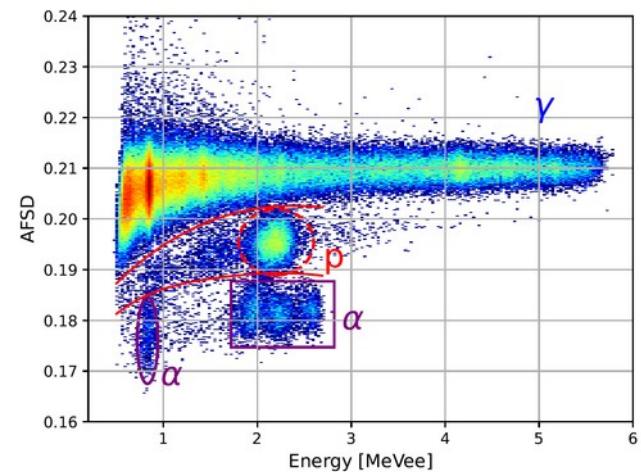

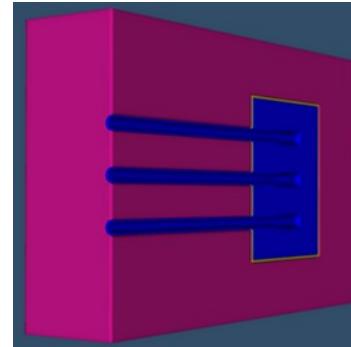

- Stray B field approx 100 mT perpendicular to PMT
- Possible alternatives are Si-PMTs

# Tangential Compact Neutron Spectrometer

- Detection of DD neutrons mainly based on  $\text{LaCl}_3$  scintillator  $^{35}\text{Cl}(\text{n},\text{p})^{35}\text{S}$  nuclear reactions coupled to a PMT
- High energy resolution (49000 ph/MeV)
- Fast scintillation (28 ns) -> higher count rates
- n/ $\gamma$  discrimination with enhanced algorithm
- Collimator: 1.4 cm diameter, 95 cm length
- Detector: 1.4 cm diameter, 2.54 cm length, 1.15 % efficiency

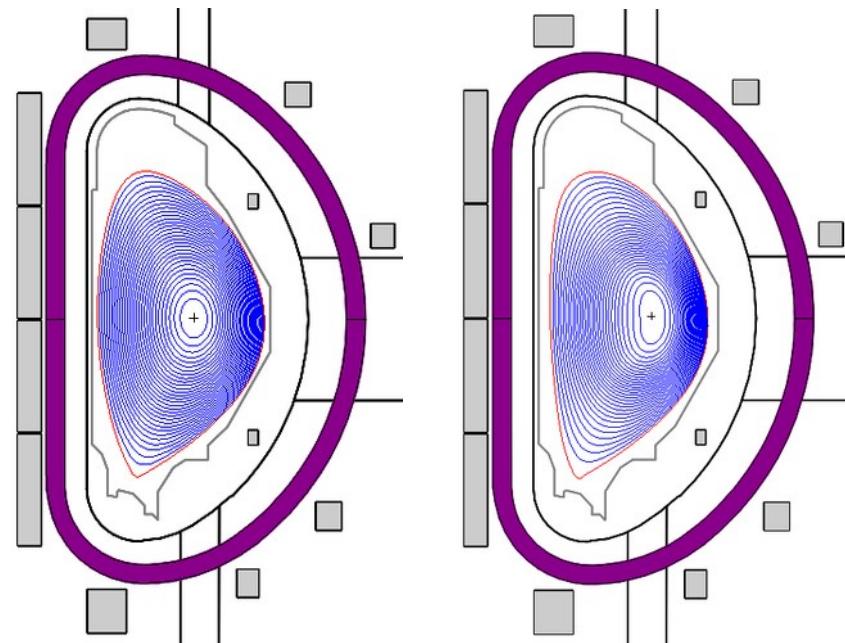

Neutron peak measured with the  $\text{LaCl}_3$  at MAST-U

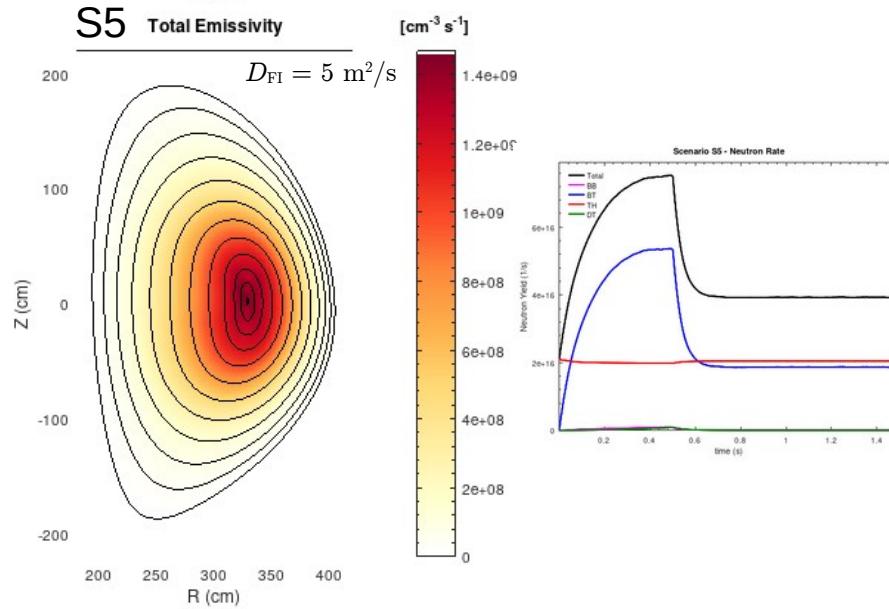

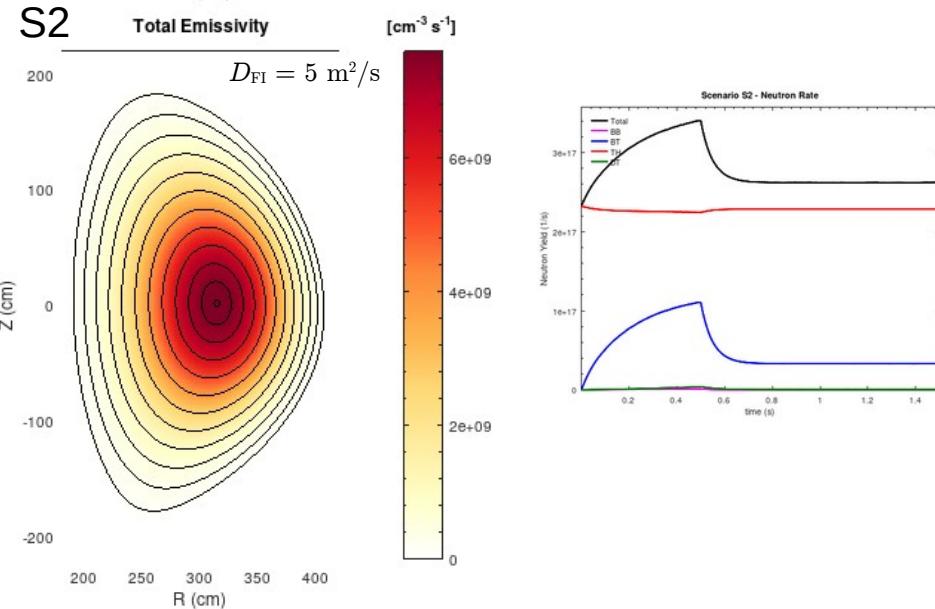

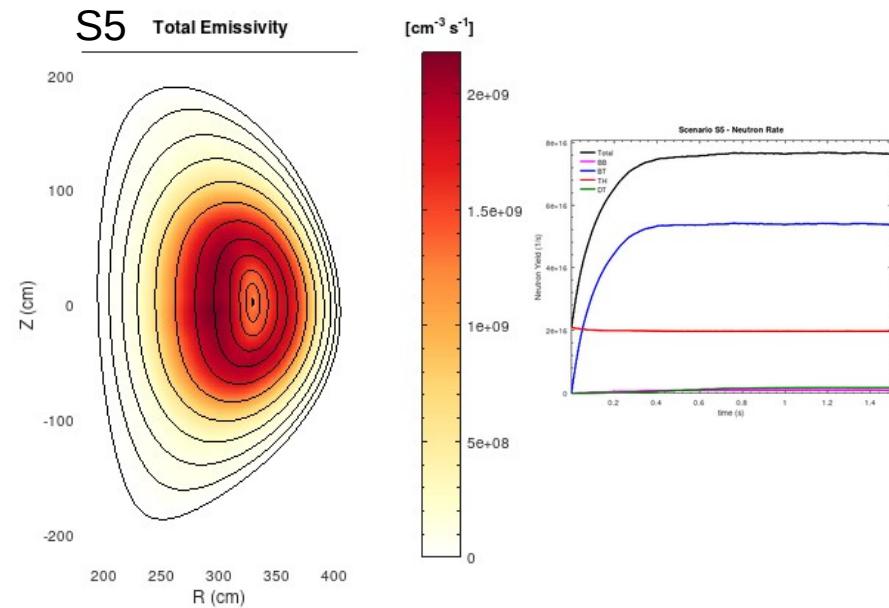

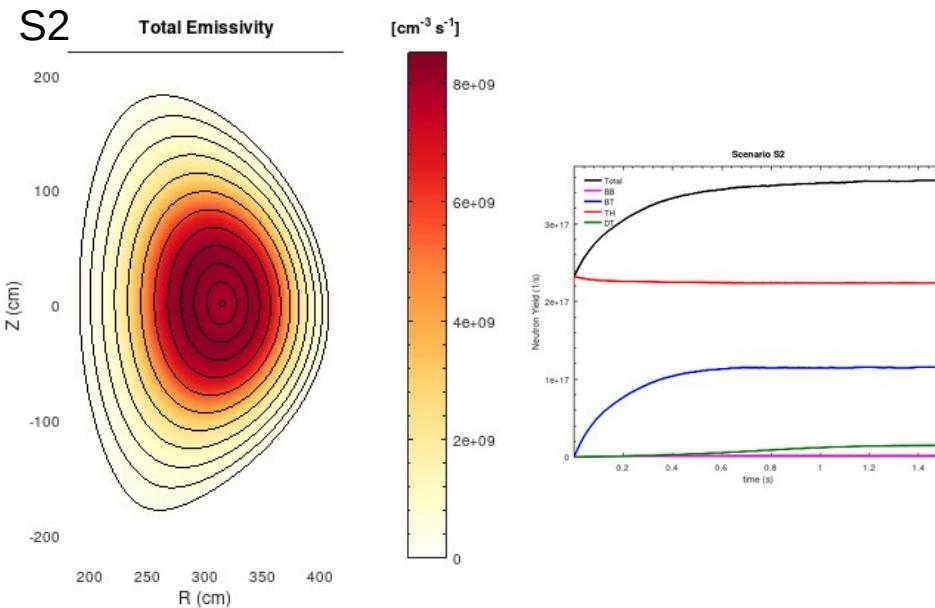

# TRANSP/NUBEAM modeling for S2 & S5

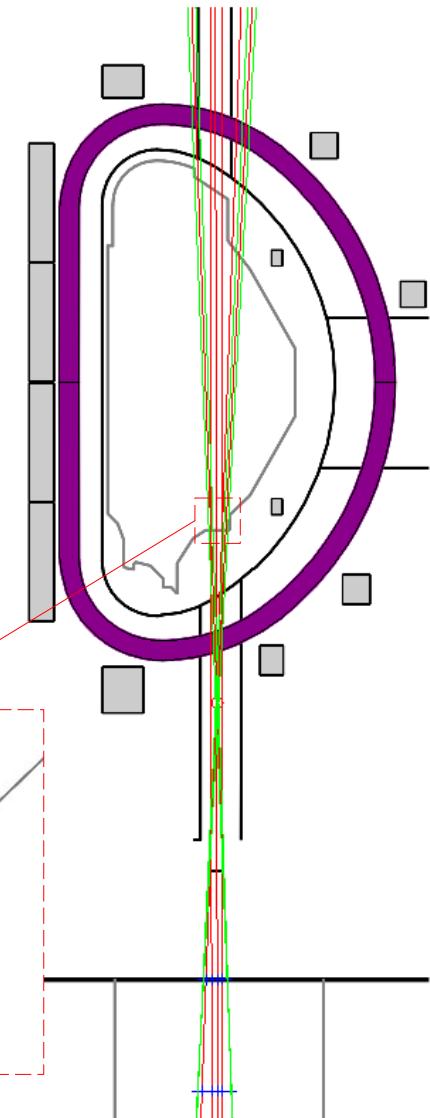

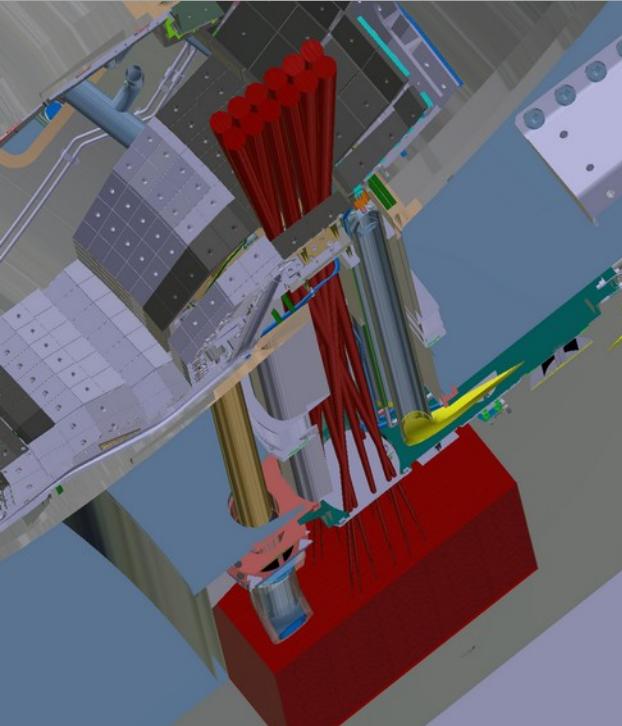

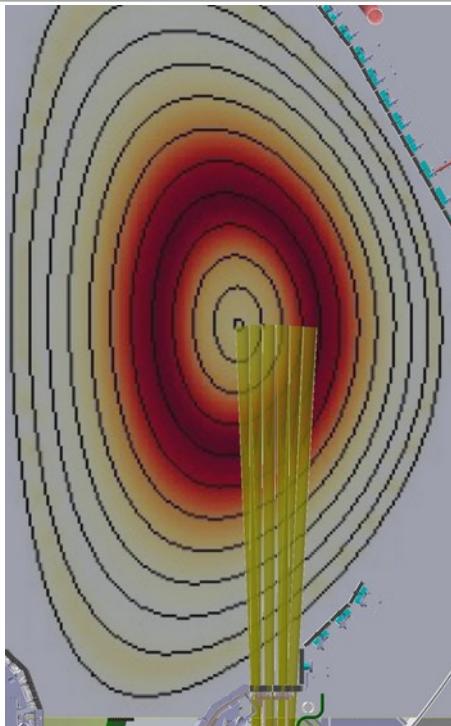

- JETTO gEQDSK equilibrium with FI pressure included converted to UFILES via scrunch2
- Kinetic profiles from JINTRAC converted to UFILES
- Profiles and equilibrium frozen
- Scenario:
  - **S2:**  $I_p = 5.5$  MA,  $R_{Bt} = 6.66$  mT with  $R = 2.96$  m,  $B_t = 2.25$  T, P-NBI power at 1 MW (Extended Research Phase)
  - **S5:**  $I_p = 2.36$  MA,  $R_{Bt} = 5.11$  mT with  $R = 2.96$  m,  $B_t = 1.72$  T, P-NBI power at 0.85 MW (Integrated Research Phase)
- Plasma rotation set to zero
- NLBCCW = NLJCCW = false (correct sign of  $I_p$  and  $B_t$ )
- NTPCLS =  $1 \times 10^5$ , medium fidelity, no FLR/GFLR correction
- Simulation time 1.5 s
- ADAS with JBP for atomic physics
- FI output at 1.45 s (fully slowed down FI)
- Fusion products output
- Without and with Anomalous Fast Ion Diffusion:
  - $D_{FI} = 5$  m $^2$ /s
  - Flat radial profile
  - No energy dependence
  - Applied to all FI (fusion products included)
  - For  $t > 0.5$  s

$\Delta t \approx 3 - 10$  ms

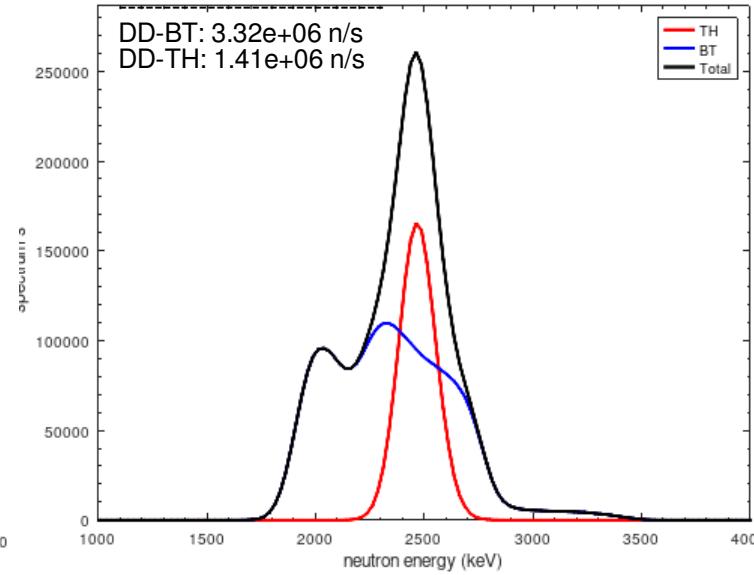

for

$N = 1000$   
counts

DRESS: spectra scenario2 AFID horizontal.dat

DRESS: spectra scenario5 AFID horizontal.dat

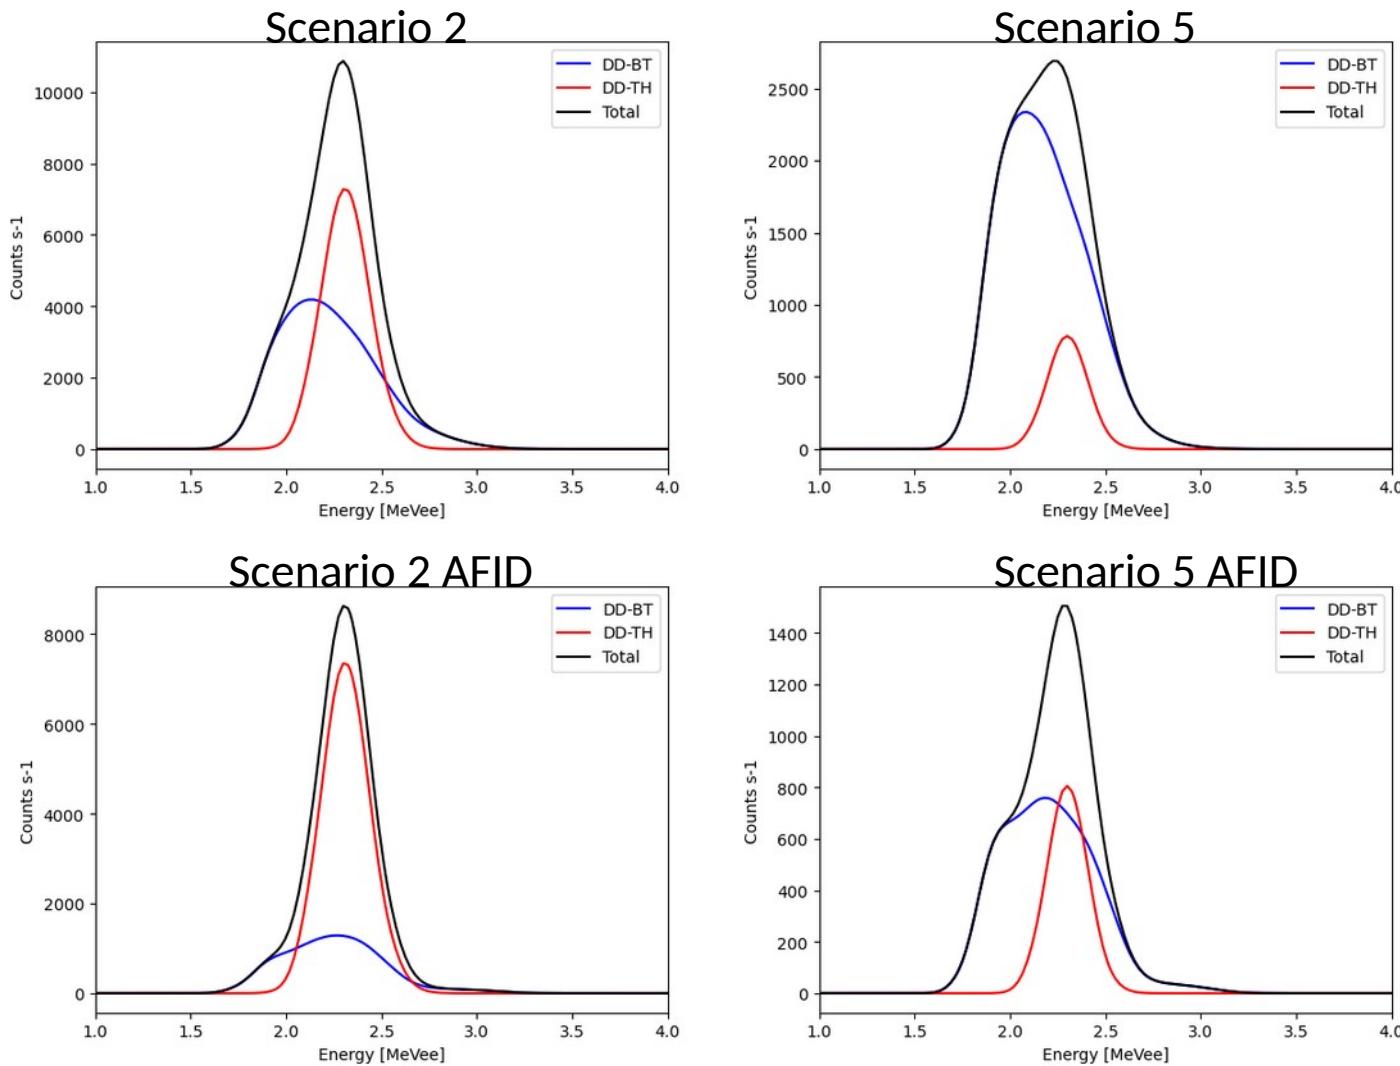

If  $D_{FI} = 5$  m<sup>2</sup>/s

$\Delta t \approx 5 - 50$  ms

# Expected proton spectra with LaCl<sub>3</sub> detectors

- 8% broadening due to “energy resolution”
- Birks law applied for MeVee conversion
- No background and no other reaction channels have been considered for these calculations.

# Conclusion and Future work

- Interfacing constraints severely limits the field of view.
  - Changes in the profile due to FI redistribution detectable.
  - Count rate sufficiently high for both VNC (particularly with the double array of detectors) and TCNS with time resolution below 50 ms for  $10^3$  counts.
- 
- More realistic redistribution of fast ions due to MHD instabilities
  - Optimization of the neutron shielding for the VNC (MCNP)
  - Estimation of scattered neutron spectra and fluxes at detector locations
  - DT burn flux and spectrum
  - Integration with Horizontal Neutron Camera (JA)
  - Final design in 2026
  - Aiming at OP3 (2027/28) for installation and commissioning
