First Fit Test for BSO e- template on single wf

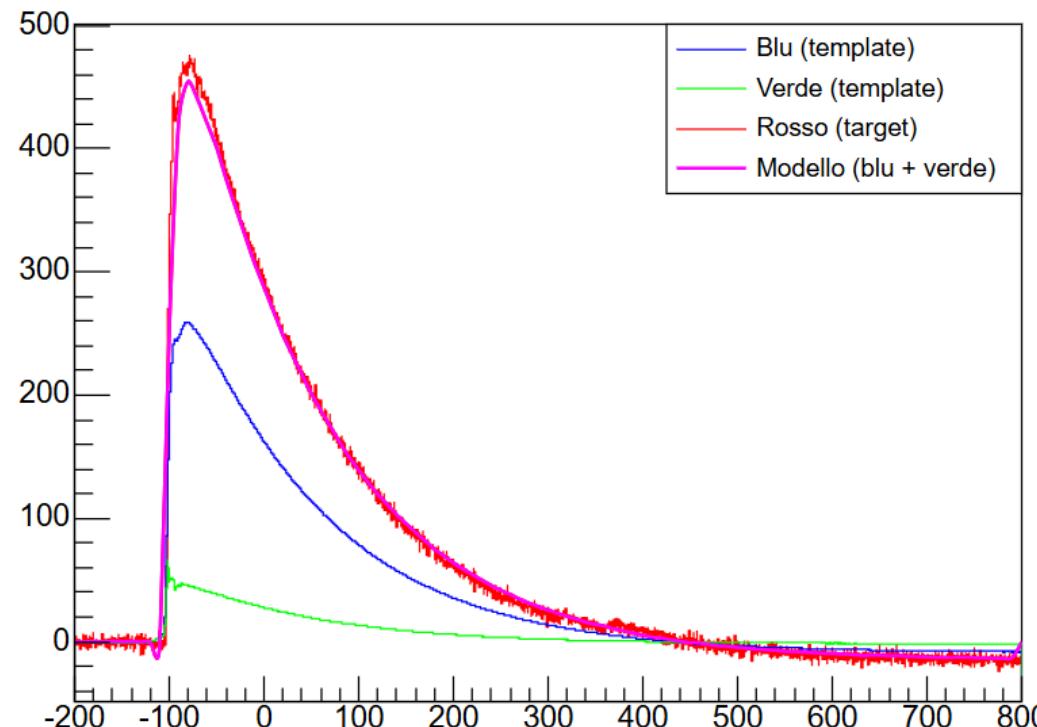

graph

In this case this template does not fit the initial peak of wf well.
Therefore, I am working on improving the template to fit the single wf better, so that it also fits the initial peak

First Fit Test for PWO e- template on single wf

hgraph

Again, the template
does not fit the initial
peak of the wf well.

Summary SiPM 6x6 Calibration

SiPM	Gain	Gain amplitude conversion	Method	$p_0 + error$	$p_1 + error$ [mV/ n_{pe}]	$\tau(ns)$	conversion factor charge $\tau(1 - 0,0497)$
6x6	28	25,12	A	0,4±0,1	3,46±0,02	132,26	125,7
6x6	28		B	15±1	3,49±0,006		
6x6	18	7,94	A	1,31±0,06	1,161±0,005	120,72	114,7
6x6	18		B	3,0±0,4	1,156±0,003		
6x6	24	15,85	A	0,20±0,05	2,27±0,01	149,72	142,3
6x6	24		B	17,5±0,7	2,169±0,003		

Summary SiPM 3x3 Calibration

SiPM	Gain	Gain amplitude conversion	Method	$p_0 + error$	$p_1 + error$ [mV/ n_{pe}]	$\tau + error(ns)$	conversion factor charge $\tau(1 - 0,0497)$
3x3	28	25,12	B	-1,4±0,4	1,236±0,002	46,9±0,2	44,61
3x3	24	15,85	B	-0,9±0,2	0,785±0,002	45,2±0,2	42,93
3x3	18	7,94	B	-0,3±0,1	0,401±0,002	46,3±0,6	44,02
3x3	Passive Preamp	-	B	0,064±0,005	0,0425±0,0009	18,3±0,3	17,41

Gain conversion factor at various temperatures

$$V_{OV}(26^\circ C) = V_{OP}(25^\circ C) - V_{BD}$$

$$V_{BD}(T^\circ) = V_{BD}(25^\circ) + 0,034 \frac{V}{^\circ C} \delta T$$

This is in case of temperature increase from 25°C, or in case of temperature decrease

$$G(26^\circ C) = \alpha V_{OV}(26^\circ C) = \text{calculated} \rightarrow \alpha = \frac{G(26^\circ C)}{V_{OV}(26^\circ C)}$$

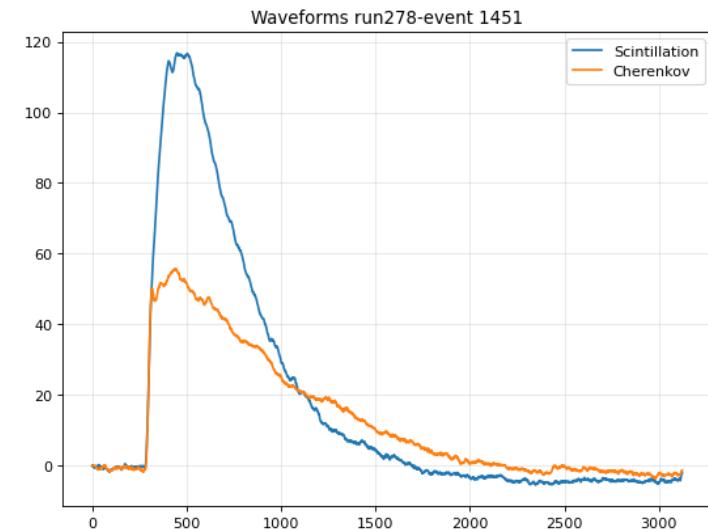

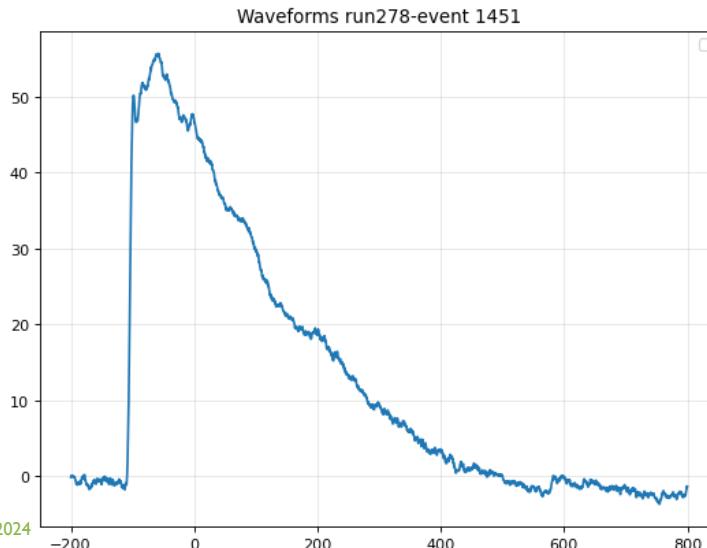

$$G(23^\circ C) = \alpha V_{OV}(23^\circ C)$$

We then have the 26°C gain and we want to know how much is the gain at 23°C:

SiPM	$V_{OP}(V)$ tabulated 25°C	$V_{BD}(V)$ tabulated 25°C	$V_{OV}(26^\circ)$	$G(26^\circ C)$	α	$V_{OV}(23^\circ)$	$V_{BD}(23^\circ)$	$G(23^\circ C)$
6x6	40,7	38	2,67	3,461	1,30	2,77	37,93	3,59
3x3	44	39	4,97	1,236	0,25	5,07	38,93	1,26

Analysis of the 264-278 BSO angular scan with e+ 10GeV

- Ch1 CAEN amp 18
- CH2 CAEN amp 18 e Filtro UG11
- CH3 LYSO
- CH4 MPC
- CH5 Plastico 1x1x1 cm³
- CH6 Trigger signal (from MIB plastic)

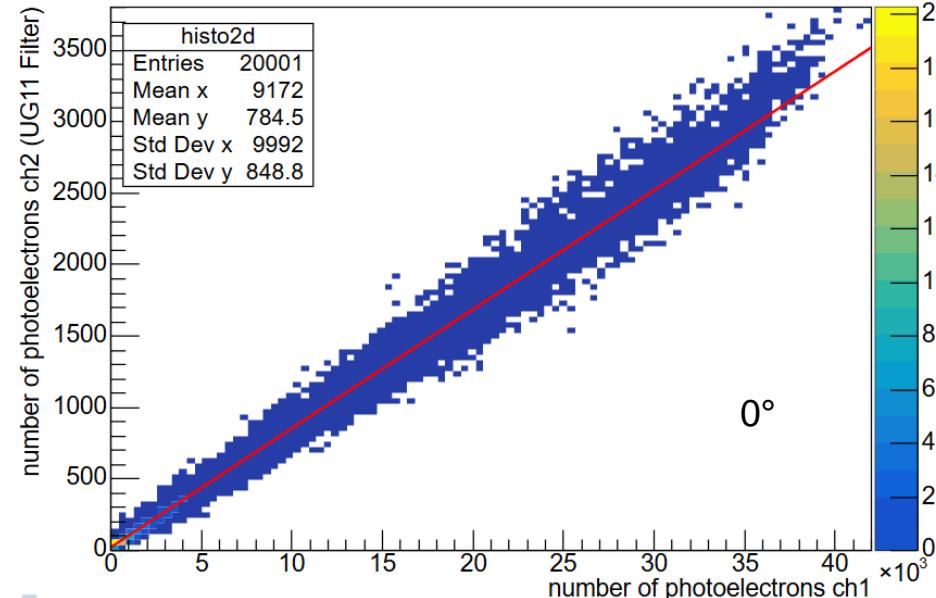

2D Histogram and fit for BSO e+10GeV

calcolo l'integrale delle waveforms

```
integral_ch1 = np.sum(np.abs(wf_channel1))
integral_ch2 = np.sum(np.abs(wf_channel2))

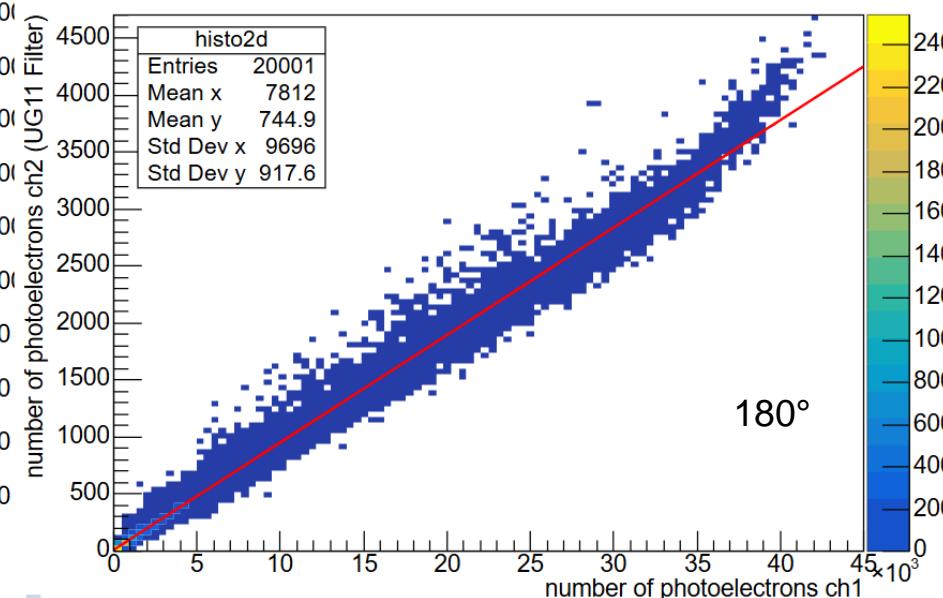

a=integral_ch1/(44.02*0.401)
b=integral_ch2/(114.7*1.16)
```

number of photoelectrons ch2 vs number of photoelectrons ch1 run278

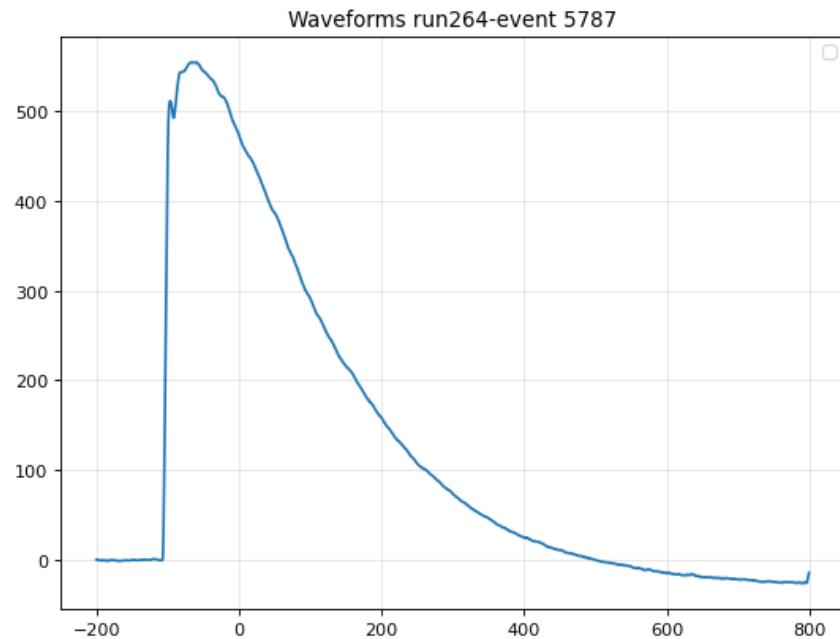

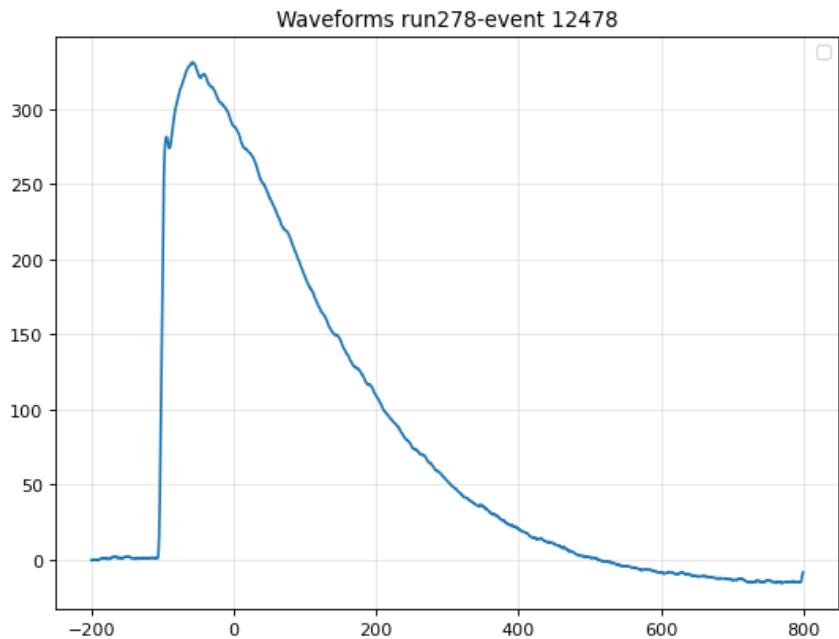

- If there were only scintillation the slope would always be equal depending on the angle

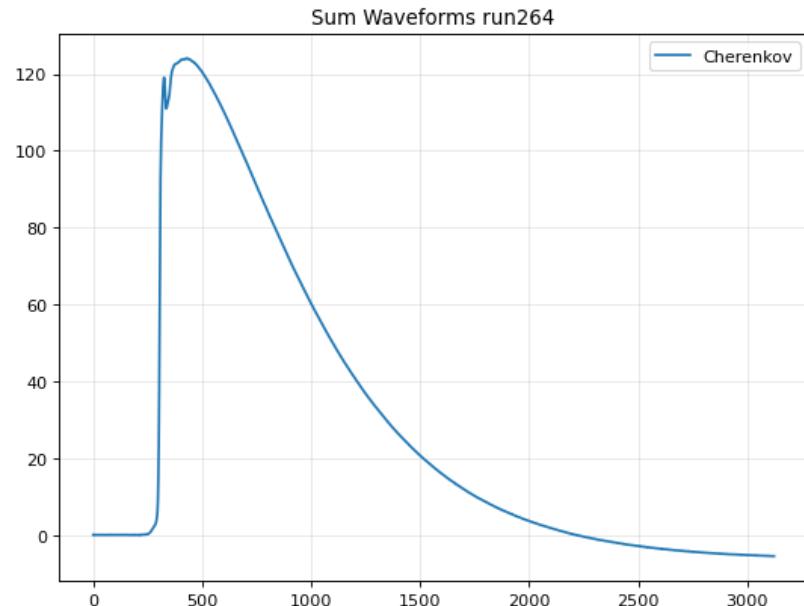

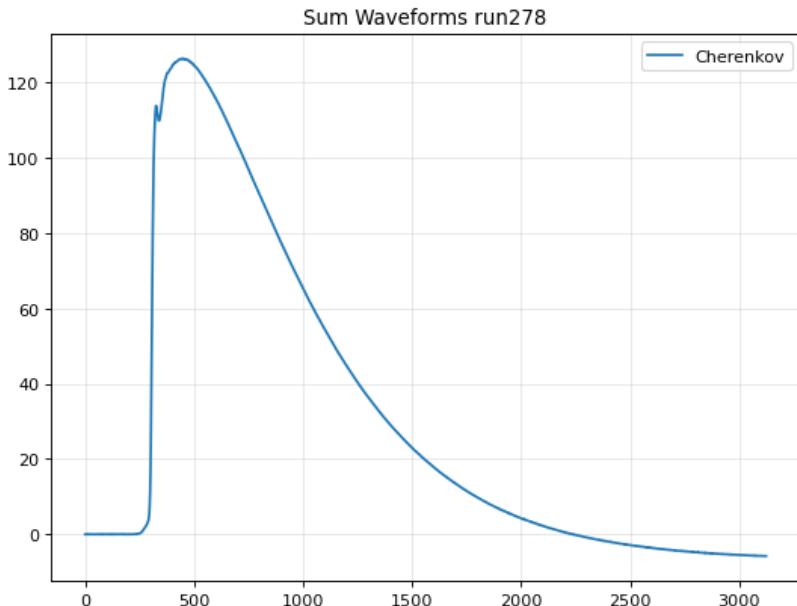

number of photoelectrons ch2 vs number of photoelectrons ch1 run264

Wf for BSO e+10GeV

Wf for BSO e+10GeV

Calibration procedure

We want to calibrate the Silicon Photomultiplier (SiPM) that we used at the test beam: 2 SiPM of different sizes and using a variable-gain preamplifier that allows us to have various gains.

Procedure:

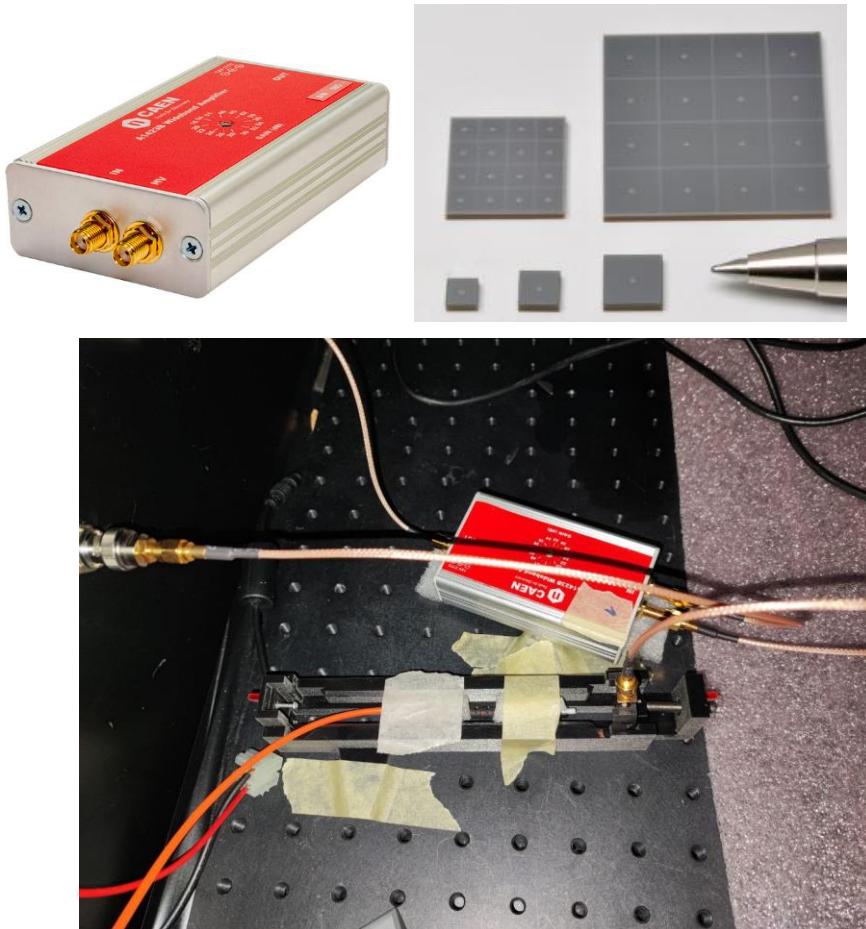

- Reproduce the SiPM - Preamplifier - Oscilloscope chain in the Naples lab
- Use a led drive that to generate light for our sipm in a controlled way
- Acquire our signal with the oscilloscope
- Calibrate the SiPM response to derive the number of incoming photons.

Two different methods have been used (to be described in the next slides):

- A) Waveform integral measurement from the amplitude (Peak id)
- B) Photoelectrons counting (PE Count)

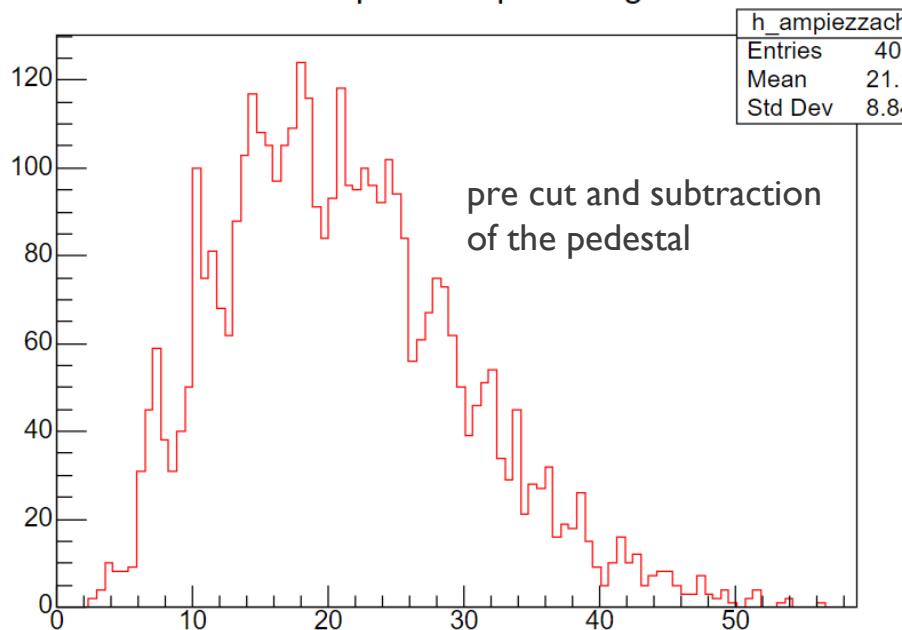

Setup:

- SiPM Hamamatsu S14160-6050HS:
 - photosensitive area $6 \times 6 \text{ mm}^2$
 - number of pixels= 14331
- SiPM Hamamatsu S14160-3010PS:
 - photosensitive area $3 \times 3 \text{ mm}^2$
 - number of pixels= 89984
- Preamplifier CAEN serie A1423B:
 - Gain range from +18dB to +54dB
- CAEN Led Driver SP5601
- CAEN NIM HV Power supply module N1419ET
 - 4 Ch Reversible 500 V/200 μA
- Tektronix Oscilloscope MSO66B:
 - 1,5 GHz Bandwidth
 - 6 Analog channels
