7Be Electron Capture decay to 7Li

The study of the 7Be decay rate in ionized state would provide information on beta-decay matrix element.

The triple ionized state of the 7Be is an hydrogenoid atom with a well known electronic wavefunction.

$$t_{1/2} = \kappa / f_0 \xi$$

$$\xi = B_F + B_{GT}$$

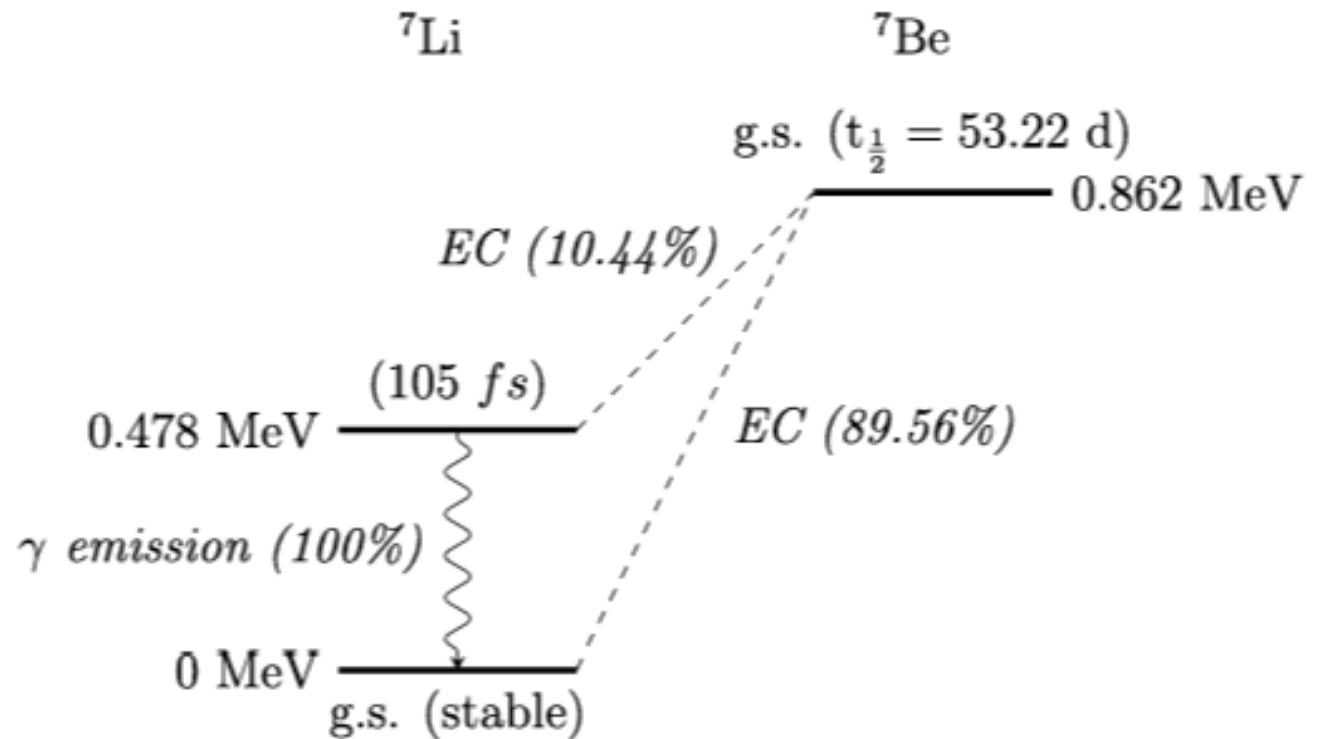

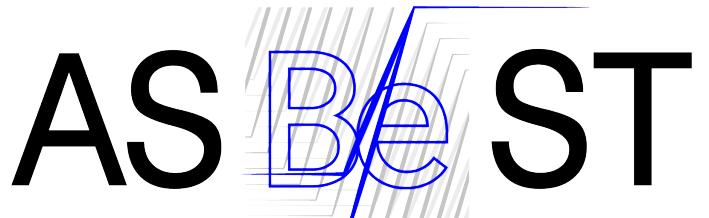

Figure 1. Decay scheme for the 7Be nucleus from ground state.

The phase space factor f_0 is determined by the environmental conditions

- ionization state
- chemical bounds

A 7-Beryllium electron capture STudy for nuclear and solid state physics

A 7-Beryllium electron capture STudy for nuclear and solid state physics (ASBeST)

How can we change f_0 in a laboratory?

In solid state environments

In ions

In flight-decay experiment

Li beam - Cell 26 mbar - Chamber 10 mbar

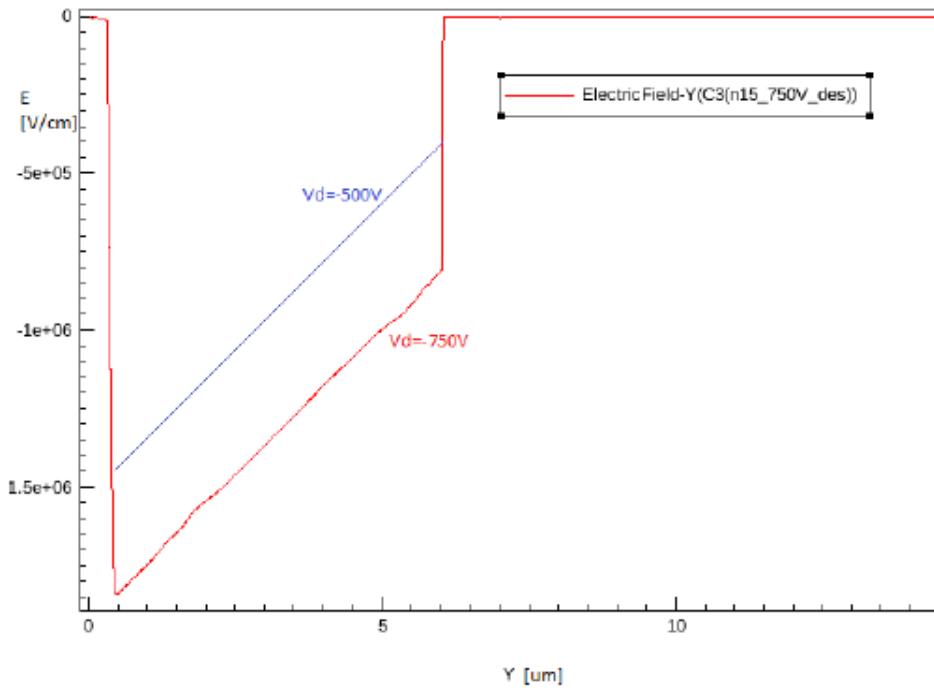

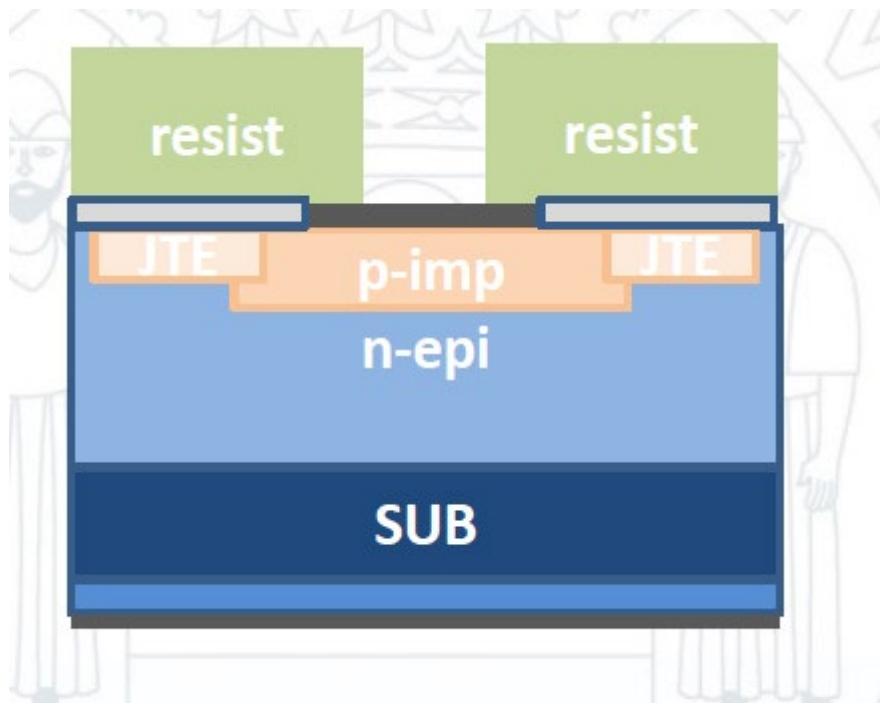

Be beam - Cell 26 mbar - Chamber 10 mbar

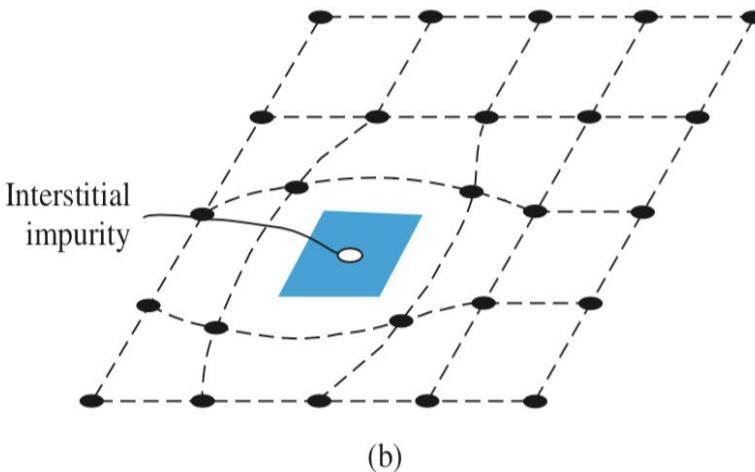

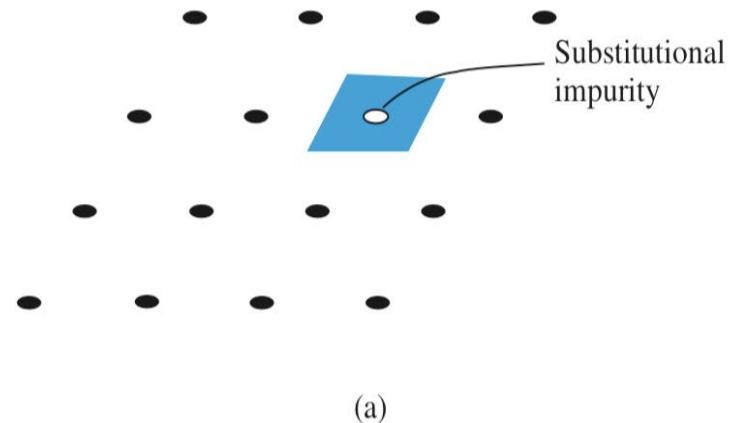

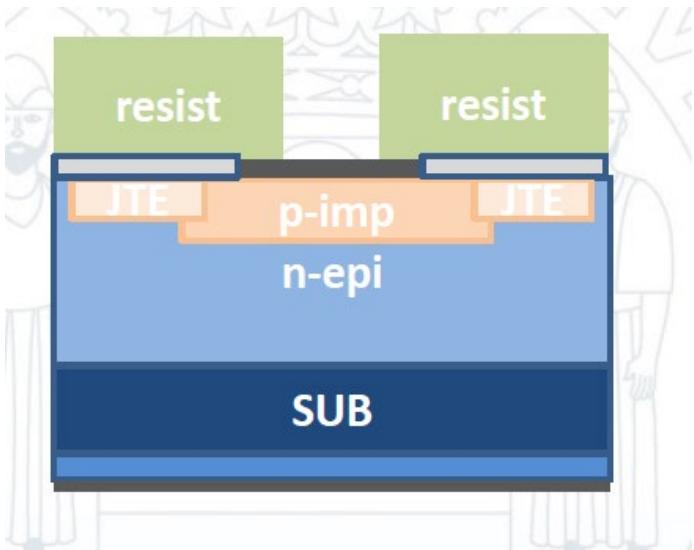

- A long run with high intensity ${}^7\text{Li}$ beam injected shows that ${}^7\text{Li}$ is sufficiently suppressed.

SiC Implantation experiment

- The electronic wavefunction and the density of electrons in the nucleus can be perturbate by the application of an electric field (Stark effect).
- Implantation of 7Be atoms inside the depletion region of a SiC diode with inverse polarization in order to produce intense electric field.

Summary and outlook:

1. Commissioning for ${}^7\text{Be}^{n+}$ inflight half-life measurement completed.
 2. Precise measurement of ${}^7\text{Be}$ half-life of ${}^7\text{Be}$ hosted in SiC performed.
 3. Complete ${}^7\text{Be}$ EC measurements when enough ${}^7\text{Be}$ will be available.
 4. Long run at LNGS – STELLA laboratory with implanted SiC diode, planned from September 2025.
