MAYORANA Workshop II edition

Muon lifetime of ⁷⁶Se

Benchmarking NMEs with the MONUMENT experiment

Elizabeth Mondragón on behalf of the MONUMENT Collaboration

June 18th 2025

Technical University of Munich

Motivation

[1] J. Schechter and J. W. F. Valle, Neutrinoless double- β decay in SU(2) × U(1) theories, Phys. Rev. D, vol. 25, pp. 2951–2954, 11 (1982)

$0\nu\beta\beta$ decay

- Beyond the SM physics
- Majorana nature of neutrinos^[1]

[2] M. Kortelainen and J. Suhonen, Ordinary muon capture as a probe of virtual transitions of double-beta decay, EPL, vol. 58, pp. 666–672, (2002).
[3] M. Kortelainen and J. Suhonen, Nuclear muon capture as a powerful probe of double-beta decays in light nuclei, J. Phys. G, vol. 30, no. 12, p. 2003, (2004).

$0\nu\beta\beta$ decay

- Beyond the SM physics
- Majorana nature of neutrinos^[1]

Ordinary Muon Capture ^[2,3]

- Similar momentum transfer
- Probe intermediate states
- Benchmark nuclear matrix element calculations

Measurement

Collaboration

ETH Zurich, Switzerland IEAP, CTU, Prague, Czech Republic CIFRA, Romania JINR, Dubna, Russia KU Leuven, Belgium Osaka University, Japan PSI, Switzerland TU Munich, Germany The University of Alabama, USA Universiti Teknologi Malaysia, Malaysia University of Jyväskylä, Finland University of Zurich, Switzerland

Measurement

- **Tag muon trajectory** from beam to target $\mu_{stop} = \hat{C}_0 \wedge C_1 \wedge C_2 \wedge \hat{C}_3$ rate of stopped muons $\mathcal{O}(10^4)$ Hz

- *γ*-spectroscopy with HPGe detectors,
 typical rates of *Q*(10³) Hz
- Coincident measurement,

 $\Delta t = t_{HPGe} - t_{\mu stop}$

 Two parallel DAQ systems,

_

-

 $A_{Z+1}W^*$

High-level analysis: µ lifetime in ⁷⁶Se

- Muon stopped at target atom $\rightarrow \mu X$ -rays
- After OMC, de-excitation via γ-ray emission
- $\Delta t = t_{\gamma-rays} t_{\mu stop}$ tell about the muon lifetime
- Related to total capture strength which can be calculated by nuclear structure theorists

① Time profile extraction (intensities over time)

y.

(2) Lifetime fit (muon lifetime τ)

- μX ray provides prompt response of the detector system, γ is convolution with exponential decay due to muon lifetime
- Prompt profile not trivial, use monotonic cubic spline
- Combined shape-only χ² fit using covariance matrix from ①

$$(138.9 \pm 1.3_{\text{stat}} \pm 3.5_{\text{syst}}) \text{ ns}$$

- Tail fit for comparison

2) Lifetime fit (muon lifetime τ)

- μX ray provides prompt response of the detector system, γ is convolution with exponential decay due to muon lifetime
- Prompt profile not trivial, use monotonic cubic spline -
- Combined shape-only χ^2 fit using covariance matrix from (1)

$$(138.9 \pm 1.3_{\rm stat} \pm 3.5_{\rm syst})$$
 ns

Tail fit for comparison -

E. Mondragón | June 2025

Systematics

A. Line position drift

Charge collection effect due to drift time selection

B. Background shape

Over/under estimation of intensity due to background model insufficiencies

± 0.9 ns

C. Prompt timing energy-dependence

S

Stretched time response due to energy dependence

Conclusions

• MONUMENT measures OMC on $\beta\beta$ -decay daughter isotopes to inform $0\nu\beta\beta$ -decay NME calculations

New experimental result for ⁷⁶Se muon lifetime based on novel analysis method
 (134.8±0.7) ns ^[8]

• First comparison with with phenomenological calculations available

Thanks!

Dataset

126 out of 132 h of beam-on data, 2D histograms mapping HPGe energy over time since last muon:

- Correlated events with $\Delta t = \pm 800$ ns
- High-frequency HPGe waveforms (8ns sampling)
- Low-frequency PMT waveforms (32ns sampling)

High-level analysis: muon lifetime

- **BEGe** detector #6

- Doublet of μ X and γ ray at (466, 469) keV
- $\Delta t = \pm 640 \text{ ns} \rightarrow 40 \text{ bins in time}$

dimension

- 10 keV with 0.2 keV binning \rightarrow **50 bins in**

energy dimension

- 2000 data points

① Time profile extraction

- Combined maximum likelihood fit using Poisson likelihood
- Shared shape (σ, α, β) and position (μ) parameters per line, individual intensity (n_j) and

background (p_{0j}, p_{1j}) parameters per time slice *j*, **168 free parameters**

- Gaussian pull terms for systematics, 160 constrained parameters*

*Discussed in Systematics

① Time profile extraction

E. Mondragón | June 2025

Systematics

- A. Line position drift (1), 1^{2})
- B. Background shape (① ②)
- C. Prompt timing energy -dependence (2)

A. Line position drift

Hypothesis:

Time slices correspond to HPGe detector **drift time** selection, later events are reconstructed with lower energies

- Include **additional parameters** ($\Delta \mu_j$ and $\Delta \alpha_j$), bound by **pull terms** (1 keV and 5%) \rightarrow (1)
- Additional uncertainty for slices where no line is present (statistical uncertainty of background counts under each peak, $\sqrt{p_0 \times FWTM}$) \rightarrow (1)(2)

A. Line position drift

± 0.7 ns

Y1

B. Background shape

- Simple **linear function might be insufficient** in some cases
- Convex/concave background shape can lead to under/over-estimation of intensity

Assume number of counts attributed to slope as uncertainty that is missed without higher order of polynomial → ①②

± 0.9 ns

C. Prompt timing energy-dependence

- Time response is energy and HPGe dependent
- Taken into account as transformation adding 2
 additional parameters: stretch *s* from anchor *a* of spline before convolution
- Parameters constrained by pull terms (64 ns,
 25%) based on μX rays →②

Features

(Simulating detector 7 data...)

- Asymmetric timing
 modeled by two Gaussians
 with different central value
 and different left and right
 tail
- True Monte Carlo lifetime is 130 ns (feeding tau)

E. Mondragón | June 2025

Toy study

- Monte Carlo study
 - Generate time profiles that resemble the real dataset using asymmetric prompt timing distribution
 - Apply combined lifetime fit (and tail fit)
 method
- Median result differs from Monte Carlo truth, added as method uncertainty to final result

Tail fit start dependence

Example of "bad χ^2 -fit"

S

 χ^2 profile

μ and α change over time

μ and α change over time
