

Gravitational waves from a quantum-field-theory perspective

Jan Steinhoff

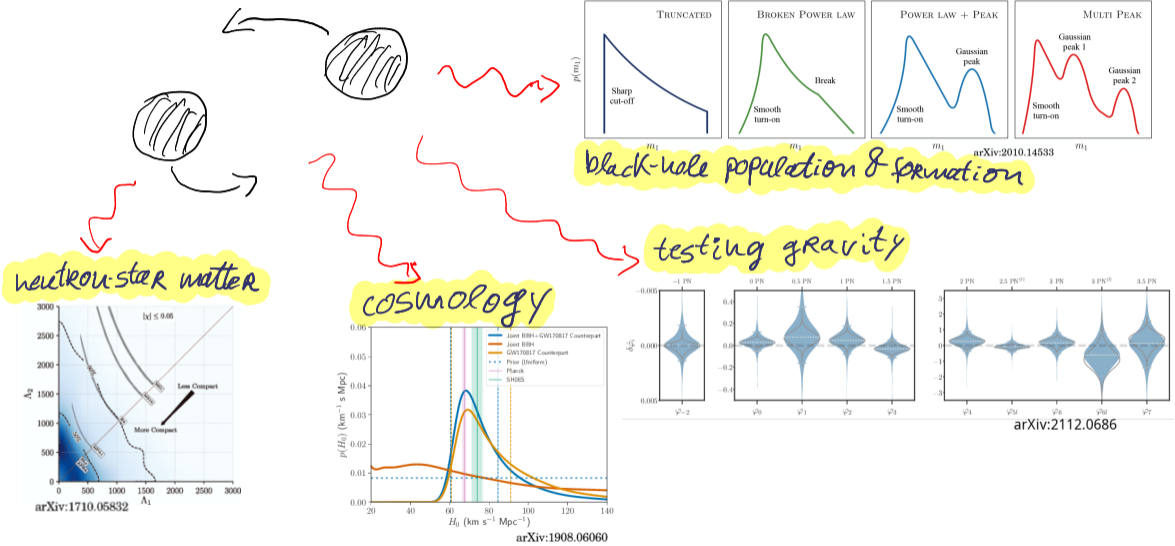

Max-Planck-Institute for Gravitational Physics (Albert-Einstein-Institute), Potsdam, Germany

String Theory as a Bridge between Gauge Theory and Quantum Gravity

Rome, February 18, 2025

Gravitational waves and their applications

Frequency of gravitational waves

sensitive frequency range

$$f \sim 40 - 400\text{Hz}$$

$$\text{3rd Kepler: } r^3(2\pi f)^2 = GM$$

GW150914: binary black hole

$$\rightarrow \frac{v}{c} \sim \frac{GM}{c^2 r} \sim 0.12 \dots 0.5$$

need numerical simulations

Frequency of gravitational waves

sensitive frequency range

$$f \sim 40 - 400\text{Hz}$$

$$\text{3rd Kepler: } r^3(2\pi f)^2 = GM$$

GW150914: binary black hole

$$\rightarrow \frac{v}{c} \sim \frac{GM}{c^2 r} \sim 0.12 \dots 0.5$$

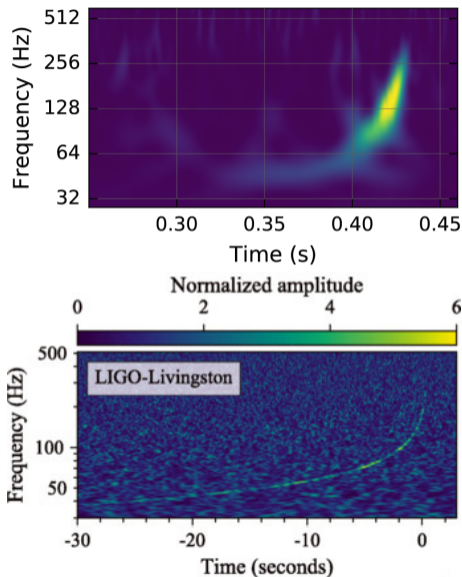

need numerical simulations

GW170817: binary neutron star

$$\rightarrow \frac{v}{c} \sim \frac{GM}{c^2 r} \sim 0.01 \dots 0.07$$

weak field and slow motion

(post-Newtonian) approximation

“Ready for what lies ahead?”

[M. Pürrer, C.-J. Haster, arXiv:1912.100]

Pürrer, Haster, arXiv:1912.10055

→ need better analytic (and numeric) predictions!

on top of that, include more physical effects (eccentricity+precession, tides, ...)

Look at the relativistic binary problem from a quantum perspective!

J. A. Wheeler

nytimes.com

“The Hamilton-Jacobi description of motion:
natural because ratified by the quantum principle”

Box 25.3 in [*Gravitation*, Misner, Thorne, Wheeler (MTW)]

Particle physics perspective: scattering black holes are natural!

- ▶ classical scattering: scattering angle χ
(more for spinning black holes)
- ▶ quantum scattering: probability amplitude \mathcal{M}

Particle physics perspective: scattering black holes are natural!

Standard Model of Elementary Particles

	three generations of matter (fermions)			interactions / force carriers (bosons)	
	I	II	III		
mass	$\approx 2.2 \text{ MeV}/c^2$	$\approx 1.28 \text{ GeV}/c^2$	$\approx 173.1 \text{ GeV}/c^2$	0	$\approx 125.99 \text{ GeV}/c^2$
charge	$\frac{2}{3}$	$\frac{2}{3}$	$\frac{2}{3}$	0	0
spin	$\frac{1}{2}$	$\frac{1}{2}$	$\frac{1}{2}$	1	0
	u up	c charm	t top	g gluon	H higgs
	d down	s strange	b bottom	γ photon	
	e electron	μ muon	τ tau	Z Z boson	
	ν_e electron neutrino	ν_μ muon neutrino	ν_τ tau neutrino	W W boson	

QUARKS (rows 1-3)
LEPTONS (rows 4-5)
SCALAR BOSONS (row 6)
GAUGE BOSONS VECTOR BOSONS (rows 7-8)

- ▶ classical scattering: scattering angle χ
(more for spinning black holes)
- ▶ quantum scattering: probability amplitude \mathcal{M}
- ▶ black holes \sim higher-spin massive particles?
e.g. [Arkani-Hamed, Huang, Huang (2017)]

scattering particles

vs

scattering waves

$\chi^M(\tau)$

α : scattering angle

$\psi \approx$ (slow) amp. $\times e^{iS}$
eikonal approx.

constructive interference

wavefronts energy E

1st quantize.

2nd quantize.

M : scattering amplitude

John A. Wheeler

Worldline quantum field theory (WQFT)

[Jakobsen, Mogull, Plefka, Sauer, JS, '20+]

- ▶ connecting quantum fields to worldlines:
 - Schwinger-Feynman dressed massive propagator
- ▶ scattering: expansion around straight worldline
 - Feynman rules with manifest \hbar counting
 - classical limit $\hbar \rightarrow 0$ and eikonal exponentiation manifest
- ▶ calculate classical ($\hbar \rightarrow 0$) scattering observables: scattering angle, waveform

Black holes as particles? Effective field theory (EFT)!

[adopted from arXiv:1906.08161]

- ▶ black holes have \approx minimal coupling in amplitudes / quantum fields
- ▶ black holes have nonminimal couplings in worldline action
- ▶ EFT framework can be applied to larger scales:
→ binary dynamics, gravitational waves

Continuing the EFT to larger scales: binaries / post-Newtonian approx.

[Goldberger, Rothstein, PRD **73** (2006) 104029; Goldberger, arXiv:hep-ph/0701129]

requirement:

separation of scales (scale μ)

- ▶ object size r_s
- ▶ orbital size r
- ▶ wavelength $\sim \frac{r}{v}$

applicable to:

- ▶ bound orbits
- ▶ scattering (close connection to WQFT)
- ▶ beyond general relativity

$$\mu=1/r_s \frac{\text{BH,NS +GR}}{\text{pt. particle +GR}} \quad \text{match}$$

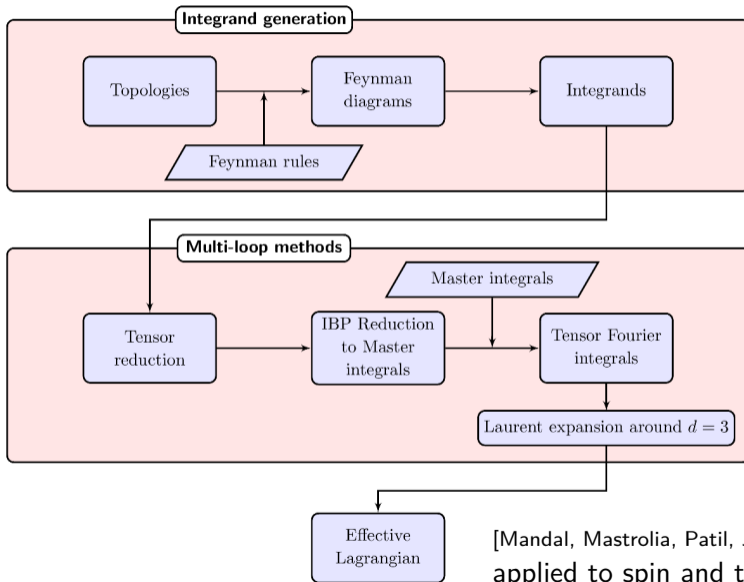

$$\mu=1/r \frac{\text{bd. state}}{\text{mult. + rad.}} \quad \text{match}$$

$$\mu=v/r \text{-----}$$

from [Goldberger, arXiv:hep-ph/0701129]

Conservative binary potential from EFT and Feynman integral calculus

[Mandal, Mastrolia, Patil, JS, '22+] applied to spin and tidal effects

Dynamical tidal response of neutron stars

response F

external quadrupolar field

→ deformation →

quadrupolar response

Dynamical tidal response of neutron stars

response F

external quadrupolar field \longrightarrow deformation \longrightarrow quadrupolar response

oscillation modes

\rightarrow harmonic oscillator response

\rightarrow (transient) resonances!

[Chakrabarti, Delsate, JS, arXiv:1304.2228]

Dynamical tidal response of neutron stars

response F

external quadrupolar field \longrightarrow deformation \longrightarrow quadrupolar response

oscillation modes

\rightarrow harmonic oscillator response

\rightarrow (transient) resonances!

resonance \leftrightarrow gravitational wave phase shift

gravitational wave spectroscopy!

matching F is difficult: high loop order, divergences

[Goldberger, Ross, arXiv:0912.4254]

[Chakrabarti, Delsate, JS, arXiv:1304.2228]

EFT modeling tides of spinning compact objects

black-hole horizon absorption (tidal heating):

- ▶ calculated absorption in binaries to 1.5PN
[Saketh, JS, Vines, Buonanno, arXiv:2212.13095]
- ▶ disagreement with previous result
[Chatziioannou, Poisson, Yunes, arXiv:1608.02899]
agreement with small mass ratio case
[Tagoshi, Mano, Takasugi, arXiv:gr-qc/9711072.]

EFT modeling tides of spinning compact objects

black-hole horizon absorption (tidal heating):

- ▶ calculated absorption in binaries to 1.5PN
[Saketh, JS, Vines, Buonanno, arXiv:2212.13095]
- ▶ disagreement with previous result
[Chatziioannou, Poisson, Yunes, arXiv:1608.02899]
agreement with small mass ratio case
[Tagoshi, Mano, Takasugi, arXiv:gr-qc/9711072.]

neutron-star gravitomagnetic tides:

[Gupta, JS, Hinderer, arXiv:2011.03508]

- ▶ adiabatic + inertial-mode effects
- ▶ sensitive to: spin, microphysics

EFT modeling tides of spinning compact objects

black-hole horizon absorption (tidal heating):

- ▶ calculated absorption in binaries to 1.5PN [Saketh, JS, Vines, Buonanno, arXiv:2212.13095]
- ▶ disagreement with previous result [Chatziioannou, Poisson, Yunes, arXiv:1608.02899]
- ▶ agreement with small mass ratio case [Tagoshi, Mano, Takasugi, arXiv:gr-qc/9711072.]

neutron-star gravitomagnetic tides:

[Gupta, JS, Hinderer, arXiv:2011.03508]

- ▶ adiabatic + inertial-mode effects
- ▶ sensitive to: spin, microphysics
- ▶ **plot:** effect on data analysis

spins $\chi = 0.01$, SNR = 1800

[Gupta, JS, Hinderer, arXiv:2302.11274]

Beyond general relativity

Ideally, consider realistic modifications:

- ▶ higher curvature corrections,
→ strong-field effects from:
 - ▶ modified spin-induced multipoles
 - ▶ modified tidal response
- ▶ adding scalar fields
 - strong-field effect from scalarization
 - dipole radiation

Beyond general relativity

Ideally, consider realistic modifications:

- ▶ higher curvature corrections,
→ strong-field effects from:
 - ▶ modified spin-induced multipoles
 - ▶ modified tidal response
- ▶ adding scalar fields
→ strong-field effect from scalarization
→ dipole radiation

scalarization:

- ▶ spontaneous scalarization:
→ linearly unstable scalar mode $\omega_{\text{mode}}^2 < 0$
- ▶ dynamical scalarization:
→ barely stable scalar mode $\omega_{\text{mode}}^2 \sim \text{small} > 0$

scalar charge q over orbital frequency Ω
[Khalil, Mendes, Ortiz, JS, arXiv:2206.13233]

Gravitational waves from a quantum-field-theory perspective

- ▶ need more accurate gravitational waveforms
- ▶ EFT and Feynman diagrammatic expansion are powerful tools
 - ▶ to predict gravitational waves
 - ▶ to include spin and tides
 - ▶ to go beyond general relativity
- ▶ connecting GW to scattering amplitudes may allow application of modern “on-shell” methods

Standard Model of Elementary Particles

	three generations of matter (fermions)			interactions / force carriers (bosons)	
	I	II	III		
mass	-2.2 MeV/c ²	-1.28 GeV/c ²	-173.1 GeV/c ²	0	=125.09 GeV/c ²
spin	1/2	1/2	1/2	1	0
QUARKS	u up	c charm	t top	g gluon	H higgs
	d down	s strange	b bottom	γ photon	
	e electron	μ muon	τ tau	Z Z boson	
LEPTONS	ν_e electron neutrino	ν_μ muon neutrino	ν_τ tau neutrino	W W boson	
					SCALAR BOSONS
					GAUGE BOSONS VECTOR BOSONS

Gravitational waves from a quantum-field-theory perspective
