The Scattering and Neutrino Detector at the LHC

Wednesday, October 1, 2025 12:40 PM (20 minutes)

SND@LHC is a compact and stand-alone experiment to perform measurements with neutrinos produced at the LHC in a hitherto unexplored pseudo-rapidity region of $7.2 < \eta < 8.4$, complementary to all the other experiments at the LHC. The experiment is located 480 m downstream of IP1 in the unused TI18 tunnel. The detector is composed of a hybrid system based on an 800 kg target mass of tungsten plates, interleaved with emulsion and electronic trackers, followed downstream by a calorimeter and a muon system. The configuration allows efficiently distinguishing between all three neutrino flavours, opening a unique opportunity to probe physics of heavy flavour production at the LHC in the region that is not accessible to ATLAS, CMS and LHCb. This region is of particular interest also for future circular colliders and for predictions of very high-energy atmospheric neutrinos. The detector concept is also well suited to searching for Feebly Interacting Particles via signatures of scattering in the detector target. The first phase aims at operating the detector throughout LHC Run 3 to collect a total of 250 fb^{-1} . The presentation will focus on the results of the data taken in 2022-2023 and report the status of the analysis of 2024 data.

Neutrino Properties

neutrino cross-section studies

Neutrino Telescopes & Multi-messenger

exploration of physics beyond the Standard Model

Neutrino Theory & Cosmology

LFU test

Data Science and Detector R&D

data analysis techniques
