

Update on SVT Mechanics

F. Bosi

Activity

What we are doing:

- Modelling Ribs for L1-5
- Modelling Fanouts for L1-5
- I.R. general layout /quick demounting
- QMUL : working on the space frame dimensioning
- Milan : working on modelling connectors/ cables of the L0 Hybrid

SVT L1-5 Layout design

Modelling ribs for Layer 1-5

1) L5B longer about **230 mm** respect Babar dimensions
(L5B total length about 760mm)

2) Need ribs more height and also with a reinforced profile along the barrel sensors (soon structural simulation to dimension the right height !)

Actual design rib $h=18$ mm and snake reinforcement $h=10$ mm , dimensions respectful of space frame design (clearance of few mm)

SVT L1-5 Layout design

Modelling ribs for Layer 1-5

1) L5B longer about **230 mm** respect Babar dimensions
(L5B total length about 760mm)

2) Need ribs more height and also with a reinforced profile along the barrel sensors (soon structural simulation to dimension the right height !)

Actual design rib $h=18$ mm and snake reinforcement $h=10$ mm , dimensions respectful of space frame design (clearance of few mm)

SVT L1-5 Layout design

Modelling fanouts for L1-5

- 1) L3-4-5 fanouts not particular problems
- 2) L1-2 fanouts shape very peculiar (need to round around the L0 Hybrid and probably ribs will be used like constrain to hold the fanout on the right shape...)

I.R. Layout

Reduction in the actual CFRP semicone to allow easier passing of L0 cables towards the transition Card

80-85 mm L1 fanout

L0 cable length 400 mm?

Design of gimbal ring/conical-shield to allow L0 cable to reach transition cards

(Old slide for semicone design)

It's sufficient move
back 50 mm the
connection flange?

- Transition card dimensions : important to know dimensions asap in order to modify the criostat vessel to transfer to fabbricatore.....

I.R. Architecture/quick demounting

- Present I.R. design has the goal to assume W conical shield independent from cylindrical shield to move less mass for quick demounting operation (all SVT components have minor diameter respect to W conical shield int.diam.) .

-In this configuration, criostat forw/back+SVT+LO+Be pipe+conical shield forw/back are one body (like in BaBar) but, in SuperB, to gain in X0, is not present the C.F. BaBar supporting tube and the Be pipe and SVT are the weak part of the mechanical chain .

-Quick demounting plans to insert-remove a temporary cage to make rigid SVT /Be pipe during sliding operation to replace LO in short time.

-Has been asked to assume $R=245$ (+10 mm respect now) as internal diameter of D.C. in order to have minimum radial space to design the mechanics of operation.

-The temporary cage should put together the two opposite W conical shield from a remote region (FCAL) previous blocking the external tube forw/back to the internal part of cylindrical W shield.

Cylindrical
Shielding 1300 Kg

Cylindrical
Shielding 1300 Kg

Total weight to move for quick demounting ≈ 1400 Kg

Quick demounting

Quick demounting

Quick demounting

Quick demounting

SVT

- 1) In experimental condition
- 2) In removal condition at the end of stroke

Quick demounting

Tablet usefull for trieste group to fix **sensor** and **fanout** dimensions

Modules have sensor in symmetric position respect I.P. but are shifted along z direction to avoid middle dead space

General Layout SVT

Complete Modules stripleets positioned on the Be beam-pipe and supported by Cold Flange.

Be pipe flanges

Cold Flanges Buttons

All LO components very close to the flanges beam pipe
