

# Precise Predictions for H+j production at the LHC

Roberto Bonciani

Dipartimento di Fisica e Astronomia, Università di Firenze  
INFN - Sezione di Firenze

In Collaboration with: V. Del Duca, M. Becchetti, H. Frellesvig, M. Hidding, V. Hirschi, F. Moriello,  
G. Salvatori, A. Schweitzer, G. Somogyi, and F. Tramontano

Florence Theory Group Day, March 19 2025

# Plan of the talk

- ◆ Brief Introduction
- ◆ Theoretical Predictions in the literature
- ◆ Some details about the calculation of  
 $H+j$  @ NLO in QCD

# H+jet

- ◆ Phenomenological importance

- ◆ The Higgs sector of the SM since 2012 is under careful scrutiny to understand whether the H boson is indeed SM-like. Possible portal to New Physics.
- ◆ Many production channels ... many parameters to check ...
- ◆ The study of H+j is important for many pheno reasons:
  - ◆ recoiling against the Higgs system, the jet can reveal a possible substructure of the Higgs boson, therefore distributions are instrumental for the search of NP effect ...
  - ◆ The high-pt part of the spectrum is sensible to New Physics (i.e. new heavy particles running in the loops) ...

- ◆ Computational importance

- ◆ H+j is a NLO QCD computation, i.e. the number of Feynman diagrams is quite reduced ( $\sim 100$  ??); however their computation is quite complicated due to the presence of 4 scales ( $s, t, m_t$  and  $p_H$ )
- ◆ interesting playground for computational techniques, study of the functional structure of Feynman diagrams etc ...

# H+jet

- ◆ The  $p_T$  distribution is known at LO in the full theory and at higher orders in the heavy-top limit

R. K. Ellis, J. Hinchliffe, M. Soldate, J. J. Van der Baj, Nucl. Phys. B 297 (1988) 221  
U. Baur, E. W. N. Glover, Nucl. Phys. B 339 (1990) 38

- ◆ In HEFT (infinite top mass) the NNLO QCD corrections are known

R. Boughezal, F. Caola, K. Melnikov, F. Petriello, M. Schulze, JHEP 06 (2013) 072  
Phys. Rev. Lett. 115 (2015) 082003  
X. Chen, T. Gehrmann, E. W. N. Glover, M. Jaquier, Phys. Lett. B 740 (2015) 147  
R. Boughezal, C. Focke, W. Giele, X. Liu, F. Petriello, Phys. Lett. B 748 (2015) 5

- ◆ Power in  $1/m_t^2$  corrections at NLO in QCD were also calculated

R. Harlander, T. Neumann, K. J. Ozeren, M. Wiesemann, JHEP 08 (2012) 139  
T. Neumann, M. Wiesemann, JHEP 11 (2014) 150

- ◆ Small bottom mass interference effects and asymptotic  $p_{t,H} \geq 400$  GeV were also calculated

K. Melnikov, L. Tancredi, C. Wever, JHEP 11 (2016) 104; Phys. Rev. D 95 (2017) 054012  
R. Mueller, D. G. Ozturk, JHEP 08 (2016) 055  
J. M. Lindert, K. Melnikov, L. Tancredi, C. Wever, Phys. Rev. Lett. 118 (2017) 252002  
K. Kudashkin, K. Melnikov, C. Wever, JHEP 02 (2018) 135  
J. M. Lindert, K. Kudashkin, K. Melnikov, C. Wever, Phys. Lett. B 782 (2018) 210

# H+jet

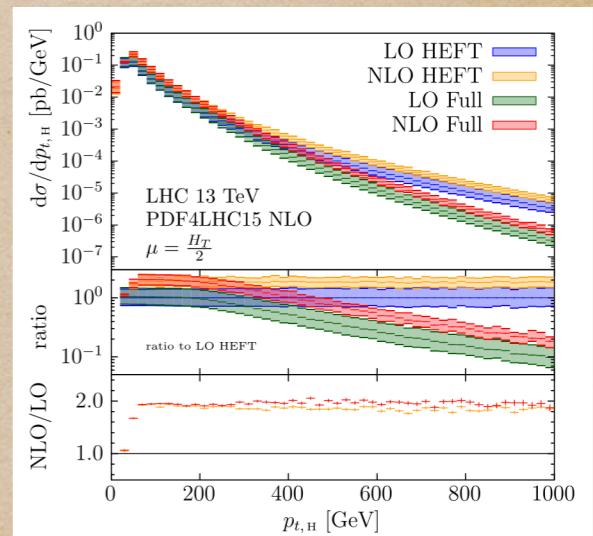

- ◆ H+j was computed at NLO in QCD with the full TOP mass dependence

S. P. Jones, M. Kerner, G. Luisoni, Phys. Rev. Lett. 120 (2018) 162001

X.Chen, A.Huss, S.P.Jones, M.Kerner, J.N.Lang, J.M.Lindert, H.Zhang, JHEP 03 (2022) 096

- ◆ Everything except virtual corrections are calculated analytically
- ◆ VIRTUAL: reduction to the Master Integrals, the MI basis is chosen to be composed by quasi-finite integrals (better numeric convergence)
  - MI's are calculated numerically with SecDec

- ◆ Total CS: Corrections from LO to NLO are large ( $K_f=1.8$ )  
NLOfull w.r.t. NLOheft = +9%
- ◆  $p_{t,H}$  The bands of scales variation at NLO do not overlap anymore for  $p_{t,H} \geq 340$  GeV  
But agreement if EFT rescaled with the full LO
- ◆ TOP mass renormalised in OS scheme

# H+jet

- ◆ H+j was computed at NLO in QCD with the full dependence on TOP and BOTTOM masses

R.B., V. Del Duca, H. Frellesvig, M. Hidding, V. Hirschi, F. Moriello, G. Salvatori, G. Somogyi, F. Tramontano, PLB 843 (2023) 137995

- ◆ Master Integrals computed using differential equations solved in expansion
- ◆ Renormalization of the Amplitude done in two different schemes:
  - ◆ External fields are renormalised on-shell.  $\alpha_S$  is renormalised in a mixed scheme in which light-flavor contribution in  $\overline{MS}$  and heavy-flavor contrib at zero momentum
  - ◆ TOP-quark mass and Yukawa OS. TOP-quark mass and Yukawa in  $\overline{MS}$
  - ◆ TOP and BOTTOM masses and Yukawas in  $\overline{MS}$
- ◆ Two-Loop 2  $\rightarrow$  2 and One-Loop 2  $\rightarrow$  3 are IR div. We combine them using Dipole Subtraction
- ◆ Several checks at the level of the masters (with AMFlow) and the amplitude
  - ◆ Behaviour of the Two-Loop 2  $\rightarrow$  2 amplitude in the soft and collinear limits of one unresolved parton against factorisation formulas
  - ◆ Very large pt against Kudashkin-Melnikov-Wever
  - ◆ CS and pt for TOP against Chen-Huss-Jones-Kerner-Lang-Lindert-Zhang
- ◆ In the case of  $\overline{MS}$  masses: dynamical evaluation in each point of phase space
- ◆ Implementation in MADGRAPH5\_aMC@NLO

# H+jet

$$G_F = 1.16639 \cdot 10^{-5} \text{ GeV}^{-2} \quad m_H = 125.25 \text{ GeV} \quad m_t^{OS} = 172.5 \text{ GeV}$$

$$m_t^{\overline{\text{MS}}}(m_t^{\overline{\text{MS}}}) = 163.4 \text{ GeV} \quad m_b^{\overline{\text{MS}}}(m_b^{\overline{\text{MS}}}) = 4.18 \text{ GeV}$$

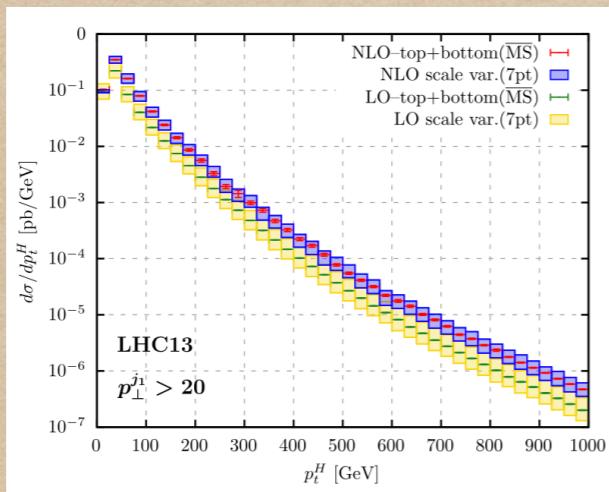

$$\mu_R^0 = \mu_F^0 = \frac{H_T}{2} = \frac{1}{2} \left( \sqrt{m_H^2 + p_{t,H}^2} + \sum_i |p_{t,i}| \right)$$

NNPDF40\_nlo\_as\_01180

CS with  $p_t > 20 \text{ GeV}$

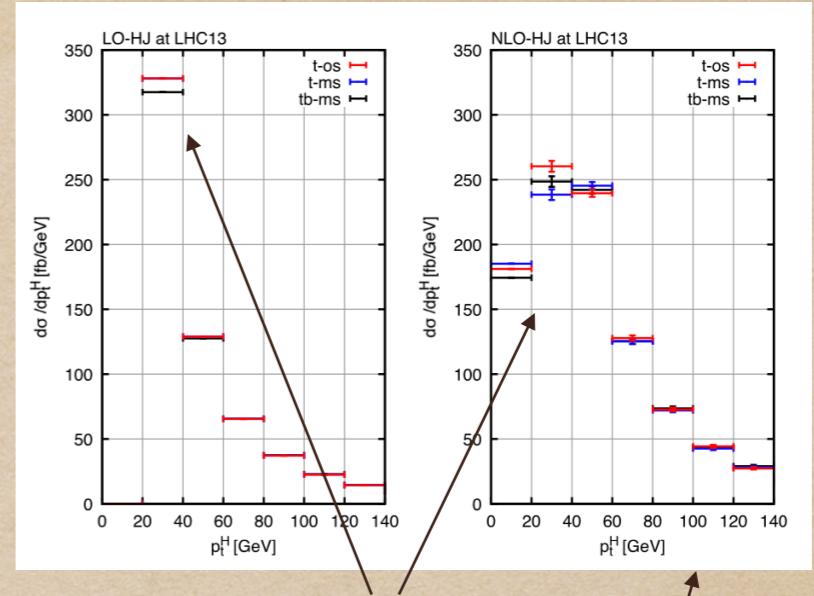

renormalisation of internal masses	$\sigma_{\text{LO}} [\text{pb}]$	$\sigma_{\text{NLO}} [\text{pb}]$
top+bottom-( $\overline{\text{MS}}$ )	$12.318^{+4.711}_{-3.117}$	$19.89(8)^{+2.84}_{-3.19}$
top-( $\overline{\text{MS}}$ )	$12.538^{+4.822}_{-3.183}$	$19.90(8)^{+2.66}_{-2.85}$
top-(OS)	$12.551^{+4.933}_{-3.244}$	$20.22(8)^{+3.06}_{-3.09}$

- Big K-factor ( $\sim 2$  at the diff level bin-by-bin)
- Scale uncertainty from 30% to 14%
- t-b interf. covers the gap from LO

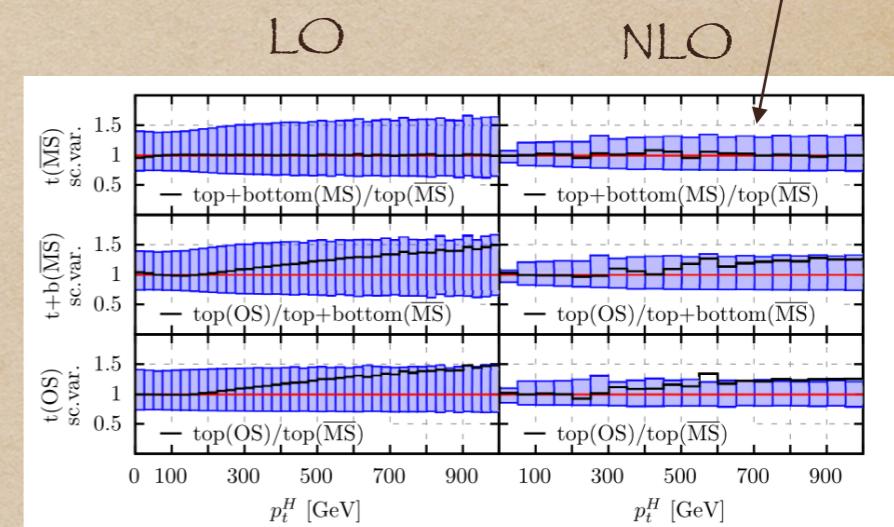

Some more details about the calculation:

Scale variation not shown

- The t-b interf changes the shape at low pt
- t-b interf irrelevant at medium-high pt (only TOP ok)

- Behavior of renormalization:  $\overline{\text{MS}}$  falls off faster than OS
- Behavior less pronounced at NLO (as it should ...)

Florence Theory Group Day, March 19 2025

# Theoretical framework: Perturbative QCD

At LHC hadronic collisions

$$h_1 + h_2 \rightarrow H + j + X$$

we rely on Factorization Theorem

PDFs: Universal Part  
Evolution with Fact scale  
predicted by the theory

Partonic CS: Process-dep Part  
Calculation in PT Theory

$$\sigma_{h_1, h_2} = \sum_{i,j} \int_0^1 dx_1 \int_0^1 dx_2 f_{i,h_1}(x_1, \mu_F) f_{j,h_2}(x_2, \mu_F) \hat{\sigma}_{ij}(\hat{s}, m^2, \alpha_S(\mu_R), \mu_F, \mu_R)$$

NNLO

Approximate NNNLO pdfs J. McGowan, et al. Eur. Phys. J. C. 83(3) (2023) 185

Florence Theory Group Day, March 19 2025

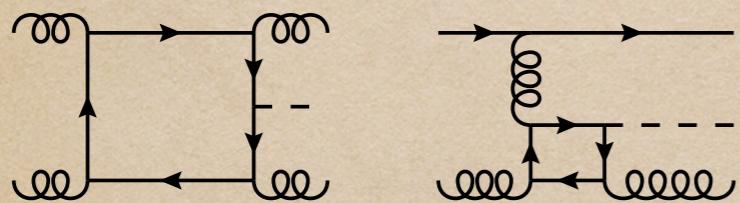

# Exact Calculation: Partonic Cross Section

- Two-Loop  $2 \rightarrow 2$  interfered with the One-loop  $2 \rightarrow 2$

$$\begin{aligned} gg &\rightarrow Hg \\ q\bar{q} &\rightarrow Hg \\ qg &\rightarrow Hq \end{aligned}$$

- One-Loop  $2 \rightarrow 3$  interfered with the One-loop  $2 \rightarrow 3$

Computed with  
MCFM 9.1

V. Del Duca, W. Kilgore, C. Oleari, C. Schmidt, D. Zeppenfeld, PRL 87 (2001) 122001  
L. Budge, J.M. Campbell, G. De Laurentis, R.K. Ellis, S. Seth, JHEP 05 (2020) 079  
R.K. Ellis, S. Seth, JHEP 11 (2018) 006  
J.M. Campbell, T. Neumann, JHEP 12 (2019) 034

- We renormalize UV divergences both in OS and/or in  $\overline{\text{MS}}$
- The two UV-ren sets are still separately IR divergent: we need IR counterterms in a subtraction scheme: we used Dipole Subtraction as implemented in MCFM 9.1

S. Catani and M. H. Seymour, Nucl. Phys. B 485 (1997) 291

# Structure of the Amplitude

- Let us focus on the Two-Loop  $2 \rightarrow 2$  amplitude
- Kinematics:  $H(p_4) \rightarrow g(p_1) + g(p_2) + g(p_3)$        $H(p_4) \rightarrow q(p_1) + \bar{q}(p_2) + g(p_3)$   
 $s = (p_1 + p_2)^2$   $t = (p_1 + p_3)^2$   $u = (p_2 + p_3)^2$ ;     $p_1^2 = p_2^2 = p_3^2 = 0$ ;     $s + t + u = p_4^2$   
 Integrals function of 3 dimless var:       $x_1 = \frac{s}{m_t^2}$ ;     $x_2 = \frac{t}{m_t^2}$ ;     $x_3 = \frac{p_4^2}{m_t^2}$
- The  $H \rightarrow 3g$  amplitude can be expressed in terms of 4 form factors while the  $H \rightarrow g\bar{q}q$  amplitude in terms of 2 form factors

T. Gehrmann, M. Jaquier, E. W. N. Glover, A. Koukoutsakis, JHEP 02 (2012) 056

$H \rightarrow 3g$

$$\mathcal{M}^{\mu\nu\rho} = A_{212}T_{212}^{\mu\nu\rho} + A_{332}T_{332}^{\mu\nu\rho} + A_{311}T_{311}^{\mu\nu\rho} + A_{312}T_{312}^{\mu\nu\rho}$$

$H \rightarrow g\bar{q}q$

$$\mathcal{M}^\mu = A_1 T_1^\mu + A_2 T_2^\mu$$

- We project the contributions of the Feynman diagrams to the different FF

$$\mathcal{P}_i \cdot \mathcal{M} = A_i$$

where the  $A_i$  are expressed in terms of dim reg scalar integrals and then at every order in  $\alpha_s$  we have  $A_i = A_i(x_1, x_2, x_3, \epsilon)$

Florence Theory Group Day, March 19 2025

# Computation of the Amplitude

... goes through the “usual” steps:

- ◆ Generation of the Feynman diagrams: **QGRAF** and **FeynArts**  
P. Nogueira, J. Comput. Phys. 105 (1993) 279  
T. Hahn, Comput.Phys.Commun. 140 (2001) 418-431
- ◆ We computed the Form Factors projecting the single Feyn diags: **FORM**  
B. Ruijl, T. Ueda and J. A. M. Vermaasen, 1707.06453
- ◆ We can renormalize in different schemes. We always renormalize ext fields on-shell.  $\alpha_S$  is renormalized in a mixed scheme with light-flavor contrib in  $\overline{\text{MS}}$  and heavy-flavor at zero momentum. Masses are renormalized in OS or in  $\overline{\text{MS}}$
- ◆ The Dim-Regularized scalar integrals were reduced to the MIs using IBP identities as implemented in **KIRA** and **FIRE**

P. Maierhoefer, J. Usovitsch and P. Uwer, Comp. Phys. Commun. 230 (2018) 99  
J. Klappert, F. Lange, P. Maierhoefer and J. Usovitsch, Comput.Phys.Commun. 266 (2021) 108024  
A. A. V. Smirnov, JHEP 10 (2008) 107  
B. A. V. Smirnov, F. S. Chuharev, Comput. Phys. Commun. 247 (2020) 106877

Florence Theory Group Day, March 19 2025

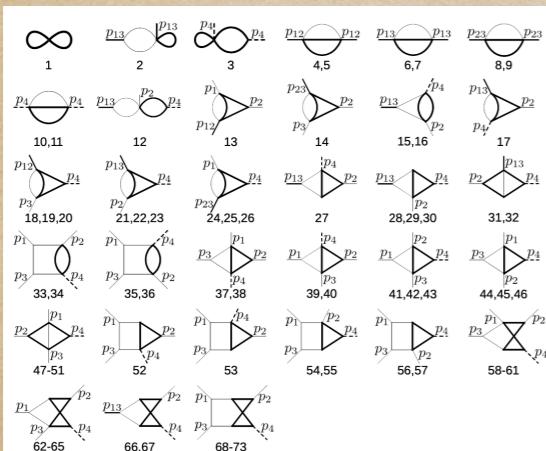

# Master Integrals

- ◆ We divided the computation in three sets, corresponding to the various topologies

## ◆ MIs for the planar topologies A, B, C, D. Analytic approach

- All of them except 2 sectors with 4 MIs can be expressed in MPLs
- MPLs sectors “effectively” written instead as a one-fold integration over weight-2 kernels
- Elliptic sectors: repeated integrations of MPLs over ellipt. kernels

R.B., V. Del Duca, H. Frellesvig, J. M. Henn, F. Moriello, V. A. Smirnov, JHEP 12 (2016) 096

### Elliptic sectors:

- A - Homog. Eq. Elliptic; Non-Homog. polylogarithmic
- B - Homog. Eq. Polylog; Non-Homog. Elliptic

## ◆ MIs for the crossed topology G

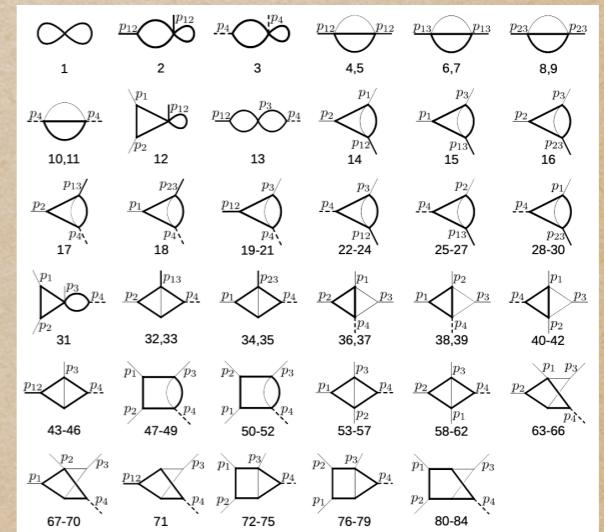

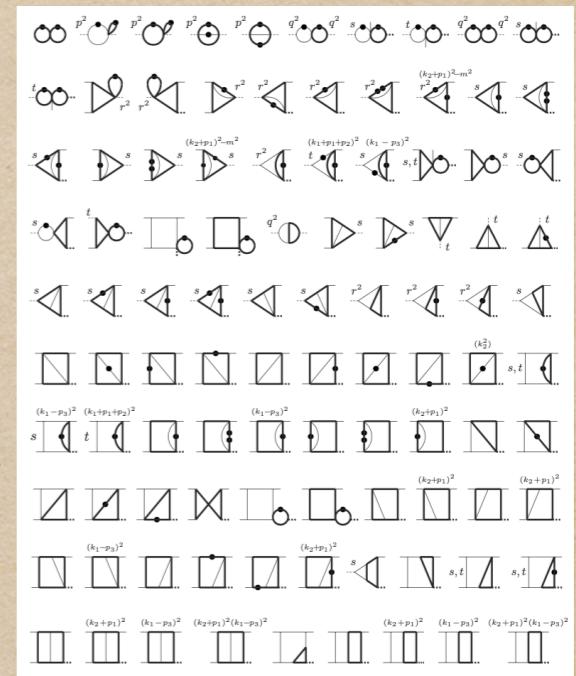

- Solved by series expansions

R.B., V. Del Duca, H. Frellesvig, J. M. Henn, M. Hidding, L. Maestri, F. Moriello, G. Salvatori, V. A. Smirnov, JHEP 01 (2020) 132

## ◆ MIs for the crossed topology F

- Solved by series expansions

H. Frellesvig, M. Hidding, L. Maestri, F. Moriello, G. Salvatori, JHEP 06 (2020) 093

# Differential Equations

- ◆ The MIs were computed using the Differential Equations Method

$$\frac{\partial}{\partial x_i} f(x, \epsilon) = A_{x_i}(x, \epsilon) f(x, \epsilon)$$

V. Kotikov, Phys. Lett. B 254 (1991) 158

Z. Bern, L. J. Dixon and D. A. Kosower, Nucl. Phys. B 412 (1994) 751

E. Remiddi, Nuovo Cim. A 110 (1997) 1435

T. Gehrmann and E. Remiddi, Nucl. Phys. B 580 (2000) 485

- ◆ The system of differential equations was put (where possible) in canonical form

$$df(x, \epsilon) = \epsilon dA(x) f(x, \epsilon)$$

J. M. Henn, Phys. Rev. Lett. 110 (2013) 251601

M. Argeri, S. Di Vita, P. Mastrolia, E. Mirabella, J. Schlenk, U. Schubert and L. Tancredi, JHEP 03 (2014) 082

- ◆ Although in “polylogarithmic form, square roots prevent a simple solution in iterated integrations. We found weight-2 in Polylog form and expressed weight-4 as a one-fold integration

C. Duhr, H. Gangl, J. R. Rhodes, JHEP 10 (2012) 075

S. Caron-Huot and J. M. Henn, JHEP 06 (2014) 114

- ◆ The elliptic sectors where evaluated solving Second-order linear diff eqs that revealed a good behaviour if combined in parametric form

Solution:  $\int_0^1 \mathcal{F}(\alpha) \{K^i(\alpha), E^i(\alpha)\} d\alpha$

Difficult analytic continuation .... Series exp

Florence Theory Group Day, March 19 2025

# Differential Equations: Semi-analytic evaluation

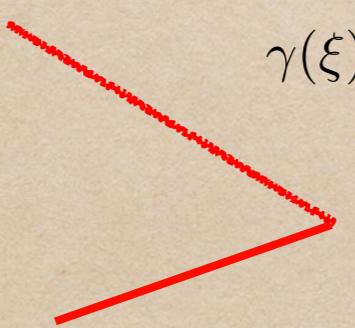

- ◆ The examples above are one-dimensional, but the approach can be generalised to more dimensions and used for a general system of differential equations for the MIs
- ◆ The differential equations in  $s$  and  $t$  are combined and a one-dim diff eq is recovered and solved along a contour connecting two fixed points in the  $s$ - $t$  plane

$(s_1, t_1)$

$\gamma(\xi) : \xi \rightarrow \{s(\xi), t(\xi)\}$

$(s_0, t_0)$

$(s, t)$

$$\frac{d}{d\xi} f(\xi, \epsilon) = A(\xi, \epsilon) f(\xi, \epsilon)$$

$$f^{(i)}(\xi) = \sum_{j=0}^{\infty} c^{(i,j)} (\xi - \xi_0)^j$$

$$f(\xi, \epsilon) = \sum_{i=0}^N f^{(i)}(\xi) \epsilon^i$$

$$f^{(i)}(\xi) = \sum_{j_1 \in S_1} \sum_{j_2=0}^{\infty} \sum_{j_3=0}^{\infty} c^{(i,j_1,j_2,j_3)} (\xi - \xi_0)^{w_{j_1} + j_2} \log^{j_3} (\xi - \xi_0)$$

- ◆ Analytical continuation is done expanding in the singular point and matching the series using Feynman prescription for the invariants
- ◆ The method is quite efficient and enables to compute fast a point in the phase space with arbitrary precision
- ◆ Recently this method was implemented in a Mathematica code: **DiffExp**

F. Moriello, JHEP 01 (2020) 150

M. Hidding, Comput.Phys.Commun. 269 (2021) 108125

Florence Theory Group Day, March 19 2025

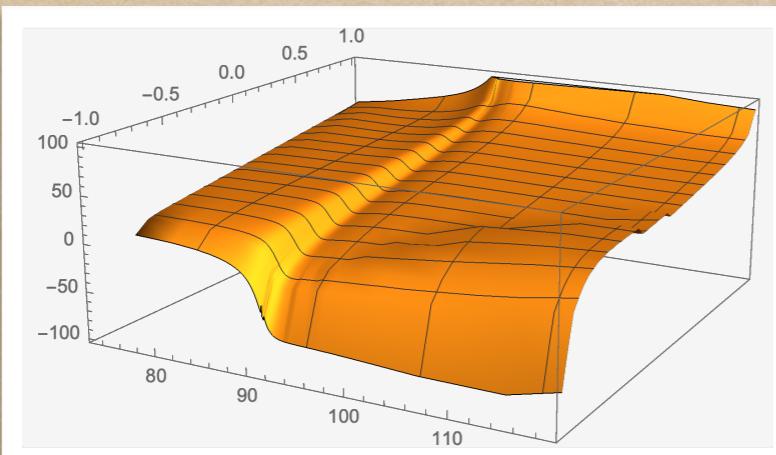

# The Calculation in a Nutshell

Generation of  
Feynman Diagrams

Projection on  
Form Factors

Solution of the system  
using series expansions

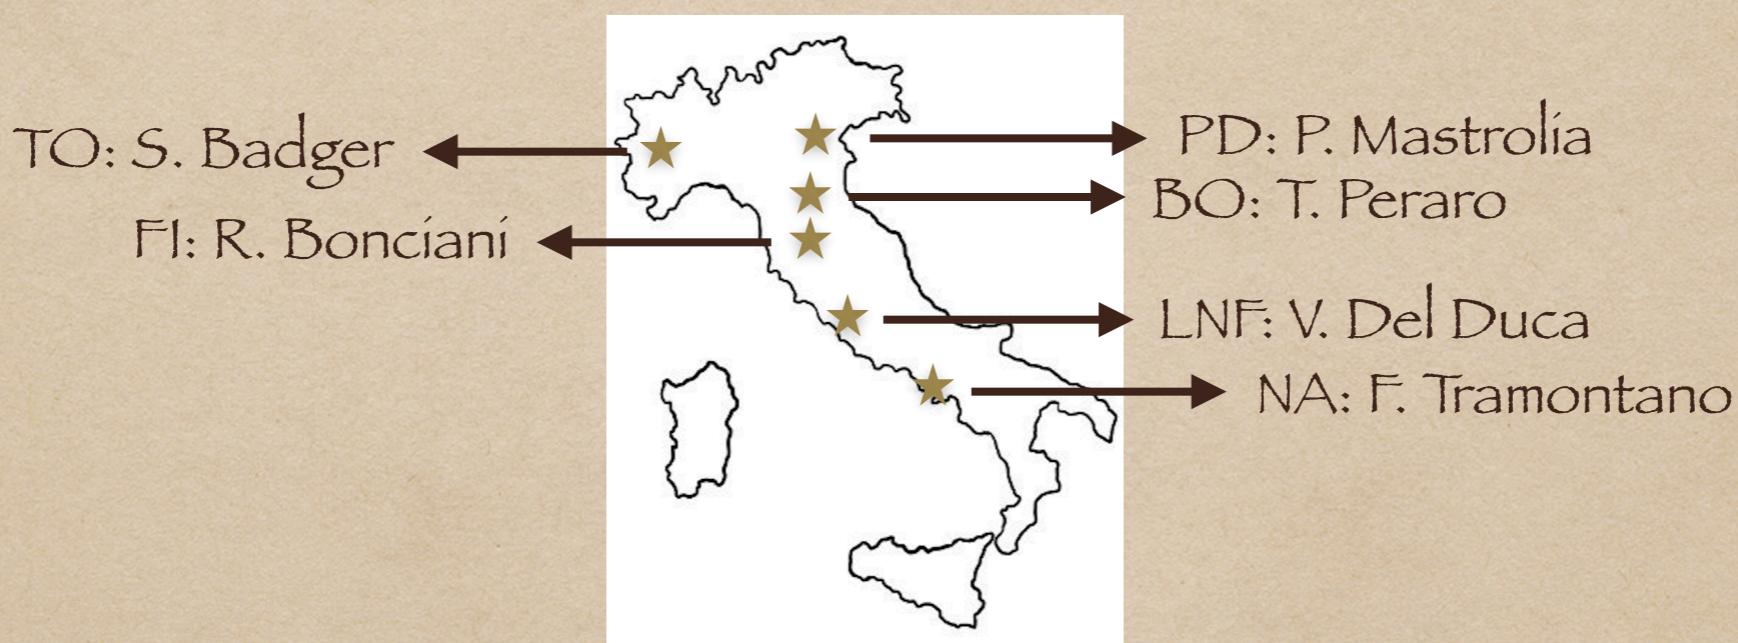

Reduction to the MIs  
Integration-by-Part IDs

The MIs satisfy systems  
of 1st-order linear diff eqs

# Conclusions

- Progress in Higher-order PT calculations important for the test of the SM at the %-level @ LHC. Possible NP effects.
- This is part of the program of “AMPLITUDES”, an INFN Iniziativa Specifica with 6 nodes:

Thank you for your attention!

Florence Theory Group Day, March 19 2025

# Problems to face ...

- Size of the reduction/size of the coefficients: many MIs, complicated coefficients (many masses and invariants) of MB's
  - Possible simplifications: partial fractions "MultivariateApart", finite fields in "FiniteFlow"  
M. Heller, A. Von Manteuffel, Comput. Phys. Commun. 271 (2022) 108174  
T. Peraro, HEP 07 (2019) 031
  - Direct numerical evaluation of the reduction?
- Analytic Solution of the Differential Equations in presence of many invariants/masses
  - Although in the Polylogarithmic case ... square roots -> difficult evaluation of a closed form
  - Although in closed form, problematic numerical evaluation: big formulas
- Semi-Analytic Evaluation in principle no problem ... in practice
  - Big systems -> large evaluation time
- Numeric evaluation (SecDec)?

# Higgs Production at the LHC

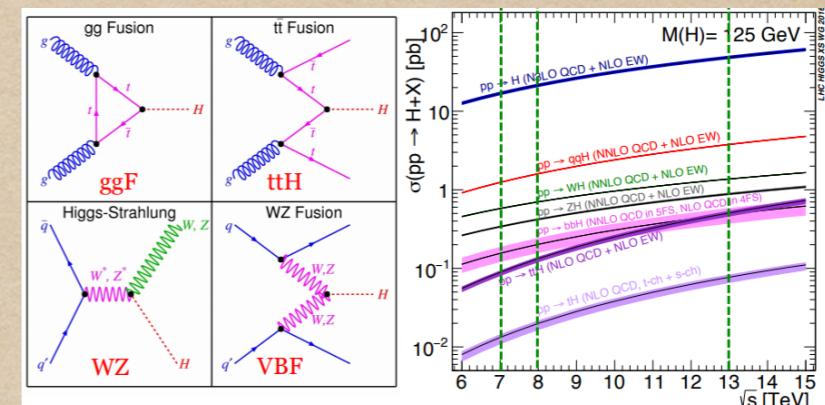

- Higgs boson detected for the first time in 2012 by ATLAS and CMS collaborations at CERN.  
Since that date effort of the community for the study of the properties of this particle Standard Model like?
- Higgs boson produced at LHC in many production channels:

gluon gluon fusion (ggF)

vector boson fusion (VBF),

associated production with a vector boson

associated production with a t-tbar pair

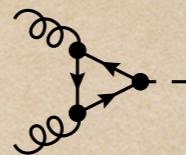

- Although gluon-fusion is a loop-induced process, because the Higgs does not couple directly to gluons, the CS in this channel is one order of magnitude bigger than VBF
- Since gluon-fusion proceeds via a loop of heavy quarks, it is sensible to possible new heavy states running into the loops: portal to NP effects

In the following, focus on ggF

# Higgs Production at the LHC

- LO prediction end of the '70

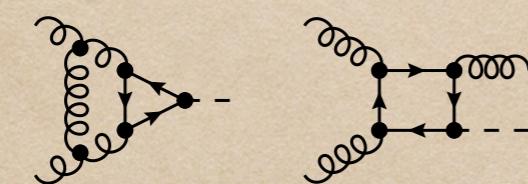

H. M. Georgi, S. L. Glashow, M. E. Machacek, D. V. Nanopoulos, Phys. Rev. Lett. 40 (1978) 642

- NLO QCD corrections in the '90: increase of the CS by 50-70%; scale dependence 30%

S. Dawson, Nucl. Phys. B 359 (1991) 283

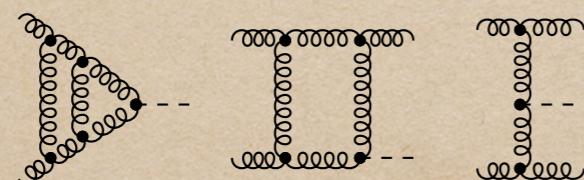

A. Djouadi, M. Spira, P. M. Zerwas, Phys. Lett. B 264 (1991) 440

D. Graudenz, M. Spira, P. M. Zerwas, Phys. Rev. Lett. 70 (1993) 1372

M. Spira, A. Djouadi, D. Graudenz, P. M. Zerwas, Nucl. Phys. B 453 (1995) 17

- NNLO QCD corrections in 2002: further increase of the CS by 15% w.r.t. NLO; reduction of the scales dependence to 15-20%

R. V. Harlander, W. B. Kilgore, Phys. Rev. Lett. 88 (2002) 201801

C. Anastasiou, K. Melnikov, Nucl. Phys. B 646 (2002) 220

V. Ravindran, J. Smith, W. L. Van Neerven, Nucl. Phys. B 665 (2003) 325

- The dynamics of Higgs production is governed by the soft region, where the partonic c.m. energy is near  $m_H$  (validity of infinite top mass limit). Important Soft-gluon resummation: 6% increase of the CS; residual theoretical uncertainty 10%

S. Catani, D. De Florian, M. Grazzini, P. Nason, JHEP 0307 (2003) 028

Florence Theory Group Day, March 19 2025

# Higgs Production at the LHC

- ◆ The state-of-the-art, up to some years ago, was represented by the total  $ggF$  CS known at the NNNLO in QCD! Nice convergence of the pt series: moderate increase of the central value but sizeable reduction in the scale dependence w.r.t. NNLO. At 13 TeV and Higgs mass of 125 GeV

$$\sigma = 48.58 \text{ pb}^{+2.22 \text{ pb (4.56\%)}}_{-3.27 \text{ pb (-6.72\%)}} \pm 1.56 \text{ pb(3.2\%)}$$

It includes mass effects and EW

C. Anastasiou, C. Duhr, F. Dulat, F. Herzog, B. Mistlberger, Phys. Rev. Lett. 114 (2015) 212001

C. Anastasiou, C. Duhr, F. Dulat, E. Furlan, T. Gehrmann, F. Herzog, A. Lazopoulos, B. Mistlberger, JHEP 1615 (2016) 058

B. Mistlberger, JHEP 05 (2018) 028

- ◆ The calculation was done in the  $m_t \rightarrow \infty$  limit
- ◆ Inclusive calculation (integration over the whole phase space) with reverse unitarity
- ◆ More differential observables in the same limit:  
Fiducial CS and Rapidity distribution with  $Q_t$  subtr.

L. Cieri, X. Chen, T. Gehrmann, E. W. N. Glover, A. Huss, JHEP 02 (2019) 096

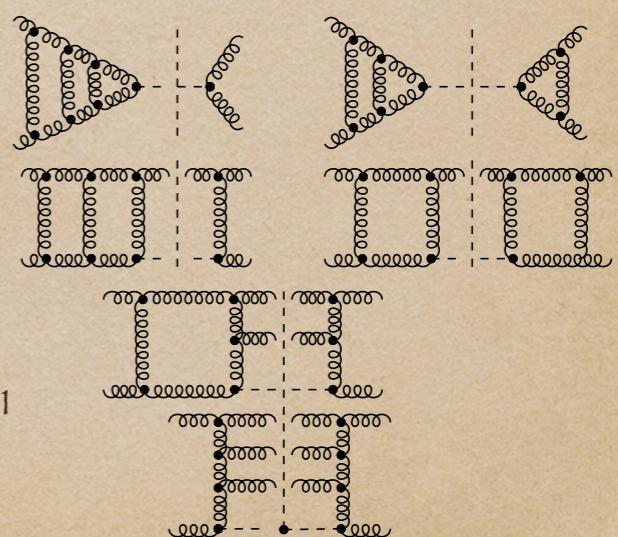

Differential CS + resummation up to NNNLL

G. Billis, B. Dehnadi, M. A. Ebert, J. K. L. Michel, F. J. Tackmann, PRL 127 (2021) 072001

X. Chen, T. Gehrmann, E. W. N. Glover, A. Huss, B. Mistlberger, A. Pelloni, PRL 127 (2021) 072002

C. Anastasiou, K. Melnikov, Nucl. Phys. B646 (2002) 220

# Higgs Production at the LHC

- Due to the extreme accuracy of the NNNLO prediction, it was/is important to look at possible “effects” at the percent level!

In the last 7 years big progress:

$\delta(\text{theory})$	$=$	$+0.13pb$	$(+0.28\%)$	$\delta(\text{scale})$
		$-1.20pb$	$(-2.50\%)$	
	$+$	$\pm 0.56pb$	$(\pm 1.16\%)$	$\delta(\text{PDF-TH})$
	$+$	$\pm 0.49pb$	$(\pm 1.00\%)$	$\delta(\text{EWK})$
	$+$	$\pm 0.41pb$	$(\pm 0.85\%)$	$\delta(t,b,c)$
	$+$	$\pm 0.49pb$	$(\pm 1.00\%)$	$\delta(1/m_t)$
	$=$	$+2.08pb$	$(+4.28\%)$	
		$-3.16pb$	$(-6.5\%)$	
$\delta(\text{PDF})$	$=$	$\pm 0.89pb$	$(\pm 1.85\%)$	,
$\delta(\alpha_s)$	$=$	$+1.25pb$	$(+2.59\%)$	
		$-1.26pb$	$(-2.62\%)$	.

F. Dulat, A. Lazopoulos, B. Mistlberger,  
Comput.Phys.Commun. 233 (2018) 243-260

Uncertainty reduced to 0.26%  
With Mixed QCD-EW at NLO

M. Becchetti, R.B., V. Del Duca, V. Hirschi, F. Moriello,  
A. Schweitzer, Phys. Rev. D 103 (2021) 054037

QCD @ NNLO  
Top + Top-B interf:  
BIG effect ~4% of the CS

M. Czakon, F. Eschment, M. Niggetiedt, R. Poncelet,  
T. Schellenberger, Phys.Rev.Lett. 132 (2024) 21, 211902

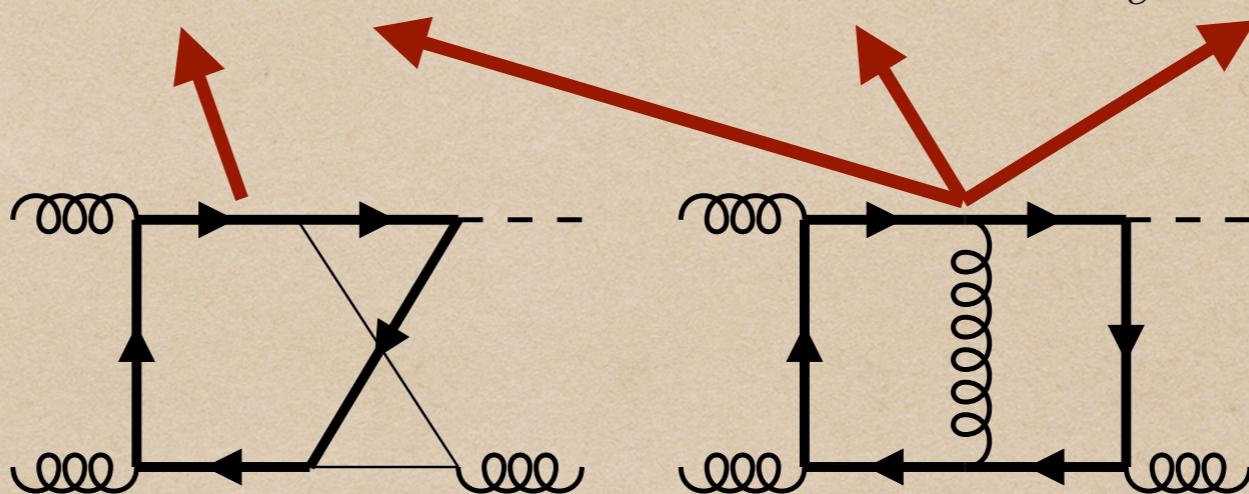

In the last years Four-Loop Splitting Functions,  
First moments and first release of approx NNNLO pdfs

S. Moch, B. Ruijl, T. Ueda, J. Vermaseren, A. Vogt,  
Phys.Lett.B 825 (2022) 136853  
J. McGowan, et al. Eur. Phys. J. C. 83(3) (2023) 185

# Structure of the Amplitude

- Color structure ( $Hggg$ )

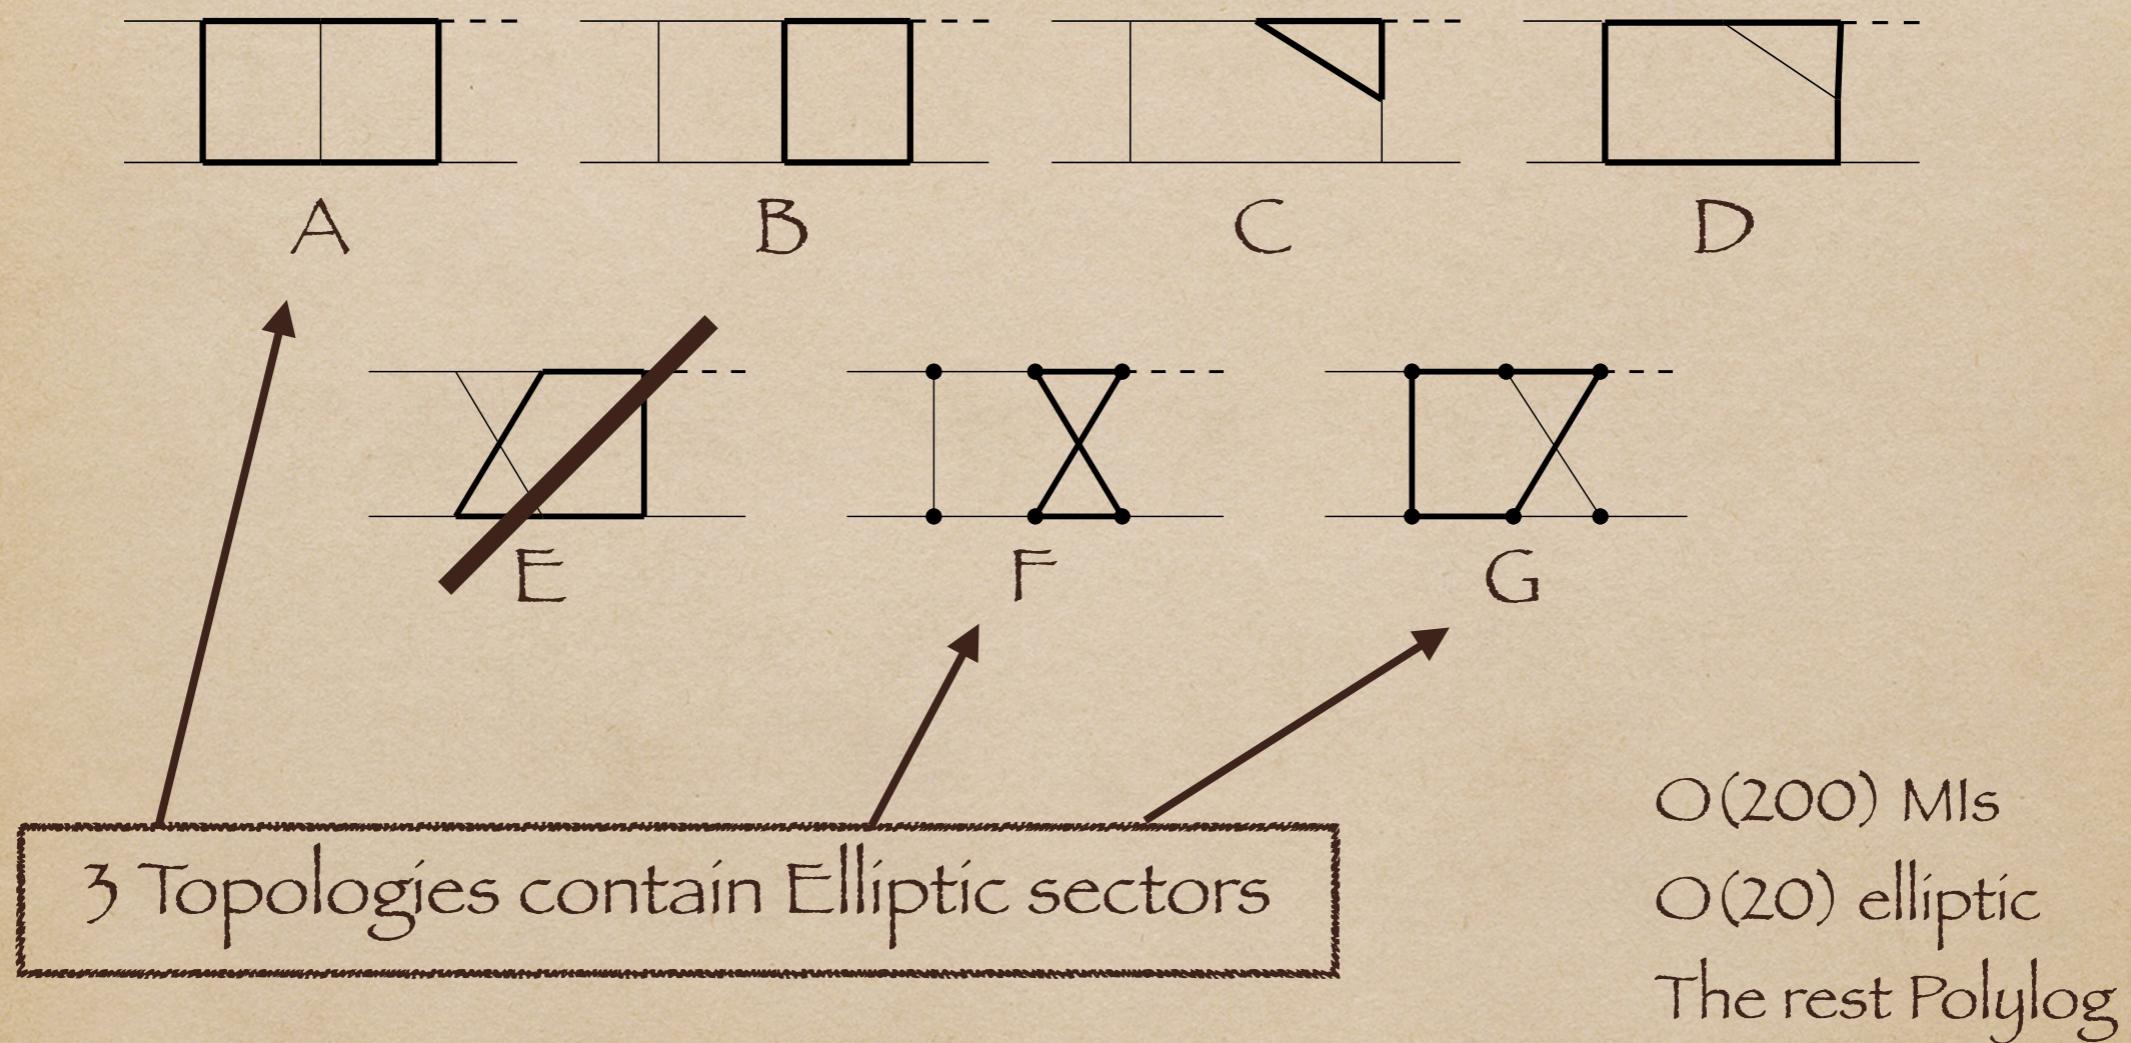

$$A_i^{NLO}(x_1, x_2, x_3) \propto N_c A_{i1}^{NLO}(x_1, x_2, x_3) + A_{i2}^{NLO}(x_1, x_2, x_3) + \frac{1}{N_c} A_{i3}^{NLO}(x_1, x_2, x_3)$$

The planar diagrams contribute to the 3 FF while the crossed only to the leading color

# Topologies and Master Integrals

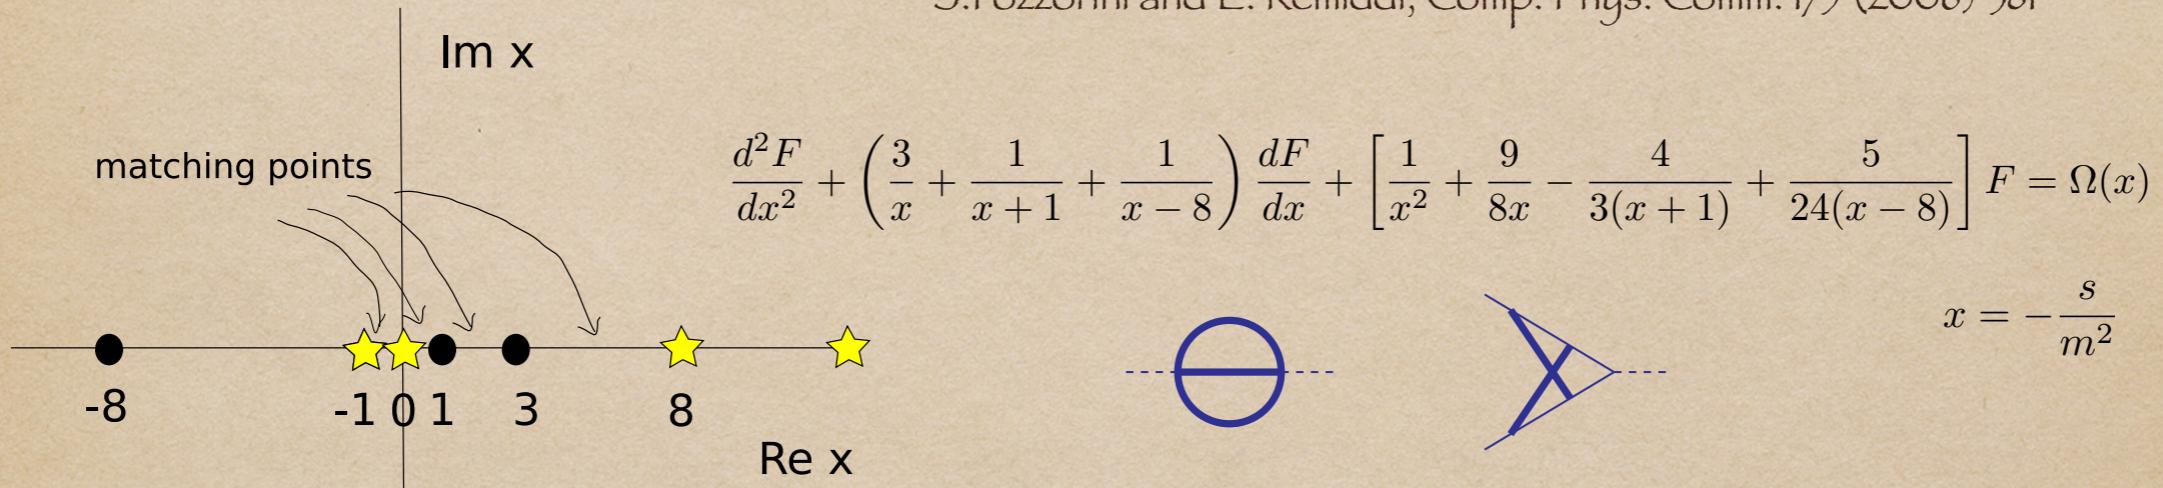

- The MIs belong to SIX 7-denominator topologies

# Differential Equations: Semi-analytic evaluation

In some cases it is difficult to find closed-form solutions for the differential equations  
 What can be done is a solution of the relative differential equation in series expansion

S.Pozzorini and E. Remiddi, Comp. Phys. Comm. 175 (2006) 381

- ◆ The differential equation and the solution are expanded in series around the singular points  
 Every series depends on two arbitrary constants. Imposing the matching we express all of them in terms of the two constants
- ◆ Imposing initial conditions we fix the two constants. One can construct a numerical routine that evaluates  $F(x)$  for every value of  $x$  with arbitrary precision !!
- ◆ The convergence can be improved adding series expansions in intermediate regular points

# Example: elliptic vertex for ttbar production

$$\begin{cases} \frac{dM_9}{dx} = -\frac{2}{x}M_9 + \frac{4m^2}{x}M_{10} \\ \frac{dM_{10}}{dx} = -\frac{1}{16m^2} \left( \frac{1}{x} - \frac{1}{x-16} \right) M_9 - \left( \frac{1}{x} + \frac{1}{x-16} \right) M_{10} + \Omega_s(x) \end{cases} \quad x = -\frac{s}{m^2}$$

$$\frac{d^2M_9}{dx^2} + \left( \frac{4}{x} + \frac{1}{x-16} \right) \frac{dM_9}{dx} + \left( \frac{9}{4x^2} - \frac{7}{64x} + \frac{7}{64(x-16)} \right) M_9 = \Omega(x)$$

Solution in  $x = 0$

$$M_9^{(0)} = x^\alpha \sum_{n=0}^{\infty} a_n x^n \quad \left( \alpha + \frac{3}{2} \right)^2 = 0$$

♦ Homogeneous solutions  $M_9^{(0)}(x) = \frac{1}{\sqrt{x}} \sum_{n=-1}^{\infty} a_n x^n + \frac{\log x}{\sqrt{x}} \sum_{n=-1}^{\infty} b_n x^n \quad a_0 = \frac{1}{64} a_{-1} + \frac{1}{32} b_{-1}, \quad b_0 = \frac{1}{64} b_{-1}$

two independent solutions with  $\begin{cases} a_{-1} = 1, b_{-1} = 0 \\ a_{-1} = 0, b_{-1} = 1 \end{cases}$

♦ Particular solutions  $\Omega(x) = \sum_{n=-2}^{\infty} k_n x^n + \log x \sum_{n=-2}^{\infty} r_n x^n \quad \tilde{M}_9(x) = \sum_{n=-1}^{\infty} p_n x^n + \log x \sum_{n=-1}^{\infty} q_n x^n$

♦ Matching with initial condition in  $x = 0$  (only log)  $M_9(x) = \sum_{n=0}^{\infty} p_n x^n + \log x \sum_{n=0}^{\infty} q_n x^n$

♦ The same in  $x = 16$  + matching with the series in  $x = 0 \dots$  and so on

♦ Analytic continuation

# Differential Equations: Semi-analytic evaluation

**SeaSyde** (Series Expansion Approach for Systems of Differential Equations)

- ◆ However DiffExp is designed for real masses. EW radiative corrections involve unstable particles Z, W, H, ... : **Complex Masses**
  - ◆ We developed an independent package, **SeaSyde**, to deal with series expansions solutions in the complex plane
- $$z = -\frac{s}{m_V^2} \quad q = -\frac{t}{m_V^2} \quad m_V^2 = M_V^2 - iM_V\Gamma_V$$
- ◆ Now we have cuts in the complex plane: we choose them to be parallel to the real axis, from the branching point to  $-\infty$
  - ◆ The path to avoid the cut proceeds via segments parallel to the real and to the imaginary axis in every complex variable, z and q
  - ◆ We solve the equation in z, at fixed q (cuts in the complex z-plane) then the eq. in q at fixed z

# Differential Equations: Semi-analytic evaluation

- ◆ The Strategy is to use semi-analytic evaluations to build a grid of points
- ◆ The simplest approach is “the snake”,  
that can be used on a single core/single  
kernel computer: every point becomes the  
Initial condition for the following one
- ◆ Difficult parallelization: Mathematica kernels (and sub-kernels)  
Use of the sub-kernels: calculation of a line of points (high accuracy)  
And then each sub-kernel evolves a straight line in the other dimension
- ◆ Consider order of minutes for the evaluation of a single point:  
from 1 min to several, depending on the system and on the point ...  
Need of many licences ... break away from Mathematica ??
- ◆ Recently a C++ implementation: LINE, Prisco-Ronca-Tramontano 2501.01943
