

K to pi semileptonic form factor on the lattice with 2+1 flavor Domain Wall Fermions

Monday, 21 May 2007 15:50 (20 minutes)

We present the latest results from UKQCD/RBC collaborations for the K_{l3} form factor with 2+1 flavours of dynamical domain wall quarks. Simulations are performed on $16^3 \times 32 \times 16$ and $24^3 \times 64 \times 16$ lattices with three values of the light quark mass, allowing for an extrapolation to the chiral limit
