

Towards nanoscale parallelism in VACNTs

From scratch

Luca Cecchini

Ptolemy Italia Meeting

February 19th, 2025

- **Vertically Aligned Carbon Nanotubes (VACNTs)**
- **Why and How to reach parallelism @ nanoscale**
- **1° solution: Plasma Enhanced CVD**
- **2° solution: Optimization of nucleation sites**
- **Further optimizations & conclusions**

Vertically Aligned Carbon Nanotubes

- ❖ Aligned parallelly at microscale, local waviness at nanoscale.

- Increase electron transmittance: towards channeling.
- Increase directional sensitivity of anisotropic detector

Nonlithographic synthesis of VACNTs

Substrate selection

Catalyst deposition

CVD Synthesis
(C_2H_2 , ...)

Dewetting

H_2 reduction

Heat up ($720^\circ C$, ...)

1st solution: PECVD

Substrate selection

Diffusion barrier
(Si Native Oxide, ...)

Mechanical support
(Silicon, ...)

Catalyst deposition

E-beam
evaporation
(Fe, ...)

Dewetting

H₂ reduction

Heat up (720°C, ...)

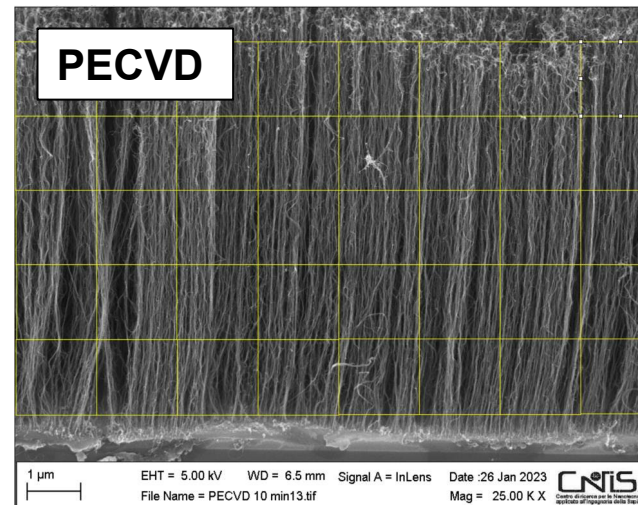

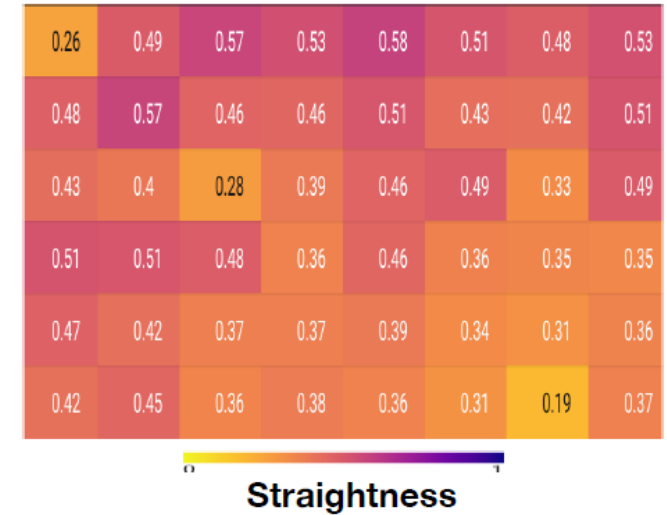

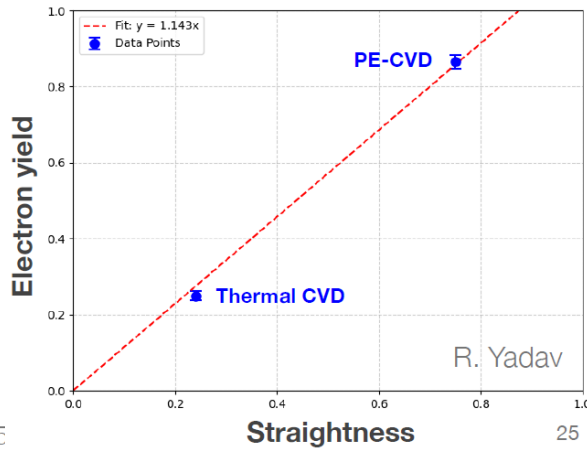

CVD Synthesis
(C₂H₂, ...)

1st solution: PECVD

- ❖ RF Acetylene Plasma
- ❖ Quantitative analysis on morphology: straightness defined from image gradient
- ❖ Confirmed qualitatively also by photoemission

R. Yadav et al., *Evaluation of vertical alignment in carbon nanotubes: A quantitative approach*, 2024, <https://doi.org/10.1016/j.nima.2024.169081>.

2nd solution: Nucleation sites

Substrate selection

Diffusion barrier
(Si Native Oxide, ...)

Mechanical support
(Silicon, ...)

CVD Synthesis
(C_2H_2 , ...)

Catalyst deposition

E-beam
evaporation
(Fe, ...)

Dewetting

H_2 reduction

Heat up (720°C, ...)

2nd solution: Nucleation sites

- ❖ More dense nanotubes means higher Van der Waals interactions: straighter!

New e-beam evaporator @Titan Lab

- Calibrated Fe deposition
- UHV: 10^{-9} mbar

- ❖ Optimize parameters to get density of FeNPs $> 10^{12}$ cm⁻²

2nd solution: An example

Fe Thickness (nm)	$\delta_{\text{FeNP}} \times 10^{10} \text{ cm}^{-2}$	Surface Coverage
1	0.21	1.2 %
2	1.98	21.9 %
3	3.38	44.1 %
4	1.54	38.7 %

Conclusions & Further optimization

- PECVD most suitable synthesis technique
- Increase density FeNPs (10^{12} cm⁻² or more!) using commissioned E-beam evaporator
- Quantitative characterization of alignment (morphology, photoemission, ...)
- Deposition of different diffusion layer (Al₂O₃,...)
- Use different substrate (Cu,...)
- H₂ plasma with FeNPs

**Thanks for the attention.
Any question?**

Ptolemy Italia Meeting

February 19th, 2025

TitanLab: from Si to VACNTs

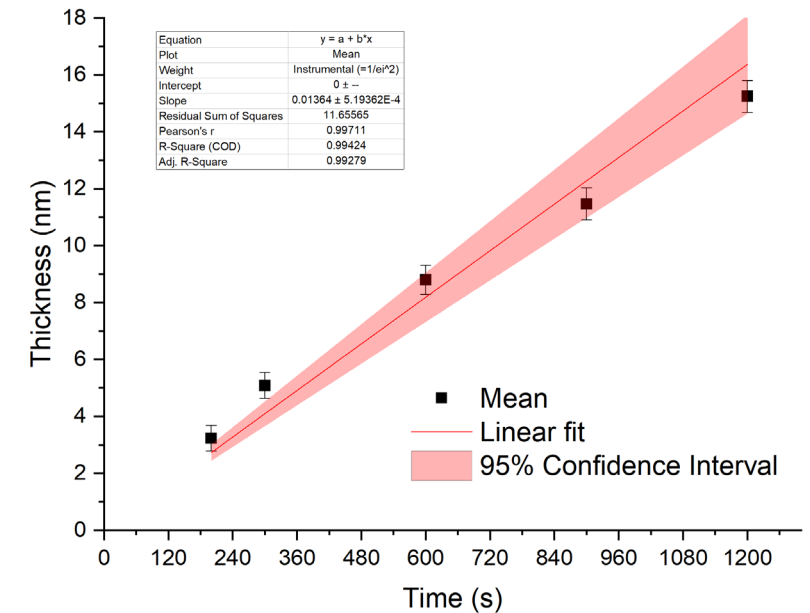

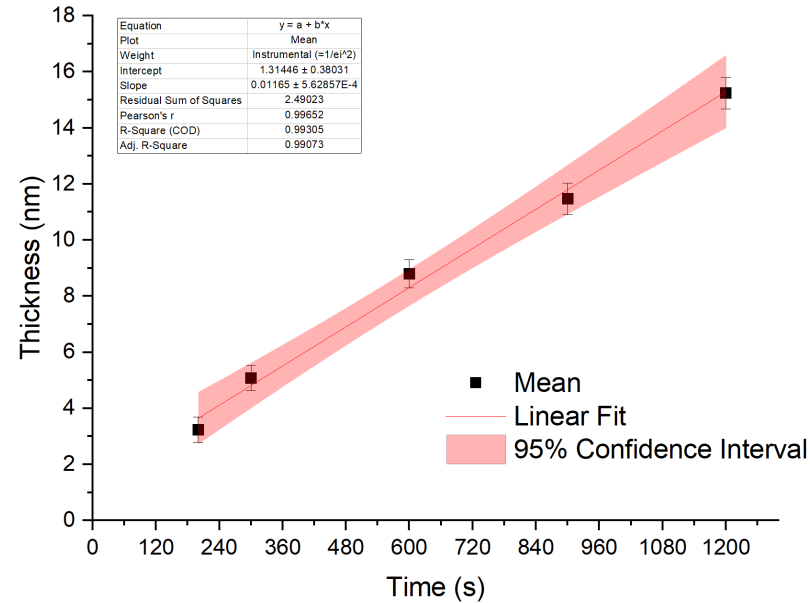

TITAN LAB

TECHNOLOGY INNOVATION THROUGH
ADVANCED NANOSTRUCTURES

Fe calibration

Quartz Microbalance

$$\phi(z_1) = \phi(z_2) \left(\frac{z_2}{z_1} \right)^2$$

$$= 0.05 \pm 0.01 \frac{\text{\AA}}{\text{s}} \left(\frac{133}{83} \right)^2 = 0.15 \pm 0.03 \frac{\text{\AA}}{\text{s}}$$

1st solution: PECVD

- ❖ UV Photoemission, shooting UV photons on nanotubes on nanotubes
- $E_{\gamma} = 5 \text{ eV} > \Phi_{\text{CNT}} = 4.7 \text{ eV}$
- ❖ More electrons are extracted from straighter tubes

Photoemission apparatus Hyperion-II @ TitanLab

2nd solution: Nucleation sites

❖ Study morphology of FeNPs, reaching dense nanoparticles with diameter < 20nm.

E-beam Evaporator

Chemical Vapor Deposition
