Feb 6 2025

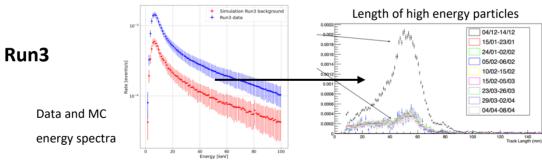

# WHERE WERE WE

Data Analysis on Run4 data ( copper and water shielding) was begun.

Highlighed stability of data taking (>90% duty cycle)

• Data-MC comparison hinted internal contamination (Radon?)

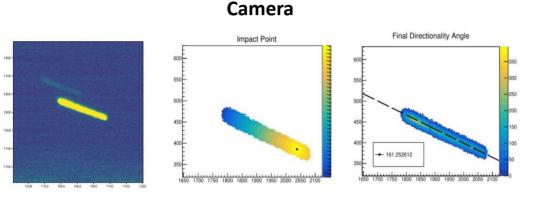

• This half year we focused a lot on development of software and tools to more efficiently and better analyse data

Reconstruction 3D association Digitisation (simulation) Directionality Physics fit

#### **3D RECO**

- To develop the 3D reconstruction algoritm we started simple long, st
  - long, straight, not-so-rare tracks: alphas

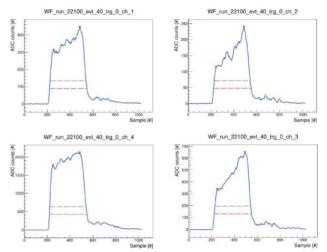

• 2 detector type:

From X-Y pixel distribution and intensity we can obtain:

- bidimensional angle of direction ( $\Phi$ )
- sense of direction in 2D
- Projected length in 2D

PMT

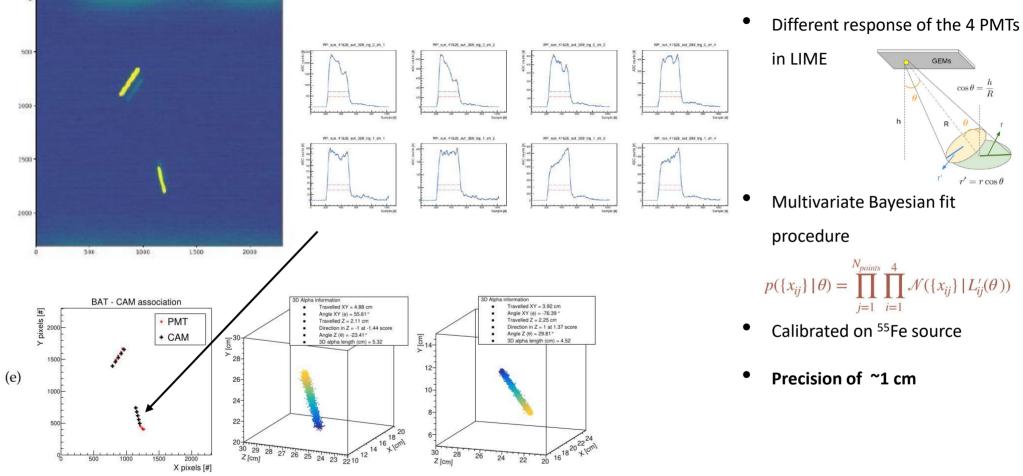

From relative intensity of PMT signals, Time over

threshold and waveform shape we can obtain:

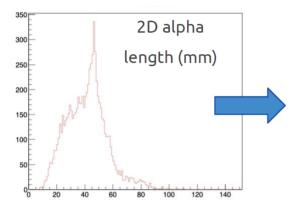

- sense of direction in Z
- Projected length in Z

# **3D RECO II**

## **RUN4: HIGH ENERGY**

- Normalisation of spectra based on time duration of runs
- Different periods of data of Run4 taken into consideration
- Data normalised in light intensity: 10<sup>4</sup> about 5.9 keV (non-linear response in z not considered yet)

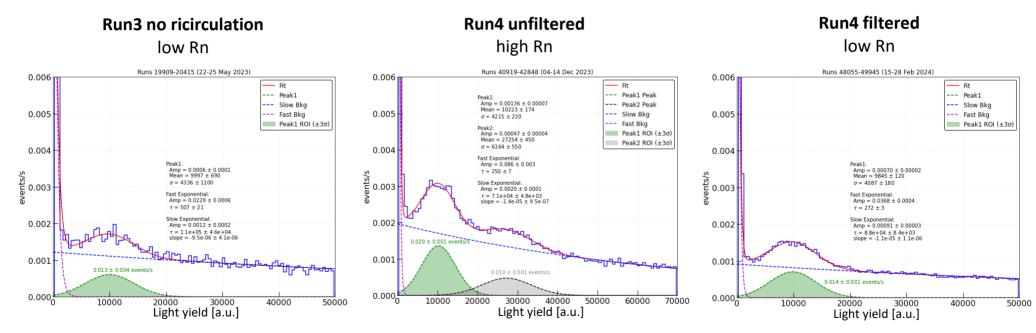

Energy range of alphas

## **RUN4: LOW ENERGY**

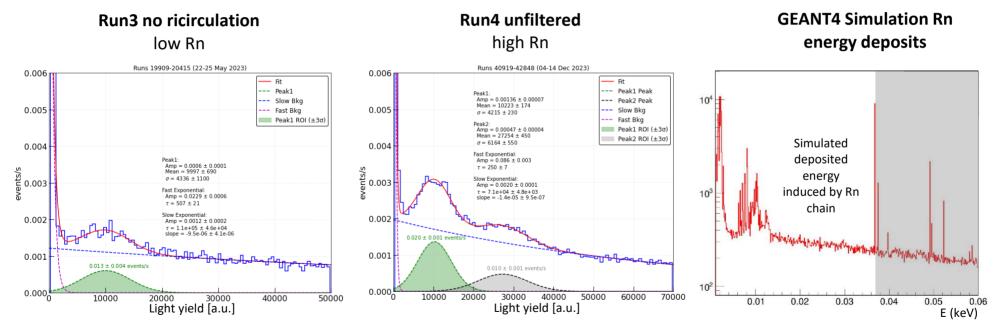

WP2.1

- Different periods of data of Run4 taken into consideration
- Data normalised in light intensity: 10000 about 5.9 keV (non-linear response in z not considered yet)
- How is the low energy range behaving?

# **RUN4: LOW ENERGY**

- Different periods of data of Run4 taken into consideration
- Data normalised in light intensity: 10000 about 5.9 keV (non-linear response in z not considered yet)
- How is the low energy range behaving?

MC comparison will give further insight

We are studying the impact of Rn chain on low energy region

Simulation code improved to speed up MC comparison: Now 10 times faster and more efficient

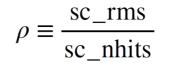

#### G.Dho

#### WP2.1 and 2.2

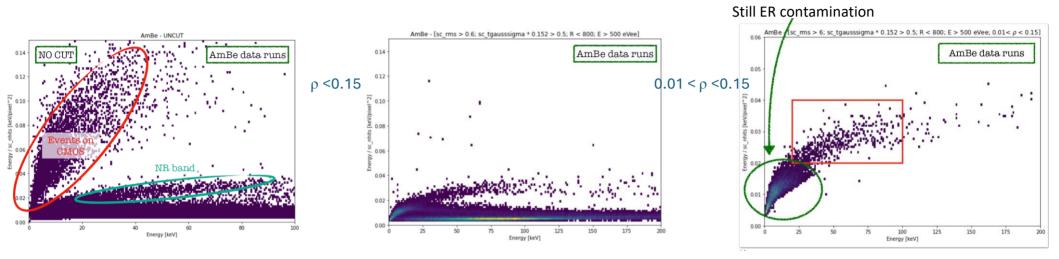

#### **RUN4: NEW VARIABLES**

New reconstructed variables exploiting pixel distribution and intensity

Number of pixel above threshold

RMS of distribution of pixel intensity

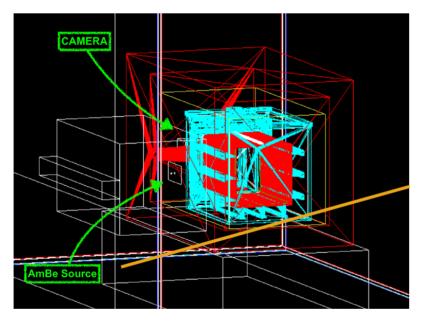

- This variable appears to be a good method to remove ER
- It will be included in ER/NR rejection studies
   Recent interest received from a Trieste group expert on

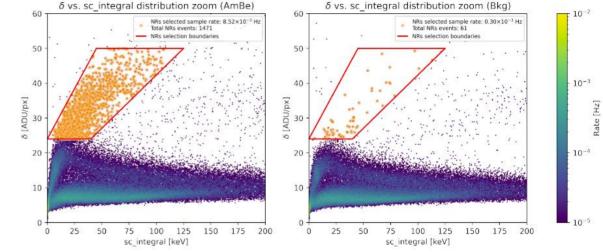

machine learning (prof. Trotta)

G.Dho

## WP2.1 and 2.2 NUCLEAR RECOIL ANGULAR RESOLUTION

- AmBe neutron source was exploited to induce large amount of NR in LIME detector
- This data set is a key test bench for NR angular resolution measurements, ER/NR discrimination

 From the camera point of view, the neutrons emitted horizontally are aligned so that their angle is 0° Machine learning work on ER/NR discrimination will help improve selection and select in lower energy range

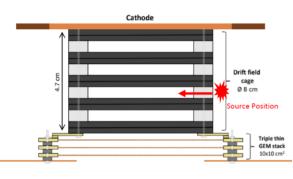

# **NUCLEAR RECOIL ANGULAR RESOLUTION III**

- PRELIMINARY Direction estimated by simple principal 1190 component decomposition 1180 100 ă 1170 · 2<sup>nd</sup> order polynomial fit 1160 1150 -1-2 MeV recoil 1140 905 910 50 F With AmBe Kinematic simulation of the recoil distribution is 40 **30** convoluted with gaussian angular resolution and 20 F No AmBe = Bkg tested with data 10 -100-50 50 100 Data suggests 45° 2D angular angle w.r.t. horizontal axis Background is flat resolution above 100 keV<sub>ee</sub> at Source peaked at 0 deg atmospheric pressure
  - Convolution with source distribution to be removed
- 3D reconstruction can help improving the direction and the determination of the energy (by length)
- New simulation will improve the MC comparison

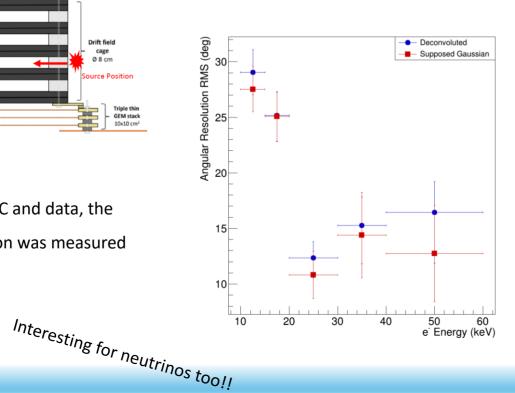

#### **DIRECTIONAL RECONSTRUCTION**

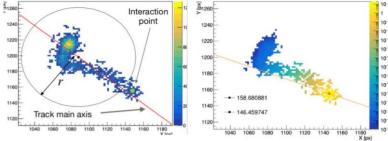

- Code for directional reconstruction was developed in the past
- Recently the code was improved and applied to real data taken with a prototype
- Beta<sup>-</sup> emitter <sup>90</sup>Sr source

G.Dho

Confronting MC and data, the angular resolution was measured

- Excellent result on data for ER angular resolution
- HT 100% at all energies

• Can be adapted to NR and applied to AmBe data

Paper in published in the context of the PRIN project

# SENSITIVITY LIME

 Strong effort to put into a single code the calculation of the spectra of expected DM signal and the Bayesian fit procedure to estimate Credible interval limit (BAT toolkit used)

$$p(\vec{\mu}, \vec{\theta} | \vec{x}, H) = \frac{p(\vec{x} | \vec{\mu}, \vec{\theta}, H) \pi(\vec{\mu}, \vec{\theta} | H)}{\int_{\Omega} \int_{D} p(\vec{x} | \vec{\mu}, \vec{\theta}, H) \pi(\vec{\mu}, \vec{\theta} | H) d\vec{\mu} d\vec{\theta}}$$
$$\mathcal{L}(\vec{x} | \mu_s, \mu_b, H_1) = (\mu_b + \mu_s)^{N_{evt}} e^{-(\mu_b + \mu_s)} \prod_{i=1}^{N_{bins}} \left[ \left( \frac{\mu_b}{\mu_b + \mu_s} P_{i,b} + \frac{\mu_s}{\mu_b + \mu_s} P_{i,s} \right)^{n_i} \frac{1}{n_i!} \right]$$

Detector effects can be included

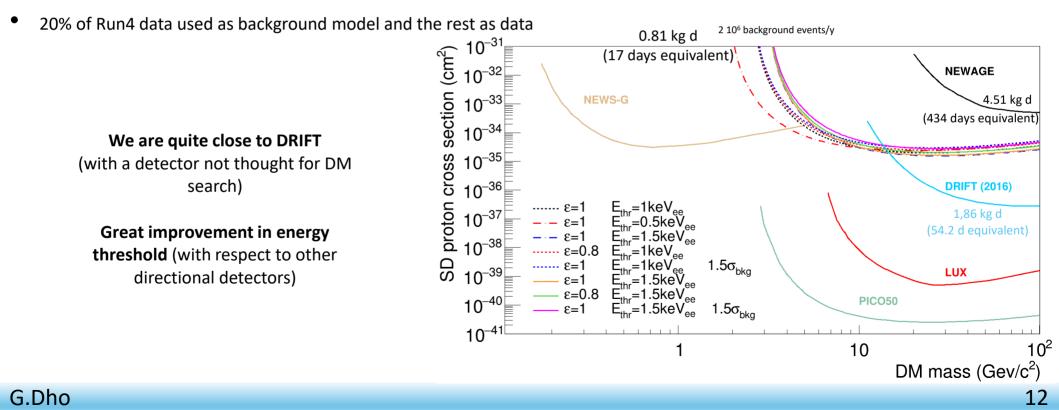

b (deg) 60 0.9 0.8 SI coupling Angular and 0.7 energy 0.6 0.5 distribution of a - C 0.4 signal and 0.3 Mixture composition background 0.2 -60 0.1 0<u>⊢</u> 10<sup>−</sup> 150 -150-10050 l (dea)

- LIME is not able to provide limits yet: unknown contamination -> no background model (LIME was not meant for this!!)
- However, we can use it to estimate where the exposure of the detector can lead us
- As a first test no measurable variables were included in the study:
   As if LIME was a simple counting experiment
   Large background
   Counting experiment:
   Worst possible scenario

# SENSITIVITY LIME II

PRELIMINARY

- Simple cuts on geometry to exclude borders (33 L active volume)
- Loose cut on rho variable to remove many ER (Machine learning technique will strongly improve this)
- Different thresholds and NR efficiency analysed

#### WP2.2

## **ANALYSIS CODE AND DATA REDUCTION**

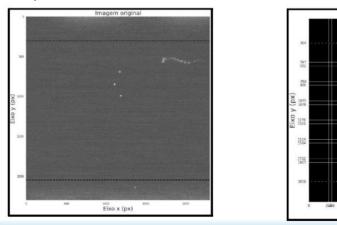

- CYGNO-04 will use ORCA QUEST camera as sCMOS detector (different shape, noise, performance) and new lens
- Analysis and simulation code integrated the new camera and lens interface
- Example of data clusterised with same reconstruction parameters

 Machine learning technique (and not) study to be applied at frontend level to reduce the raw data output for CYGNO-04 (we will use 6 cameras!)

Predicão CNN

Eixo x (px)

Efficiency at low energy under study (already outperforming current reconstruction algorithm)

#### CONCLUSIONS

- During these months a lot of effort was spent in improvement of software in order to carry out more complex analysis
- 3D reconstruction algorithm is currently working for long NR tracks with extremely interesting results
- AmBe campaigns are paramount to determine operative parameters of the CYGNO detector and will soon exploit the software improvements
- A conservative angular resolution of 45 deg on NR above 100 keV<sub>ee</sub> was found
- An angular resolution on electrons was measured of 30 deg at 10 keV and below 20 deg above 20 keV
- Extremely conservative estimation of exposure of LIME puts it within range of DRIFT results
- Work on analysis tools and data reduction for CYGNO-04 has already started

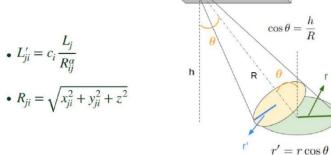

# BACKUP I: 3D RECO II

One can retrieve from PMT signals x,y

coordinate and L (light yield at GEM)

- Merging the two detector allows 3D reconstruction
- LIME has 4 PMTs whose distance from the event changes their intensity
- Important to match the signals of the detectors: multivariate Bayesian fit

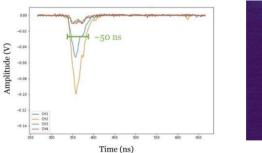

$$p(\{x_{ij}\} | \theta) = \prod_{j=1}^{N_{points}} \prod_{i=1}^{4} \mathcal{N}(\{x_{ij}\} | L'_{ij}(\theta))$$

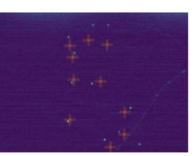

2. Applied to alpha signal

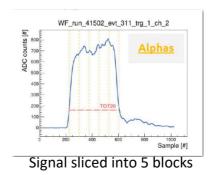

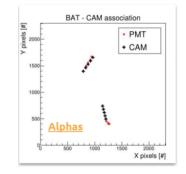

Resolution of about 1 cm

Accuracy within 2 cm

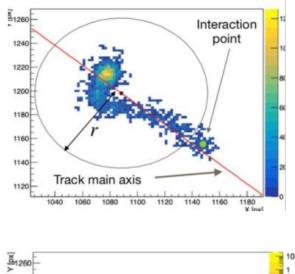

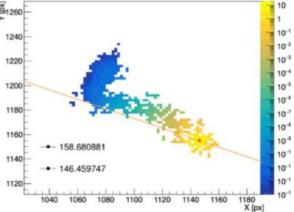

GEMs

Enough for association purposes

## **BACKUP II: DIRECTIONALITY**

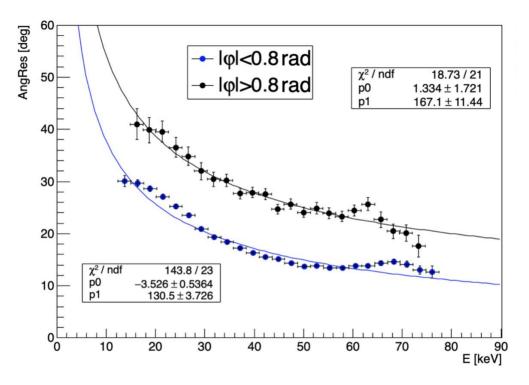

- Track reconstructed by analysis code
- Noise and below threshold pixel pruned
- Principal axis component and barycenter calculated
- Radius r opened around the barycenter and new barycenter calculated on the pixels outside the radius in the region with low skewness
- After finding the Impact Point (IP), the track is weighted in intensity as a function of the distance from IP
- Linear fit of the weighted points

### **BACKUP III: ANGULAR RESOLUTION SIMULATION**

• Directionality algorithm was applied in the past to simulation of ER, yielding:

In the data tracks were mostly parallel to the GEM -> like blue points

Measurement has finer granularity than simulation and results in **better results** than simulation

#### WP2.1 and 2.2

# BACKUP IV: SENSITIVITY LIME

- The limit estimation and fit procedure of the data is a key element for dark matter physics
- Strong effort to put into a single code the calculation of the spectra of expected DM signal and the Bayesian fit procedure to estimate limit (BAT toolkit used)
- Limit evaluation based on Credible Interval calculated by exploiting Bayesian technique.

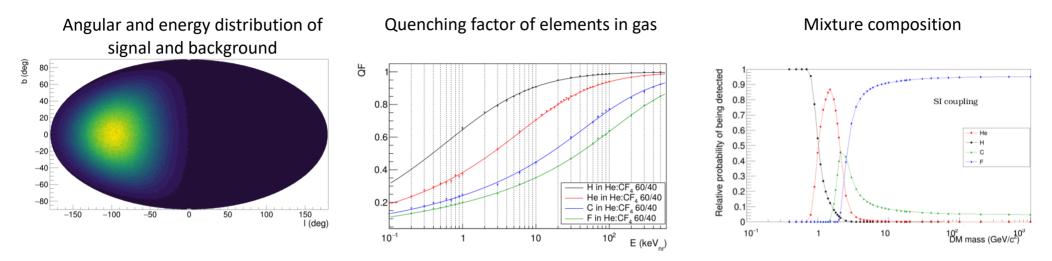

$$p(\vec{\mu}, \vec{\theta} | \vec{x}, H) = \frac{p(\vec{x} | \vec{\mu}, \vec{\theta}, H) \pi(\vec{\mu}, \vec{\theta} | H)}{\int_{\Omega} \int_{D} p(\vec{x} | \vec{\mu}, \vec{\theta}, H) \pi(\vec{\mu}, \vec{\theta} | H) d\vec{\mu} d\vec{\theta}} \qquad \mu_1(90\% CI) : \int_{0}^{\mu_1(90\% CI)} p(\mu_1 | \vec{x}, H) d\mu_1 = 0.9$$

In general based on a Likelihood profiled on measurable variables as direction and energy

$$\mathcal{L}(\vec{x}|\mu_s,\mu_b,H_1) = (\mu_b + \mu_s)^{N_{evt}} e^{-(\mu_b + \mu_s)} \prod_{i=1}^{N_{bins}} \left[ \left( \frac{\mu_b}{\mu_b + \mu_s} P_{i,b} + \frac{\mu_s}{\mu_b + \mu_s} P_{i,s} \right)^{n_i} \frac{1}{n_i!} \right]$$

# SENSITIVITY LIME II

• Detector effects which can be included are

- LIME is not able to provide limits yet: unknown contamination -> no background model (LIME was not meant for this!!)
- However, we can use it to estimate where the exposure of the detector can lead us
- As a first test no measurable variables were included in the study:

   As if LIME was a simple counting experiment
   Large background
   Counting experiment:
   Worst possible scenario
