

# Analysis Test Beam

---

Giovanni Gaudino – FCC Napoli – 2025, 7<sup>th</sup> February

# An example of fit

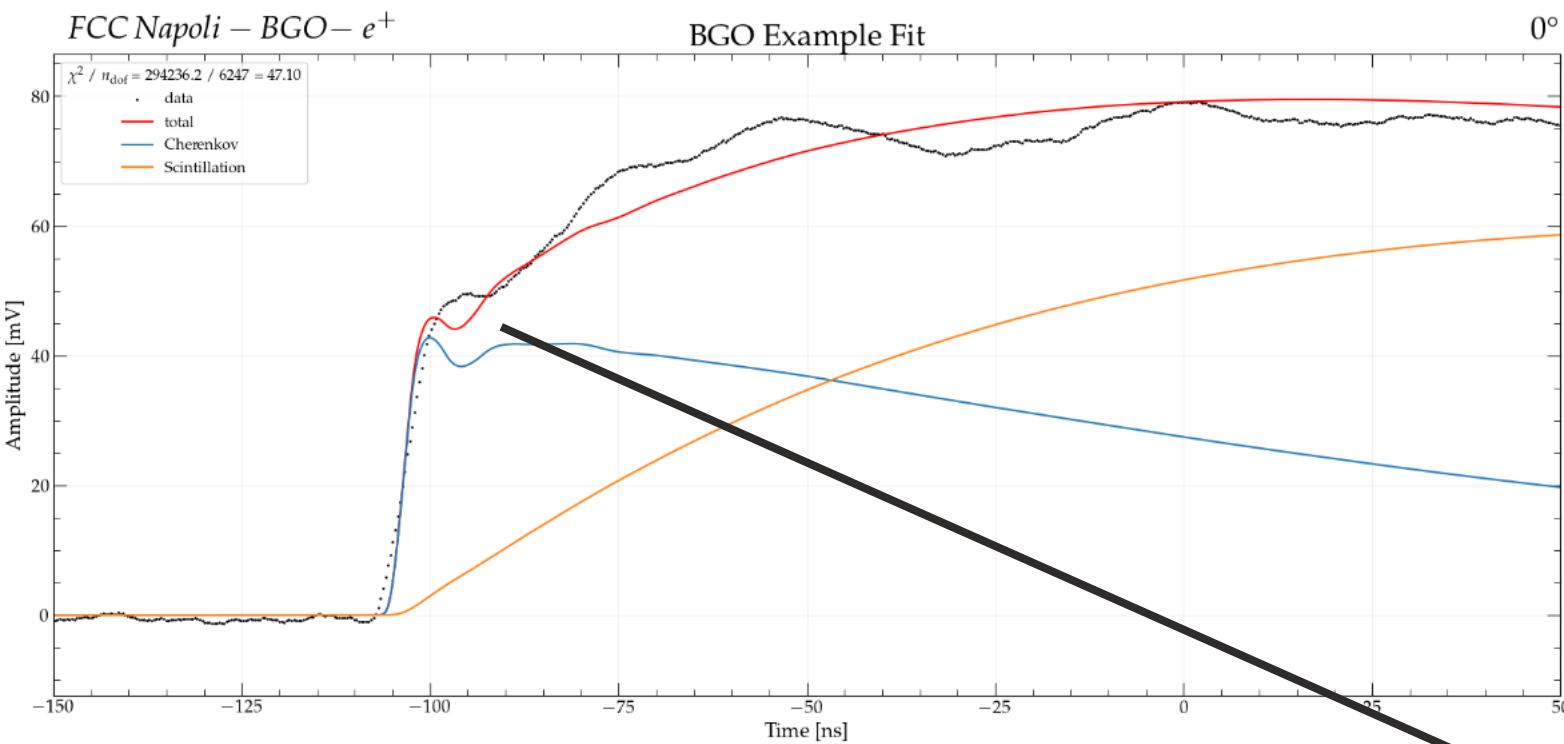

- Čerenkov signal: it is prompt, so same shape as SPR;
- Scintillation signal: from the convolution of SPR with the characteristic crystal time distribution;

## Floating parameters:

- normalizations  $\rightarrow$  C and S yields
- Trigger time
- Offset fixed at 0

- The templates follow the decay time of the waveform very well, also for negative values
- We can estimate the Čerenkov yield wrt the scintillation yield

# Un poco di zoom

- The templates follow the decay time of the waveform very well, also for negative values
- We can estimate the Čerenkov yield wrt the scintillation yield

- Čerenkov signal: it is prompt, so same shape as SPR;
- Scintillation signal: from the convolution of SPR with the characteristic crystal time distribution;

## Floating parameters:

- normalizations  $\rightarrow$  C and S yields
- Trigger time
- Offset fixed at 0

## Possible improvement

Let float the Čerenkov rising time

# Angle Scan – $c/s$ – Channel 2

Repeating the fit for all the runs with BGO we obtain the expected shape

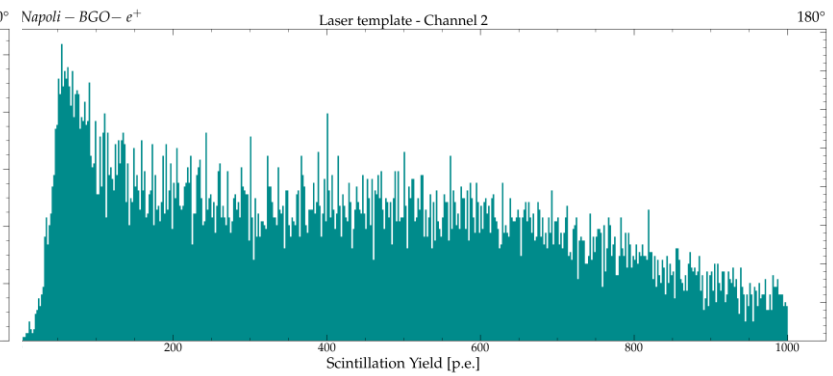

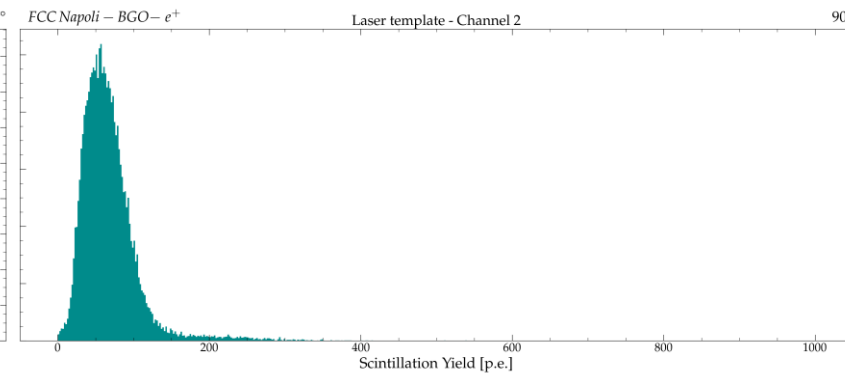

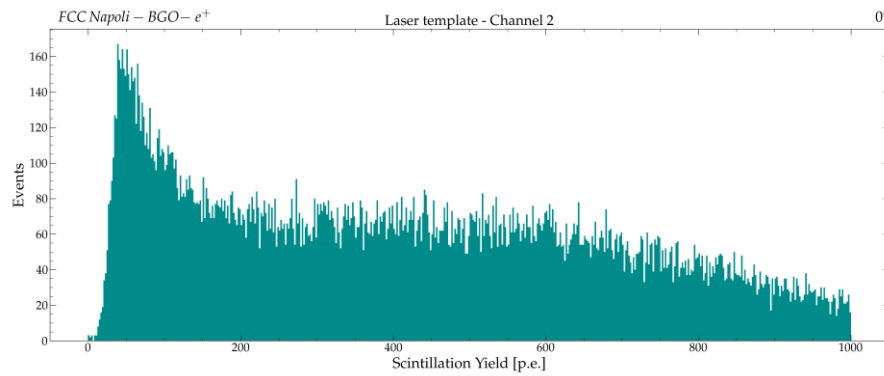

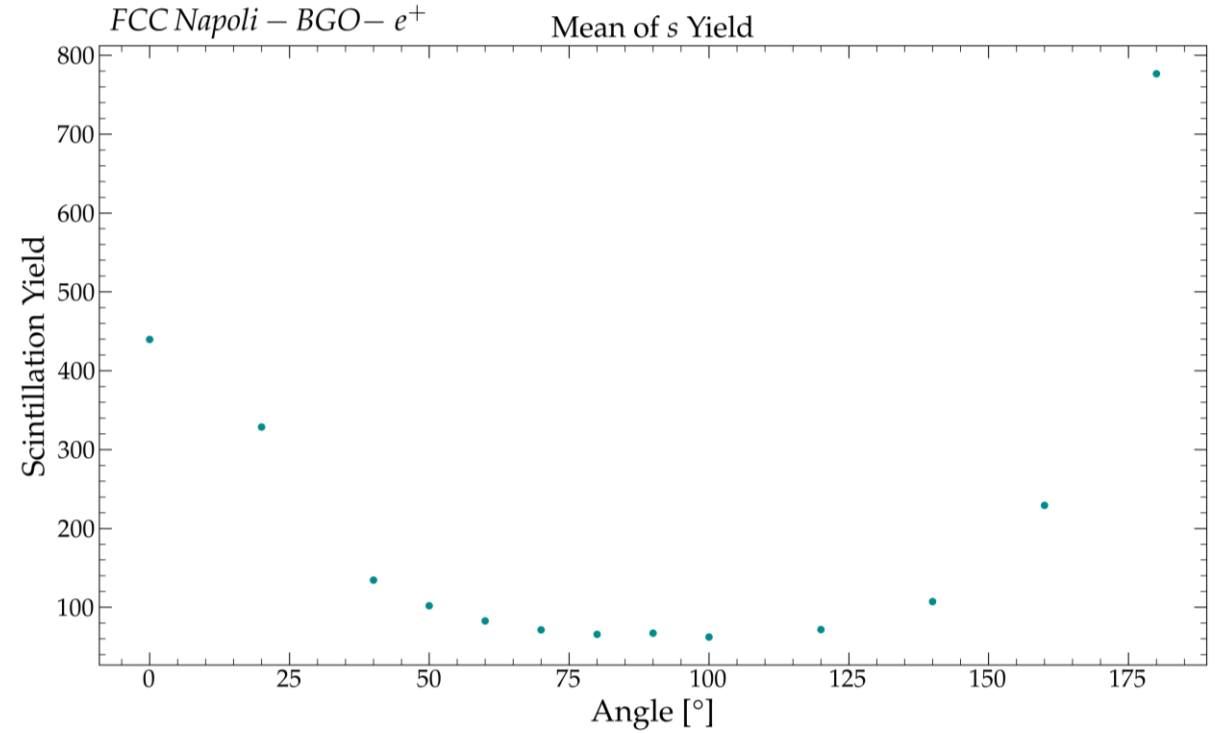

We improved the framework and put all the scripts in a github repo:

[FCCNA/fcc-testbeam\\_analysis](#)

Lucrezia is working on BSO

# Angle Scan – $s$ Yield – Channel 2

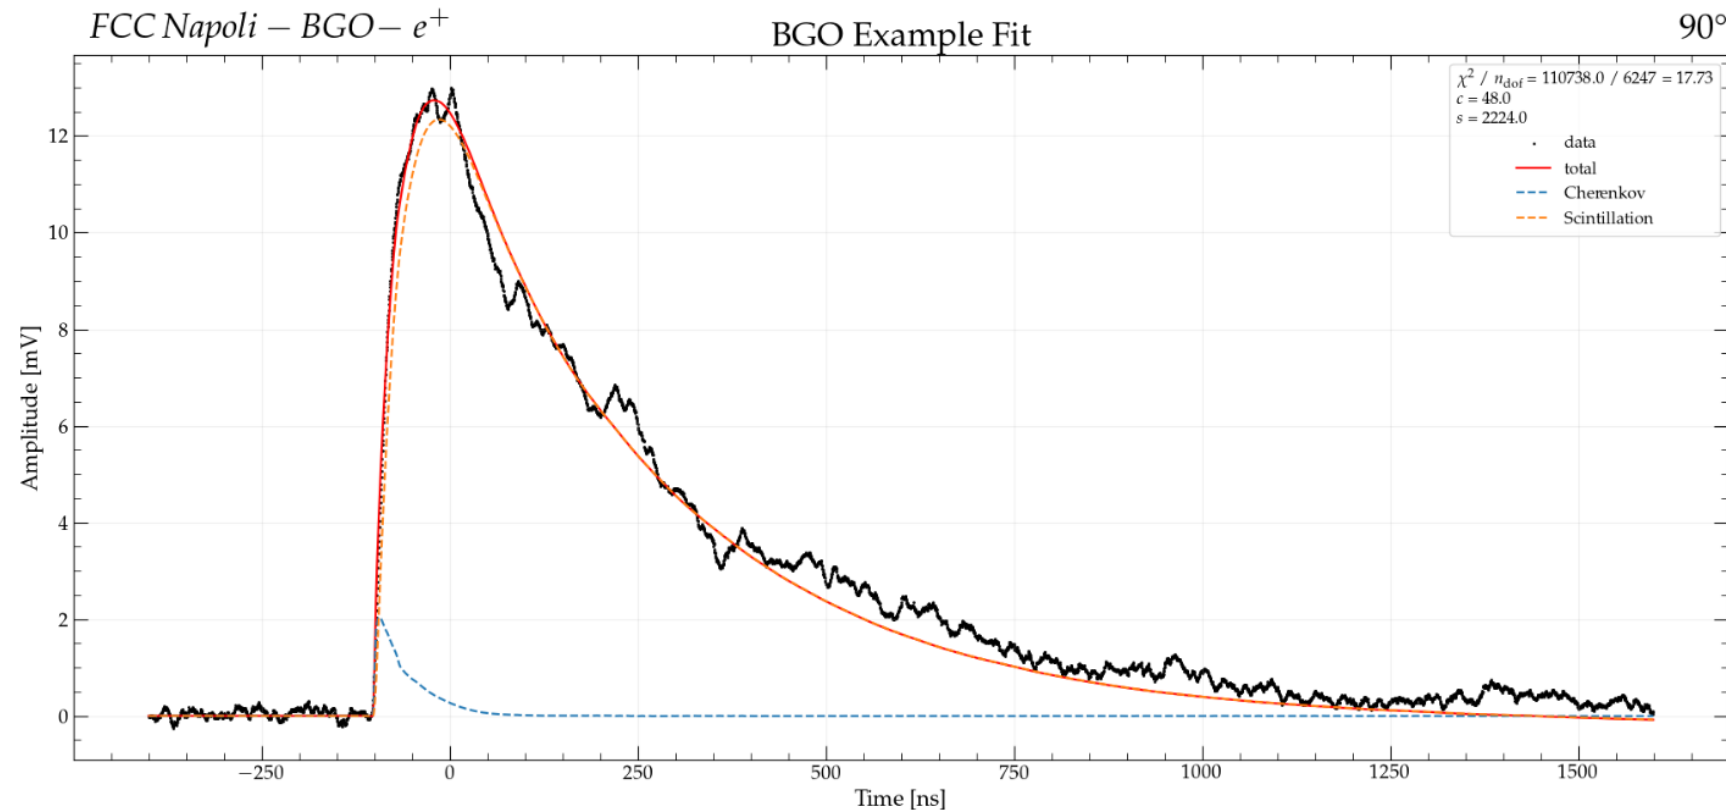

# Angle Scan - $c$ Yield - Channel 2

7<sup>th</sup> February, 2025

Giovanni Gaudino

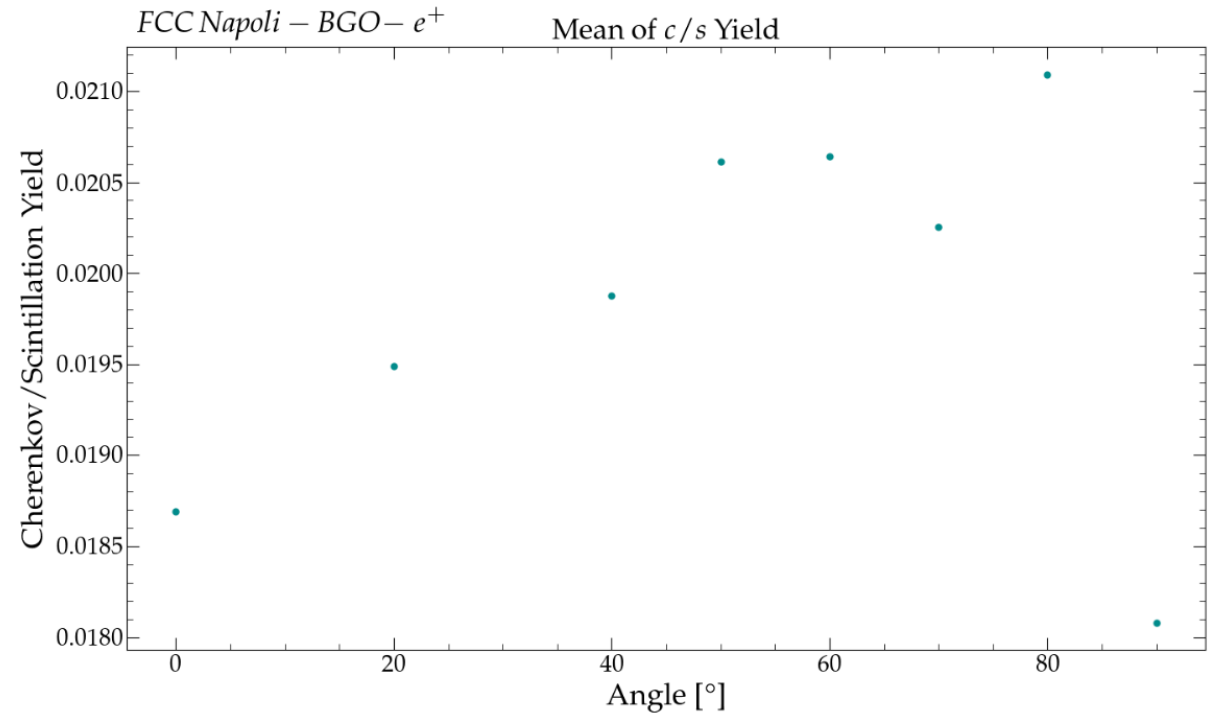

# An example of fit in the $s$ side

An example of the fit on the scintillation side.

I repeated the fit in (almost) all the angles, same configuration of the Cherenkov side

# Angle Scan - Channel 1

- The c/s Yield is very low (2%), and it looks to be constant → a first hint of a systematic uncertainty
- Not trivial how to compare Channel 1 result with Channel 2
