

Updates on HRPPD #25 activities

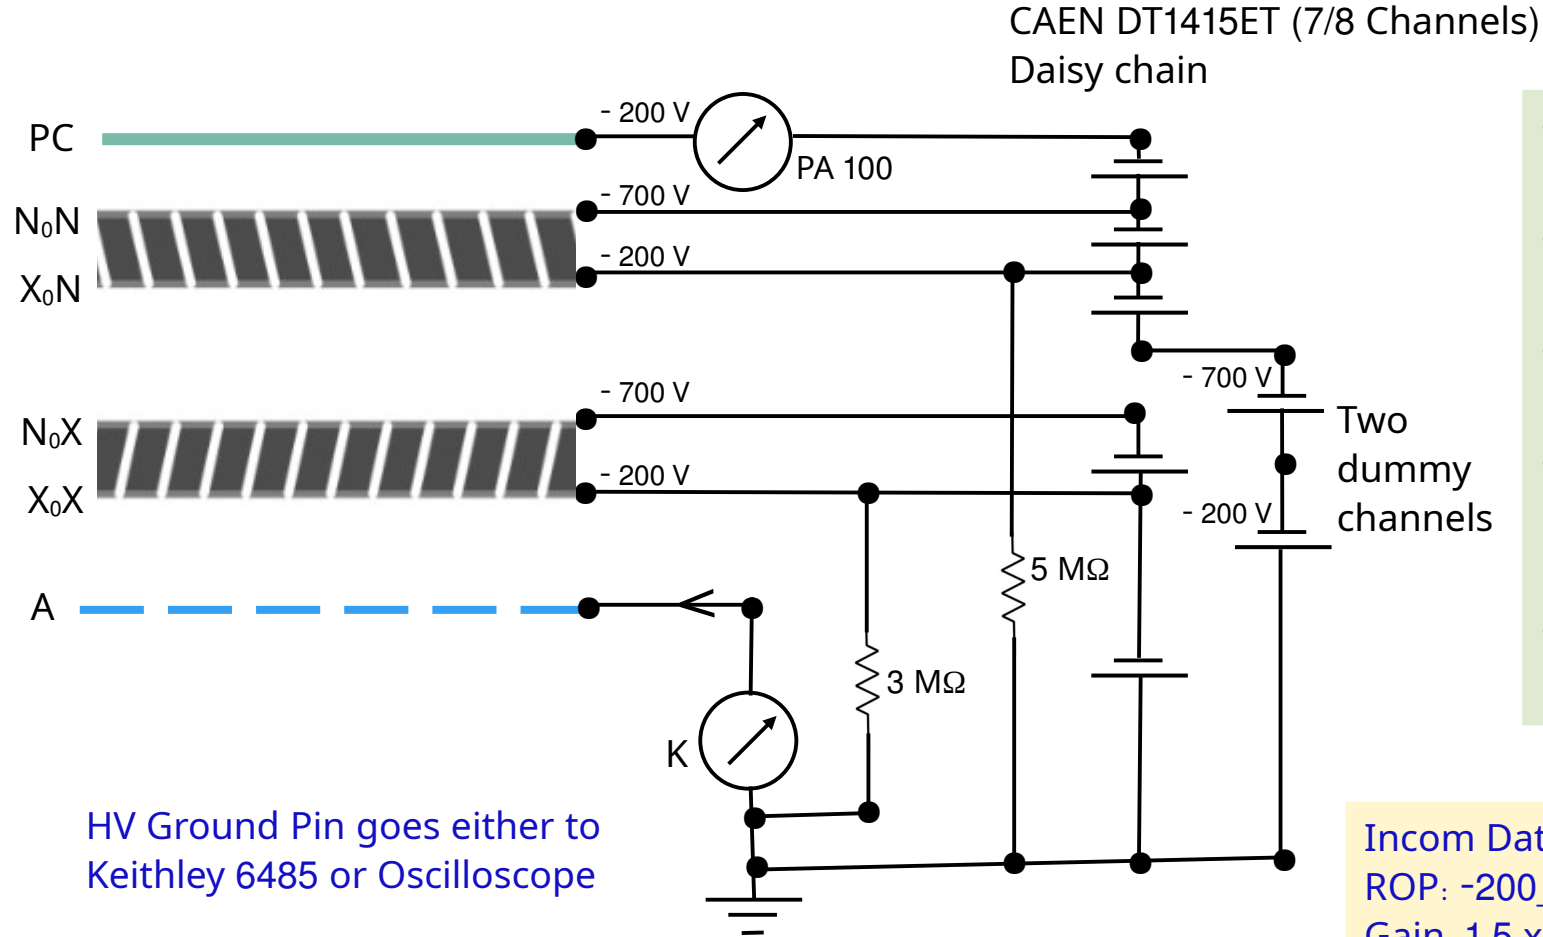

Turning On HVs and Looking at signals

Weekly Meet

Chandra, Fulvio, Jinky

25/02/2025

Circuit

- CAEN DT1415ET
- Protection resistors
- Keithley 6485
- Custom-designed PicoAmmeters
- 2.5 GHz Oscilloscope (waverunner 9254)

Incom Datasheet:
ROP: -200_-700_-200_-700_-200V
Gain: 1.5×10^7

Noise and Grounding

- 8/40 pins on Samtec connectors are internally grounded and NOT connected to Anode pads. These pins were connected to the bread board ground – **this was bridging internal HRPPD ground to the external ground of the SMA coaxial cables**. Mauro removed this connection:
 - **Anode pads, Guard rings, etc. are floating**
 - Lower noise level on single pads **$< \sim 1$ mV on scope** for NO HV connections

- HV cabling + HV hw ON **~ 5 mV noise and 1 nA** on Keithley
 - Grounding provided and **15 pA on Keithley**

- After dark covering, HV sw “OFF”, noise on channel #13 **~ 3 mV**
- HV On: -200_-670_-200_-670_-30 V @ XoX_NoX_XoN_NoN_PC → noise level increase upto ~ 10 mV

Dark signals

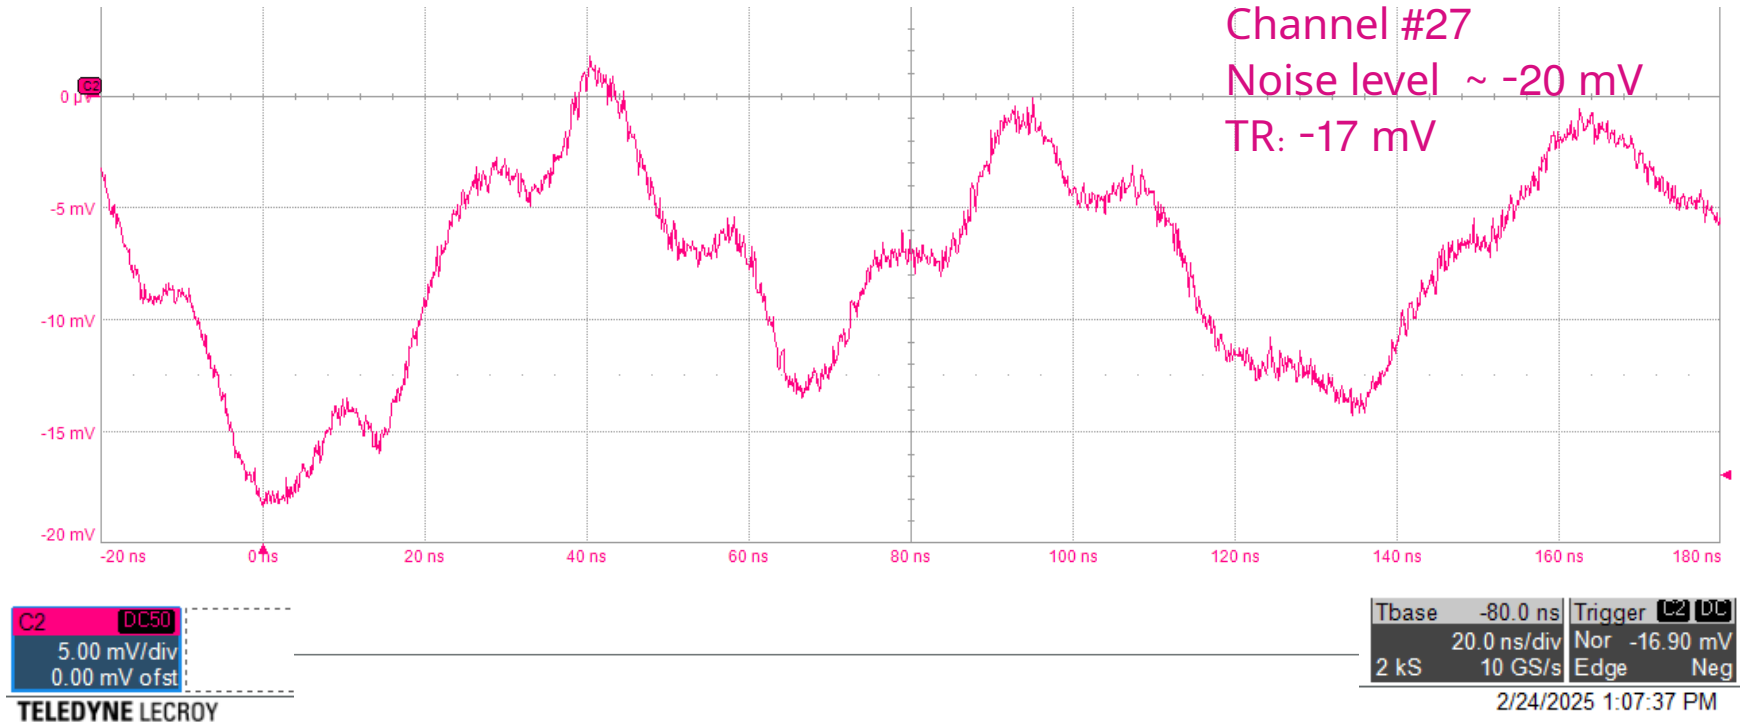

2 ways of looking at signals

- Single channels (any of the 32 channels from the bread board) – directly to Scope
- Multiple electrodes (~1000 pads, Guard rings, Ground pins of Samtec connectors etc.) - via Anode Ground Pin

Dark signals

2 ways of looking at signals

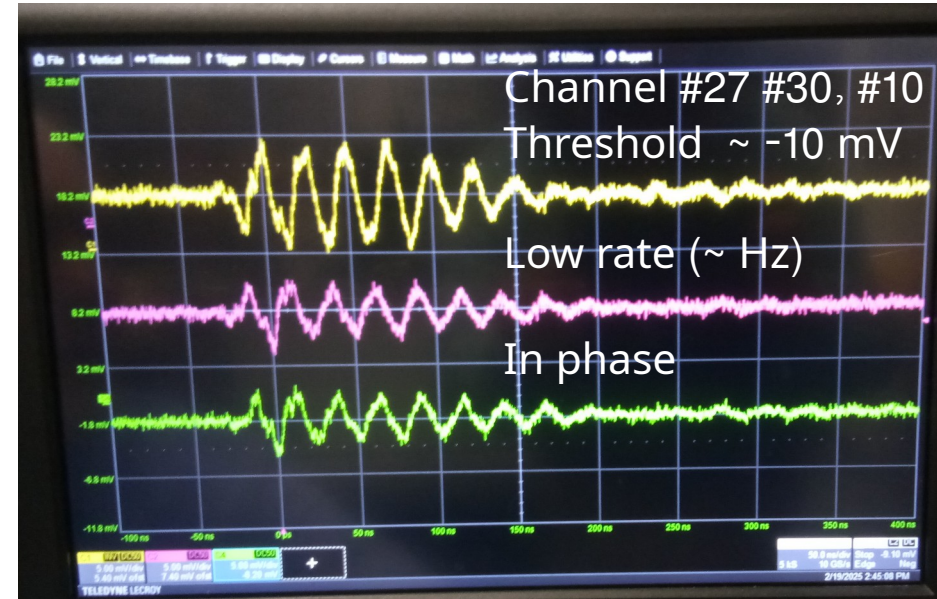

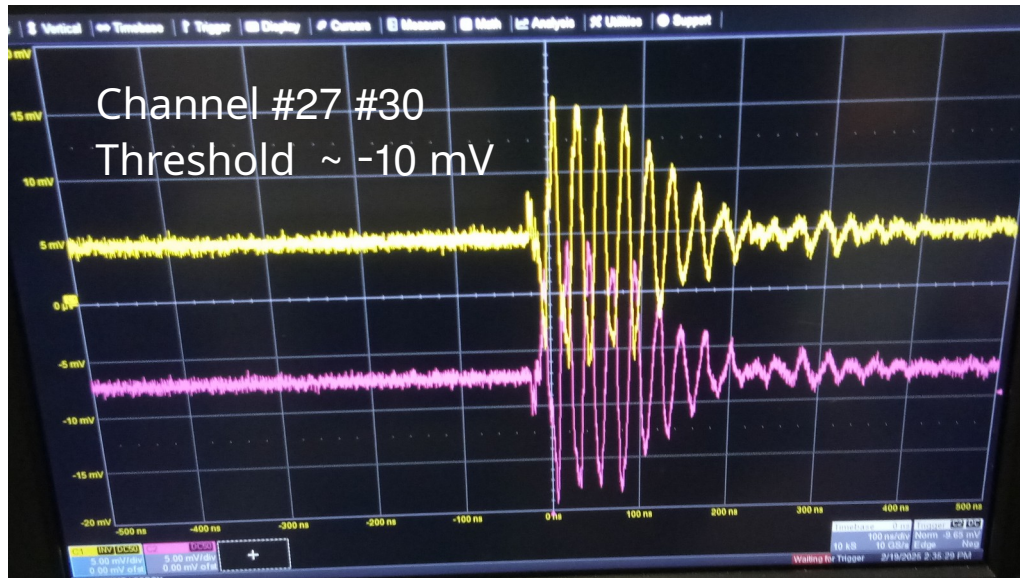

- Single channels (any of the 32 channels from the bread board) – directly to Scope
- Multiple electrodes (~1000 pads, Guard rings, Ground pins of Samtec connectors etc.) - via Anode Ground Pin

Dark signals

- Single channels (any of the 32 channels from the bread board) – dir
- Multiple electrodes (~1000 pads, Guard rings, Ground pins of Samte
Anode Ground Pin

Dark signal from multi-electrodes

Anode Ground Pin is connected to a number of electrodes which are inter-connected

- $1024 - 32 = 992$ Anode and RO pads
- Guard ring (vacuum side)
- 16 small Guard rings (RO side)
- 16 pins out of 80 Pins in Samtec connectors (total 240 pins)

Grounded internally on the grounding cap PCBs and on the Samtec connector prepared by Mauro

Internal HRPPD Ground

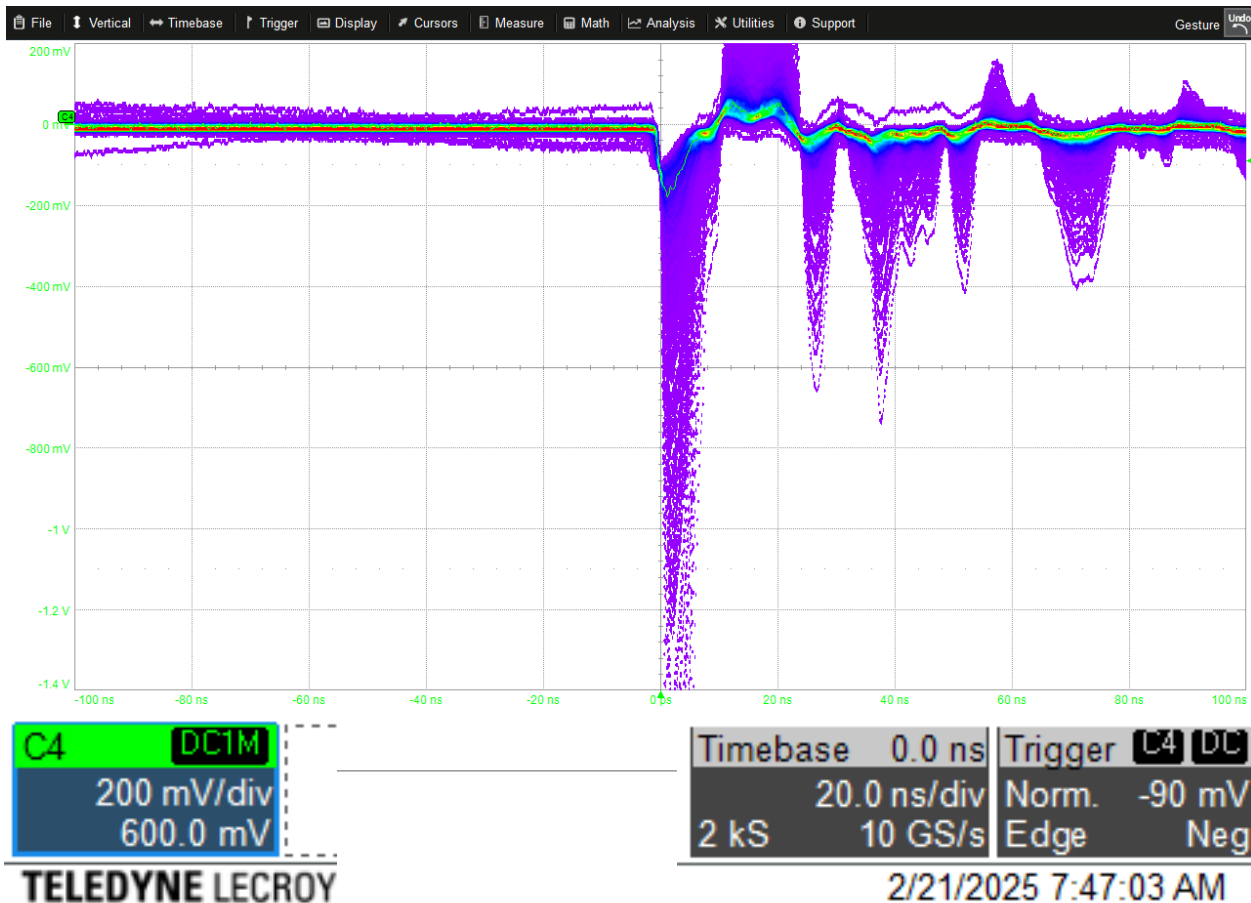

Anode Ground Pin is a common output to all these electrodes

- Signals are distributed in all these inter-connected electrodes
- These (big) signals are observed

Dark signal from multi-electrodes

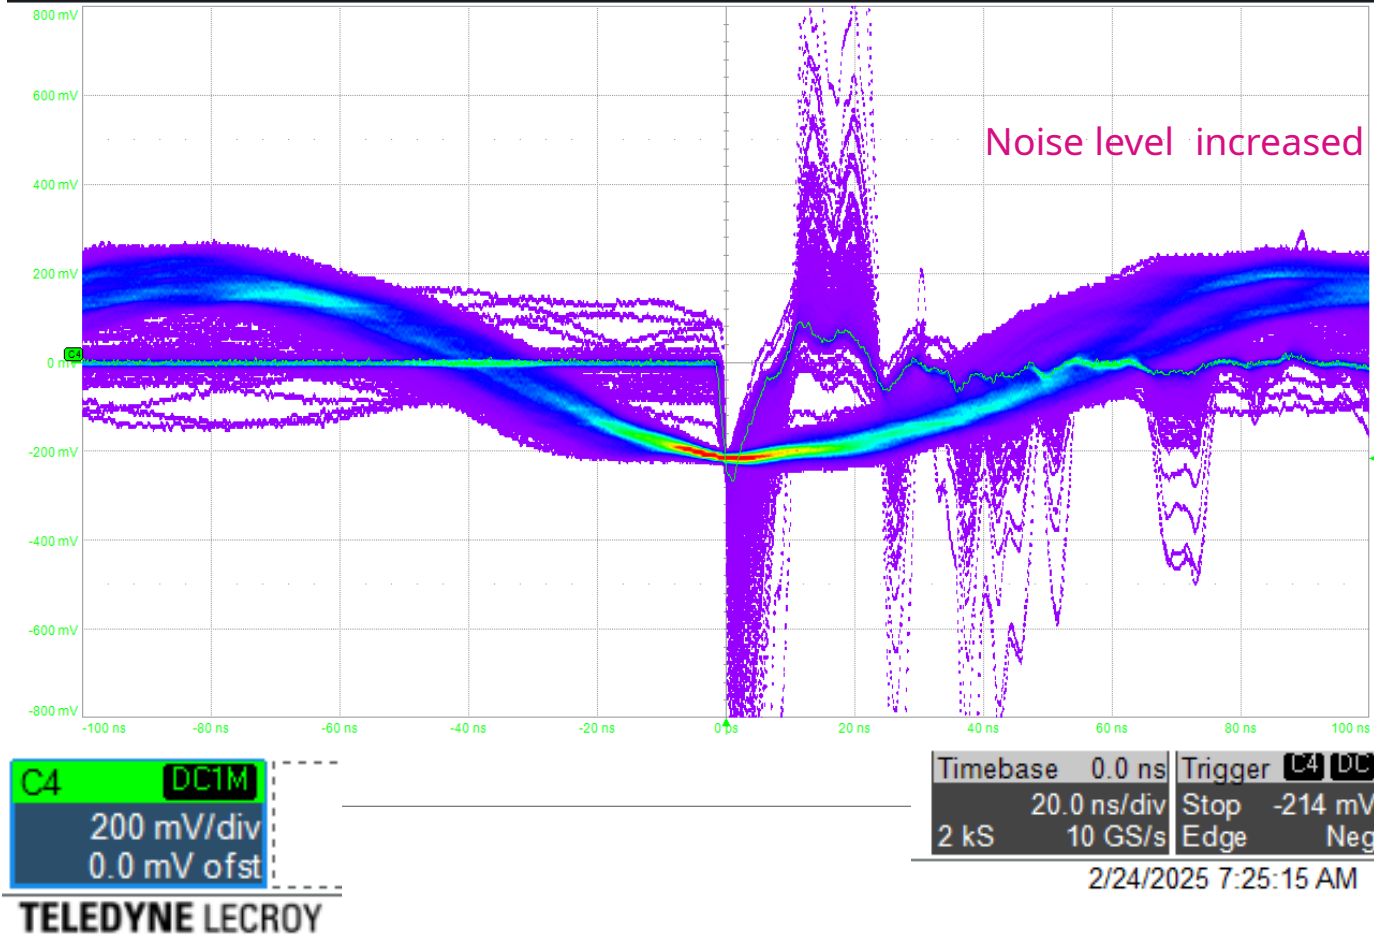

HV configuration: -200_-670_-200_-670_-30 V @ XoX_NoX_XoN_NoN_PC

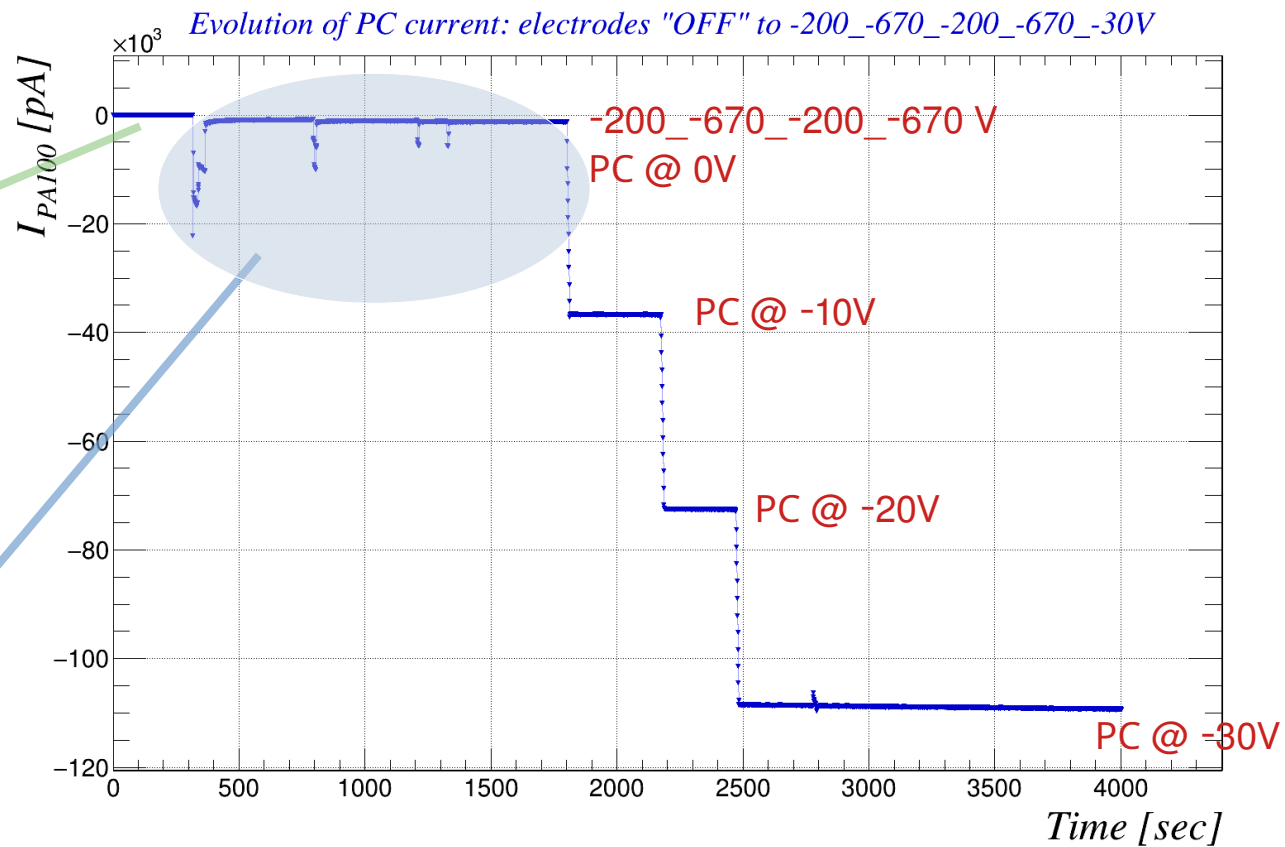

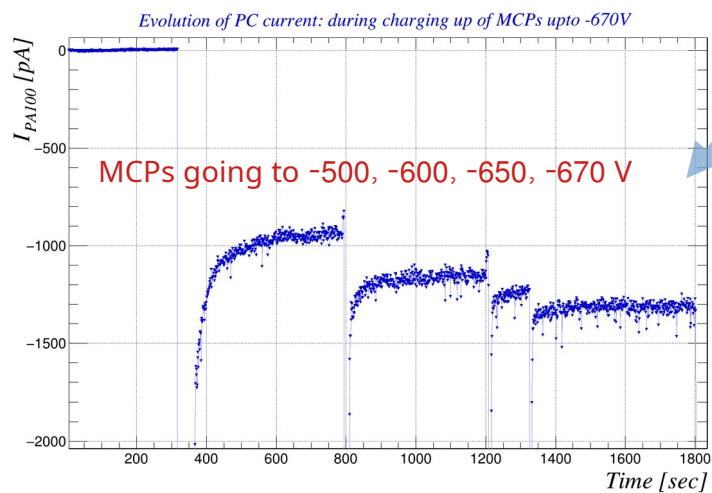

- Threshold -90 mV; neg. edge
- Rise time ~1 ns; Fall time ~4 ns
- Average amplitude: between -100 to -200 mV
- Rate: 1-2 Hz
- Amplitude > 800 mV with a rate of 0.05 Hz
- $I_K \sim -186$ nA (nominal leak 165 nA)
- $I_{PA100} \sim -115$ nA (as expected, leak 0.26 G Ω)

Dark signal from multi-electrodes

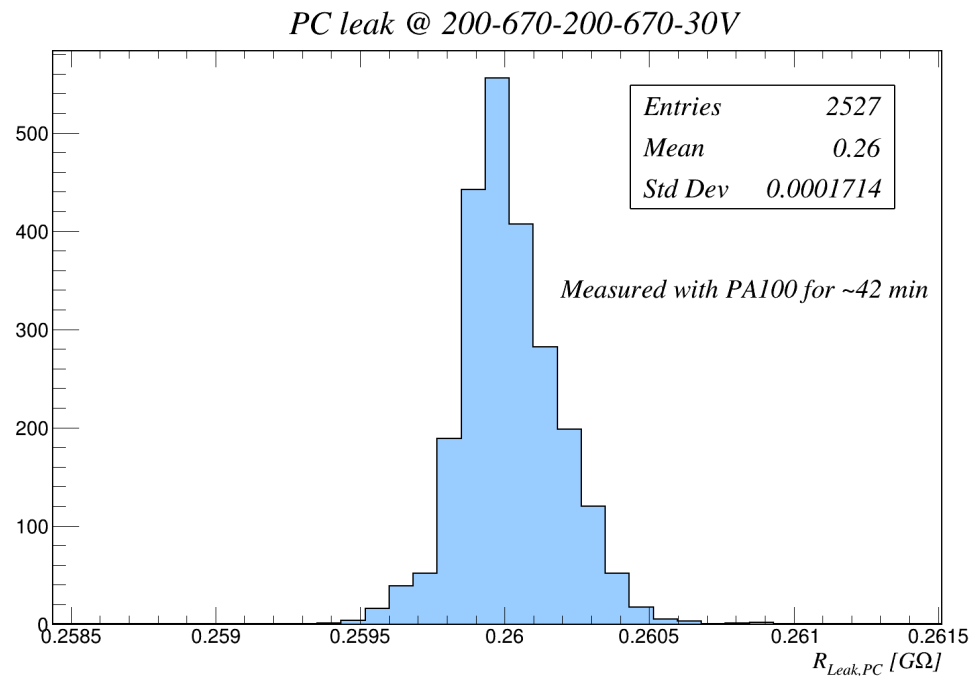

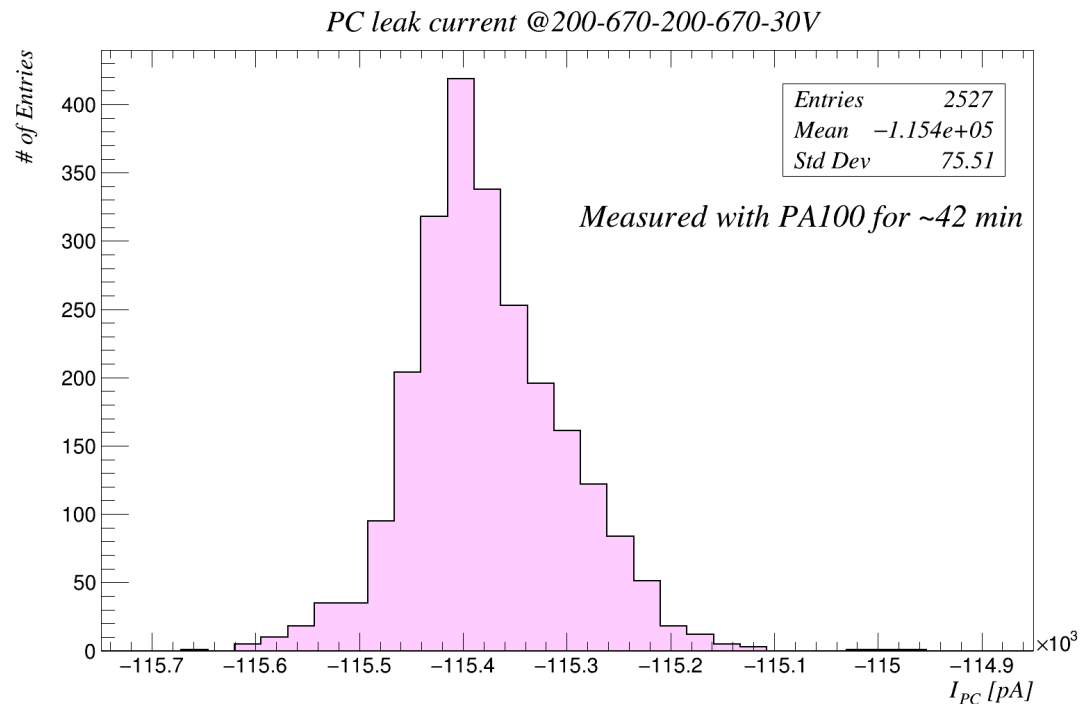

HV configuration: -200_-670_-200_-670_-30 V @ XoX_NoX_XoN_NoN_PC

PC leak during charging up electrodes

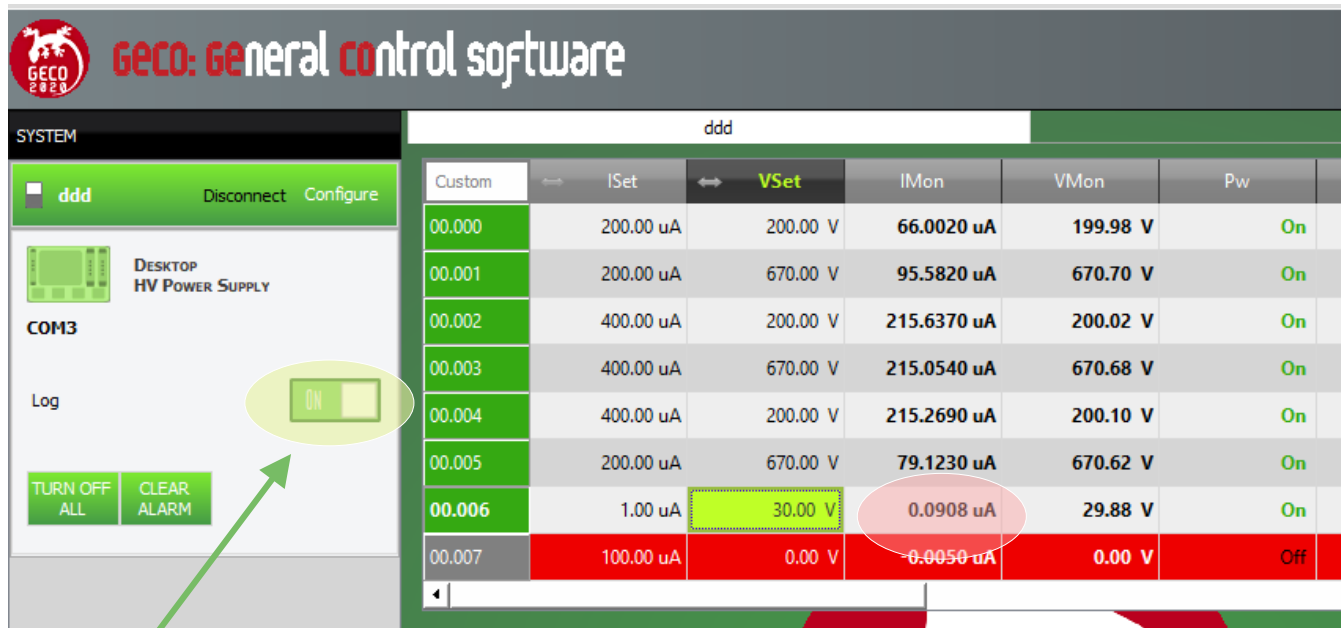

PC leak during HV On

Some outliers are cut off

CAEN currents

GECO2020 updated: Now, Version 1.13.1

Recording ON

Custom	ISet	VSet	IMon	VMon	Pw
00.000	200.00 uA	200.00 V	66.0020 uA	199.98 V	On
00.001	200.00 uA	670.00 V	95.5820 uA	670.70 V	On
00.002	400.00 uA	200.00 V	215.6370 uA	200.02 V	On
00.003	400.00 uA	670.00 V	215.0540 uA	670.68 V	On
00.004	400.00 uA	200.00 V	215.2690 uA	200.10 V	On
00.005	200.00 uA	670.00 V	79.1230 uA	670.62 V	On
00.006	1.00 uA	30.00 V	0.0908 uA	29.88 V	On
00.007	100.00 uA	0.00 V	-0.0050 uA	0.00 V	Off

All CAEN currents are reasonable when $> 1 \mu\text{A}$

$$200\text{V}/66.0 \mu\text{A} = 3.03 \text{ M}\Omega$$

$$670 \text{ V}/95.58 \mu\text{A} = 7.01 \text{ M}\Omega$$

$$1070 \text{ V}/215 \mu\text{A} = 4.98 \text{ M}\Omega$$

$$1070 \text{ V}/215 \mu\text{A} = 4.98 \text{ M}\Omega$$

$$1070 \text{ V}/215 \mu\text{A} = 4.98 \text{ M}\Omega$$

$$670 \text{ V}/79.12 \mu\text{A} = 8.5 \text{ M}\Omega$$

PC current Not correct.
We read PA100.

Turning On the laser

- Hole diameter: ~8 mm
- Hole Centre: X= -39.0 mm, Y= -45.5 mm
- Position of fibre on moving arm:
(96.8, 45.0001, 41) [mm]
(up-down, back-forth, left-right)

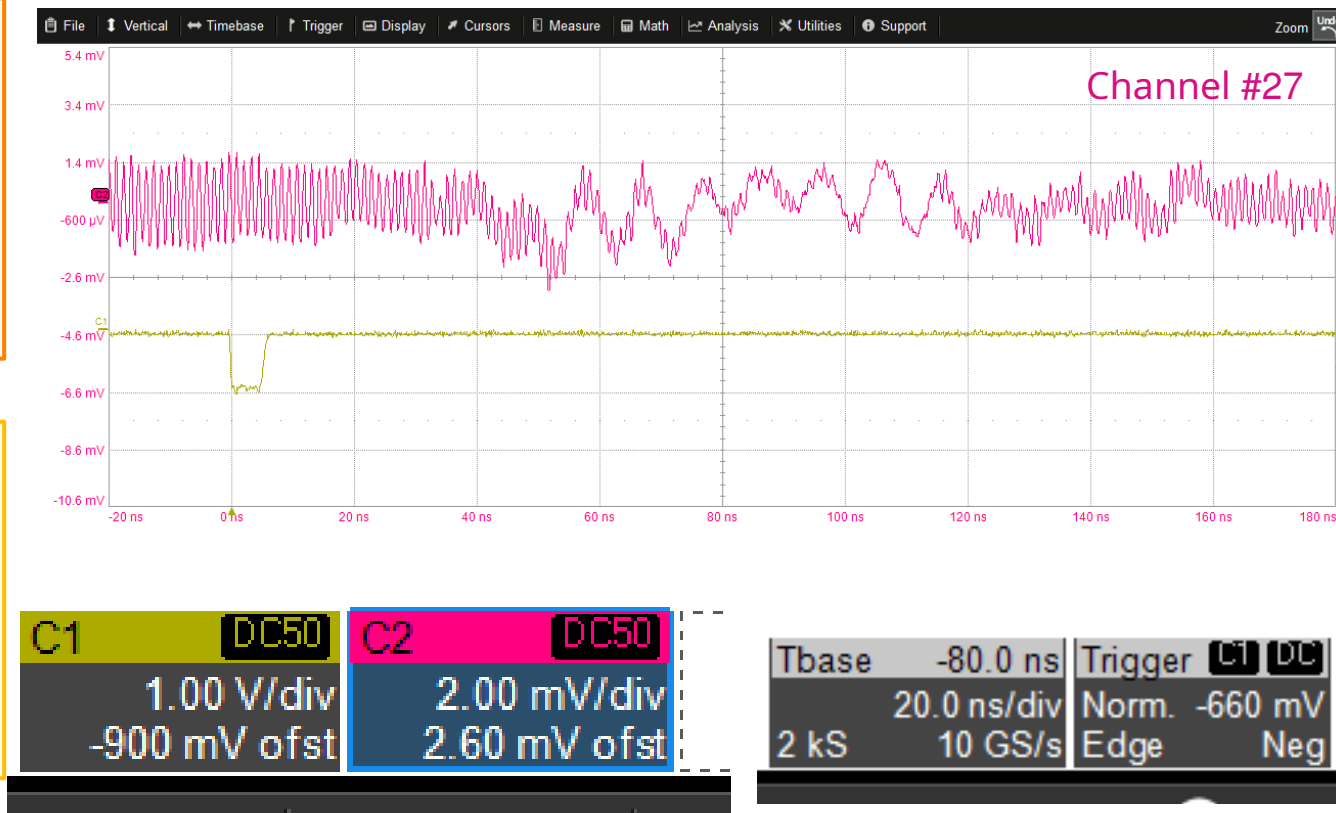

- Double protection card
- Fibre tip ~ 1 cm away from window

Light signals

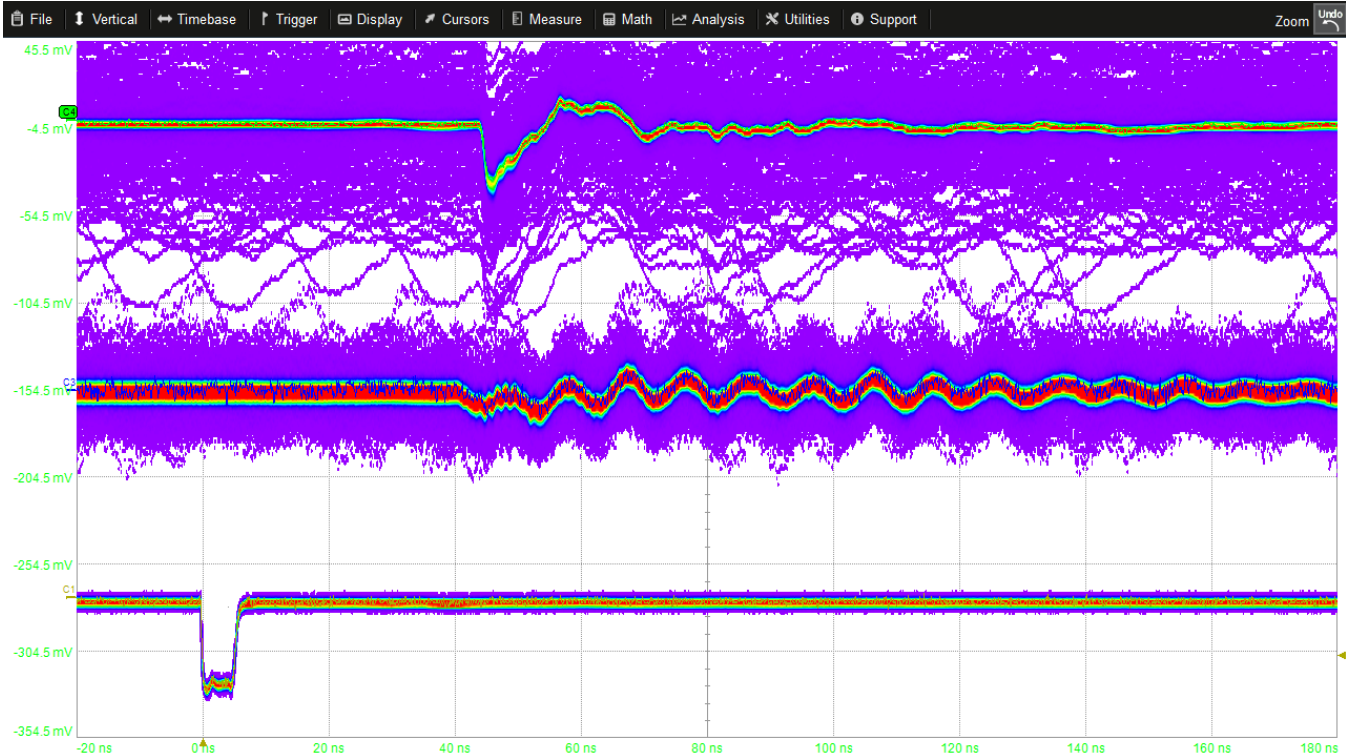

HV configuration: -200_-670_-200_-670_-20 V @ XoX_NoX_XoN_NoN_PC

- Waveform Generator Output to trigger the laser head
 - ✓ $1.2 \text{ V}_{\text{RMS}}$, 600 Hz, 100 μs width
- Laser Intensity: 2.8

- Triggering on the pulse (-660 mV)
- Signal Amplitude: $\sim 4 \text{ mV}$
- $I_K \sim -184 \text{ nA}$
- $I_{\text{PA}100} \sim -78 \text{ nA}$

Light signals

C4, Anode G. Pin
~ 50 mV amplitude
In 45 ns after TR

C3, single pad

C1, Trigger

C1	DC50	C3	DC50	C4	DC1M
1.00 V/div	5.00 mV/div	50.0 mV/div			
-2.380 V ofst	0.00 mV ofst	154.5 mV			

Tbase	-80.0 ns	Trigger	C1	DC
	20.0 ns/div	Norm.	-660 mV	
2 kS	10 GS/s	Edge	Neg	

Interlock flag

- The HV system went to INTERLOCK MODE when we were looking at dark signals.
- We were not doing anything on the HV (neither hardware level nor software level), so we didn't understand what went wrong.
- We followed instructions from the User Manual: KILL the channels and then turned them OFF (hardware level)

Interlock signal

A schematic diagram of the Interlock input is shown in the figure on the left, where the diode is part of opto-coupler stage. Interlock means that channels are hardware disabled. The following table explains the interlock operation:

CONFIGURATION ↓	INTERLOCK MODE →	UNDRIVEN	DRIVEN
leave contact open		INTERLOCK	ENABLED
voltage level (0÷1V, ~5mA current) between pin 2 (high) and pin 3 (low)		INTERLOCK	ENABLED
short circuit pin 1 with pin 2, and pin 3 with pin 4		ENABLED	INTERLOCK
voltage level (4÷6V, ~5mA current) between pin 2 (high) and pin 3 (low)		ENABLED	INTERLOCK

The front panel Interlock LED is ON when the INTERLOCK is active; as INTERLOCK is active, channels are turned off at the fastest available rate, regardless the RAMP DOWN setting. To reset the Interlock flag, all switches must be placed on KILL and then on OFF.

ddd

ISet	VSet	IMon	VMon	Pw	Status	RUp
200.00 uA	200.00 V	-0.2040 uA	0.00 V	Off	Interlock	10
200.00 uA	670.00 V	-0.2220 uA	0.06 V	Off	Interlock	10
400.00 uA	200.00 V	-0.0010 uA	0.00 V	Off	Interlock	10

“Driven” is Green in operating mode

A different Daisy Chain – another dummy

A proposal from Fulvio

Benefits:

- Measure XoX currents using a Pico-Ammeter ($< 1 \mu\text{A}$).
- Separating generators for XoX and NoX, -200 V stable at XoX.
- -200 V stable at Dummy_0, ensuring stable V at NoX.

Thank you!
