

Towards a Cavity Haloscope with a GHz Tuning System Using Galvanically Contacted Transmon Qubits

20th Patras workshop on Axion, WIMPs and WISPs

09/23/2025

Speaker: Kan Nakazono (the University of Tokyo)

DarQ Collaboration

Outline

- Main idea (based on Patras 19th talk, arXiv:2505.15619)
- Status for the next run
- Introduction of DarQ experiment

arXiv:2505.15619

Search for Dark Photon Dark Matter with a Mass around $36.1 \mu\text{eV}$ Using a Frequency-tunable Cavity Controlled through a Coupled Superconducting Qubit

K. Nakazono,^{1,*} S. Chen,² H. Fukuda,¹ Y. Iiyama,³ T. Inada,³ T. Moroi,^{1,4} T. Nitta,⁴ A. Noguchi,^{5,6,7} R. Sawada,³ S. Shirai,^{5,6} T. Sichanugrist,¹ K. Terashi,³ and K. Watanabe¹

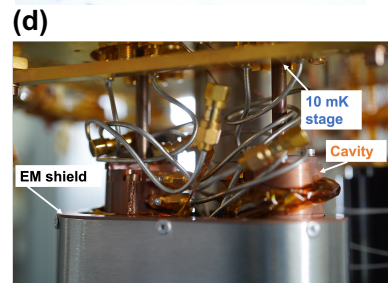

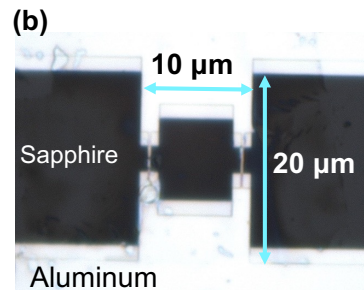

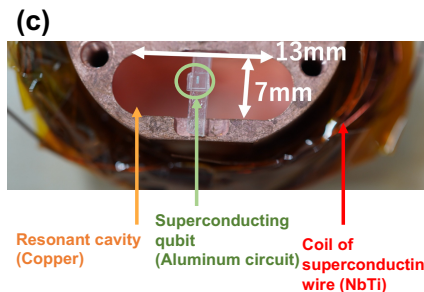

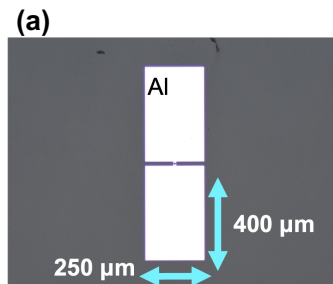

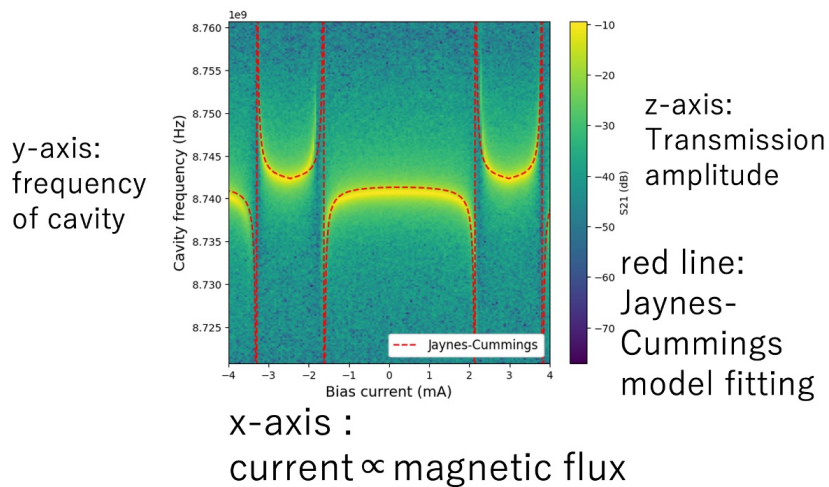

(DarQ Collaboration)

DarQ-Lamb experiment

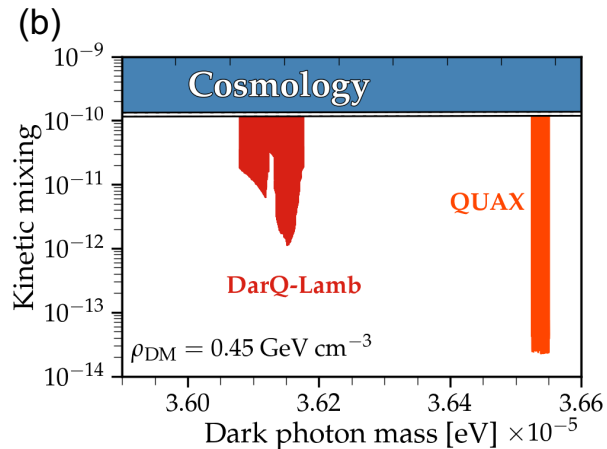

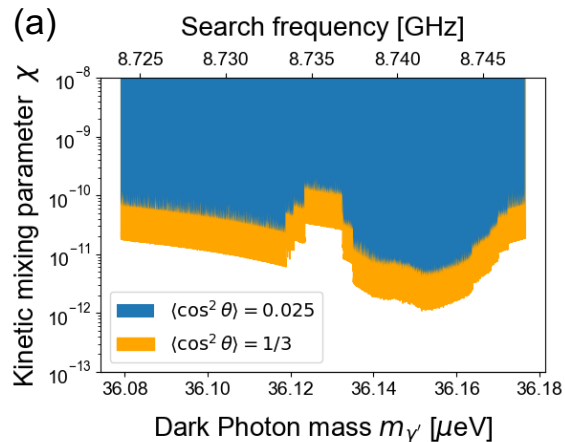

Using a superconducting qubit as a cavity frequency tuner

Lamb shift
(dispersive shift) $\propto \frac{g^2}{\Delta}$...coupling constant $g \sim \mu E$
...detuning $\Delta = \omega_q - \omega_c$

Bias current tuning test (2024)

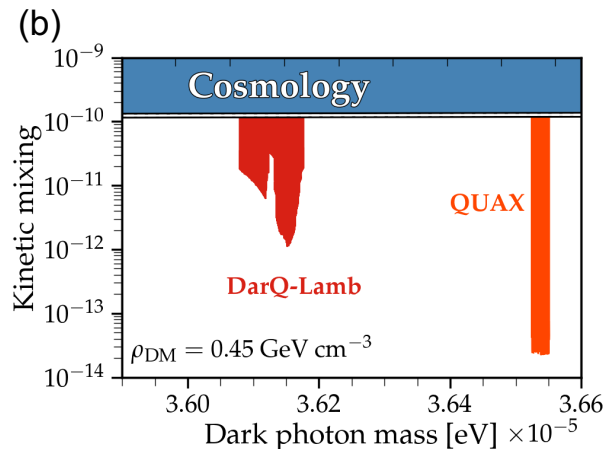

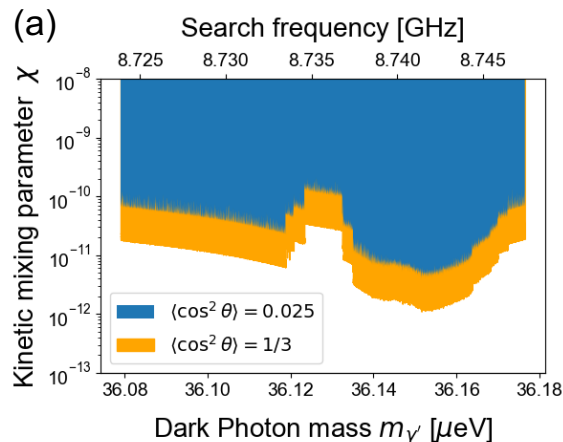

Dark photon DM search around $36.1 \mu\text{eV}$ in 2024

[arXiv:2505.15619](https://arxiv.org/abs/2505.15619)

Dark photon DM search around $36.1 \mu\text{eV}$ in 2024

[arXiv:2505.15619](https://arxiv.org/abs/2505.15619)

For the Next run...

① high sensitivity or ② broaden frequency tuning range

This poster

Status

Wider frequency tuning range \leftrightarrow Stronger the qubit-cavity coupling

(physically)

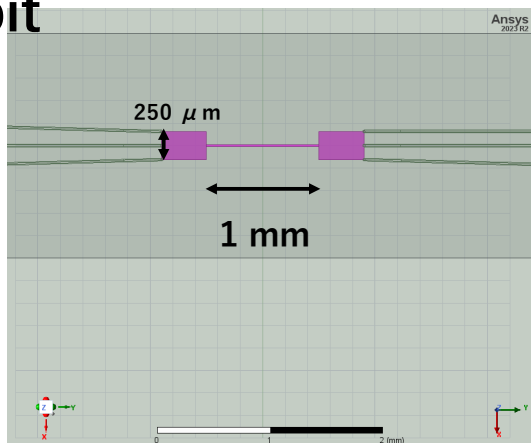

Galvanically contacted qubit-cavity system

Contact SRF cavity and qubit's pad with **wire bonding**

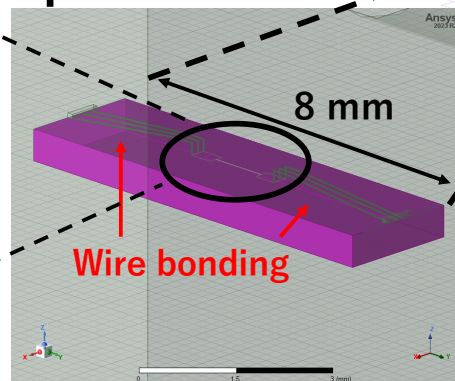

Ansyes HFSS FEM simulation...

$$\omega_c \sim 7 \text{ GHz}$$

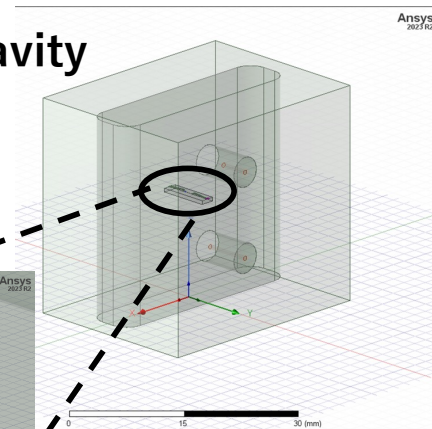

Qubit

Chip

Cavity

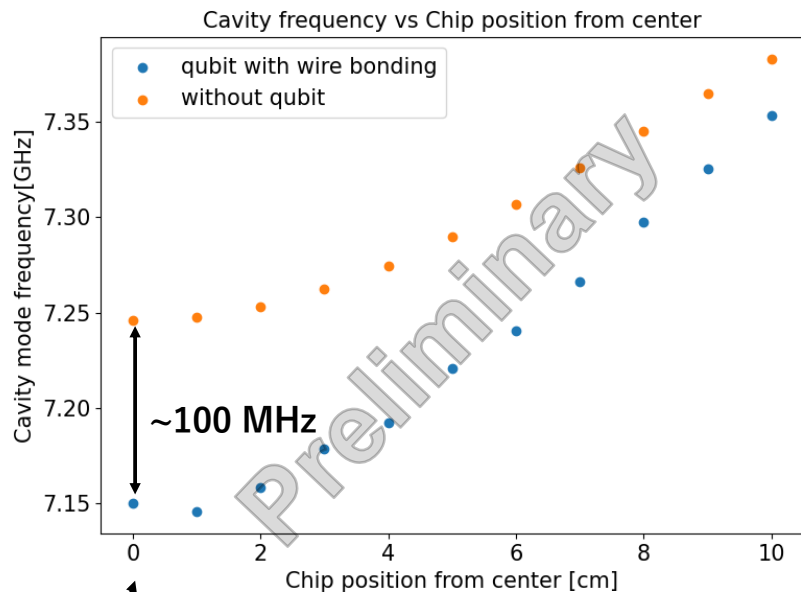

Simulation... chip position sweep

Outputs... Cavity frequency and Form factor

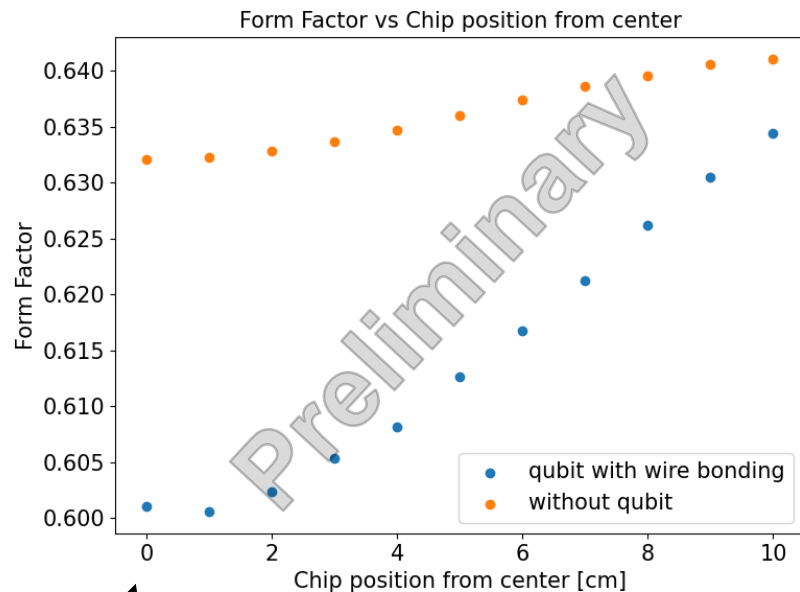

$$C_y = \frac{\left| \int dV \vec{E} \cdot \vec{X} \right|^2}{V \int dV |\vec{E}|^2 |\vec{X}|^2}$$

Form factor...

$$(\text{dark photon detection efficiency depends on the E-field distribution}) = \frac{\left| \int dV \vec{E} \cdot \vec{n}_y \right|^2}{V \int dV |\vec{E}|^2}$$

Center of the cavity (Maximum interaction)

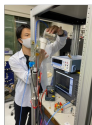

Center of the cavity (Maximum Energy loss)

Thank you for listening!

Back Up

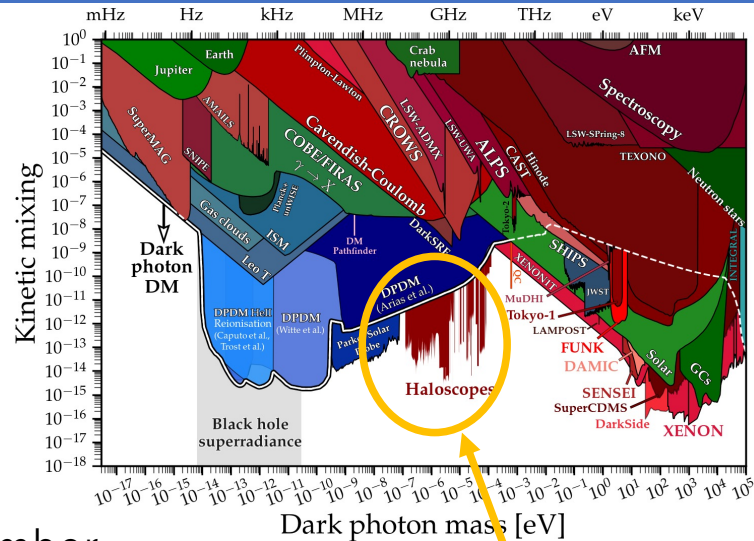

Search for dark photon

Dark photon

- Mixed with photon by kinetic mixing parameter χ
- Converted to the ordinary photon
 - Frequency of photons corresponds to dark photon's mass $\hbar\omega \approx m_{DM}c^2$

In the μeV to meV range...

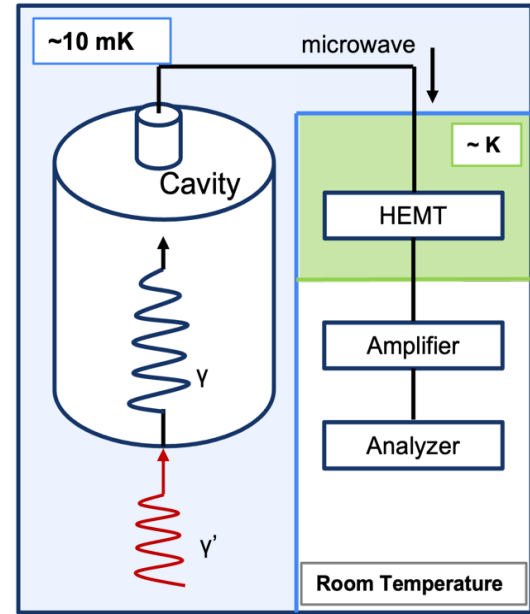

- Long de Broglie wavelength and high number density
 - Phase is coherent (like classical wave)
 - Enable to apply coherent weak electric field detection technology!
- Overlapping mass range with well-motivated QCD axions

This regime

Cavity haloscope

- Accumulating powers and enhancing signals near the resonance frequency of a cavity
- Cooling down the resonator to cryogenic temperatures (Dilution Refrigerator: $\sim 10\text{mK}$)
- Reducing background noise (blackbody radiation)

Goal: Broadband Frequency Search \leftrightarrow Wide frequency tuning of a cavity

Signal power, noise power and variables

$$P_s = \eta \chi^2 m_{\gamma'} \rho_{DM} V_{eff} Q_L \frac{\beta}{1 + \beta} L(f, f_0, Q)$$

$$P_{noise} = k_B b T_{sys} / \sqrt{N}$$

Variable	explanation	value	others
$m_{\gamma'}$	frequency	~ 8.74 GHz	each measurement
ρ	DM density	0.45 GeV/cm ³	from (Asztalos et al., 2001)
β	coupling constant	~ 0.3	each measurement
T_{sys}	system noise	7.9 K	Y-factor measurement
V_{eff}	effective volume	3.14 cm ³	$V \times formfactor$
Q_L	(Loaded) Quality factor	~ 5000	each measurement
η	attenuation factor	1.02	SG filtering
N	number of data	100	per measurement
b	bandwidth	200 Hz	bandwidth of spectrum analyzer

χ : kinetic mixing parameter \propto sensitivity of the detector
