L'acceleratore ALPI, costruito negli anni '90 e progettato interamente nel INFN, consta di 72 cavità acceleranti, contenute in 18 cristalli.

Una prima sezione (bassa e media energia, 8 cristalli), è seguita da un'anella magnetica, che curva il fascio di 180°, e da una seconda sezione (media ad alta energia).

Al centro dell'insieme, fra le due linee acceleranti, è collocato il refrigeratore criogenico ad Elio, con capacità nominale isotermica equivalente, a 4,5 K, di 1300 W, più 3900 W a circa 70K. Le cavità acceleranti sono in Rame rivestito di Niobio, oppure in Niobio massiccio, e, raffreddate dall'Elio liquido, lavorano in regime di superconduttività, a frequenza di 80 o 160 MHz, sviluppando campi acceleranti di 4-7 MV/m.

ALPI può accelerare fasci di ioni da più leggeri ( $^3\text{He}$ ) ai più pesanti ( $^{238}\text{U}$ ), funzionando come post-acceleratore dell'acceleratore Van de Graaff XTU-TANDEM, oppure, separatamente, con l'iniettore PIAVE.

L'energia finale del fascio può variare da 5 a 20 MeV/u.

# PIAVE: positive injector for ion at low velocity

**PIAVE  $V_{eq} \sim 8$  MV**

PIAVE is a superconducting linac (for us main an injector ) operating at a rf frequency of 80 MHz and containing two SRFQ resonators followed by eight QWR's.

It accelerates beams from  $b=0.0089$  to  $b=0.045$ , in the case of a  $+28\text{U}238$  beam, for an efficient injection into ALPI.

# TABLE OF CURRENTLY AVAILABLE PIAVE+ALPI BEAMS

Beam	E [MeV]	E/A [MeV/A]	I target [pnA]
$^{22}\text{Ne}^{4+}$	243	11.0	2
$^{84}\text{Kr}^{18+}$	800	9.5	5÷10
$^{120}\text{Sn}^{21+}$	850	7.1	1
$^{136}\text{Xe}^{34+}$	1240	9.1	1
$^{197}\text{Au}^{30+}$	1200	6.1	1

# Tandem-ALPI-PIAVE complex

Here is displayed the PIAVE-Tandem-ALPI complex, the beams being injected by the XTU Tandem into the three experimental Halls, or in to the superconductive LINAC and then distributed to three experimental halls, two of them are shown.

# Last maintenance two maintenance march 2011 & may 2012

1

- Replacement of water cooling circuit inside the tank

2

- Coil failure of a triplet (3q7) inside the ALPI U-bend

3

- Magnet selection system replacement

# Replacement of water cooling system inside the tank

15th dicembar 2010

## Old circuits

Immediately we have soldered the pipe to finish the last week of shift. After we have sent a request of quotation for a new one, with the same characteristics: thermal power exchange, conductivity, temperature and water velocity. But it was clear that the main problem would be to put inside and handling about 1 ton of copper (no crane inside the tank!). So we designed a new cooling system in a modular way.

# We changed the design of the circuit

**We found a modular solution:  
no more 4 x 280 Kg each one,  
20 x 50 Kg each one.**

# We changed the design of the circuit

**Thank to this particular kind of siphon, it was very easy to fill the circuit without leaving air bubbles inside.**

# We changed the design of the circuit

**When all the welds  
were made, we tested  
the circuit at 8 bars**

# Coil failure of one triplet (3q7) inside ALPI U-bend

# Coil failure of one triplet (3q7) inside ALPI U-bend

We found open one of the 12 coils: unbelievable but true! Temporarily, we worked connecting the coils of the triplet using it as a doublet. We were penalized a few % in transmission, but it allowed us to work waiting for new coils.

## Coil failure of one triplet (3q7) inside ALPI U-bend

We know that the copper oxide production it is mainly a result of:

- Air introduced in the water;
- Radiolysis: water + radiation;

In our case, the principle of copper oxide production has occurred due to a loss of cooling water circuit through which oxygen entered.

We have analyzed the water and we found values of conductivity  $>$  of  $1000 \mu\text{S} / \text{cm}$ . After analysis, the fault in the circuit has been repaired and today the conductivity is  $< 0.01 \mu\text{S} / \text{cm}$ .

Unbelievable!

**Dr. Per Ladefoged,  
Project Manager,  
Research & Industry, DANFYSIK**

# Coil failure of a triplet (3q7) inside ALPI U-bend

# Coil failure of a triplet (3q7) inside ALPI U-bend

January 2012

July 2012

## **Coil failure of a triplet (3q7) inside ALPI U-bend**

**Next month we will receive back the «open» coil, so we can investigate more. Until now we are sure it is not black magic ( the «open» measure ) we know it is something physical, but.... we will investigate better next year.**

# Magnet selection system replacement

**Do you remebar ?**

**In the experimental halls 1& 2 we have 7 beam lines each hall**

**And we have 2 doublet each line**

**But**

**We have just 2 P.S. (+ 1 spare)**

**So we have a Magnet selection system  
associates Power Supply to the lens ( A & B ).**

**But it was old, and last may we replace it**

# Magnet selection system replacement

## Status on March 21, 2012

# Magnet selection system replacement

# Magnet selection system replacement

# Magnet selection system replacement

## Function

### Status on April 13, 2012

It switches:

- Control P.S. Lens A, B, SW, H.E.
- Control Magnetic lenses
- Vacuum control interface (valve 1 for each line )
- Management of safety interlocks

## Use

- Bistable switches remote control
- Open industrial Ethernet standard of PROFINET International ( PI ) for automation.

D. Carlucci 2012 October 1st

SNEAP 2012

# Magnet selection system replacement

The bistable switches  
If there is a PLC failure, it is  
possible to swich manually

1700 m of cables were wired for  
auxiliary

# **The solution is industrial architecture with PROFINET**

**PROFINET is the open Industrial Standard Ethernet that combines the strength of traditional fieldbus "Profibus" with the standard Ethernet opportunity;**

**In this way, we have a robust fieldbus able to use all the facilities of the networks;**

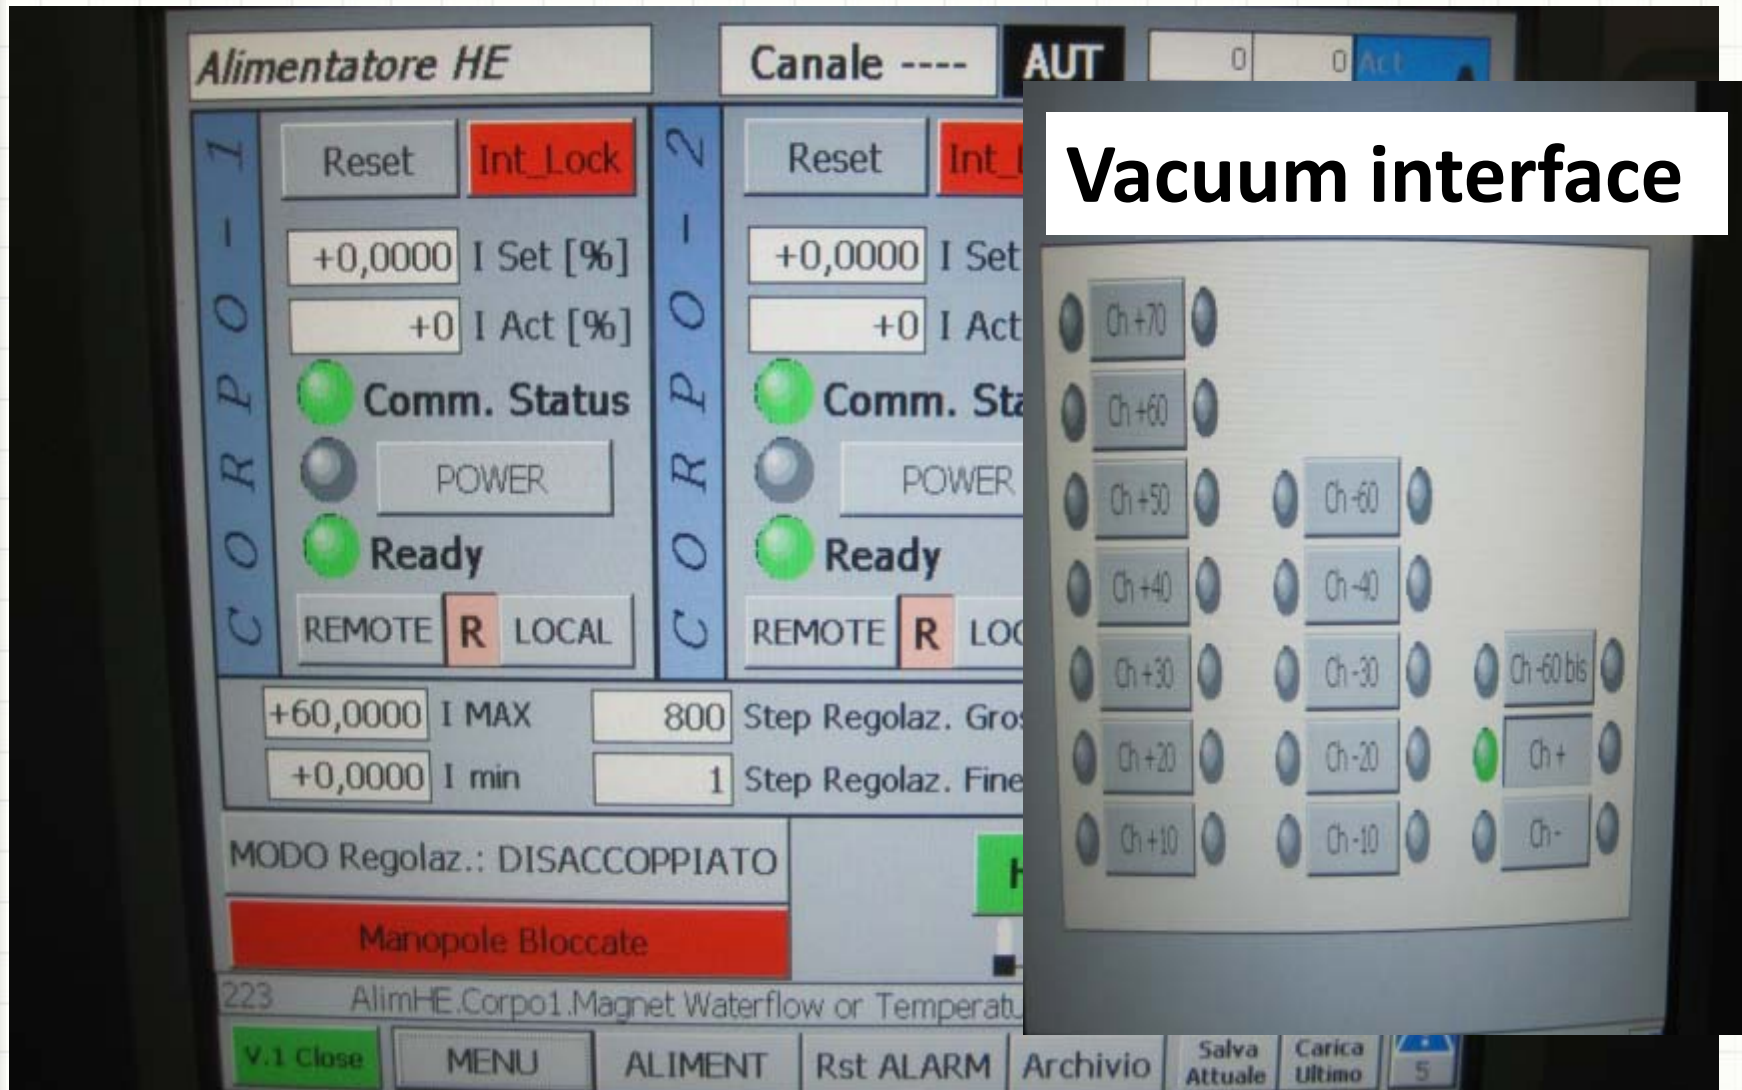

**It is divided into three levels (input, output and communication, managed with priority levels).**

# Magnet selection system replacement

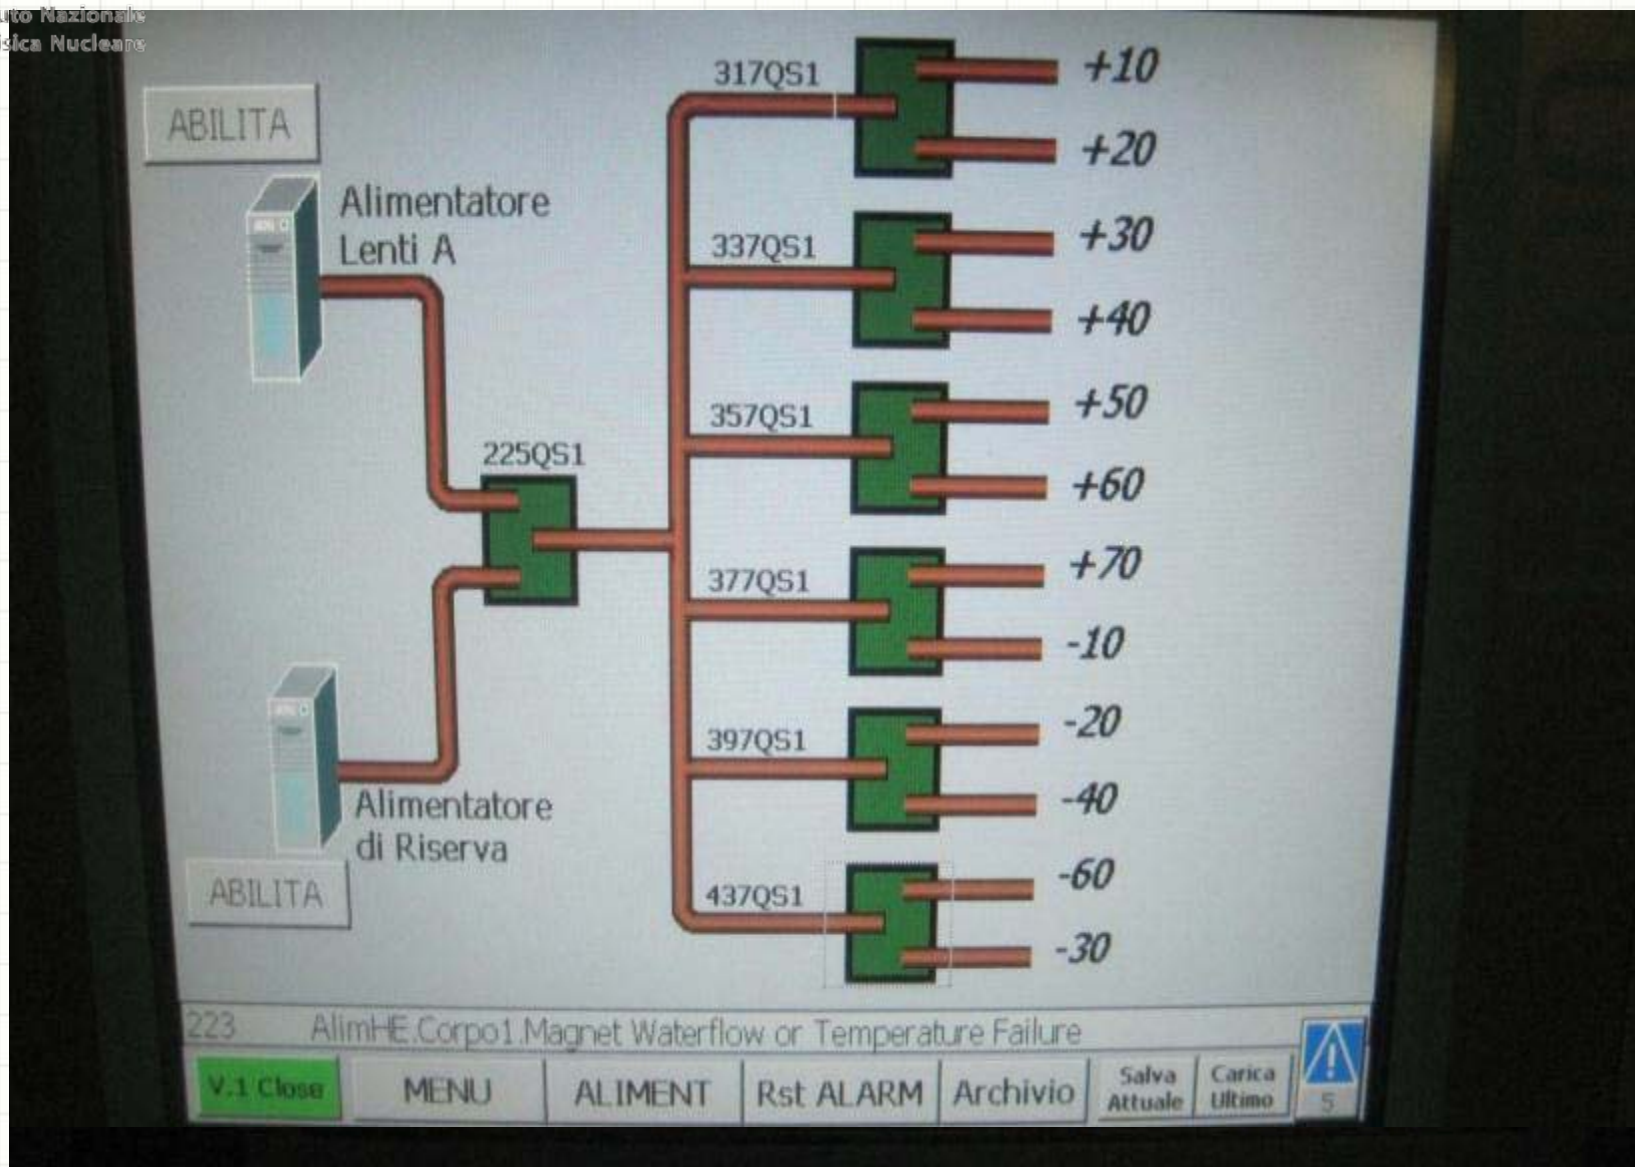

# Magnetic Lens Control System

# Magnet selection system replacement

# Magnet selection system replacement

# After just a simple scaling with the new magnet selection system

# Summary

**This presentation, it is not a lesson of Physics  
but: Just ours experience**
