DI PAVIA

## Objective

Since we would like to work on the  $\frac{e}{MIP}$  ratio, we have to obtain a pure muon beam:

- To check Muon data
- Apply some selections/cuts
- Implement SiPMs and PMTs intensity maps

### Vertical angle 2.5°, Muons beam 160 GeV

- running in T0 (x = 1 mm; y = 1170 mm)
- **preshower included**
- Cherenkov Counters: Final pressures for He 344mBar, for CO2 ~49mBar

Angle	Run #	N. Event	Comments
deg		(x1000)	
2.5°	136	21	x = -8.1mm, y = 1176mm

# Muon Counter

- Muon Counter > 160

# Preshower

- $500 < \text{Preshower} < 660$

Left is the DWC1 before cuts on MCounter and PShower, right is after

Left is the DWC2 before cuts on MCounter and PShower, right is after

## Beam position correction

We want to correct the position of the beam using the wire chamber coordinates (based on Yuchen's studies):

- Calculate  $\Delta_x$  and  $\Delta_y$ , event by event, for both DWCs
- Define corrections:
  - ①  $Correction_x(C_x)$  = the average of the difference between 'XDWC1' and 'XDWC2'
  - ②  $Correction_y(C_y)$  = the average of the difference between 'YDWC1' and 'YDWC2'
- Event selection:  $|\Delta_x - C_x| < 2cm$  and  $|\Delta_y - C_y| < 2cm$ , , i.e. we select a very collimated beam. The maximum angle of a muon is:  
$$\theta_{MAX} = \tan^{-1}\left(\frac{2cm}{174cm}\right) = \tan^{-1}(0.011) = 0.66^\circ \text{ degrees}$$

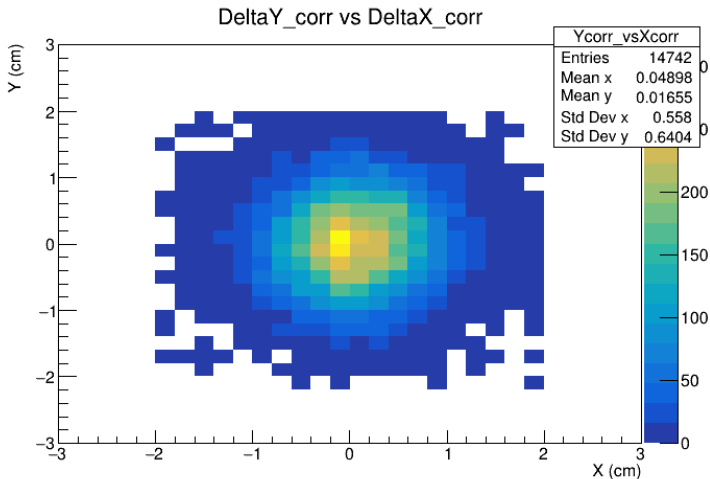

# $\Delta_x$ and $\Delta_y$ DWCs

Left is before cuts on MCounter and PShower, right is after

# Corrected positions

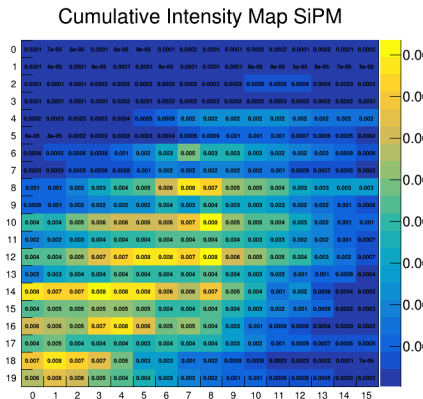

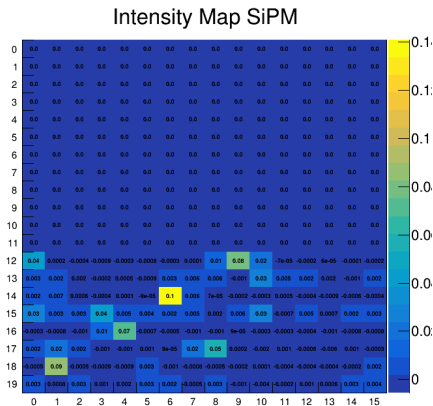

# DWCs after corrections

Left is DWC1 right is DWC2

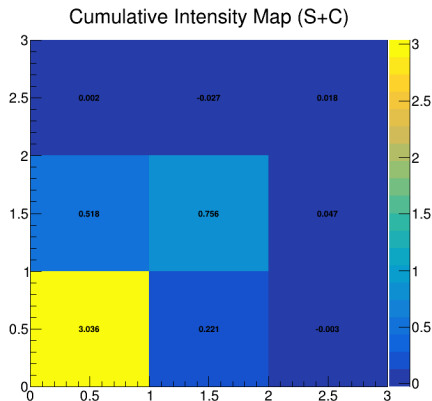

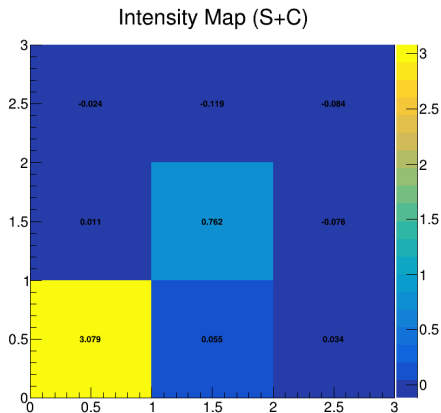

# SiPMs Intensity Maps (after selections)

Left is run 136 event 136, right is the cumulative one (sometimes negative signals)

# Calo Intensity Maps (after selections)

Left is run 136 event 136, right is the cumulative one (sometimes negative signals)

# Issue with run 136

Understand why Cerenkov signal is bigger than the scintillating one

# Issue with run 136

To investigate this: (same for DWC1)

The effect is present only in the X direction
