

Update on Cluster Counting Efficiency Studies with Garfield

- Finer momentum binning
- Use “experimental” instead of “generated” time difference as dead time
- First rough estimate of effect of S/N ratio

K/π separation for $\varepsilon=1$

- $|N_K - N_\pi|/10$
- ▲ $\langle\sigma\rangle/10$
- separation

K/π separation for $\Delta t_{\min} = 0$ ns -- $\theta=0.5$

K/π separation for $\Delta t_{\min} = 0$ ns -- $\theta=1.0$

- Total track length normalized to a drift chamber with 40 layers of 1.2cm high rectangular cells.
- Note: although I like better the definition $\langle\sigma\rangle \equiv \sqrt{\sigma_K^2 + \sigma_\pi^2}$, for the sake of comparison I'm using here $\langle\sigma\rangle \equiv (\sigma_K + \sigma_\pi)/2$
- separation $\equiv |N_K - N_\pi|/\langle\sigma\rangle$

K/π separation vs Δt_{\min}

- Definition:

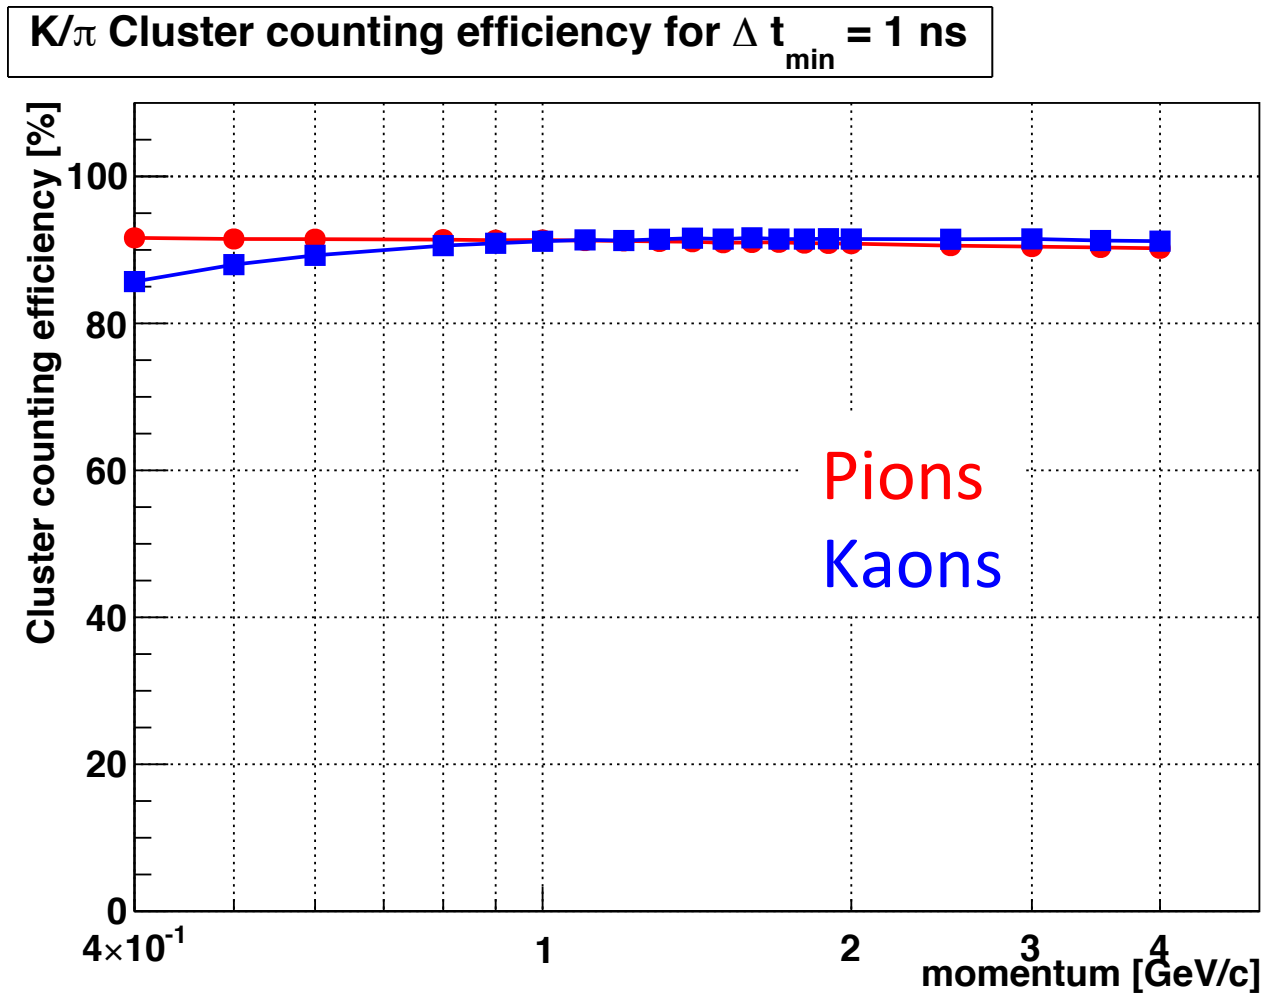

$$\Delta t_{\text{exp}} \equiv t(\text{cluster \# } i) - t(\text{previous found cluster})$$

- In my last presentation, I used

$$\Delta t_{\text{generated}} = t(\text{cluster \# } i) - t(\text{cluster \# } i-1)$$

- Plots in this talk use the experimentally relevant variable Δt_{exp}

$\epsilon(\text{cluster counting})$ vs. p for $\Delta t_{\min} = 1\text{ ns}$

$\epsilon(\text{cluster counting})$ vs. p for $\Delta t_{\min} = 3\text{ ns}$

$\epsilon(\text{cluster counting})$ vs. p for $\Delta t_{\min} = 5\text{ ns}$

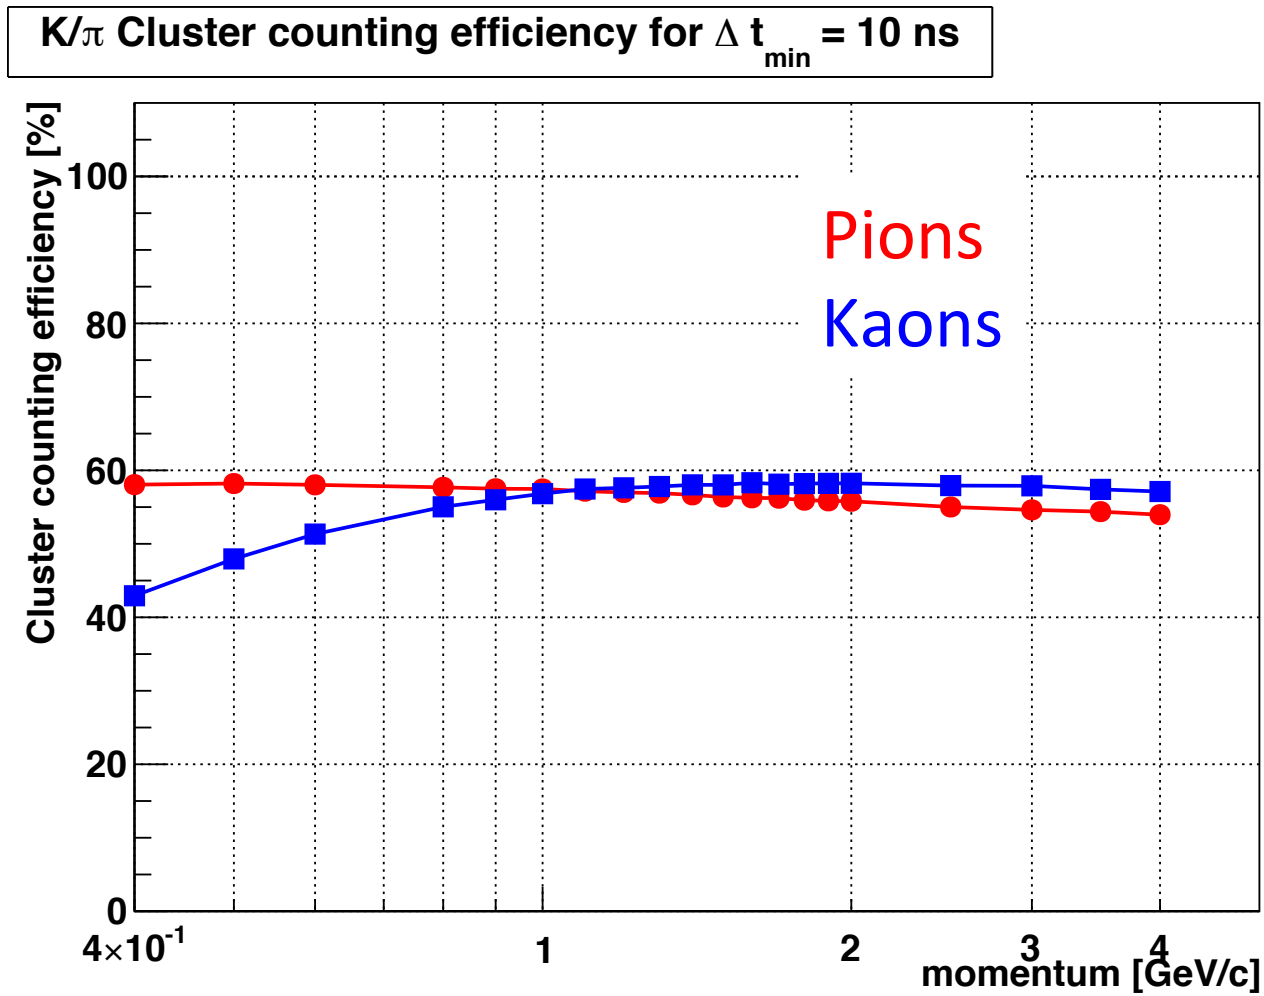

$\epsilon(\text{cluster counting})$ vs. p for $\Delta t_{\min} = 7\text{ ns}$

$\epsilon(\text{cluster counting})$ vs. p for $\Delta t_{\min} = 9\text{ ns}$

$\epsilon(\text{cluster counting})$ vs. p for $\Delta t_{\min} = 10\text{ns}$

K/π separation for $\Delta t_{\min} = 3\text{ ns}$

K/π separation for $\Delta t_{\min} = 3\text{ ns}$ -- $\theta=0.5$

K/π separation for $\Delta t_{\min} = 3\text{ ns}$ -- $\theta=1.0$

- $|N_K - N_\pi|/10$
- ▲ $\langle\sigma\rangle/10$
- separation

K/π separation for $\Delta t_{\min} = 7\text{ ns}$

K/π separation for $\Delta t_{\min} = 7\text{ ns}$ -- $\theta=0.5$

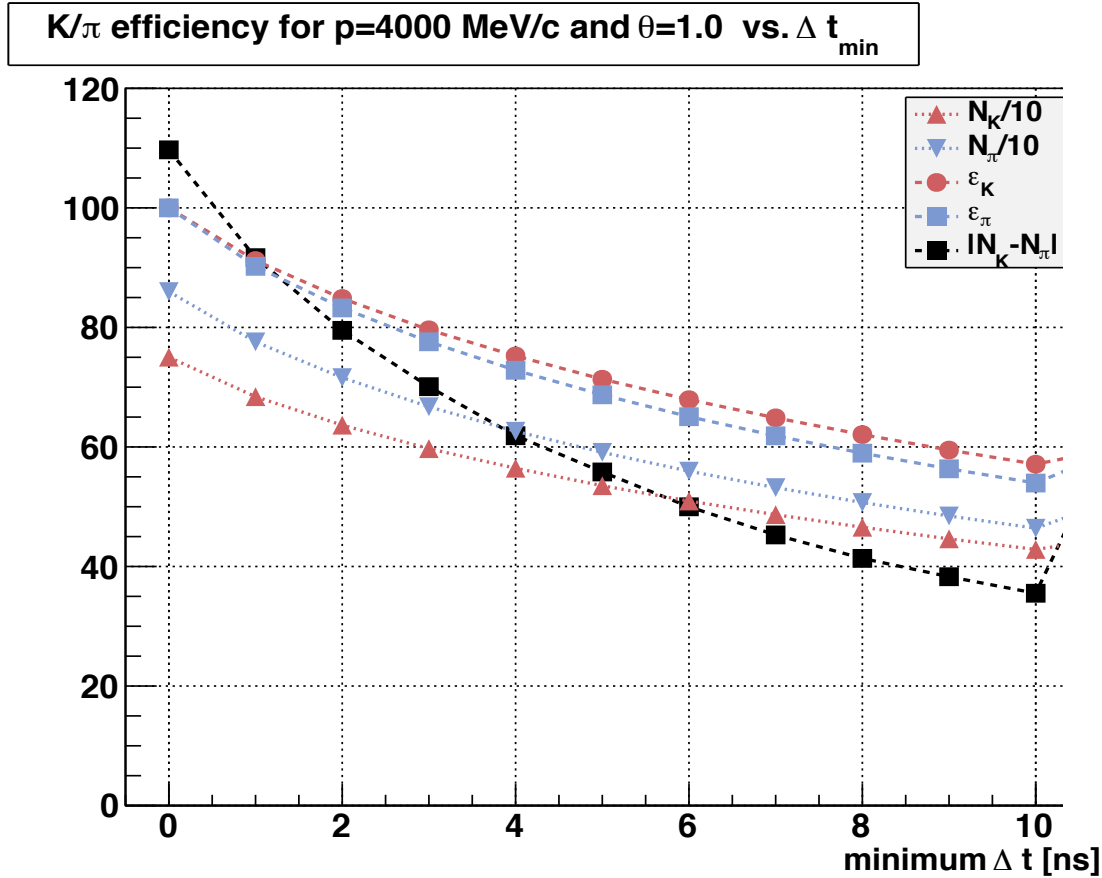

K/π separation for $\Delta t_{\min} = 7\text{ ns}$ -- $\theta=1.0$

- $|N_K - N_\pi|/10$
- ▲ $\langle \sigma \rangle/10$
- separation

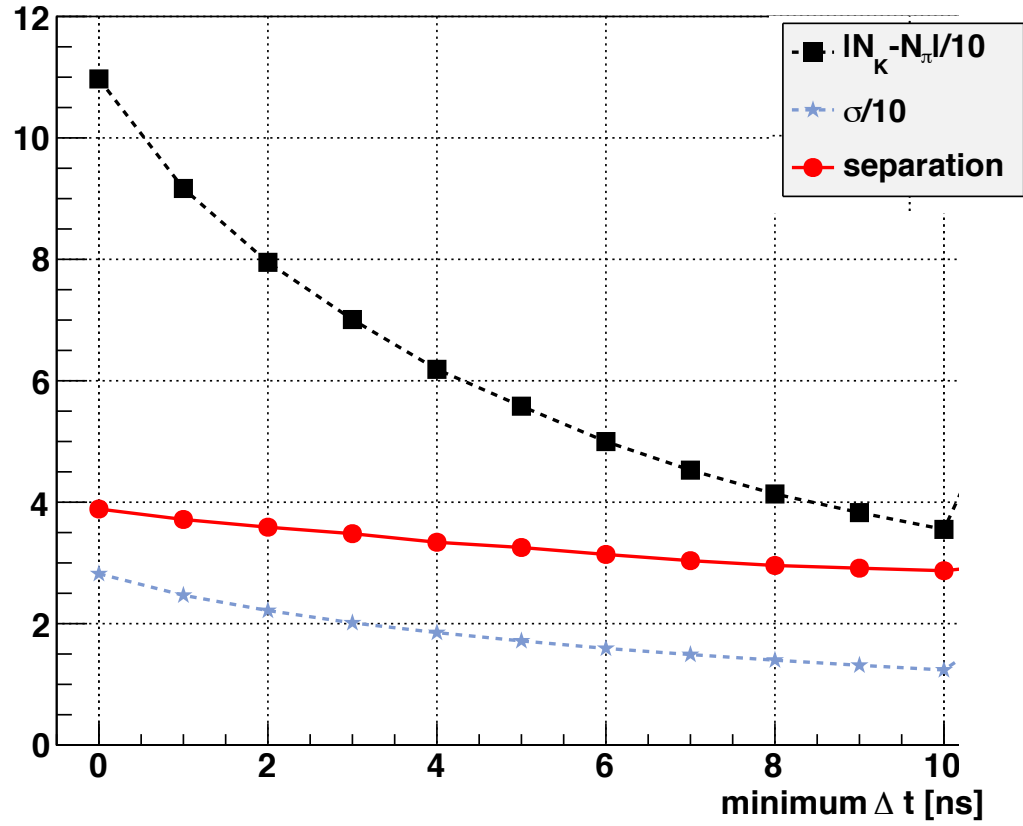

Example: K/π counting vs Δt_{\min} $p=4\text{GeV}/c$

- A small difference in pion vs. kaon efficiency generates a decrease of $|N_K - N_\pi|$

Example: K/π separation vs Δt_{\min} $p=4\text{GeV}/c$

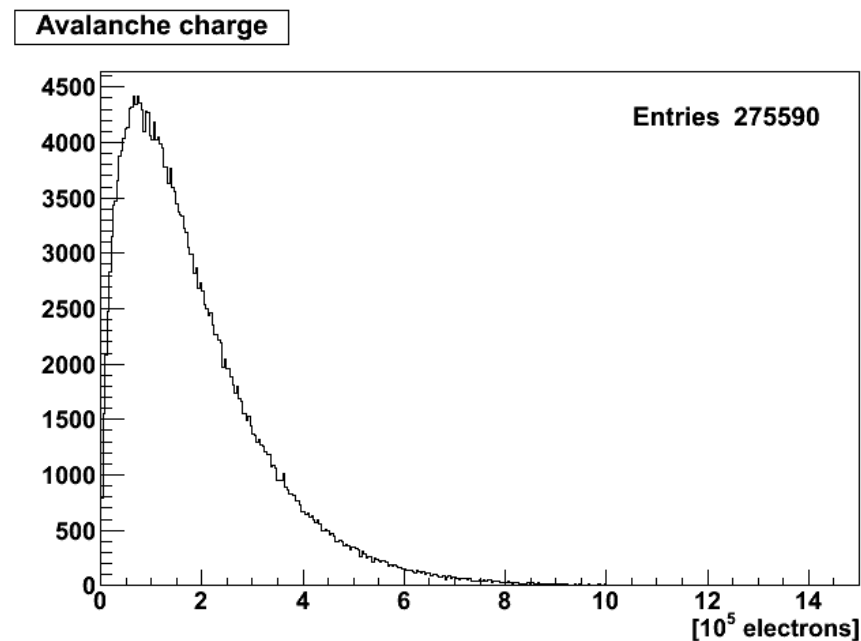

K/ π separation for $p=4000\text{ MeV}/c$ and $\theta=1.0$ vs. Δt_{\min}

- A small difference in pion vs. kaon efficiency generates a decrease of $|N_K - N_\pi|$
 - $\Delta N=110$ @ $\Delta t_{\min}=0\text{ns}$ \rightarrow $\Delta N=36$ @ $\Delta t_{\min}=10\text{ns}$

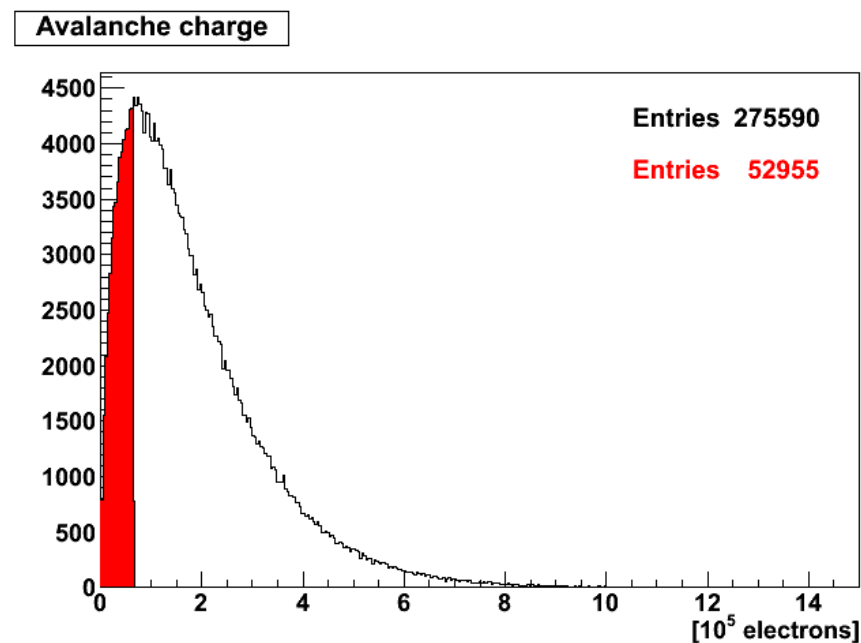

Signal-to-noise Ratio

- In addition to the rearming time of the counting algorithm, also the noise level must be taken into account
 - “any algorithm has a threshold”
- Example: charge in the electron avalanche
 - A Polya distribution with mean 1.8×10^5 and $\theta=0.6$

Signal-to-noise Ratio

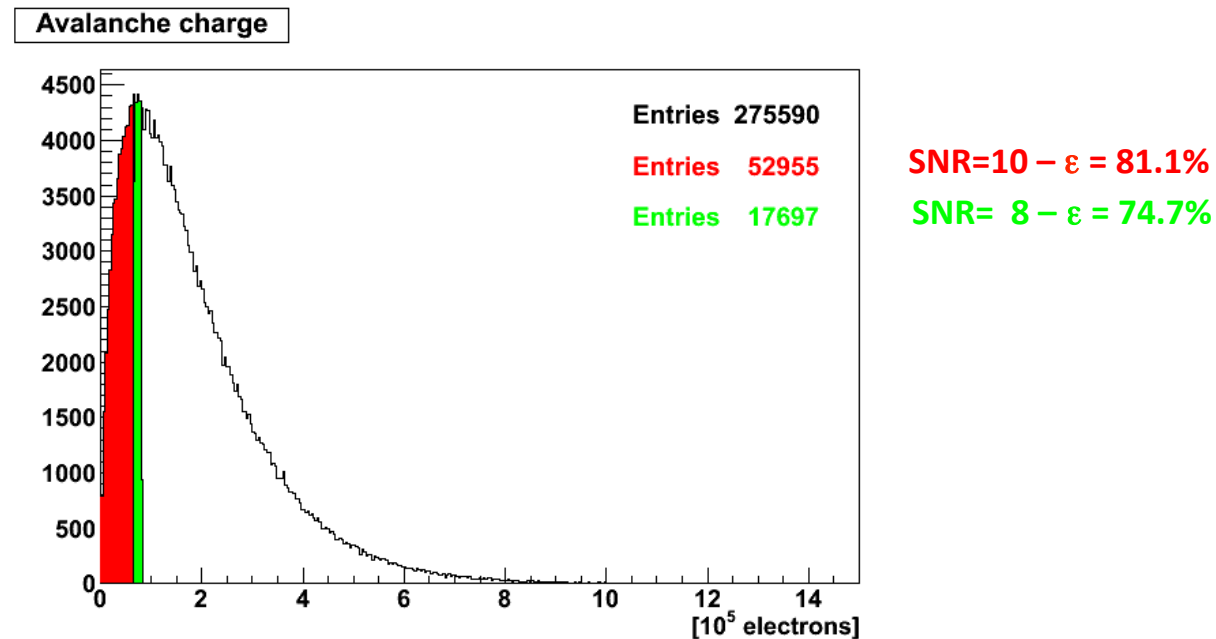

- In addition to the rearming time of the counting algorithm, also the noise level must be taken into account
 - “any algorithm has a threshold”
- Example: charge in the electron avalanche
 - A Polya distribution with mean 1.8×10^5 and $\theta=0.6$

SNR=10 - ϵ = 81.1%

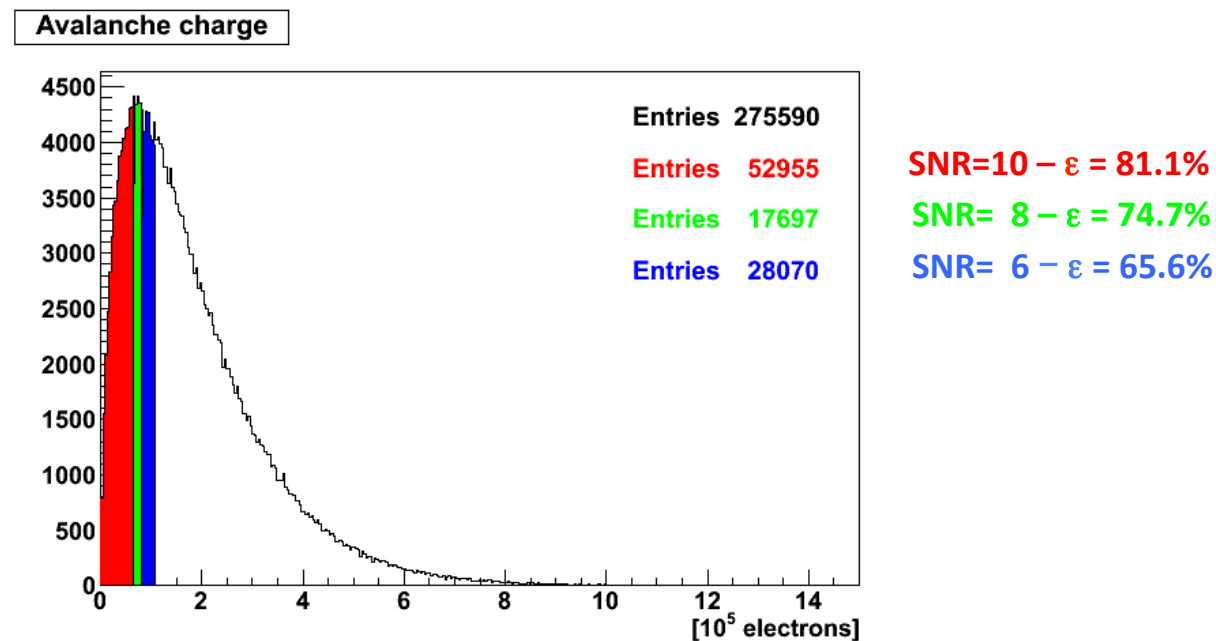

Signal-to-noise Ratio

- In addition to the rearming time of the counting algorithm, also the noise level must be taken into account
 - “any algorithm has a threshold”
- Example: charge in the electron avalanche
 - A Polya distribution with mean 1.8×10^5 and $\theta=0.6$

Signal-to-noise Ratio

- In addition to the rearming time of the counting algorithm, also the noise level must be taken into account
 - “any algorithm has a threshold”
- Example: charge in the electron avalanche
 - A Polya distribution with mean 1.8×10^5 and $\theta=0.6$

Efficiency vs SNR

- Typical average single-electron amplitude in prototype 2: **20mV**
 - typical RMS noise: **3.6mV** ⇨ **SNR ~ 5.5 (!)**

Summary

- Minimum time separation among clusters + SNR ratio both affect the detection efficiency (and achievable K/π separation)
- Caveat: analysis shown used *cluster* time separation. When *electrons* are considered, some inefficiency is recovered thanks to diffusion
 - Topic for a future talk
