

Low-x Physics results from CMS

Thursday, 13 September 2012 12:30 (20 minutes)

Summary

We report on recent results on forward and multiple hard jet production in pp collisions at CMS. Correlations between central and forward jet production are studied as well as additional jet radiation in events with dijets at large rapidity separation. Also the forward and very forward directed energy flow in pp and PbPb collisions are presented. Furthermore the inelastic cross-section measurement are discussed briefly.
