

# Regge trajectories in QCD

*Thursday, 13 September 2012 08:30 (20 minutes)*

## Summary

For soft nonsinglet binary processes in diffractive region  $t \ll s$  we show that summing the contributions of the lowest twist operators and all logarithms in QCD leads to a Regge-like amplitude and a fixed singularity in  $j$ -plane. The situation in singlet channel is also discussed.
