PIXIRAD Imaging Counters s.r.l. is an INFN Spin-off introducing an innovative, high quality radiographic sensor with intrinsically and fully digital characteristics.

PIXIRAD is based on **Chromatic Photon Counting** technology and represents a radical leap forward compared to the standard methods currently on the market.

PIXIRAD is able to count individually the incident X-ray photons and to separate them according to their energy (two *color* images per exposure).

The color mode and the very high spatial resolution (50 μm) allow to obtain the maximum ratio between image quality and absorbed dose.

The energy selection of the radiographic beam occurs in real time and single exposure thus allowing to obtain a radiological chromatic imaging and to significantly increase the information content of the images.

Energy range: 2-100 keV

Count rate > 30 GHz (4 tiles)

The individual PIXIRAD block is a two-side buttable semiconductor radiation detector made of a thin pixellated CdTe crystal (the sensor) coupled to a large area VLSI CMOS pixel ASIC (512 \times 476 pixels). PIXIRAD is able to deliver extremely clear and highly detailed images for medical, biological, industrial and scientific applications. 1, 2, 4, 8 tile units are available.

The base block of the PIXIRAD radiological system is realized by coupling with the *flip-chip bonding (bump-bonding)* technique a thin layer of semi-crystalline cadmium telluride (CdTe) to a matrix of 512×476 microcircuits (ASIC CMOS) able to count the absorbed X-ray photons in each pixel of the CdTe sensor.

The system therefore has a hybrid architecture in which the sensor and readout electronics are manufactured and processed separately. The sensor is segmented with the same ASIC geometry.

Starting from the base block, a complete imaging system is obtained by coupling a number of blocks along one direction and then operating in slot-scanning imaging mode or, in near future, along both directions, and operating in full-field imaging mode.

In the digital radiography market PIXIRAD is an innovative, high quality system being:

- intrinsically digital
- noise free, due to the photon counting technique
- with optimal values of contrast and spatial resolution
- with high frame rate (~100 frame/sec)
- with capability to separate the image in various color components depending on the incident radiation energy
- with capability to operate in dead-time free mode (reading one counter while taking data in the other one)

- Pixel sensor (ACRORAD Co., Ltd.) is a Schottky type diode with electron collection on the pixels
- Large area: $30.96 \times 24.98 \times 0.65$ mm
- Pixel pitch: $60 \mu\text{m}$ (on hexagonal matrix)
- Very low leakage current @400-500V working voltage

CdTe semiconductor characteristics:

Atomic numbers	48, 52
Effective atomic number	50
Density $\rho(\text{g/cm}^3)$	5.85
Band energy (eV)	1.5
Dielectric constant	11
Ionizing energy (eV)	4.43
Resistivity $\rho(\Omega\text{cm})$	10^9
Electron mobility μ_e (cm^2/Vs)	1100
Electrons mean lifetime τ_e (s)	3×10^{-6}
Hole mobility μ_h (cm^2/Vs)	100
Holes mean lifetime τ_h (s)	2×10^{-6}
$(\mu\tau)_e$ (cm^2/V)	3.3×10^{-3}
$(\mu\tau)_h$ (cm^2/V)	2×10^{-4}

The CMOS VLSI chip has an active area of $30.7 \times 24.8 \text{ mm}^2$, organized on a matrix of 512×476 pixels.

The chip integrates more than 350 million transistors. Each pixel incorporates a hexagonal electrode (top metal layer) connected to a charge amplifier which feeds two discriminators and two 15-bit counters.

To reduce unavoidable variations of the DC level between the pixels, a self-calibration circuit has been implemented in each pixel. In this way a global threshold per discriminator can be applied to the entire matrix.

Matrix organization: honeycomb arrangement with a $60 \mu\text{m}$ horizontal pitch and vertical pitch of $51.96 \mu\text{m}$.

Acquisition: 2 color reading (2 thresholds, 2 counters) or, alternatively, counting in one counter while reading the other one (dead-time free mode).

Pixel characteristics

Shaped pulse duration (at the base)	1 μs (adjustable)
Linear range	> 3000 electrons
Saturation level	> 6000 electrons
Equivalent noise (ENC)	50 electrons (rms)
Residual offset after auto-calibration	± 30 electrons
Maximum number of counts before reading	32768
Input signal	positive or negative
Possibility to disable, swap, by-pass pixel	user-selectable

Pixel reading

Serialization of columns for best readout time	16, 32, 64, 128
Max readout clock frequency	200 MHz
Readout time for 32 data outputs = 16 columns serialized (16 columns x 476 pixels x 15 bits x 5 ns)	< 0.6 ms
Readout time for 16 data outputs = 32 columns serialized	< 1.2 ms
Readout time for 8 data outputs = 64 columns serialized	< 2.3 ms

PIXIRAD Imaging Counters s.r.l. is currently developing innovative, high quality X-ray imaging sensors based on Chromatic Photon Counting technology, with intrinsic and fully digital characteristics.

PIXIRAD is able to deliver extremely clear and highly detailed images for medical, biological, industrial and scientific applications.

Imaging systems with 1, 2, 4, 8 tile units are available:

- PIXIRAD-1 ($3 \times 2.5 \text{ cm}^2$)
- PIXIRAD-2 ($6 \times 2.5 \text{ cm}^2$)
- PIXIRAD-4 ($12.1 \times 2.5 \text{ cm}^2$)
- PIXIRAD-8 ($24.2 \times 2.5 \text{ cm}^2$, under test)
