

XV International Workshop  
On Neutrino Telescope  
March 12, 2013

# Reactors antineutrino anomalies and searches for sterile neutrinos in Europe

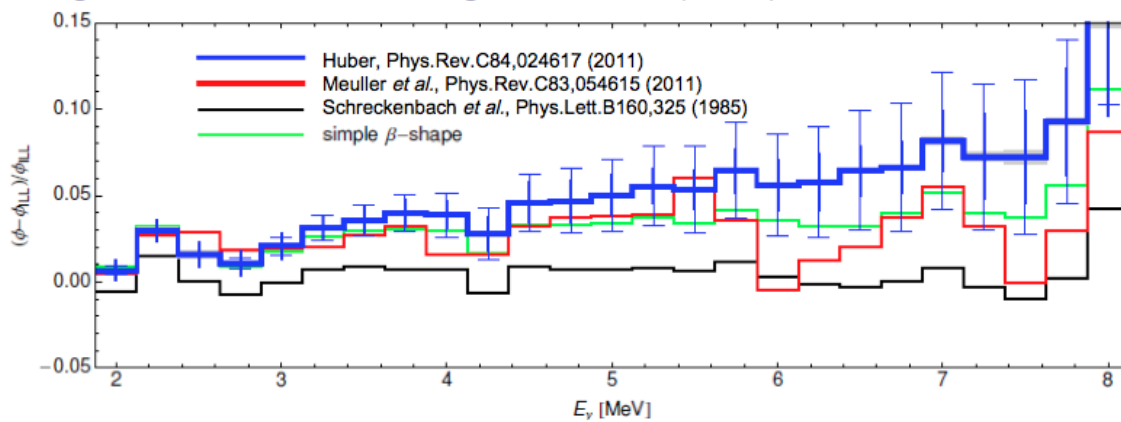

Michel Cribier  
CEA/DSM Irfu/SPP & APC-Paris

# Need a fourth neutrino ?

# Reevaluation of antineutrino spectrum emitted by reactors

- ❖ Based on same  $\beta$  spectrum measured by Schreckenbach et al.
  - at ILL in 1985
- ❖ Input of recent nuclear data bases
  - Improved reactor  $\nu$  spectrum
  - **+ 3.5 %**

## ❖ Higher IBD X-section

- decreasing  $n$  lifetime
- **+ 1%**

## ❖ Long life isotopes

- **+ 1%**

Phys. Rev. C83, 054615 (2011)  
Phys. Rev. C84, 024617 (2011)

# The Reactor Antineutrino Anomaly

- ❖ Reanalysis of the 19 previous experiments at reactors < 100 m
  - G. Mention et al.  
*Phys. Rev. D83, 073006 (2011), arXiv:1101.2755*
  - $R = 0.943 \pm 0.023$
  - Light sterile neutrinos : A White Paper  
*arXiv:1204.5379*
- ❖ Treatment of correlations between experiments
  - similar techniques/detectors
  - same reactors
  - same ILL  $\nu$  spectrum
- ❖ An overall deficit :  $R^{(meas/pred)} = 0.927 \pm 0.023$

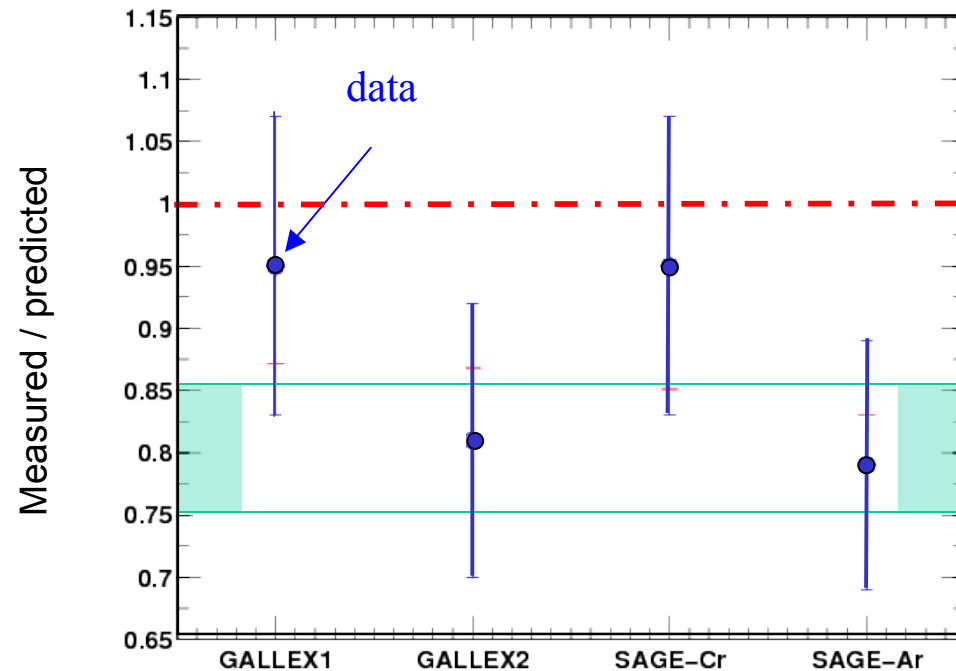

# The Gallium Anomaly

- ❖ C. Giunti & M. Laveder  
*Phys. Rev C 83, 065504 (2011)*  
*arXiv 1210.5715*
- ❖ Calibration of solar neutrino experiments
  - distance  $\lesssim 1$  m
  - with low energy neutrinos
- ❖ Gallex
  - 2  $^{51}\text{Cr}$   $\nu$  sources  $\langle L \rangle = 1.9$  m
- ❖ Sage
  - 1  $^{51}\text{Cr}$   $\nu$  source
  - 1  $^{37}\text{Ar}$   $\nu$  source  $\langle L \rangle = 0.6$  m
- ❖ Overall deficit :  **$R = 0.75 - 0.86$**

	G1	G2	S1	S2	$\langle R \rangle$
$R_B$	$0.95^{+0.11}_{-0.11}$	$0.81^{+0.10}_{-0.11}$	$0.95^{+0.12}_{-0.12}$	$0.79^{+0.08}_{-0.08}$	$0.86^{+0.05}_{-0.05}$
$R_{HK}$	$0.85^{+0.12}_{-0.12}$	$0.71^{+0.11}_{-0.11}$	$0.84^{+0.13}_{-0.12}$	$0.71^{+0.09}_{-0.09}$	$0.77^{+0.08}_{-0.08}$
$R_{FF}$	$0.93^{+0.11}_{-0.11}$	$0.79^{+0.10}_{-0.11}$	$0.93^{+0.11}_{-0.12}$	$0.77^{+0.09}_{-0.07}$	$0.84^{+0.05}_{-0.05}$
$R_{HF}$	$0.83^{+0.13}_{-0.11}$	$0.71^{+0.11}_{-0.11}$	$0.83^{+0.13}_{-0.12}$	$0.69^{+0.10}_{-0.09}$	$0.75^{+0.09}_{-0.07}$

$\langle R \rangle$  with different  $\sigma$  for  $\nu_e(^{71}\text{Ga}, ^{71}\text{Ge})$

# Reactors and Gallium

**The no-oscillation hypothesis is disfavored at 99.8% CL**

# Low energies anomalies

C. Giunti, M. Laveder, Y.F. Li, D.Y. Liu, H.W. Long, arXiv 1210.5715

# Waiting for Planck's result...

From M. Archidiacono et al.  
*arXiv 1302.6720*

- ❖ So far Cosmology prefers :
  - $\approx$  one extra  $\nu$  (3+1)
  - with a sub eV mass
- ❖ Tension between exper. datas included with WMAP9 in analysis
  - ACT vs SPT
- ❖ Correlations with other cosmological parameters
- ❖ Very soon Planck...

# on P. Vogel's et al. new reanalysis

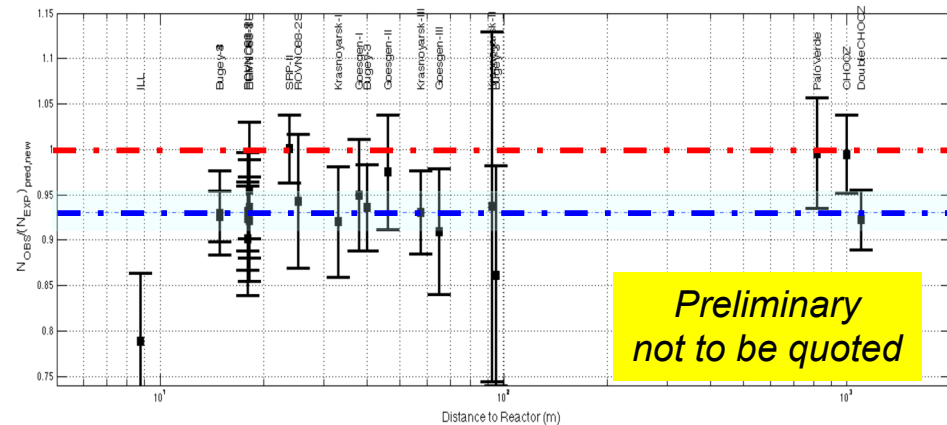

C.Zhang, X.Qian & P.Vogel ; arXiv:1303.0900v1

- ❖ First quick comments from Saclay's group
  - which IBD cross-section used ?
  - which neutrino flux ? with P. Huber's improvements ?
  - wrong error used by authors in RAA
    - 0.027 instead of 0.023
    - taken wrongly as fully correlated : only ILL electron data is fully correlated
  - Saclay preliminary similar reanalysis :  $\approx 0.93 \pm 0.022 : > 3 \sigma \text{ effect}$
  - short written answer in preparation

❖ New reanalysis of old 19 reactors antineutrinos experiments adding :

- $\sin^2(2\theta_{13}) = 0.089 \pm 0.011$
- allow to use Chooz, Palo Verde, Double Chooz (Gd & Hyd. datas)
- $\Rightarrow R = 0.959 \pm 0.009(\text{stat.}) \pm 0.027(\text{react. flux}) : 1.4 \sigma \text{ effect}$

# An intriguing result

## 1<sup>st</sup> ILL experiment

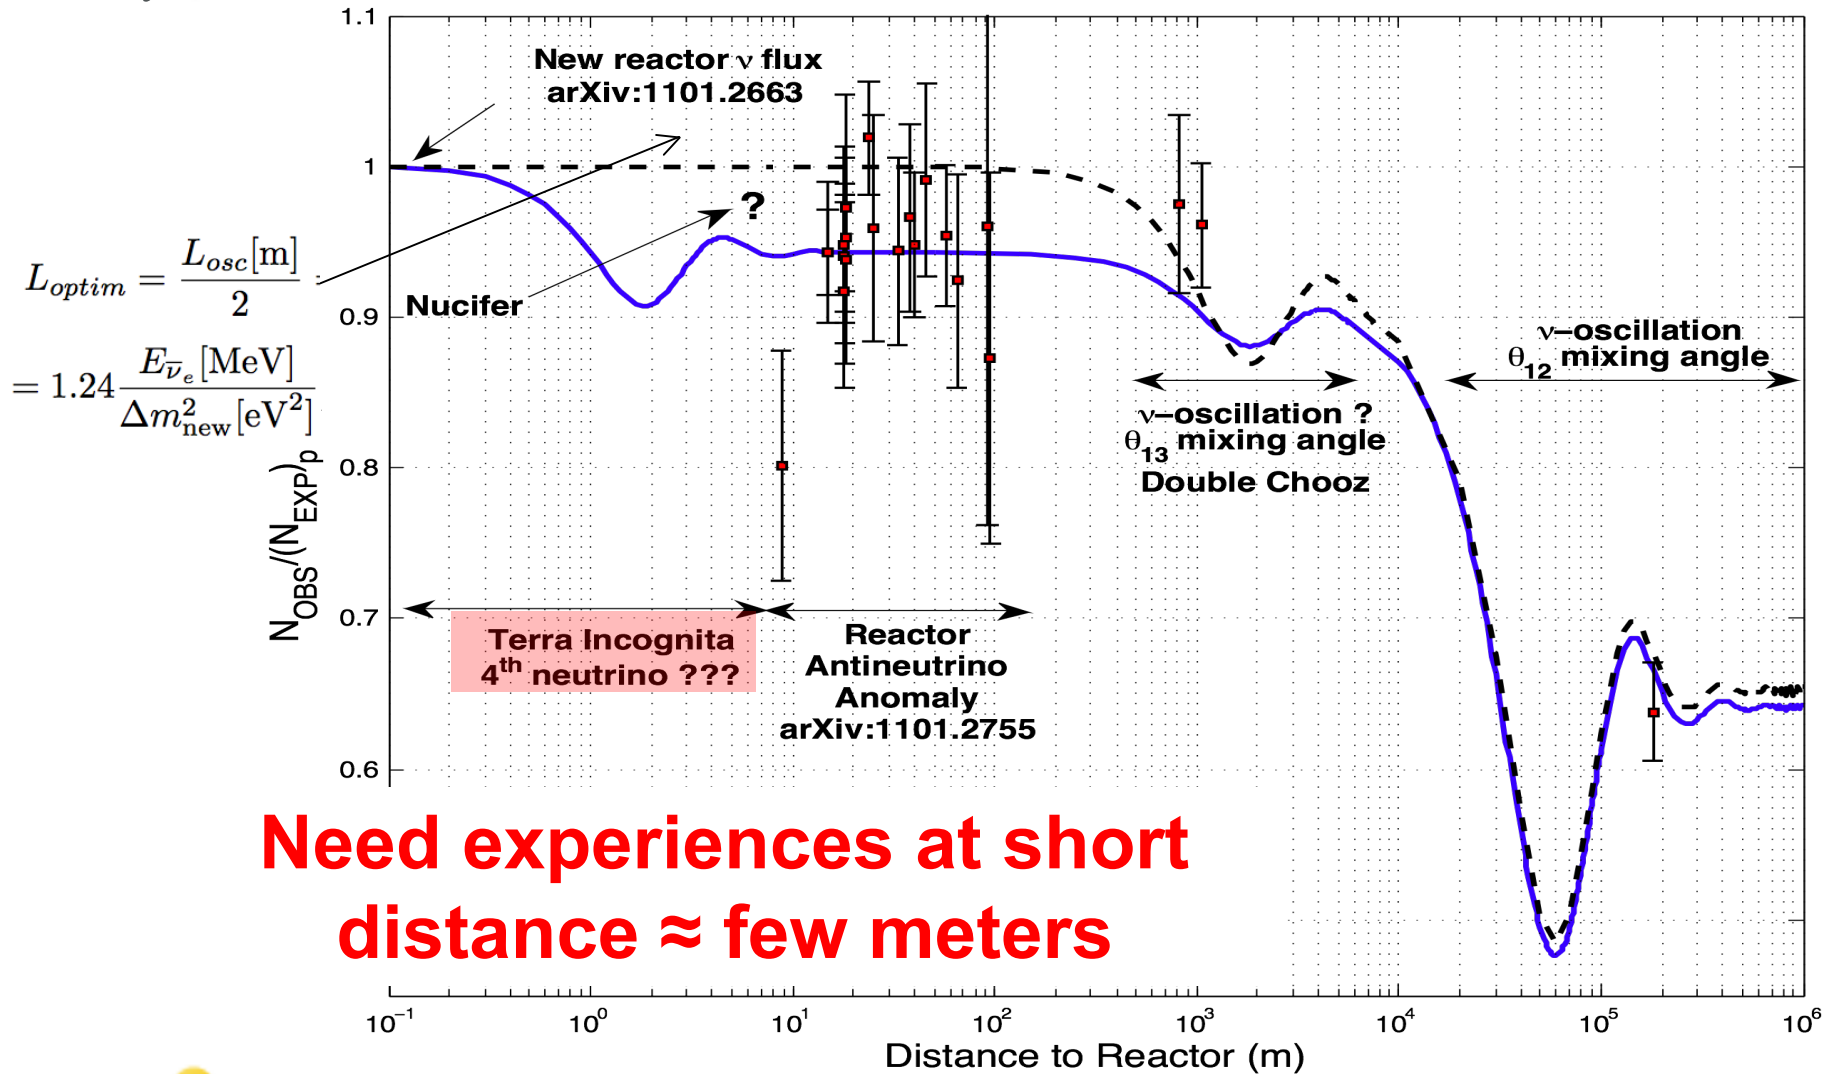

- ❖ Performed in 1980 at ILL reactor in Grenoble @ < 9 m
- ❖ Reevaluation in 1990 by 9.5 % of the reactor power
  - really a « blind analysis »
- ❖ Reanalysed in 1995 : A. Hoummada et al., Appl. Radiat. Isot. 46 (1995) 449

Fit with  
 $\Delta m^2 = 2.3 \text{ eV}^2$   
 $\sin^2(2\theta) = .24$

# We need new experimental input !

**Need experiences at short distance  $\approx$  few meters**

# Many experimental projects

Sources	Reactors	Beams
<b>CeLAND</b> $^{144}\text{Ce}$ 75 kCi@ KamLAND funded	<b>Nucifer</b> 7 m from Osiris reactor Data taking	<b>IsoDAR</b> Cyclotron to produce $^8\text{Li}$ arXiv:1205.4419

# Some of the proposed experiments

# Nucifer

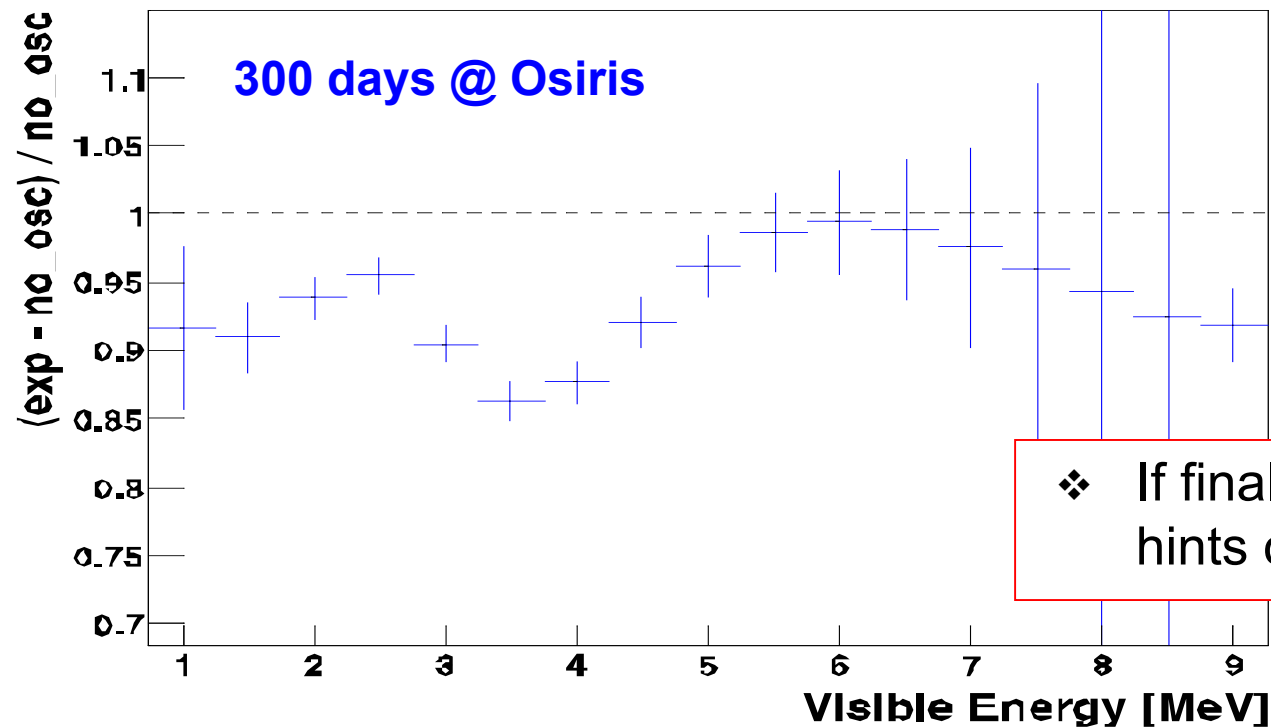

- ❖ Osiris research reactor @ Saclay  
70 MW, 20%  $^{235}\text{U}$  and compact core
- ❖ Very short base line : 7m
- ❖ Detector optimized for monitoring of reactor
  - 850 kg Gd-LS :  $\approx$  350 interactions/day

# Nucifer and sterile neutrinos

*Many difficulties so far :*

- ❖ Bad liquid scintillator
  - Replace by Double Chooz LS
- ❖ Unexpected high  $\gamma$  bkgds
  - 6-7 MeV from  $^{16}\text{O}(n,p)^{16}\text{N}$
  - New lead wall installed
- ❖ Osiris maintenance
  - At least 6 months stop

# Stereo @ ILL Grenoble

- ❖ 50 MW compact core  
 $\phi=40\text{cm}$ ,  $h=80\text{ cm}$
- ❖ Short baseline : 7 - 9 m
- ❖ Pure  $^{235}\text{U}$  spectrum

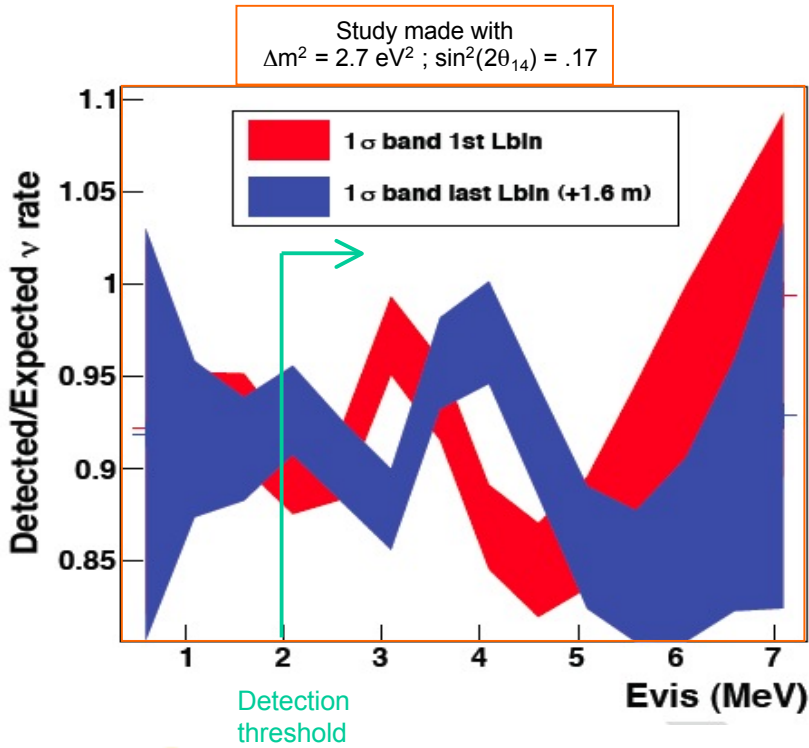

- ❖ Large passive and active shielding
- ❖ 15 m.w.e. overburden
- ❖ Pulse Shape Discrimination
- ❖ Segmented detector

Front shielding  
Stereo Detector in the shadow of front wall

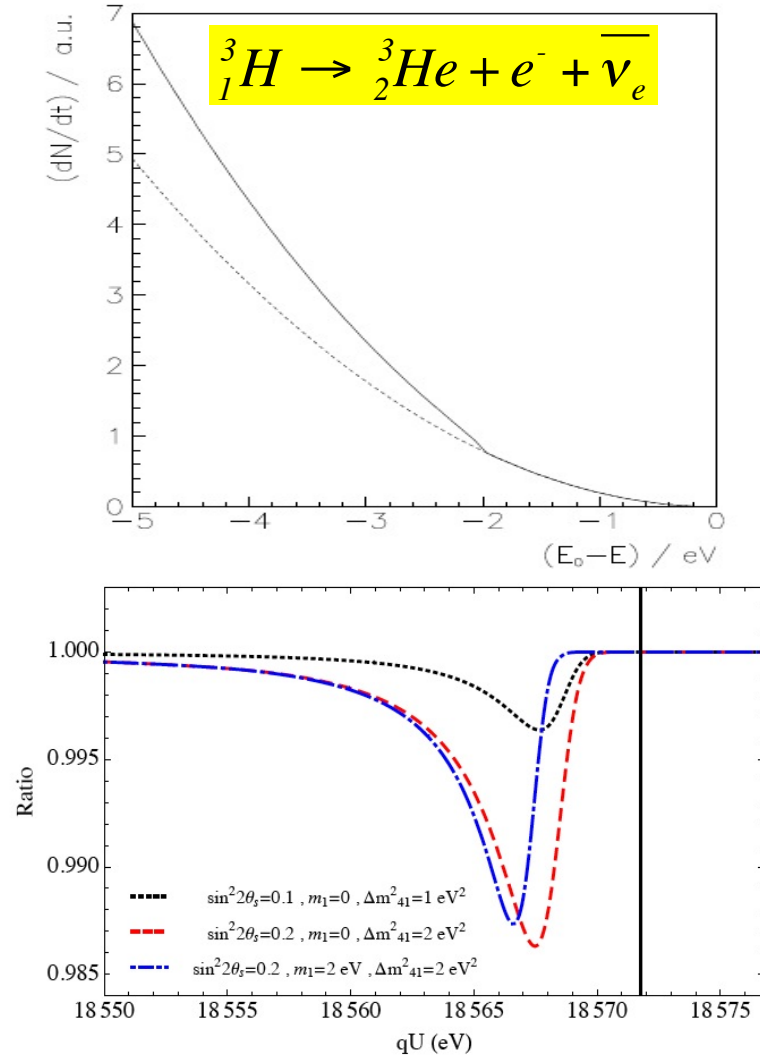

# Stereo detector and signal

15 cm Boron doped CH<sub>2</sub>  
 Light readout from top  
 20 cm acrylic buffer  
 5 independent cells filled with Gd-doped LS

Crown of 30 cm of LS  
 for leakage reduction  
 + active shielding

# Katrin

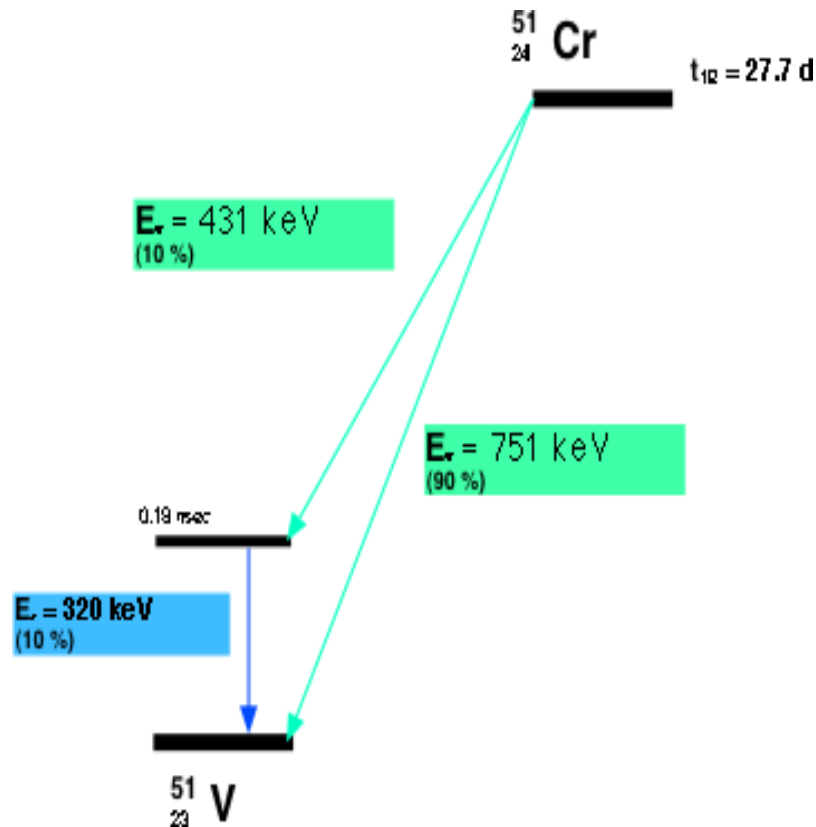

- ❖ a 4<sup>th</sup> neutrino :  
- displacement of end point

- ❖ sensitivity after 3 years

# $^{51}\text{Cr}$

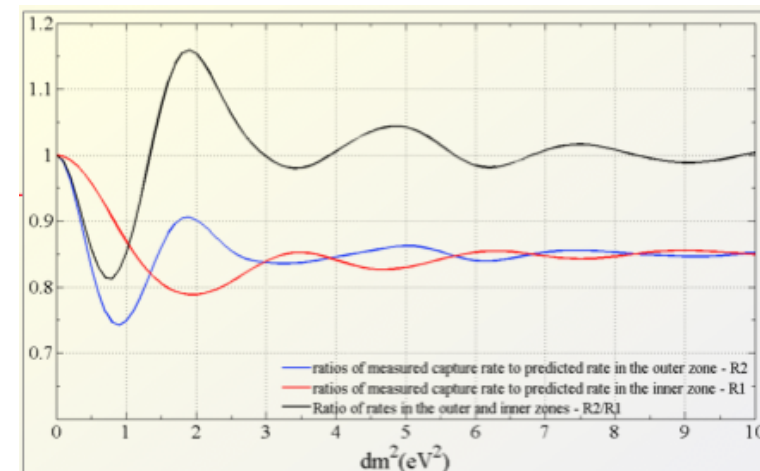

- ❖ Used in Gallex & Sage
  - Calibration solar  $\nu$  experiments
  - Need enriched Cr in  $^{50}\text{Cr}$
- ❖ Irradiation in intense thermal neutron flux
  - In Russia, Oak-Ridge ?
- ❖ Mean-life : 40 days
- ❖ In liquid scintillator detector
  - Elastic scattering
  - $^7\text{Be}$  solar  $\nu$  as bkgd

# The Baksan proposal

- ❖ V. Gavrin et al.
  - arXiv:1006.2103
- ❖ New Gallium experiment
  - well known technology
  - zone 1 : 8 t
  - zone 2 : 42 t
- ❖ Source
  - $^{51}\text{Cr}$  - 3 Mci
  - 50 days irradiation in research reactor SM3
- ❖ Well known background
  - Solar neutrinos
- ❖ Partial sensitivity to the reactor anomaly

# A proposed search for a fourth neutrino with a PBq anti-neutrino source

*M. Cribier, M. Fechner, T. Lasserre, D. Lhuillier, A. Letourneau, G. Mention, D. Franco, S. Schoenert, V. Kornoukhov*

**Phys. Rev. Lett. 107, 201801 (2011)**

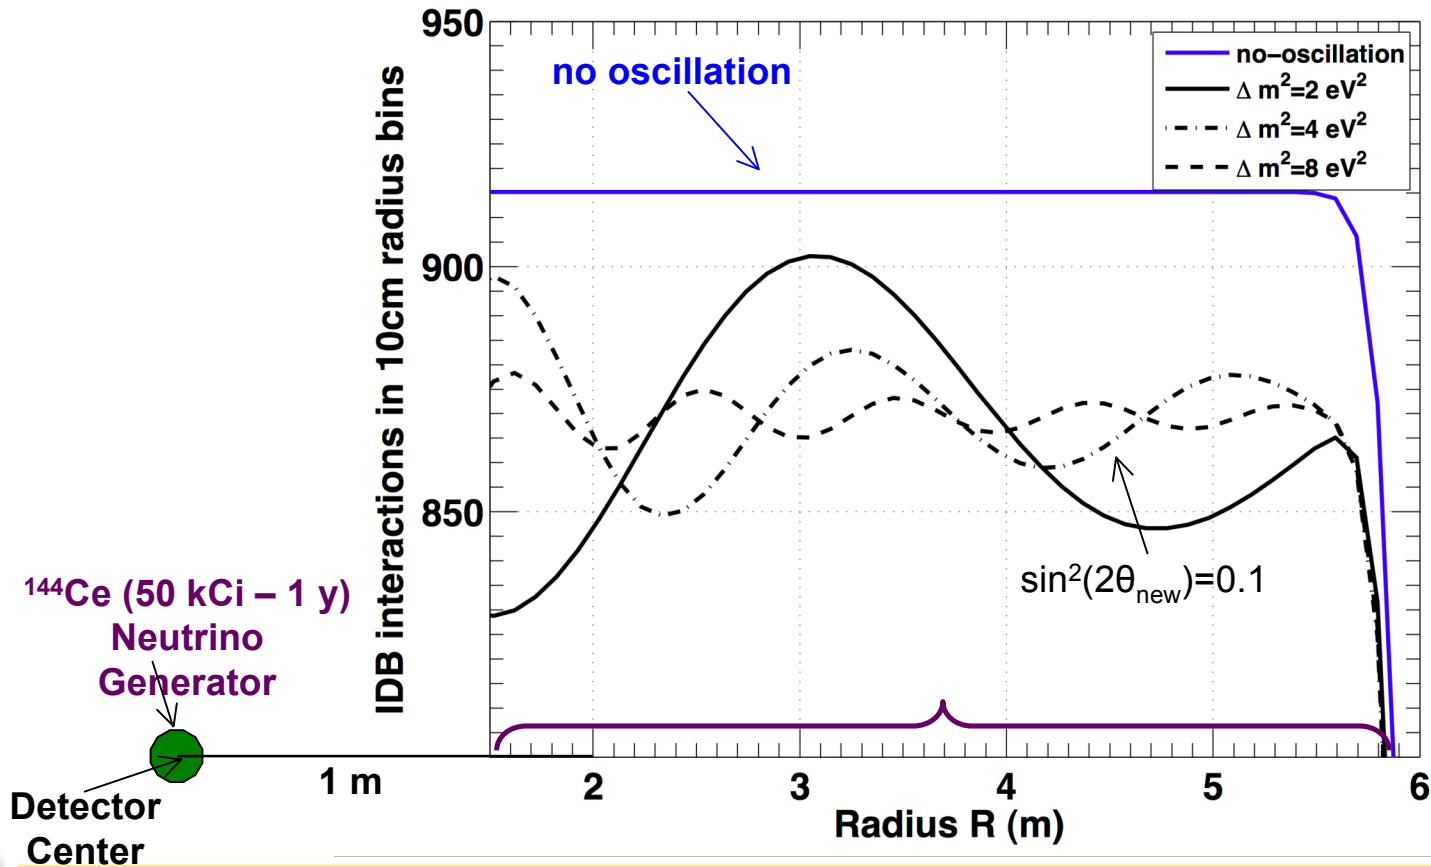

# Concept : Oscillometry

# An Unambiguous Proof

$$\frac{dN}{dR}(R,t) \propto \frac{A(t)}{4\pi R^2} \times \langle \sigma \rangle \times N_p \times \cancel{4\pi R^2} \times P_{ee} \left( \frac{\Delta m^2 R}{\langle E \rangle} \right)$$

# Advantages of antineutrinos

- ❖ Antineutrino detection via inverse beta-decay
  - high cross section ( $\approx 10^{-43}$  cm<sup>2</sup>) : from **MCi to kCi** !
  - antineutrino must have  **$E_{\bar{\nu}} > 1.8$  MeV**
  - long Lifetime : more easy production, transport and measurement
  - e<sup>+</sup>-n delayed coincidence : **background free experiment**
  
- ❖ Antineutrino source must involve
  - a long-lived low-Q nucleus...
  - ... that decays into a short-lived high-Q nucleus
  - possible candidates
    - <sup>90</sup>Sr-<sup>90</sup>Y , **<sup>144</sup>Ce-<sup>144</sup>Pr** , <sup>106</sup>Ru-<sup>106</sup>Rb , <sup>42</sup>Ar-<sup>42</sup>K
  - have been already produced

# $^{144}\text{Ce}$ - $^{144}\text{Pr}$

- ❖ Cerium, Praseodymium, Neodymium
- ❖ Mean life : 411.01 d ; -5% in 3 weeks
  - 1<sup>st</sup> forbidden, non unique decay
  - $^{144}\text{Nd}$  : 60 protons, 84 neutrons
  - nearest magic number : 82 neutrons
- ❖ 75 kCi (2.77 PBq)
  - 23.55 g  $^{144}\text{Ce}$
  - $\approx 9.0$  kg of  $\text{CeO}_2$
- ❖ 75 kCi  $\Rightarrow$  599 W
  - $\langle \text{power} \rangle_{1\text{y}} = 352$  W
  - 7.90 W/kCi
- ❖ A well identified background
  - $\gamma$  @ 2.186 MeV ; BR: 7 ‰
  - need a  $10^{-12}$  reduction

# Spectrum of $^{144}\text{Pr}$ antineutrinos

- ❖ 48.75 % of antineutrinos emitted above IBD threshold
- ❖ Forbidden decay => uncertainties on end of  $\nu$  spectrum
- ❖ Measure  $\beta$  spectrum of pure  $^{144}\text{Pr}$  sample after separation from  $^{144}\text{Ce}$

## 2-D imprint in $E_\nu, R$ space

$$\frac{d^3 N(R, E_\nu, t)}{dR dE_\nu dt} = A_0 \times n \times \sigma(E_\nu) \times S(E_\nu) \times P(R, E_\nu) \times e^{-t/\tau_{ce}}$$

# Making an antineutrino generator

# Scheme of production

VVR-440, storage

TUK-6

Cutting, digestion  
Purex

CeO<sub>2</sub> calcination

# Cerium

## an abundant fission product

- ❖ 1 ton of spent fuel
  - Fission products : 44 kg
  - Rare earth : 15 kg
  - Cerium : 4 kg
  - <sup>144</sup>Ce : 22 g ie 80 kCi
- ❖ Extraction process
  - Displacement chromatography
  - French experts tested at lab scale
- ❖ Need the required industrial capability
  - La Hague type
  - **PA Mayak in Russia** : the only place in the world
- ❖ Constraint on radioactive impurities

# Characteristics of the antineutrino generator

- ❖ Cerium is in the chemical form of  $\text{CeO}_2$ 
  - $^{144}\text{Ce}$  remain mixed with stable Cerium isotope
- ❖ A powder of apparent density  $\approx 4\text{-}5 \text{ g/cm}^3$
- ❖ Operations
  - Mixing of the  $\approx 9 \text{ kg}$  of powder
  - Cold or hot pressing to reach  $\approx 4.5 \text{ g/cm}^3$
  - In hot cell with remote handling
- ❖ The  $^{144}\text{Ce}$ - $^{144}\text{Pr}$  antineutrino generator (AvG)
  - a cylindrical object of  $\approx 15 \text{ cm}$  in diameter
  - Cerium powder enclosed in a steel envelope
  - Compact :  $R \ll L_{\text{osc}}$

# Characteristics of the source

- ❖ 75 kCi = 2.77 PBq
  - $\approx 9$  kg of  $\text{CeO}_2$  ( $\rho = 4 \text{ g/cm}^3$ )
  - 2.0 liters
- ❖ Inner double sealed stainless steel cylinders
- ❖ Cylindrical tungsten shield
  - Densimet<sup>®</sup> 185
  - $18.5 \text{ g/cm}^3$  ; 97%W +Fe,Ni
  - water tight upper cork
  - 47 cm x 47 cm
  - 15 cm width minimum
  - 1.4 ton and ext. surface  $\approx 1 \text{ m}^2$
- ❖ Dose rate (scaled estim. by SPR)
  - 1.5 mSv/h at contact
  - 50  $\mu\text{Sv/h}$  at 1m from shielding
- ❖ Estimated temperature at surface
  - 599 W ; external temp. 38 °C
  - $\approx 125$  °C

# Activity measurements

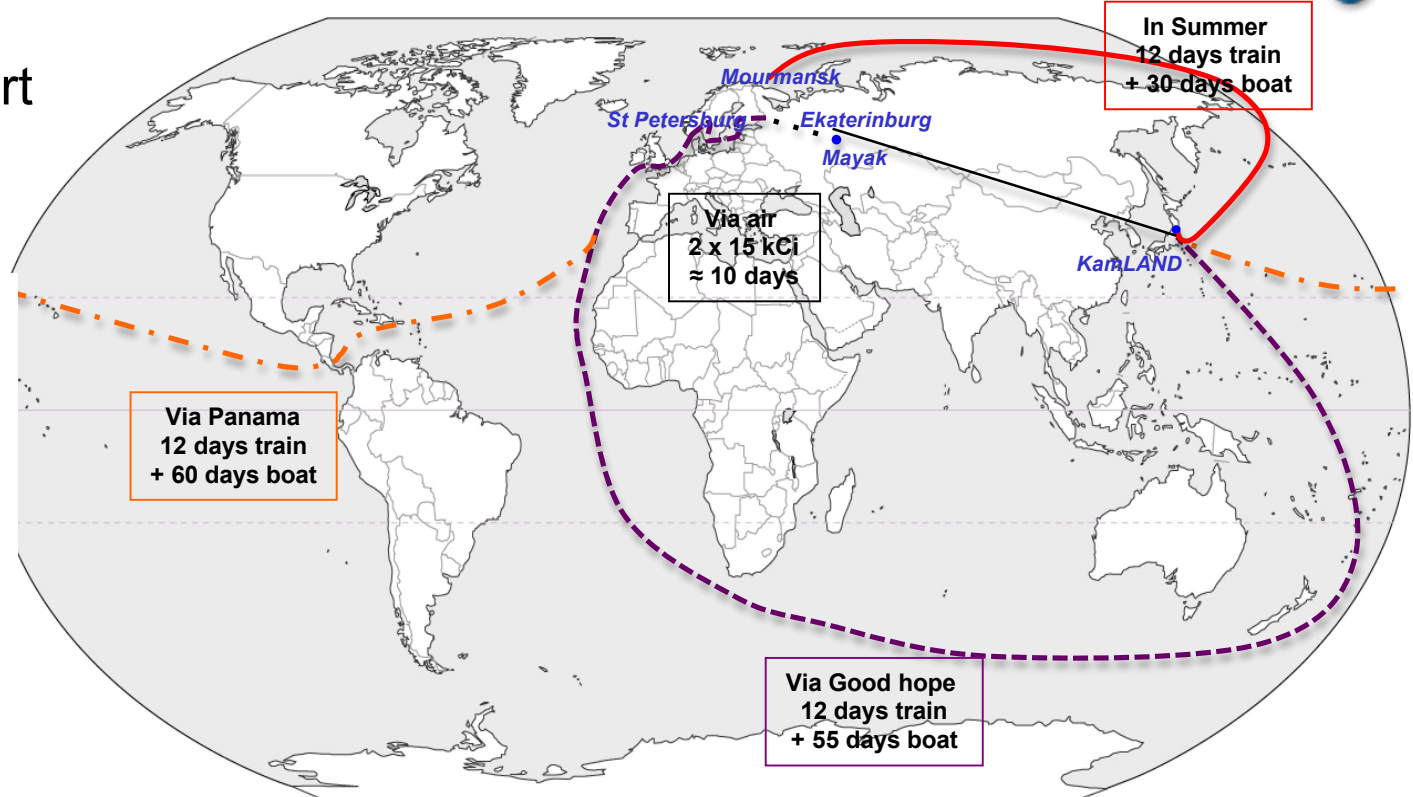

- ❖ Several ideas studied with specialists
  - Differential calorimetry in hot cells
    - 1.5 % accuracy ; need sampling ?
    - Needs 3-4 days for thermalization and counting
    - Technique used in Sage
  - Large calorimeter as used in Gallex
    - measurement prior and after the experiment
  - Common equipment with SoX ?
- ❖ Sampling and counting @ Saclay
  - Sampling, dissolution, large dilution
  - Shipment to external labs
  - Counting in Ge-counter
  - needs  $\ll 1\%$  mass measurements
- ❖ Not a limiting factor for the experiment

# Transportation issues

## ❖ Certified transport container

- 23 tons !

## ❖ Severe constraints based on regulation issued by IAEA

- nothing impossible, but long, bureaucratic and costly
- by air limit for each radioisotope : 16.2 kCi for  $^{144}\text{Ce}$ , 2.4 MCi for  $^{51}\text{Cr}$
- by boat : only limited number of harbours agreed for radioactive materials

# Solving experimental constraints

# Large liquid scintillator detectors ?

- ❖ 3 possible candidates : Borexino, KamLAND, SNO+
  - Interferences with the present experimental programs
  - Technical issues : size of chimney, liquid purity, electronics...
  - Good energy resolution : 5 %
  - Good position resolution :  $\approx 15 \text{ cm} \ll L_{\text{osc}}$

50 kCi  $^{144}\text{Ce}$ - $^{144}\text{Pr}$  source

## + internal initiative by Borexino Collaboration

# CeLAND at KamLAND : 1<sup>st</sup> phase

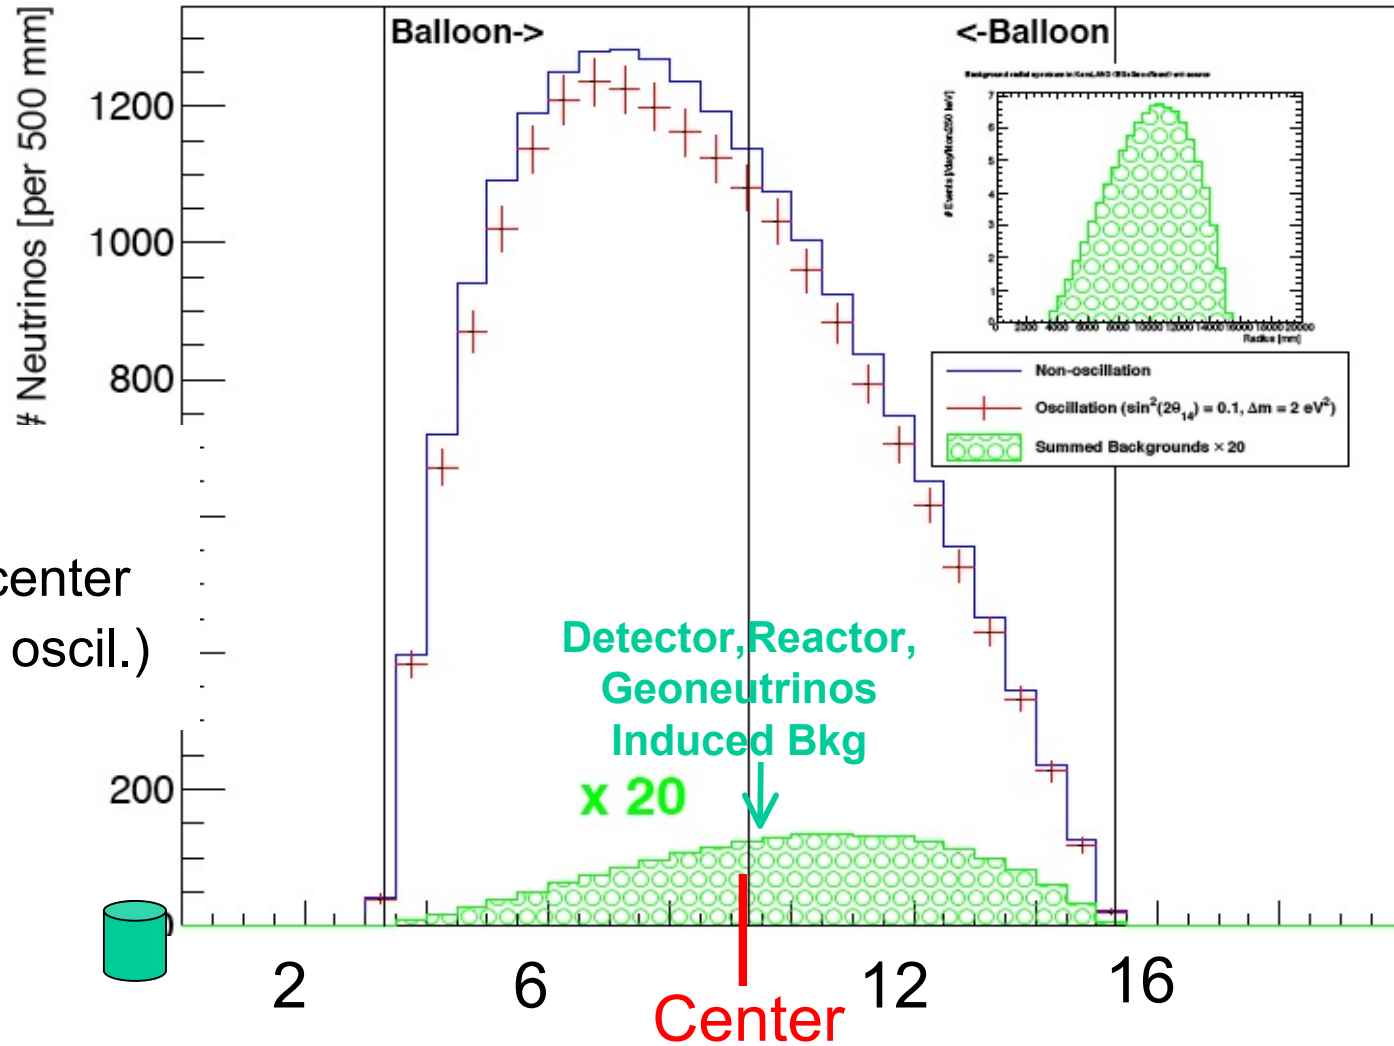

- ❖ Detector mostly studied so far
  - easily applied to Borexino
- ❖ Ranked #1 for future projects
  - a 75 kCi  $^{144}\text{Ce}$  source in spring/summer 2015
- ❖ In the outer water veto
  - 2.5 m from liquid scint.
  - much more easy to handle
- ❖ 6-18 months data taking

# Signal & Backgrounds : 1<sup>st</sup> phase

- ❖ 75 kCi ; 1 year outside @ 9.5 m from center
- ❖ 20000 evts (no oscil.)

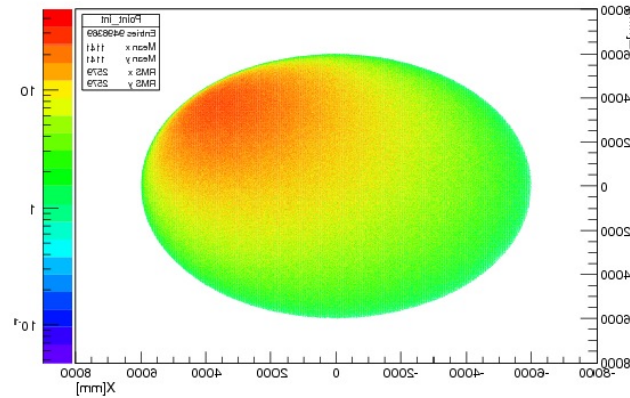

# Clear signal : 1<sup>st</sup> phase

❖  $\Delta m^2 = 2.3 \text{ eV}^2$   
 $\sin^2(2\theta_{14}) = 0.15$

❖ 75 kCi ; 12 months  
 outside @ 9.5 m from  
 center

# CeLAND : 2<sup>nd</sup> phase

- ❖ Several constraints
  - an existing underground detector
  - full of an extra pure mineral oil
    - Avoid contaminations
- ❖ The entrance hole
  - 50 cm in diameter
  - delicate operations to insert the source in center
- ❖ Planned operations
  - if hints of oscillation signal
  - move the same  $^{144}\text{Ce}$  source in the center with an extra shielding
  - 18 more months :  $\approx 56\,000$  evts

# Shielding : 2<sup>nd</sup> solution

- ❖ Central part in Densimet
  - diameter 54 cm to fit through chimney
  - central cavity to host  $^{144}\text{Ce}$   $\text{Ø} \approx 8 \text{ cm}$
  - weight : 2.3 tons
  - more than enough for biological protection
- ❖ A balloon in nylon containing heavy liquid : *Sodium paraTungstate*
  - density :  $2.82 \text{ g/cm}^3$
  - viscosity better than olive oil
  - interaction length @ 2.2 MeV : 8.1 cm
  - external radius : 107 cm
  - weight : 14.2 tons (10.5 t. with buoyancy)

# Fourth neutrino the decisive test

# Full range of parameters : 1<sup>st</sup> phase

<sup>144</sup>Ce-<sup>144</sup>Pr : 75 kCi  
1.5 y outside

95%CL

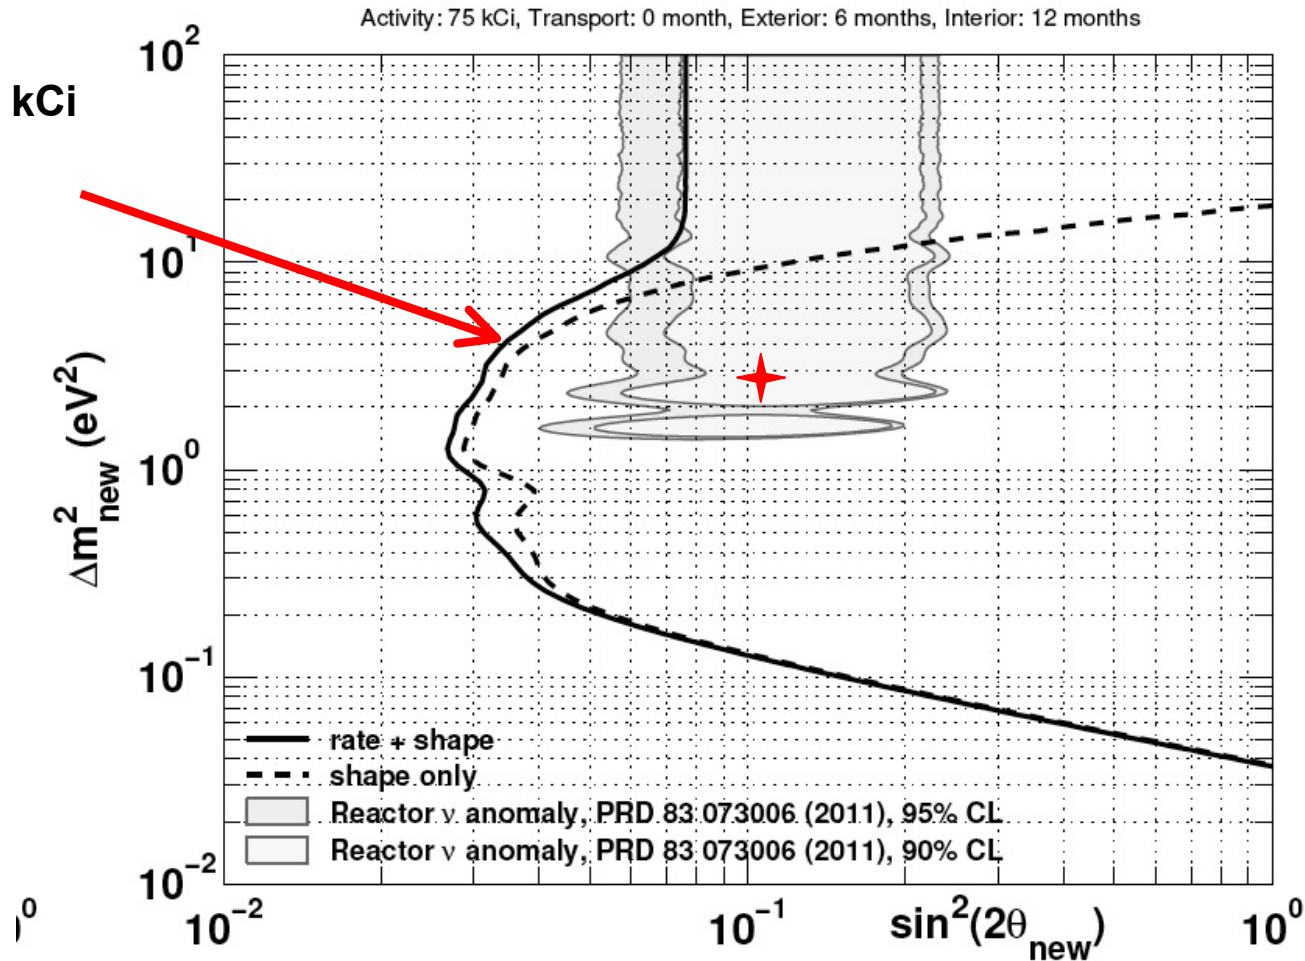

# Full range of parameters : 2<sup>nd</sup> phase

<sup>144</sup>Ce-<sup>144</sup>Pr : 75 kCi  
 0.5 y outside  
 1 y inside  
 95%CL

# Discovery potential

$\sin^2 2\theta = 0.1$  &  $\Delta m^2 = 2.2 \text{ eV}^2$  tagged at  $3\sigma$

1 y – 50 kCi  
 $^{144}\text{Ce}$ - $^{144}\text{Pr}$   
**3 $\sigma$  contour**

# Proposal sensitivities

# Conclusions

- ❖ Do we need a fourth neutrino ?
  - Intriguing anomalies in reactors experiments, Gallium,...
  - A possible revolution in physics
  - A hot topic : ERC put 5 M€ in this subject
  - Is cosmology input decisive for neutrino physic ?
    - an incredible example of multidisciplinary approach
- ❖ We need reliable experimental answers soon
  - Sources of neutrinos and antineutrinos
    - CeLAND and SoX ; KamLAND or Borexino
    - Final option dictated by easiest solutions
  - Use of antineutrinos from reactors
    - Stéreo or Solid @ ILL
  - Direct observation with Katrin
  - ...
- ❖ A clear answer in a few years

**Just do it.**

# Backup slides

# Conclusions

- ❖ Do we need a fourth neutrino ?
  - Intriguing anomalies in reactors experiments, Gallium,...
  - A possible revolution in physics
- ❖ An elegant experimental answer :  $^{144}\text{Ce}$ - $^{144}\text{Pr}$ 
  - Able to cover the full range of expected parameters
  - Difficult, but not unrealistic to achieve
    - Advance contacts with russian nuclear industry
    - Contacts for tungsten shielding encouraging
    - Preliminary studies for transport
    - Discussions with Borexino and KamLAND
  - Could be made in the 3-4 years to come
    - Few technical uncertainties
    - Mainly regulation issues to solve

❖ **Five years funding from European Research Council granted to Thierry Lasserre**

# Mayak Маяк

- ❖ Production association « Mayak »
  - State corporation of atomic energy « Rosatom »
  - Main russian center for nuclear fuel reprocessing
  - Host also « Ludmila », a 1000 MW heavy water reactor
  - Restricted access on main site, but also « clean » parts accessible
- ❖ Former important military sites
  - Several severe nuclear accidents

# In the Ural mountains

# Production at Mayak

- ❖ Facility to produce kCi  $^{144}\text{Ce}$  already existing
  - Dedicated mainly to  $^{60}\text{Co}$ 
    - main world producer : 8 MCi/y
  - $^{147}\text{Pm}$  production : 1 prod. per  $\approx 5$  years
    - Used for antistatic purpose and emergency lights
  - Reprocess fuel elements from VVER-440
    - After 3-5 years of cooling : favorable for  $^{147}\text{Pm}$
    - For  $^{144}\text{Ce}$  : better to have less than 3 y cooling with the maximal burn-up possible => increase  $^{144}\text{Ce}$  content in final Ce product.

# $^{144}\text{Ce}$ production technology

- ❖ Produced already 30 kCi of  $^{144}\text{Ce}$  in 1965
  - Line is « still almost ready » but needs « slight » upgrades
- ❖ « Standard » unit to feed the reprocessing line : 1 ton of spent nuclear fuel (SNF) ie 8 elements
  - Usual operations : cutting, dissolution in  $\text{HNO}_3$  acid, Purex, evaporation, stripping  $^{137}\text{Cs}$
  - 13 kg of REE (rare earth) and trans-uranium (250 g Am, 10g Cu) : total  $\approx 3 \text{ m}^3$

❖ Separation of REE by displacement chromatography in facility used for  $^{147}\text{Pm}$

- 7 columns (5 m high) in series called « Canyon »
- Ce is one of the last element, between Nd and La.
- Moreover Ce only REE with a valence 4

**1 ton of SNF  $\Rightarrow$  2.8 kg of Ce with 22 g of  $^{144}\text{Ce}$  ( $> 60 \text{ kCi}$ )**

# Transport to Japan

- ❖ Mayak send  $^{60}\text{Co}$  worldwide
  - By plane, normal or dedicated flight
- ❖ Present ideas under consideration
  - Ship the W shielding to « clean » Mayak
  - Fit on site the AvG inside the shielding
  - Fit in the certified transport container (rented)
  - Dedicated flight to an airport close to Kamioka
  - Transport by truck to detector
- ❖ Think to the return from Japan to Russia

# Signal and Backgrounds

- ❖ 75 kCi  $^{144}\text{Ce}$ - $^{144}\text{Pr}$
- ❖ 15 600 evts in 1<sup>st</sup> 6 months
- ❖ 56 000 evts in 1.5 year
  - 1 mHz
- ❖ Inverse  $\beta$ -decay coinc.
  - $E_{\text{prompt}} > 0.9 \text{ MeV}$
  - $E_{\text{delayed}} > 2.0 \text{ MeV}$
  - $\Delta t < 750 \mu\text{s}$
  - $\Delta V < 10 \text{ m}^3$
- ❖ Background from  $^{144}\text{Pr}$ 
  - After 1m in liquid. scint.
  - $R_{\text{prompt}} = 2.5 \text{ Hz}$
  - $R_{\text{delayed}} = 0.6 \text{ Hz}$
  - $R_{\text{accident}} = 1 \text{ mHz}$

**S/B  $\approx$  1**

  - After 1.5 m : S/B = 100
- ❖ 3 cm of tungsten  
bkgd rate divided by 10
- ❖ W induced bkgd
  - From measures by Gerda
  - Bkgd  $\ll \gamma$  from  $^{144}\text{Pr}$
  - to be rechecked with actual W

# Shielding

- ❖ Pure tungsten impossible to manufacture
  - Must use alloys (Ni, Fe)
- ❖ Densimet<sup>®</sup> from Plansee company
  - Densimet 185, the highest density
    - 18.5 g/cm<sup>3</sup> (pure W : 19.3 g/cm<sup>3</sup>)
    - 97 % W + Ni, Fe
  - Used already for the <sup>51</sup>Cr neutrino source in Gallex
  - Used in nuclear medicine
- ❖ Radioactive impurities content ?
- ❖ Meeting next Friday @ Saclay with Plansee engineers

# Shielding - 2

- ❖ Radiation length in Densimet
  - $\approx 1.2$  cm for 2.2 MeV
- ❖ We need a reduction of  $10^{-12}$ 
  - To reach 13  $\gamma$ /s entering the liquid scintillator
  - $\approx 80$  cm from the center, Signal/Bkg  $> 10$
- ❖ Total width of the W shielding : 33 cm
  - Inner radius : 8 cm ; outer radius : 41 cm
  - Weight : 5300 kg

# Shielding : the first idea

- ❖ Two separate goals
  - usual biological protection
    - Could be achieved with  $\approx 15$  cm of W
  - minimisation of accidental background during the experiment
    - need an extra 20 cm of W or equivalent attenuation for  $10^{-12}$  reduction
  - experimental requirements well above legal safety constraints
- ❖ 7 pieces to insert and assemble through chimney
  - Like a boat in a bottle...
- ❖ Impurities in tungsten ?
  - Test @ Saclay
  - Previous tests for Gerda
- ❖ Discussion with industry (Plansee)
  - Looks possible

# Radioprotection

Not to scale

❖ At least 16 cm of W

❖ Dose rate

- Basic formula for a  $\gamma$  point source

$$D = A \frac{E}{4\pi L^2} \times \frac{\mu_{en}}{\rho}$$

- In water ( $\mu_{en}/\rho = .025 \text{ cm}^2/\text{g}$ )
- Attenuation in W
  - $\exp(-16/1.2) = 1.6 \cdot 10^{-6}$
  - $\Rightarrow 50 \text{ kCi } (^{144}\text{Ce}) \rightarrow 350 \text{ Ci } (2.2 \text{ MeV})$

$$D(\text{mSv/h}) = 4.25 \times A(\text{Ci}) \times E(\text{MeV}) \frac{1}{L^2(\text{m})}$$

❖ Result : 5.2  $\mu\text{Sv/h}$

# Samples

- ❖ Physicist's concern : high energy gamma emitters
- ❖ We ask to receive samples at Saclay
  - Use the next production of  $^{147}\text{Pm}$ 
    - Early 2013
  - Russian propose to make measurement @ « clean » Mayak with us
    - Usually mainly concern with  $\beta$  lines
    - Interesting to met local people involved in the project
  - We insist to have samples (also) checked @ Saclay
- ❖ Required activity of the sample
  - $\approx 100$  kBq total ie 1 kBq for the 2.2 MeV line
  - Modest, makes shipment easier

# The Antineutrino generator

mass  $\approx$  5.5 tons  
Total diameter  $\approx$  82 cm

# Thermal problems

- ❖  $^{144}\text{Ce}$ - $^{144}\text{Pr}$ , mainly  $\beta$  emitters
  - Heat deposition localised only (99%) in the  $\text{CeO}_2$  or in the 1st few mm of shielding.
- ❖ 50 kCi  $^{144}\text{Ce}$ - $^{144}\text{Pr}$  produce 382 W
  - Decrease as lifetime of  $^{144}\text{Ce}$ 
    - 157 W after one year
- ❖ Densimet
  - Density :  $18.5 \text{ g/cm}^3$
  - Heat capacity :  $130 \text{ J/kg.K}$
  - Thermal conductivity :  $82 \text{ W/m.K}$  (much smaller than pure W)
  - Linear expansion :  $5.2 \cdot 10^{-6} \text{ m/m}$
  - Young modulus :  $380 \text{ GPa}$

## Thermal problems - 2

### ❖ Time to heat the shielding

$$\frac{dT}{dt} = \frac{P}{c_p^W M} = \frac{382}{82 \times 5387} = 3.1^\circ \text{ per hour}$$

### ❖ Surface temperature at equilibrium in air

- $h_{air}$  : heat exchange coefficient with air

$$P = h_{air} \times 4\pi R_2^2 (T_W - T_{air})$$

$$h_{air} \approx 4 \text{ W/m}^2\text{K} \Rightarrow T_W - T_{air} \approx 45 \text{ }^\circ\text{C}$$

### ❖ Exchange with liquid scintillator

- $h_{LS}$  : heat exchange with liquid scintillator (convection)

$$P = h_{LS} \times 4\pi R_2^2 (T_W - T_{LS})$$

$$h_{LS} \approx 200 \text{ W/m}^2\text{K} \Rightarrow T_W - T_{LS} \approx 1 \text{ }^\circ\text{C}$$

## Thermal problems - 3

- ❖ Try to avoid active cooling
  - Very modest water flow needed  $\approx 60$  lit./hour
  - Huge complication in the shielding, operations
- ❖ Comparison with the PMT's in KamLAND
  - 1325 PMT's in the inner detector
  - 500 W ?
- ❖ Impact on the liquid scintillator
  - 914 tons
  - w/o thermal leaks  $\Rightarrow$  increase of 4 °C in a year
  - Possible slight convection

# The Borexino proposal

- ❖ **Significant Effort**
- ❖ **Planned experiments**
  - **1<sup>st</sup>  $^{51}\text{Cr}$  > 5 MCi in pit A**
    - Gallex enriched Cr still available in Saclay
    - Compatible with existing program
  - **2<sup>nd</sup>  $^{144}\text{Ce}$  in center C**
    - need major work on detector
    - After end of solar  $\nu$  program
- ❖ **ERC funding : 3.5 M€**

# The Daya Bay proposal

- ❖ D. Dwyer et al. arXiv:1109.6036
- ❖ Based on our PRL paper
- ❖ 500 kCi  $^{144}\text{Ce}$ - $^{144}\text{Pr}$  source in the Daya Bay FD pool
- ❖ Realisation ?
  - no fuel reprocessing in the US
  - activity impossible to reach in Russia
