Sept. 11, 2012

Paolo Franchini - CNAF

# CNAF operations

- **Disk space:** testing in progress for the Fujitsu system. If it fails E4 will provide the new storage by the end of October. The total space for us will be 200 TB.
- **New servers:** new blades will replace old ones in a DELL PowerEdge M600 enclosure in one month. New machines for SuperB services:
  - 2 for the databases (with 4 eth ports)
  - 1 for Dirac
  - 1 production head node

# CNAF operations

- **CVMFS:** stratum 0 installed, tests done.  
A geographical redundancy with a stratum 1 is needed. Contacts with Padova and Torino. The service will be maintained by IGI.

-----

- Call for a deletion campaign of users' space: failed
  - 130 users on `/storage/gpfs_ui/home/SUPERB` are using 16 TB
- SGM role enabled for `superb_prod` queue
- Strange behavior of the STORM quota: under investigation. Jobs are not failing anymore.
