(Received 21 October 1998)

The ground-state band of the  $Z = 120$  isotope  $^{254}\text{No}$  has been identified up to spin 14, indicating that the nucleus is deformed. The deduced quadrupole deformation,  $\beta_2 \approx .27$ , is in agreement with theoretical predictions. These observations confirm that the shell-correction energy responsible for the stability of transactinoid nuclei is partly derived from deformation. The survival of  $^{254}\text{No}$  up to spin 14 means that its fission barrier persists at least up to that spin. [S0031-9007/98/08223-4]

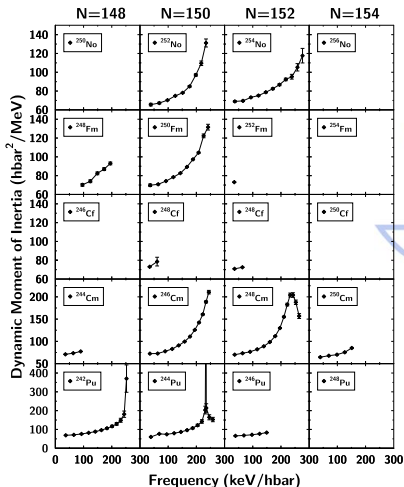

# In-beam studies in region of $^{254}\text{No}$

S. Eeckhaudt, P.T. Greenlees et al., EPJA 26, 227 (2005)

- Confirmed deformed nature of nuclei around  $^{254}\text{No}$
- Showed fission barrier robust with spin ( $> 20\hbar$ )
- Faster alignment at  $N=150$  compared to  $N=152$  ( $\pi i_{13/2}, \nu j_{15/2}$ )
- Excellent testing ground for theory; e.g. Duguet et al., NPA 679, 427 (2001), Bender et al., NPA 723, 354 (2003), Afanasjev et al., PRC 67, 024309 (2003), Egido and Robledo, PRL 85 1198 (2000)

# Next step - push to Rutherfordium $Z=104$

- Can produce  $^{256}\text{Rf}$  using:  
 $^{50}\text{Ti} + ^{208}\text{Pb} \rightarrow ^{256}\text{Rf} + 2n$
- Cross section below 20 nb
- Need high intensity  $^{50}\text{Ti}$  beam
- Used up to 70 pnA in  $^{246}\text{Fm}$  experiment
- Rotating target wheel built at IPHC Strasbourg

## $^{50}\text{Ti}$ MIVOC beam development

- Metallic Ions from Volatile Compounds
- Method developed at JYFL
- Synthesis of enriched  $^{50}\text{Ti}$  compound led by IPHC Strasbourg
- Several years of hard work!
- $19 \mu\text{A}$  of  $^{50}\text{Ti}^{11+}$  from ECR
- 490 enA on target
- Low consumption - 0.2 mg/hr
- See J.Rubert et al., NIMB **276**, 33 (2012)

# In-beam spectroscopy of SHE: $^{256}\text{Rf}$

## Experimental Details

- $^{50}\text{Ti} + ^{208}\text{Pb} \Rightarrow ^{256}\text{Rf} + 2n$
- JUROGAM II, RITU, GREAT
- Enriched  $^{50}\text{Ti}$  beam from MIVOC
- 450 hours, 29pnA beam, 2210 observed fissions
- Cross section 17 nb

R.M.Clark et al., PLB **690**, 19 (2010)

## "Determined" Configurations:

- $3^+$  -  $(\pi[514]7/2^- \otimes \pi[521]1/2^-)$
- $8^-$  -  $(\nu[734]9/2^- \otimes \nu[624]7/2^+)$
- or  $8^-$  -  $(\nu[734]9/2^- \otimes \nu[613]7/2^+)$
- $10^+$  -  $(\nu[734]9/2^- \otimes \nu[725]11/2^-)$
- $16^+$  -  $(\pi[514]7/2^- \otimes \pi[624]9/2^+) +$   
 $(\nu[734]9/2^- \otimes \nu[613]7/2^+)$

# K-isomers in $^{256}\text{Rf}$ from Berkeley

H.B.Jeppesen et al., PRC **79**, 031303(R) (2009)

# K-isomers in $^{256}\text{Rf}$ from Berkeley

H.B.Jeppesen et al., PRC **79**, 031303(R) (2009)

FIG. 3. Proposed decay scheme for  $^{256}\text{Rf}$ . Energies are given in keV. Half-lives are written beneath each isomer.

## Observed Decays

Chain	No. Events	$T_{1/2}$ (Parent-Daughter)
R-F	5400	6.67(9) ms
R-e-F	985 (18%)	25(2) $\mu\text{s}$
R-e-e-F	147 (2.7%)	17(2) $\mu\text{s}$
R-e-e-e-F	7 (0.13%)	27(2) $\mu\text{s}$

## Interpretation

- Lowest isomer 2QP  $K=6,7$
- Second isomer 2QP  $K=10-12$ :  
possibly  $10^+ - \nu[734]9/2^- \otimes \nu[725]11/2^-$
- Highest isomer? - not discussed

# K-isomers in $^{256}\text{Rf}$ from ANL

A.P.Robinson et al., PRC **83**, 064311 (2011)

## Observed Decays

Chain	No. Events	$T_{1/2}$ (Parent-Daughter)
R-F	1322	6.9(4) ms
R-e-F	19 (1.4%)	17(5) $\mu\text{s}$

## Interpretation

- Low population of isomer - similar to 4QP in  $^{254}\text{No}$ , etc
- Conclude isomer is 4QP
- Non-observation of EM decay from 2QP suggests direct fission  
- fission half-life same as g.s.

# K-isomers in $^{256}\text{Rf}$ from JYFL - PRELIMINARY!!

J.Rubert, P.T.Greenlees et al., to be published

# K-isomers in $^{256}\text{Rf}$ from JYFL - PRELIMINARY!!

J.Rubert, P.T.Greenlees et al., to be published

# K-isomers in $^{256}\text{Rf}$ from JYFL - PRELIMINARY!!

J.Rubert, P.T.Greenlees et al., to be published

## Observed Decays

Chain	No. Events	$T_{1/2}$ (Parent-Daughter)
R-F	2210	6.9(2) ms
R-e-F	382 (17%)	23 $\mu\text{s}$
R-e-e-F	67 (3.0%)	17 $\mu\text{s}$
R-e-e-e-F	4 (0.18%)	27 $\mu\text{s}$

## Rotational properties of the superheavy nucleus $^{256}\text{Rf}$ and its neighboring even-even nuclei in a particle-number-conserving cranked shell model

Zhen-Hua Zhang (张振华),<sup>1</sup> Jie Meng (孟杰),<sup>1,2,3</sup> En-Guang Zhao (赵恩广),<sup>1,4,5</sup> and Shan-Gui Zhou (周善贵)<sup>4,5,\*</sup>

# Theory - Skyrme UNEDF1<sup>SO</sup>

- Based on Skyrme UNEDF1 functional (Kortelainen et al., PRC **85**, 024304 (2012))
- Re-adjustment of pairing strengths and spin-orbit coupling constants
- Pairing first adjusted to experimental 3-point mass differences of <sup>249</sup>Bk and <sup>251</sup>Cf
- Second adjustment to reproduce low-frequency MoI of <sup>252</sup>No
- Spin-orbit coupling constants adjusted to better reproduce <sup>249</sup>Bk and <sup>251</sup>Cf spectra
- Yue Shi et al., ICFN5 Proceedings (arXiv:1303.0197) and to be published

# Theory - Skyrme UNEDF1<sup>SO</sup>

Yue Shi et al., ICFN5 Proceedings (arXiv:1303.0197) and to be published

# Summary

- Developments in instrumentation now allow in-beam  $\gamma$ -ray spectroscopy at 10 nb level
- First observation of rotational states in the superheavy nucleus  $^{256}\text{Rf}$
- Differences in MoI reveal information about underlying shell structure and pairing
- Alignment effects in  $N=152$  isotone  $^{254}\text{No}$  delayed compared to  $^{256}\text{Rf}$
- Subtle differences in MoI still not fully reproduced by theory
- New  $^{256}\text{Rf}$  K-isomer data from JYFL seems to be consistent with data from Berkeley
- Interpretation still open, better spectroscopic data needed
- Large body of experimental data has highlighted deficiencies in modern-mean field calculations
- May have consequences for the prediction of properties of SHE
- Attempts to correct these deficiencies have been started
