## *Collectivity in neutron-rich Co and Mn isotopes going towards N=40*

*Victor Modamio  
Laboratori Nazionali di Legnaro, INFN*

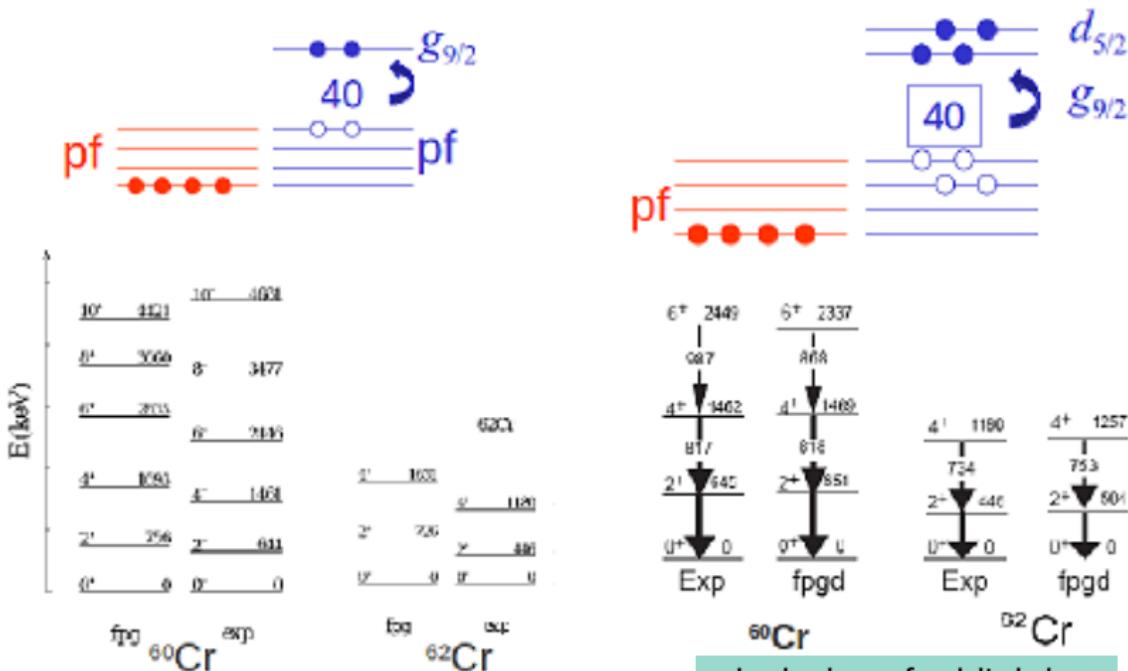

# Deformation below $N=40$ $^{68}\text{Ni}$

Quadrupole deformation can be generated by using a quadrupole force with the central field in the subspace spanned by a sequence of  $\Delta j = 2$  orbits that come lowest by the spin-orbit splitting, representing this relevant subspace a quasi-SU3.

# Conclusions

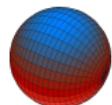

Lifetimes for the low lying states  $11/2^-$  in  $^{63,65}\text{Co}$  have been measured for first time.

Deduced  $B(\text{E}2)$  values for these states follow the strength values of the Ni isotones, indicating that the  $(11/2^-)$  states in Co present a configuration

$$\pi(f_{7/2})^{-1} \otimes 2^+ \text{Ni}$$

Large-scale shell-model calculations predict accurately the  $B(\text{E}2)$  values in Co, Fe and Ni isotopes, showing a strong dependence with the occupation of both the  $g_{9/2}$  and  $d_{5/2}$  neutron orbitals in the wavefunction.

The theoretical  $B(\text{E}2)$  value predicted for  $N=40$   $^{67}\text{Co}$  is larger than the  $B(\text{E}2)$  value for the isotope  $^{68}\text{Ni}$ , pointing to a weakening of the  $N=40$  subshell gap just by removing one proton.
