

Collectivity in medium mass self-conjugate nuclei

Adam Nichols

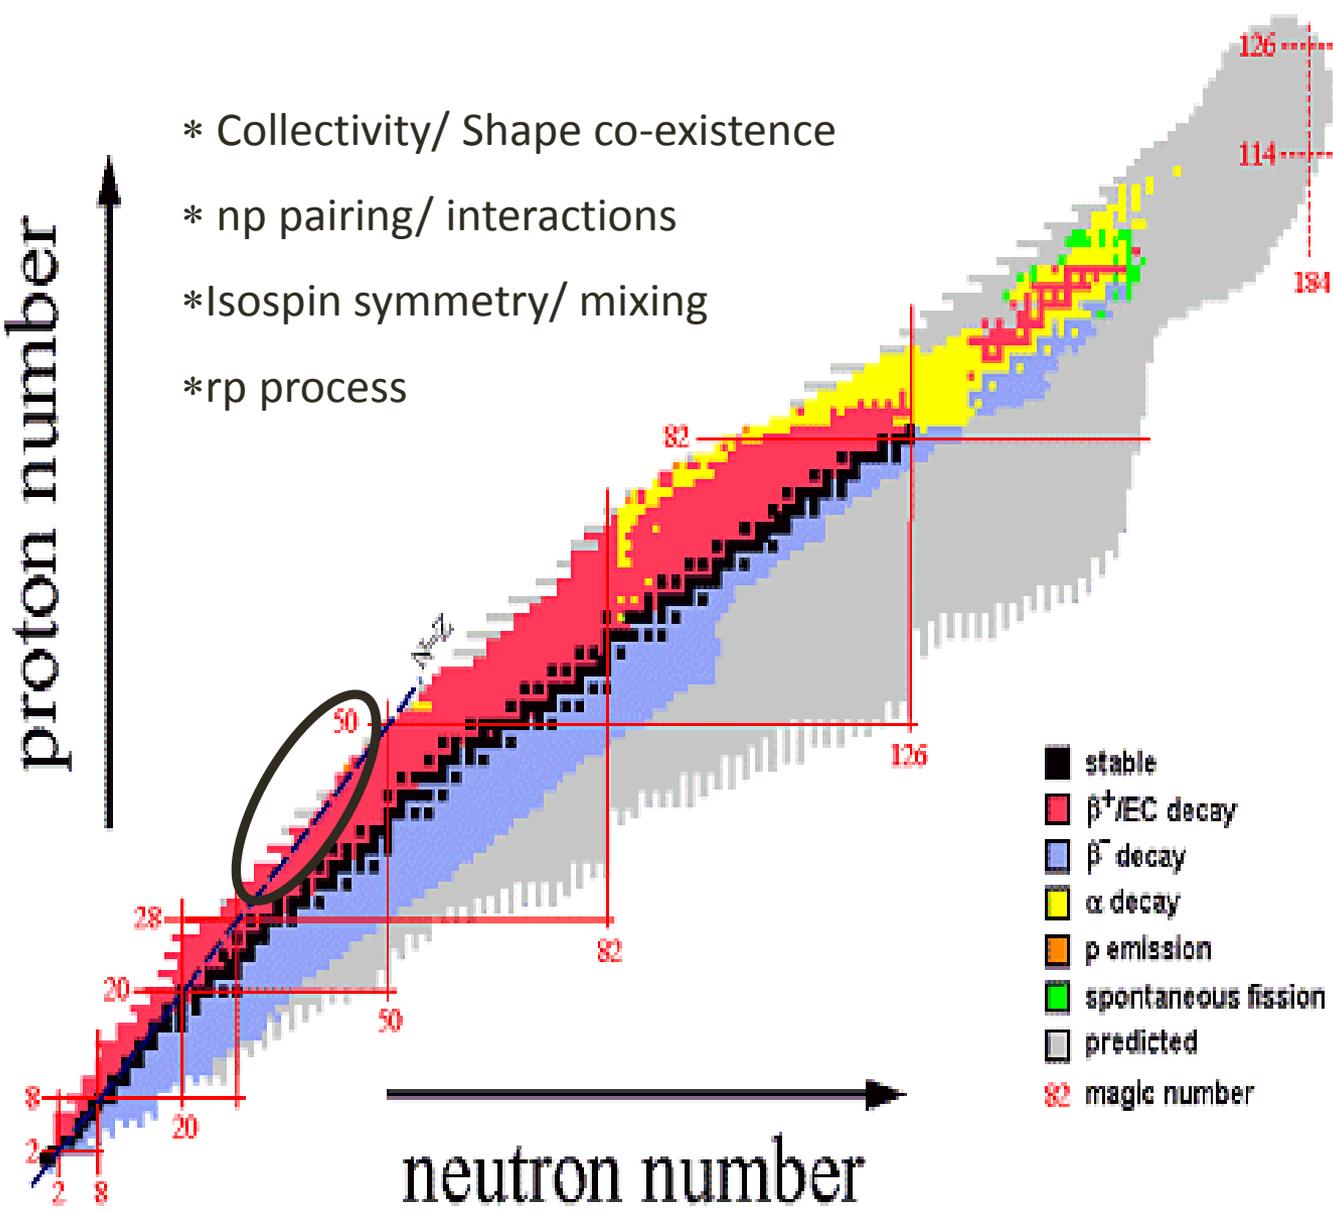

3rd Year Postgraduate Student

University of York, England

Overview

- Physics interest in the $N=Z$ mass ~ 70 region.
- The Recoil Distance Doppler Shift technique for studying excited-state lifetimes.
- The NSCL facility.
- Data analysis.
- Preliminary results.
- Discussions and further work.

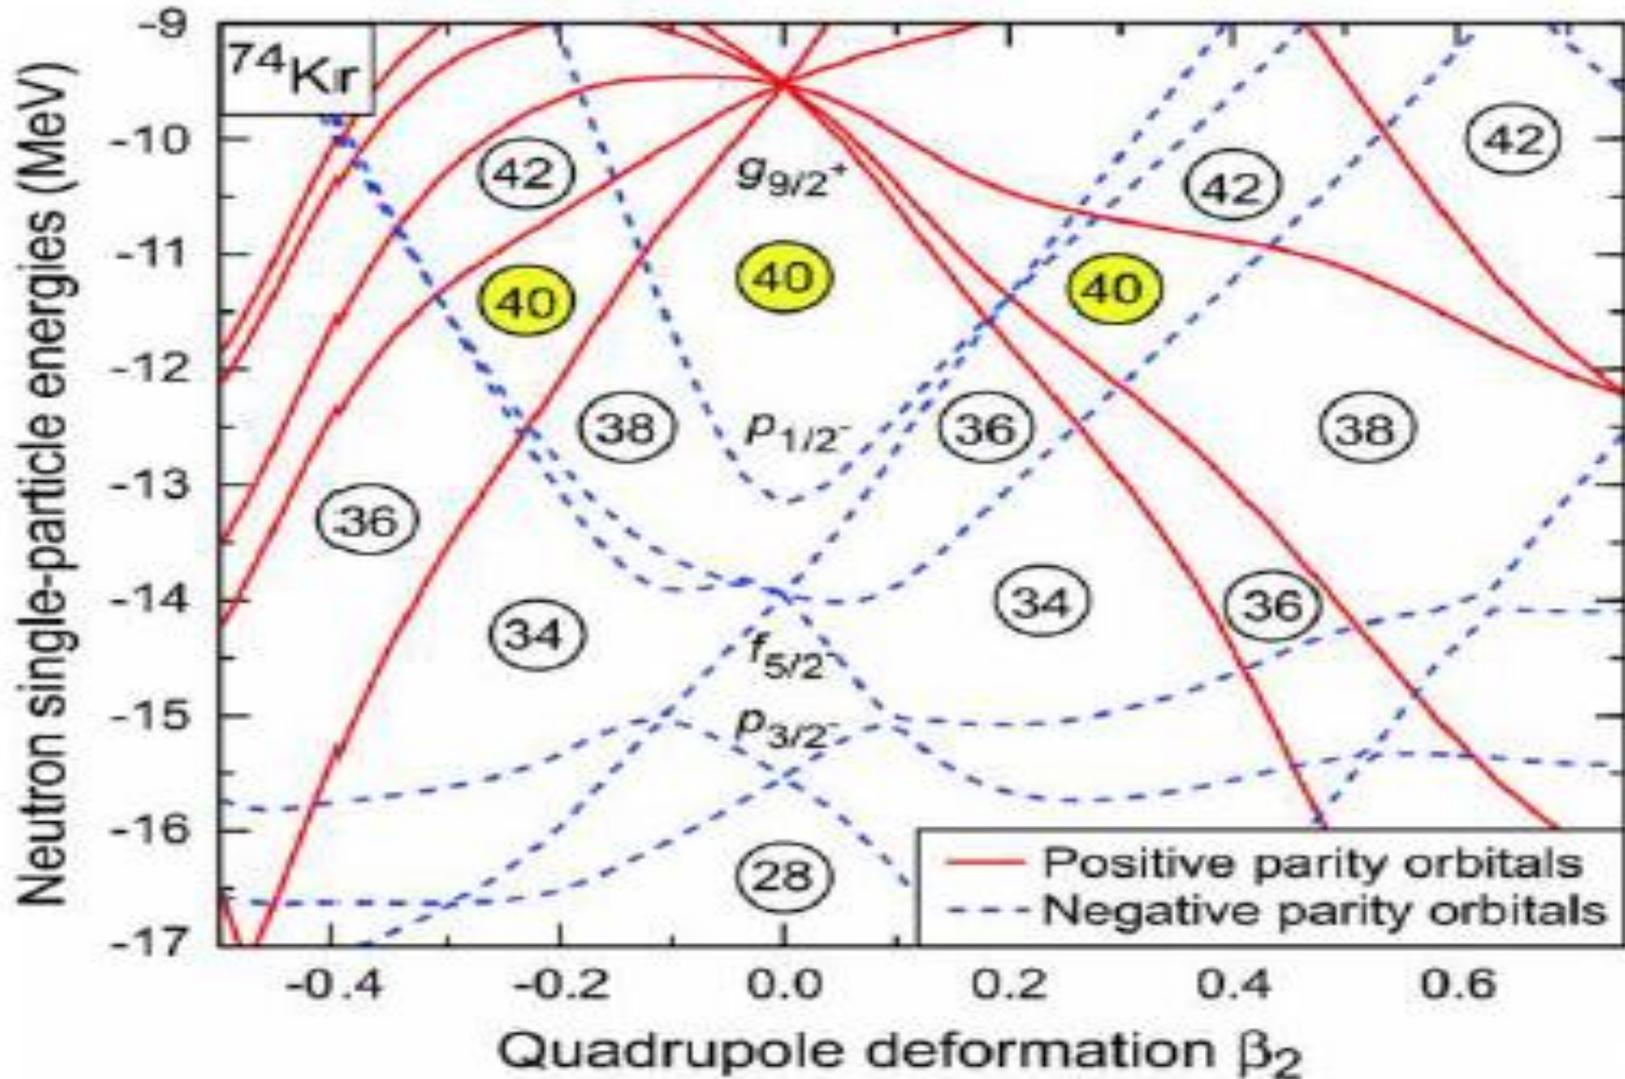

proton number

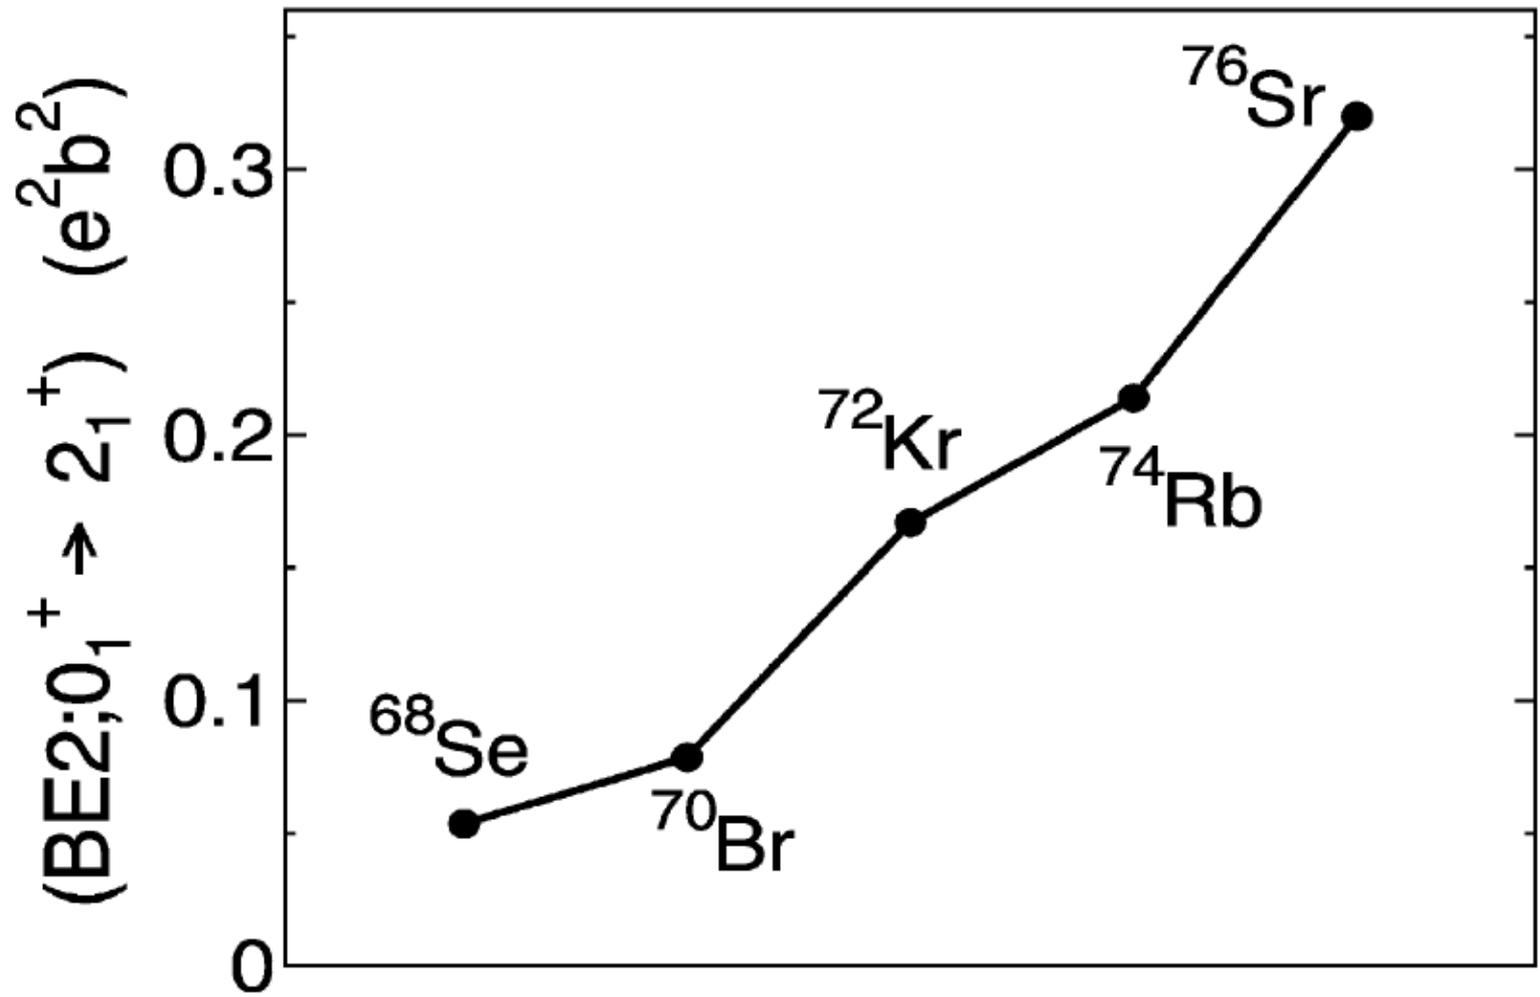

- * Collectivity/ Shape co-existence
- * np pairing/ interactions
- * Isospin symmetry/ mixing
- * rp process

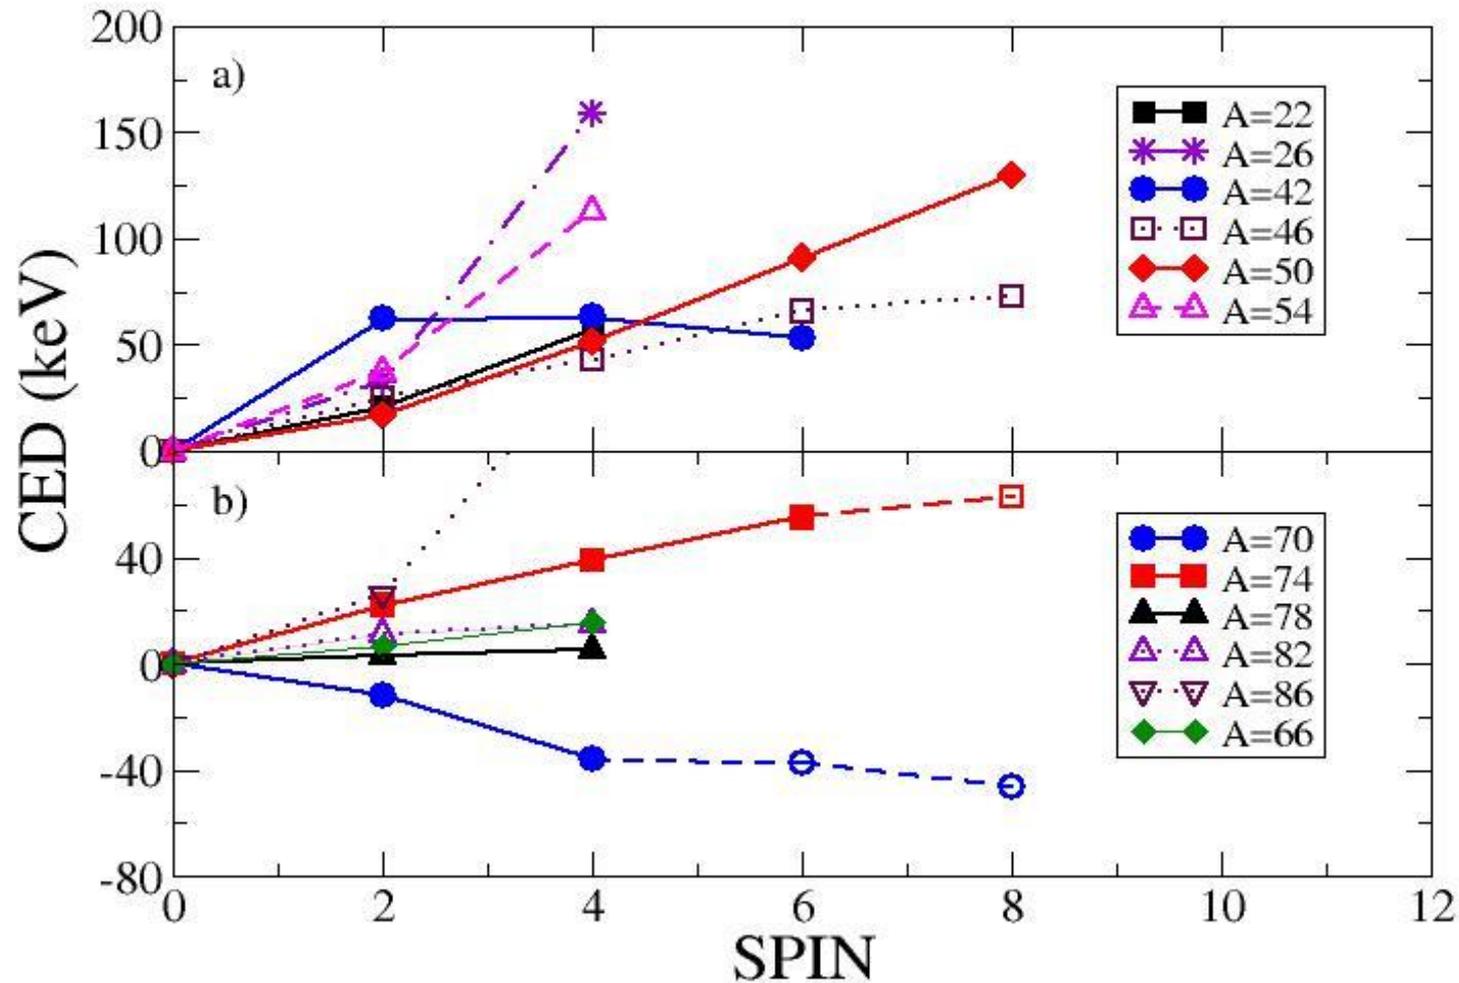

- stable
- β^+ /EC decay
- β^- decay
- α decay
- p emission
- spontaneous fission
- predicted
- 82 magic number

Collectivity in medium-mass nuclei

Coulomb energy differences

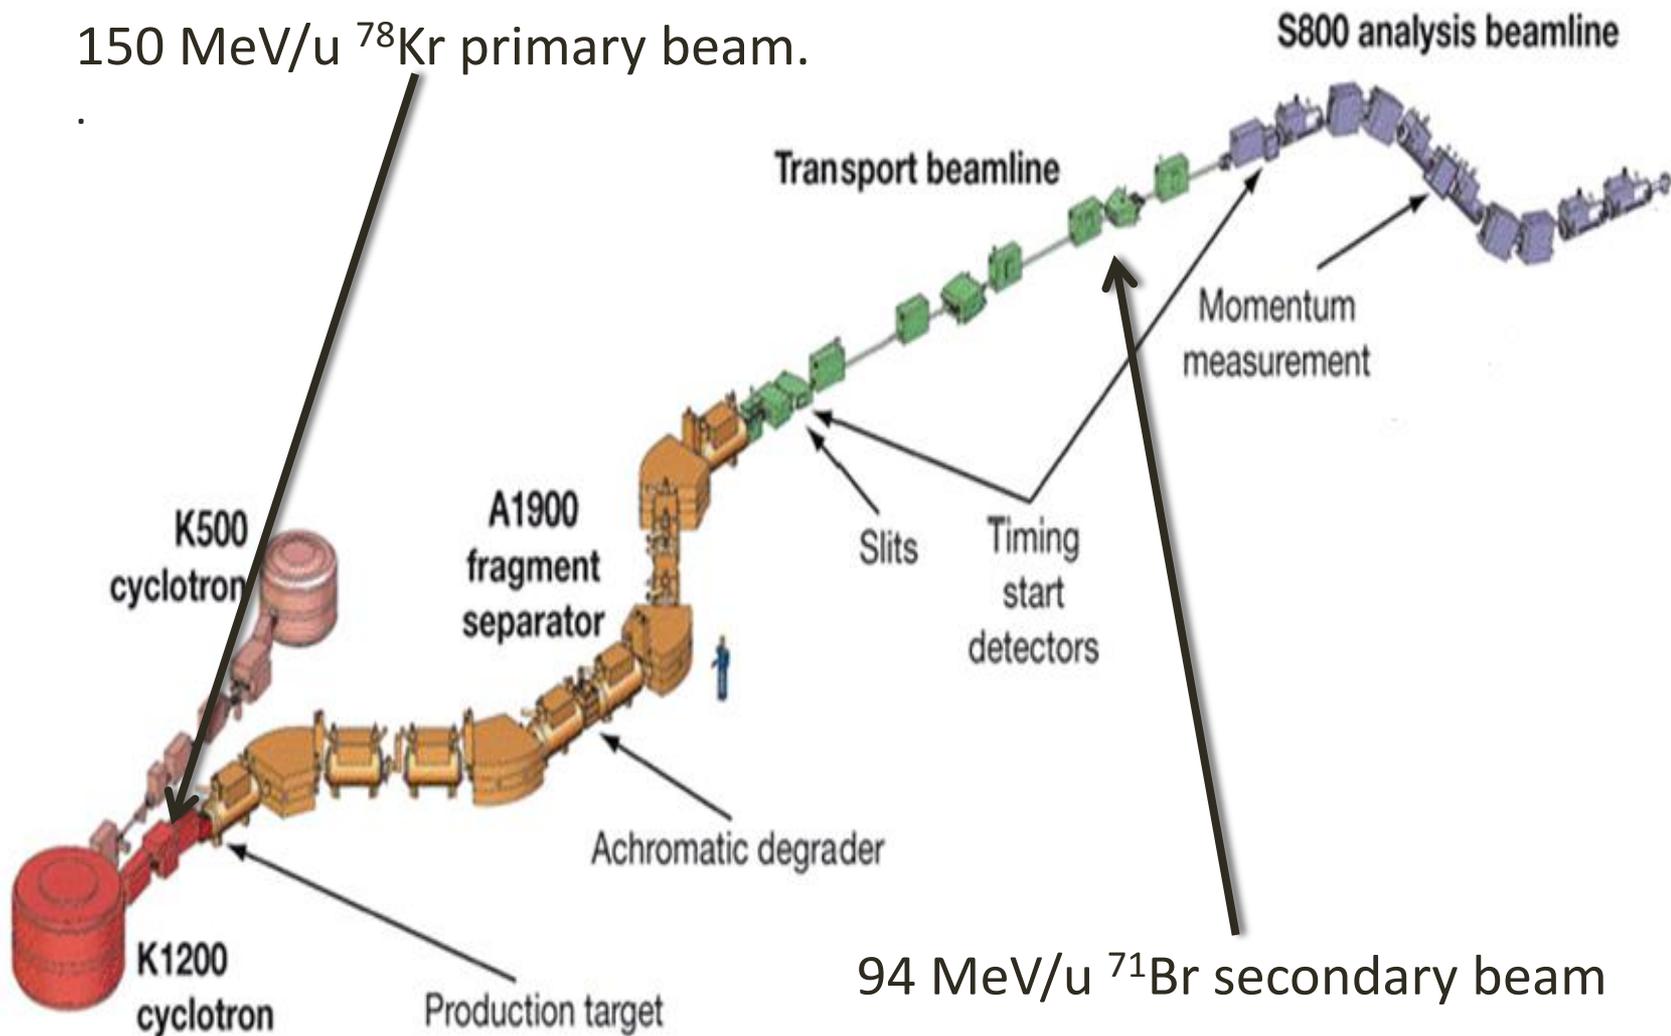

A study of ^{70}Br and ^{70}Se

- Performed at the NSCL facility at Michigan State University.
- Fragmentation, and subsequent nucleon knockout, for the first time in this region.
- S800 and SeGA.
- Recoil Distance Doppler Shift (RDDS) technique.
A. Deward et al., Prog. Part. Nucl. Phys. 67, 786 (2012)
- Commissioning of new plunger device, TRIPLEX.
- Measurement of the lifetime of the first excited 2^+ state and other low lying excited states in ^{70}Br for the first time.
- Re-measurement of the ^{70}Se 2^+ excited state in the same set-up, to confirm literature result (3.2(2) ps).
J. Ljungvall et al. PRL 100, 102502 (2008)
- Search for the previously unidentified 1^+ excited state in ^{70}Br .

NSCL Facility

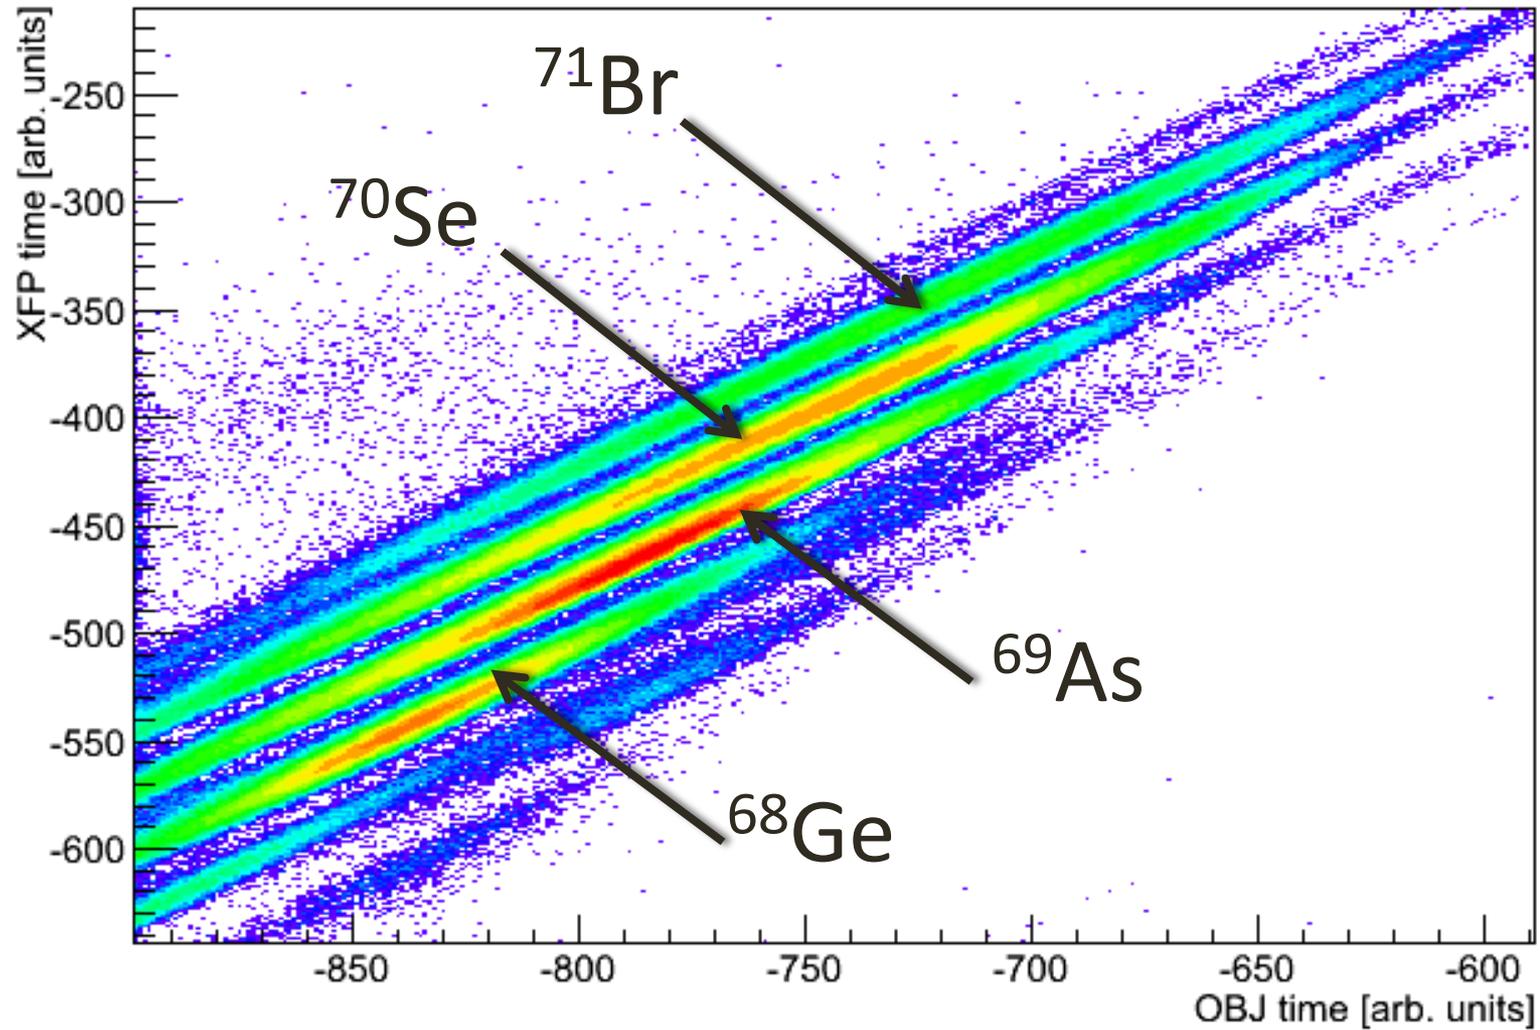

150 MeV/u ^{78}Kr primary beam.

4mm

slow

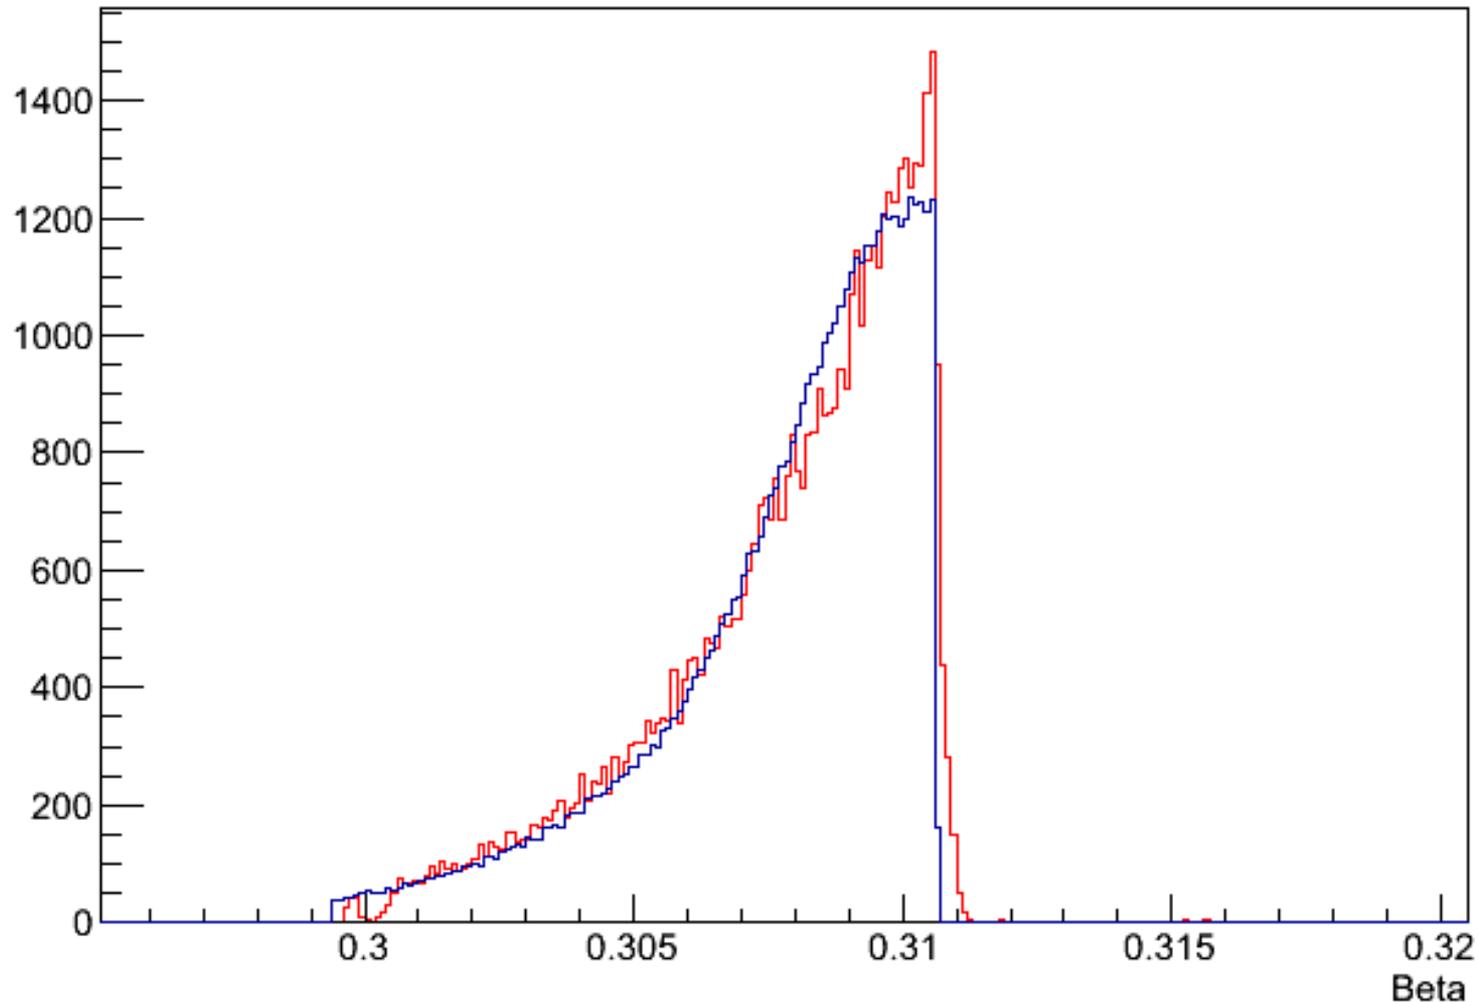

fast

Extracting lifetimes

- Use of GEANT4 simulation package G4LifeTime developed at NSCL.
- Can use experimental particle spectra to match incoming beam and outgoing recoil characteristics.
- Can accurately replicate the positions of SeGA detectors.
- Can be fit to experimental gamma spectra with a variable lifetime.
- Lifetime deduced by a chi-squared fit.

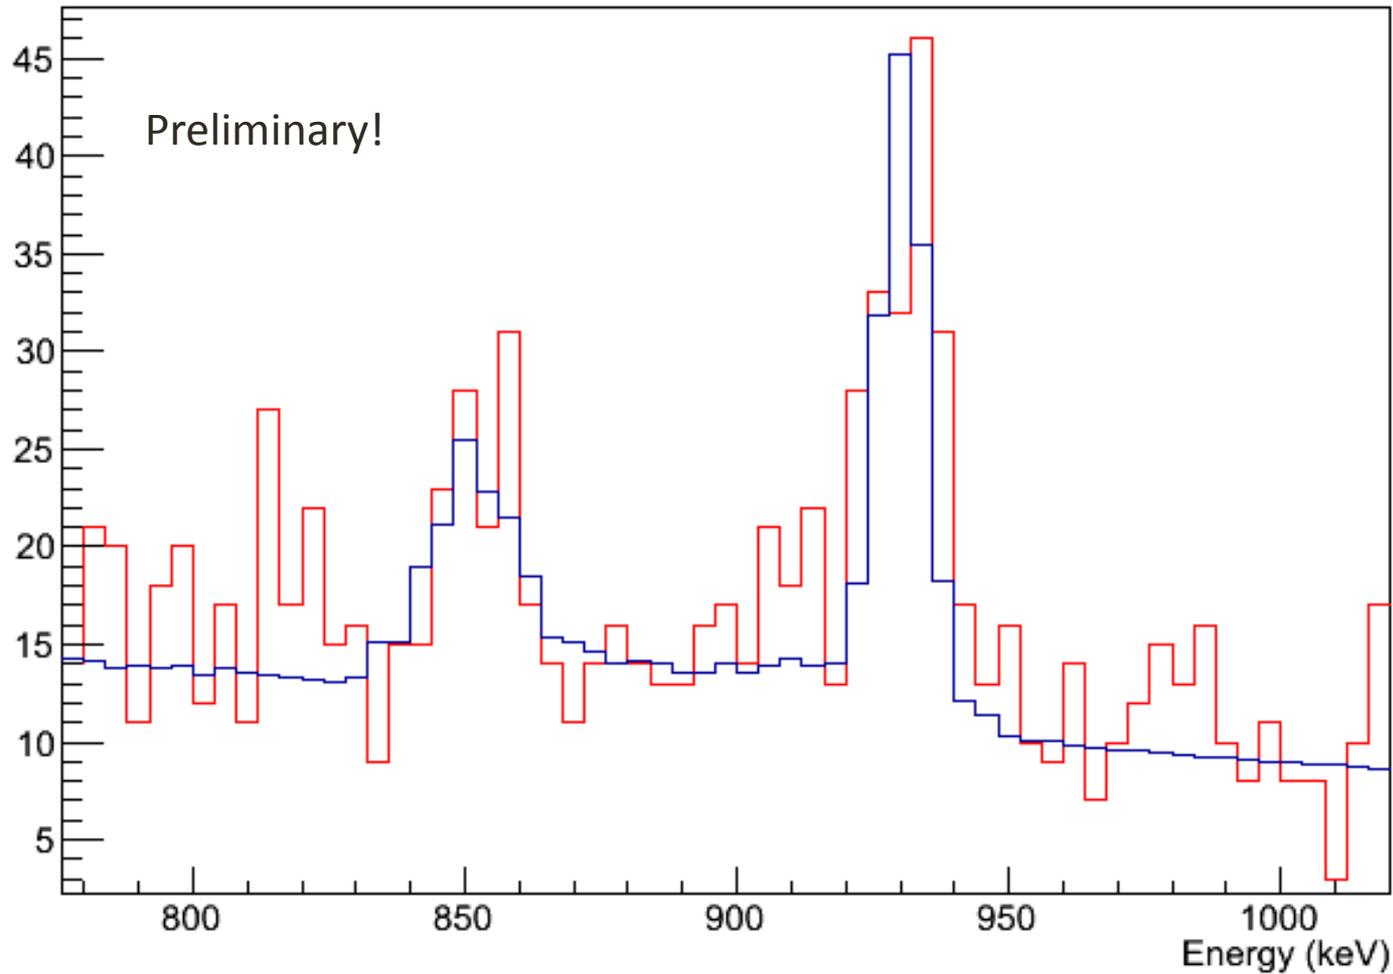

Matching the particle spectra

Beta Distribution

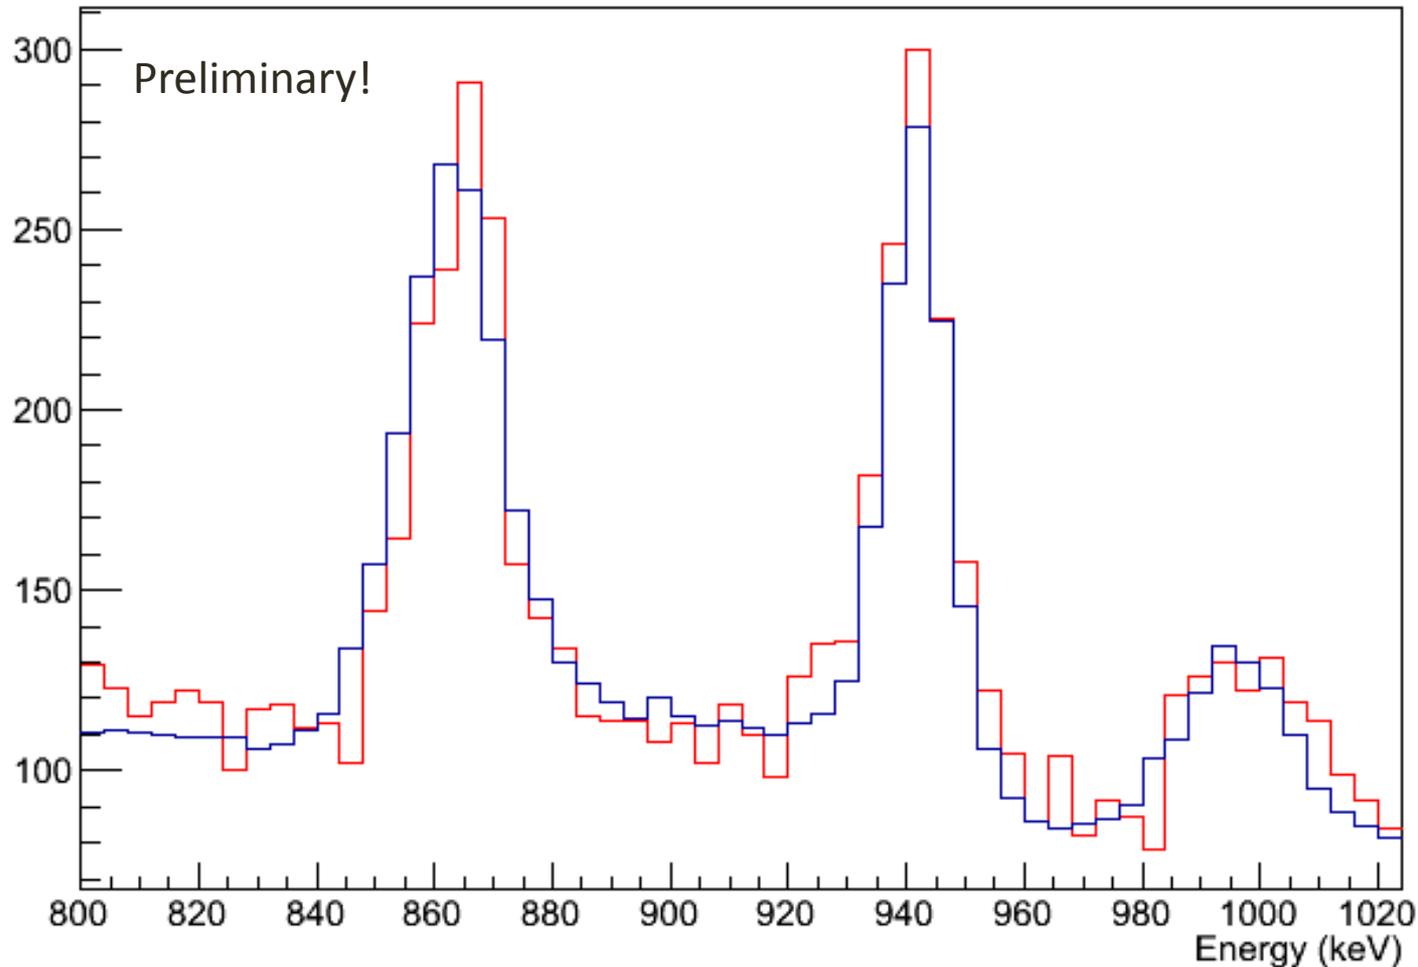

Matching the gamma spectra

70Br 48um 140 degrees, tau = 3.56 ps

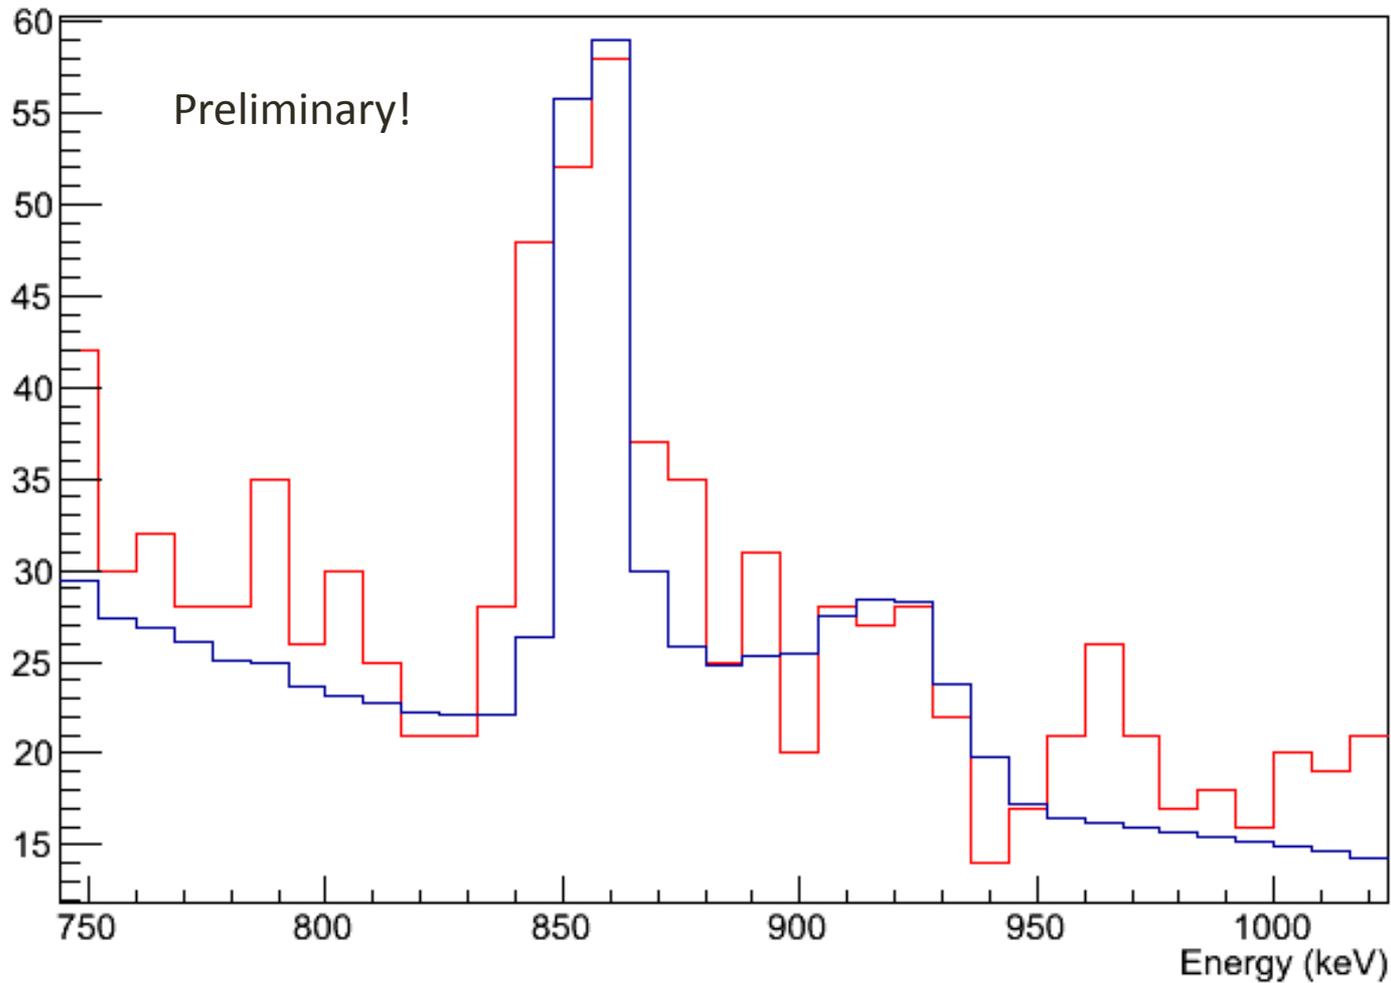

Matching the gamma spectra

70Se 150um 140 degrees, tau = 2.30 ps

Matching the gamma spectra

68Se 0um 30 degrees, tau = 3.51 ps

Lifetime Results

- Very preliminary! Systematic errors still exist.

| Nucleus | State | Energy of transition (keV) | Lifetime (ps) [lit] [2] | Lifetime (ps) [this work] |
|---------|-------|----------------------------|-------------------------|---------------------------|
| 70Br | 3+ | 403 | - | 75(15) |
| 70Br | 2+ | 934 | - | 3.56(17) |
| 70Se | 2+ | 945 | 3.2(2) | 2.30(5) |
| 68Se | 2+ | 854 | - | 3.51(38) |

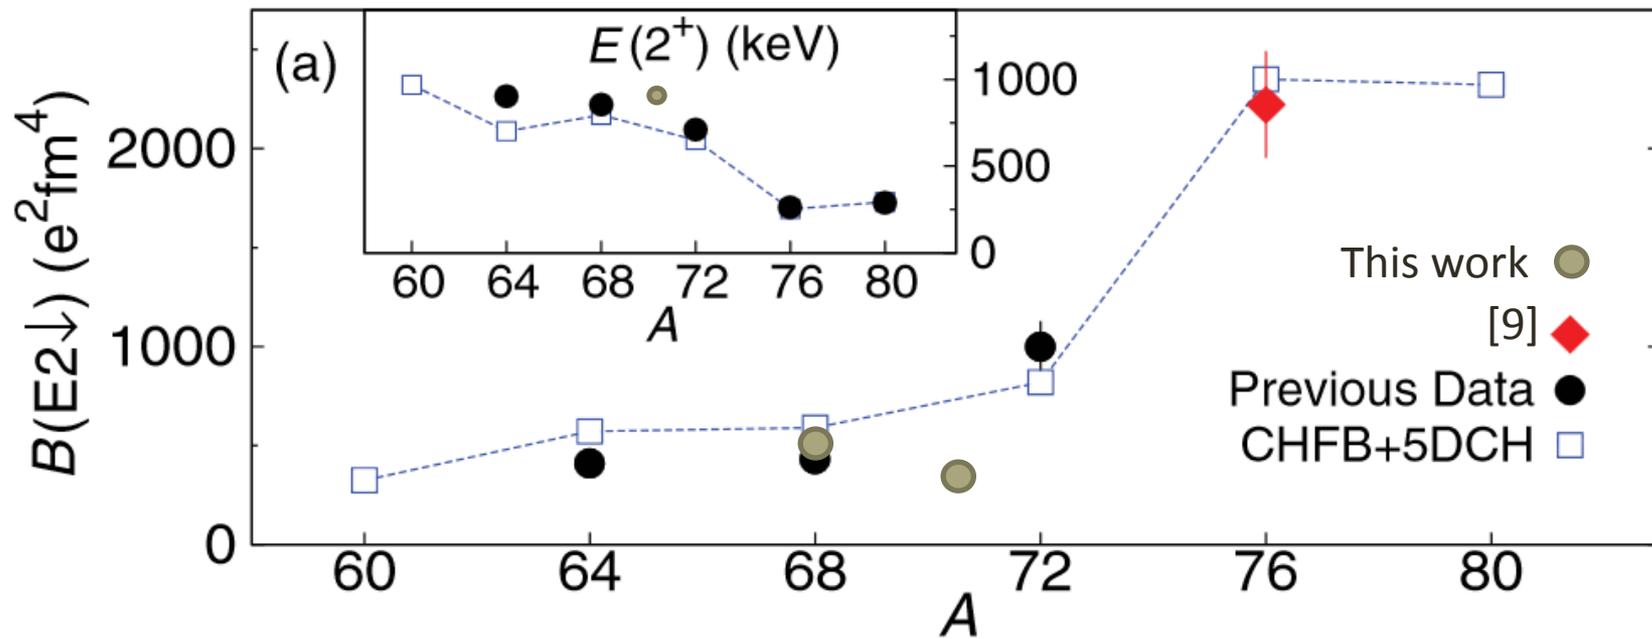

B(E2)s and B(M1)

- Very preliminary! Systematic errors still exist.

| Nucleus | State | Transition Energy (keV) | B(E2) [lit] (e ² fm ⁴) [2,3] | B(E2) this work (e ² fm ⁴) | B(E2) _{sp} this work (W.u.) |
|---------|-------|-------------------------|---|---|--------------------------------------|
| 70Br | 2+ | 934 | - | 323(16) | 18.8(9) |
| 70Se | 2+ | 945 | 342(19) | 472(10) | 27.5(6) |
| 68Se | 2+ | 854 | 432(58) | 513(56) | 31.1(34) |

- Assuming same shape for isobars (shell model), B(E2) (and hence lifetime) difference expected to be ~6% due to the difference in level energies (E_γ^5).
- Excited VAMPIR results produce different shapes in ground states.

| Nucleus | State | Transition Energy (keV) | B(M1) theory | B(M1) this work (μ_N^2) | B(M1) _{sp} this work (μ_N^2) |
|---------|-------|-------------------------|--------------|-------------------------------|---|
| 70Br | 3+ | 403 | - | 0.011(2) | 0.006(1) |

Quasi-deuteron configurations?

Constructive/destructive interference of spin and orbital parts of $\Delta T=1$ M1 transitions.

$$Core^{even-even} \otimes (j_p \otimes j_n)_{J,T}$$

Quasi... $j = l + 1/2$ $B(M1; 0^+ \rightarrow 1^+) = \frac{3}{4\pi} \frac{j+1}{j} (l + 4.706)^2 \mu_N^2$

Nonquasi... $j = l - 1/2$ $B(M1; 0^+ \rightarrow 1^+) = \frac{3}{4\pi} \frac{j+1}{j} (l - 3.706)^2 \mu_N^2$

- Hindered 3^+ suggests nonquasi-deuteron configuration.
- Suggests that the components of the 3^+ are predominantly $(f_{5/2})^2$ configuration, $j = l - 1/2$.

Summary and Outlook

- Commissioning run of new plunger device for exotic beams.
- First case of population of nucleon knockout in the region.
- First measurement of low-lying excited state lifetimes in ^{70}Br .
- Preliminary analysis suggests a strongly hindered B(M1) in ^{70}Br .
- Suggestion of different lifetimes for first excited states in ^{70}Br and ^{70}Se .
- A non-observation of the 1^+ excited state.
- ^{68}Se excited state lifetime obtained.
- Unobserved side-feeding must be correctly accounted for.
- Systematic errors still exist in the data. Lifetimes quoted are possibly marginally underestimated.
- There is potential for lifetime study of other nuclei in the data, and also potential for new spectroscopy in some nuclei.
