The puzzle of $\eta(1405)$ and $\eta(1475)$

Thursday, 12 September 2013 16:40 (20 minutes)

We raise the issue on the nature of the $\eta(1405)$ and $\eta(1475)$. We will show that so far there is no strong evidence for their being individual states. In particular, there exists a so-called “triangle singularity” mechanism which will alter the lineshape and shift the mass of a state $\eta(1440)$ in its decays into $K\bar{K}\pi$, $\eta\pi\pi$, and 3π .
