Prolegomena

The other Pauli principle:

fermions are discovered in the US, while bosons are discovered in Europe

has been spectacularly confirmed

In summary:

- Higgs hunting is over, the catch is now being skinned and prepared for grilling
- **Collider physics** has achieved the most spectacular success in its history.
- At the same time, it came dangerously close to realizing Kelvin's nightmare, of science reduced to striving for the next decimal places of accuracy.

Well, 100 years ago we avoided that fate, may be the HISTORY WILL REPEAT ITSELF?

Higgs outreach

It's a particle that some scientists have been looking for. Because they knew that without it the universe would be impossible. Because without it, the other particles in the universe wouldn't have mass. Because they would all continue to travel at the speed of light, just like photons do. Because I just said they would, and if you ask 'Why?' one more time we're not stopping at Burger King.

The fate of the EW vacuum

Many of my theory colleagues also started wild speculations/extrapolations the SM vacuum is stable/metastable and the validity of the SM can be extended up to the Planc

It is almost certain (>4 σ) that m_H > M_{nestability} and totally certain that m_H < M_h^a_{adau} (even though this certainty might by questioned by threshold effects at the Planck scale Holthausen, Lim and Lindne) '12 Not totally clear yet if m_H is above M_{stability}, but rather important question since if m_H > M_{stability}, the Higgs could serve as an inflaton

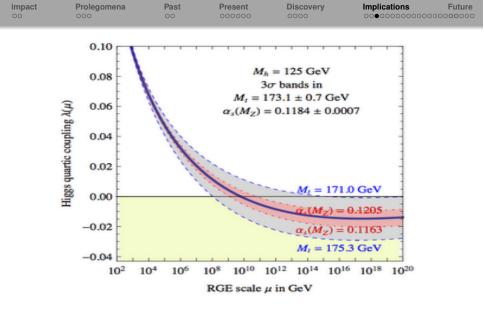

if m_H = M_{stability} the SM is asymptotically safe, ie consistent up to arbitrary high energy

need precise Higgs&top mass/couplings (and a_s) measurements (ILC, coll.) and better understanding of pole vs MS top mass alekhin, provadi, Moch (12)

Christophe Grojean

Higgs discovery implications 16

HC-Tokyo, 20th Nov. 201

Is the Higgs potential vanishing at M_{ρ} ? absence of new energy scale between

the Fermi and the Planck scales? EWSB determined by Planck physics?

One can assume that some unspecified physics near the Planck scale restores the boundedness of the Higgs potential

Still, between 10^{10} GeV and 10^{19} GeV > The potential is negative \lhd

therefore it has a global minimum at large | H | that is much deeper than the vacuum we live in

As a consequence

there is a non-zero probability of tunneling into the other vacuum

Hewever, no "end date" of the Maya calendar

HO TO TACKLE THE QUESTION

 Interpret the Higgs data in the context of the SM until any serious tension appears

- Interpret the Higgs data in the context of an Effective Theory: systematically expand interactions of a Higgs-like scalar in d > 4 operators
- Interpret the Higgs data in the context of concrete models beyond the SM (MSSM, NMSSM, ...)

A. David, A. Denner, M. Duehrssen, M. Grazzini, C. Grojean, G. P., M. Schumacher, M. Spira, G. Weiglein, M. Zanetti

The width of the assumed Higgs boson near 125 GeV is neglected (5-10% accuracy for single channels), *i.e. the zero-width*

approximation for this state is used.

$$(\boldsymbol{\sigma} \cdot \mathbf{BR})(ii \to \mathbf{H} \to ff) = \frac{\sigma_{ii} \cdot \Gamma_{ff}}{\Gamma_{\mathbf{H}}}$$

Taking the process $gg \to H \to \gamma\gamma$ as an example, one would use as cross section:

$$(\sigma \cdot BR) \left(gg \to H \to \gamma \gamma \right) = \sigma_{SM}(gg \to H) \cdot BR_{SM}(H \to \gamma \gamma) \cdot \frac{\kappa_g^2 \cdot \kappa_\gamma^2}{\kappa_H^2}$$

impact	Prolegomena	Past	Present	Discovery	Implications	Future
00	000	00	000000	0000	000000000000000000000000000000000000000	• • •••

A reason (not) to believe

This year we learned that the Higgs mass is 125.8 GeV $_{\it give \ or \ take} \ 1/2 \ GeV$

 As a consequence, we learned that God plays not only dice but also russian roulette

In other words, that life is futile because everything we cherish and hold dear will decay. In other words, that the vacuum of the standard model could be non-stable.

• Keep in mind the important disclaimer: All this discussion is valid

Perspectives

IT IS EXPENSIVE IN TIME AND MONEY TO BUILD HIGHER ENERGY COLLIDERS OUR MAIN RELIABLE TRANSPORTER INTO ▷ the high energy frontier ⊲

Relatively speaking, theoretical research is inexpensive

though hundreds of theories have been born and have died. Some have died due to incompatibility of new data, but

others have died under their own self-consistency problems. In that sense progress is made

When attempting to really explain, the consistency issues must be stretched to the maximum

Our hope that unsparing devotion to full consistency, both observational and mathematical will be the hallmarks of

the future era

◆□▶ ◆□▶ ◆三▶ ◆三▶ ◆□▶

00	000	00	000000	0000	000000000000000000000000000000000000000	0000000

A lot of take-home messages

(will be expensive if you are traveling with Easyjet!)

A new particle has been discovered and it is likely to play a key role in our understanding of the fundamental laws of Nature but we should remember that the SM doesn't "explain" the EW scale

> is the EW scale "natural" or fine-tuned? is the Dark Matter linked to the EW physics? are neutrino masses indicating a new (high) sca will the fundamental interactions unify?

we have to make sure that the next exp. facilities can answer these questions (and other ones) without (too much) theoretical prejudice

Higgs discovery implications
