

Status and plans of laser-plasma acceleration research in IAP RAS

Monday, 3 June 2013 16:30 (15 minutes)

Laser-plasma acceleration has been experimentally studied at PEARL facility. Plasma wakefields excited by low-power laser have been observed in gas-filled capillary tube. Important theoretical results have been obtained and efficient numerical codes have been developed. PEARL-10 is under construction. It will provide power up to 5 PW.

The work is supported by Ministry of Science and Education of Russian Federation.
