

# ARION - Systems for Coastal Dolphin Conservation in the Ligurian Sea

M.Taiuti on behalf of the ARION Collaboration

Copyright The Arion Project  
All rights reserved

# THE PROJECT

# ARION-LIFE+09 NAT/IT/190

- The ARION main objective is the creation of a virtual corridor for monitoring and surveillance of transient and resident bottlenose dolphins (*Tursiops truncatus*).
- Cofunded by EU, started on 1/10/2010 has now completed the infrastructure deployment
- The ARION protocol will become effective starting spring 2014 and will last two years (at least)

# Objectives

- ➔ Conservation of the *Tursiops Truncatus* by means of three actions
  - Continuous surveillance of the project area to detect the presence of the bottlenose dolphins and concurrent human activities (boats)
  - Prompt risk reduction
  - Long term activity to define regulations and protected area boundaries

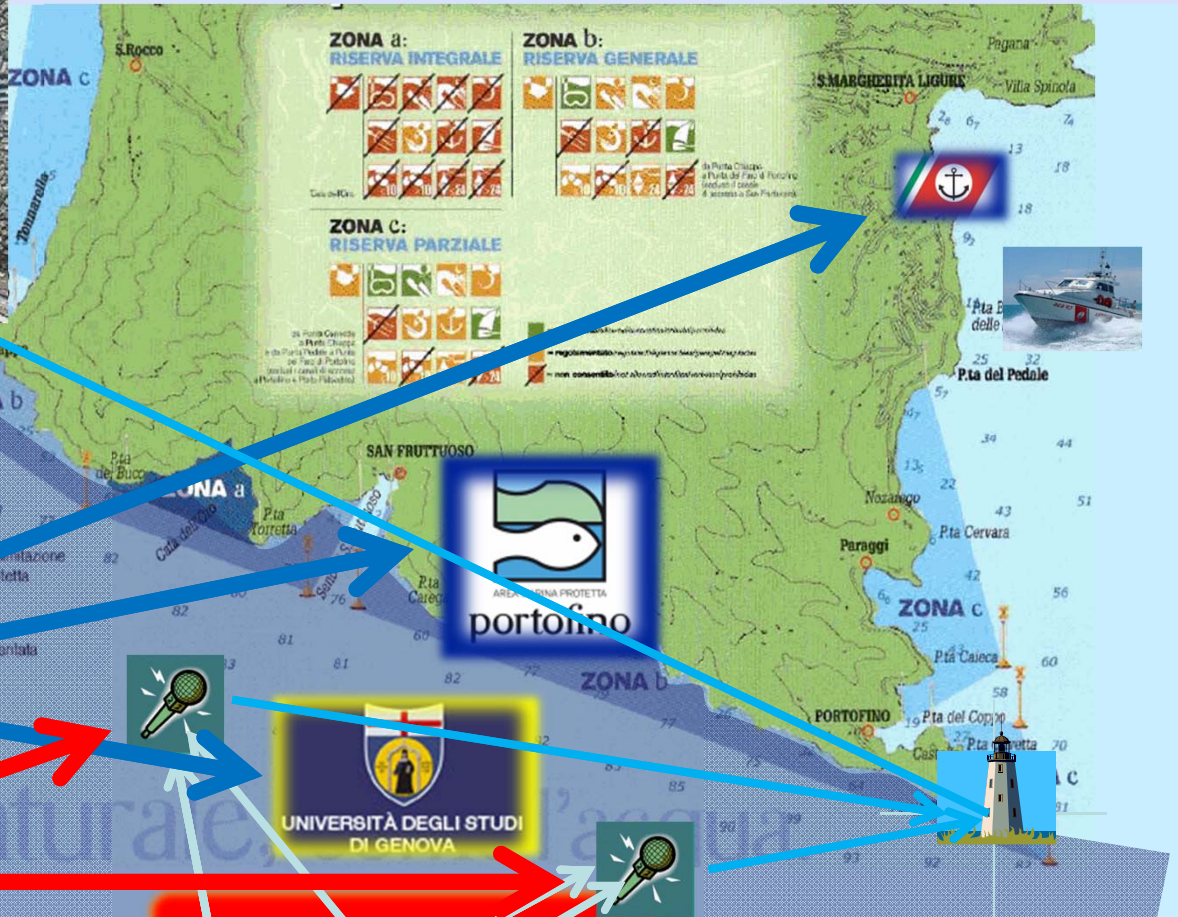

# How?

- We deployed in the Portofino MPA two detection units, based on a particular type of marine buoy (elastic beacon) each equipped with four hydrophones and an acquisition system which can record the typical “social communication whistles” emitted by the dolphins and the sounds emitted by boat engines.
- Signals are pre-filtered and sent on shore, using a wi-fi bridge, where they are elaborated to get the position of dolphins and to track the boats in real-time.

# Monitoring

PARTNERSHIP

DETECTION UNIT

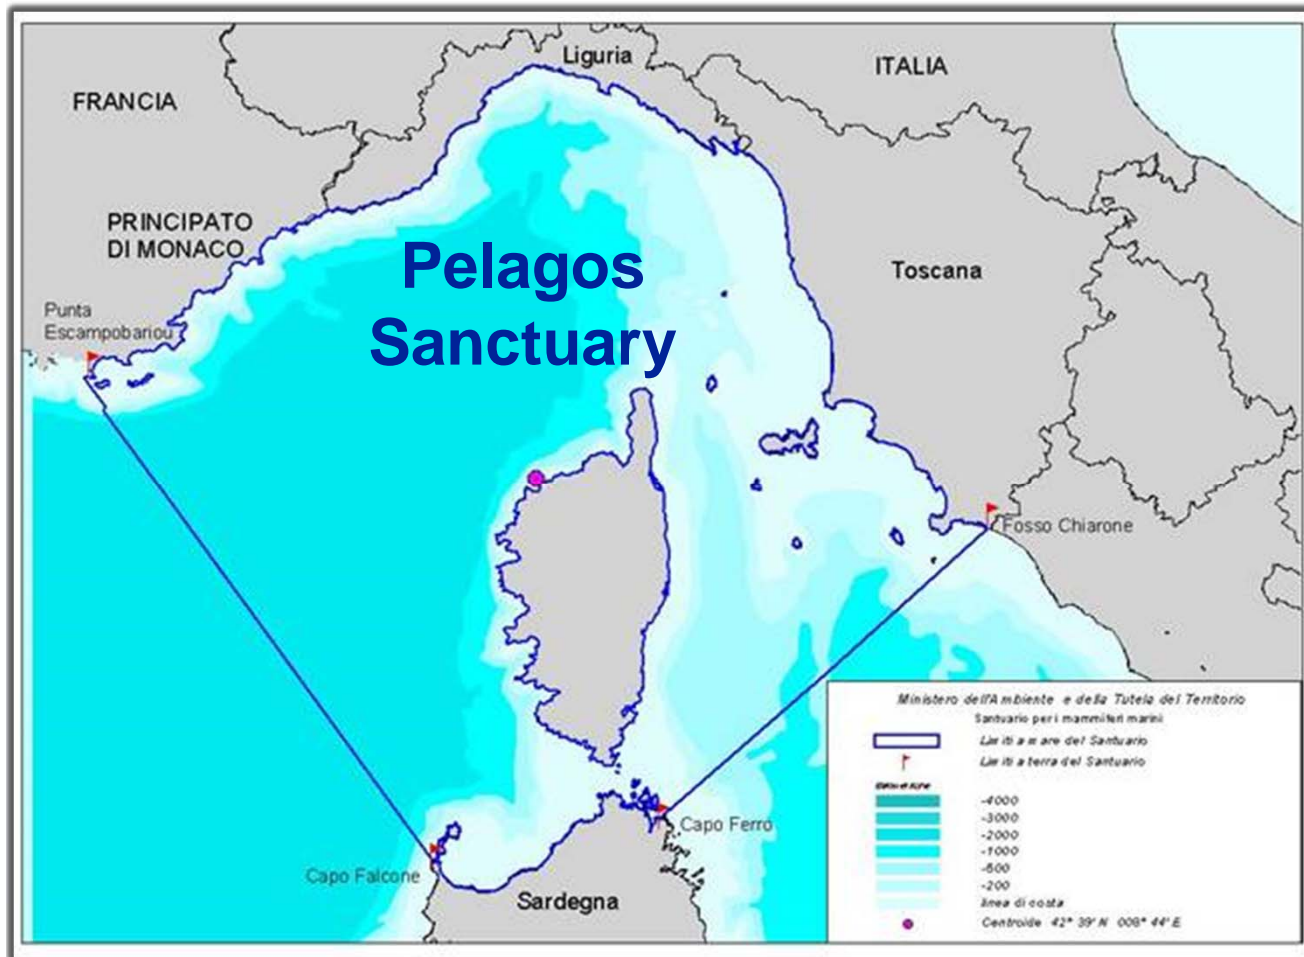

# THE PROJECT AREA

- Presence of high reproduction zones (*frontal zone*)

- *Up-welling* in the spring season generated by the prevailing north-westerly wind ("mistral")

- *Meganyctiphanes norvegica*: important role in the diet of *Balaenoptera physalus*

High and stable cetaceans presence, in according to high levels of primary production

# Portofino Marine Protected Area (MPA)

**SPAMI (2005)**  
**L-TER (2007)** site

- established in 1999
  - 374 ha
  - 15 Km of coast
- includes the towns of Camogli, Portofino and S.Margherita Ligure

# The Environment

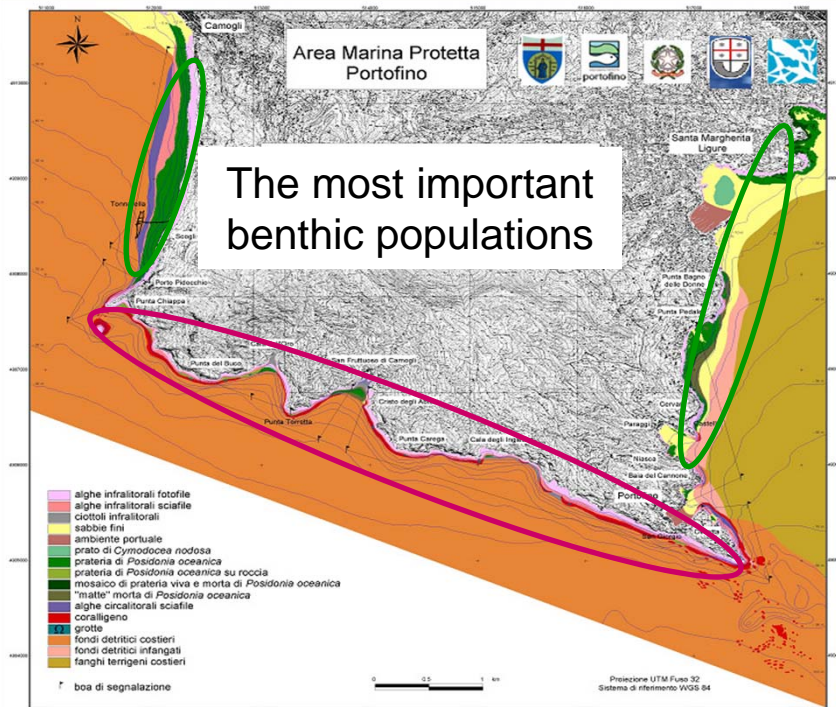

Seaweed environment

pre-coraligenous

Coralligenous and twilight environments

Along the western and eastern slopes of the Promontory: meadow of *Posidonia oceanica*  
 The typical biocenosis of the southern slope are the pre-coraligenous and coraligenous one

Portofino MPA -Zoning	A (19,05 ha)	B (167,02 ha)	C (188,061 ha)
Fine sand	0	0,13	11,49
Infralittoral plebbes (IP)	0,59	1,50	0
Photophilic infralittoral algae (PIA)	2,77	17,55	20,54
Sciaphilic red algae	1,15	11,50	15,53
<i>Posidonia</i> meadows(HP)	0,53	0,41	38,97
Mixed of living and dead <i>Posidonia</i>	0	0	0,99
Dead matte of <i>Posidonia</i>	0	0,35	3,83
Sciaphilic circalittoral algae	0		14,98
Coastal muddy bottoms (VTC)	0	0	15,58
Coralligenous assemblages (C)	0,74	17,21	2,75
Coastal detritus (CD)	10,75	144,94	42,15
Muddy detritus (MD)	0	0	14,48

# THE INFRASTRUCTURE

# Realization of a permanent marine infrastructure for bottlenose dolphins and boats detection and tracking

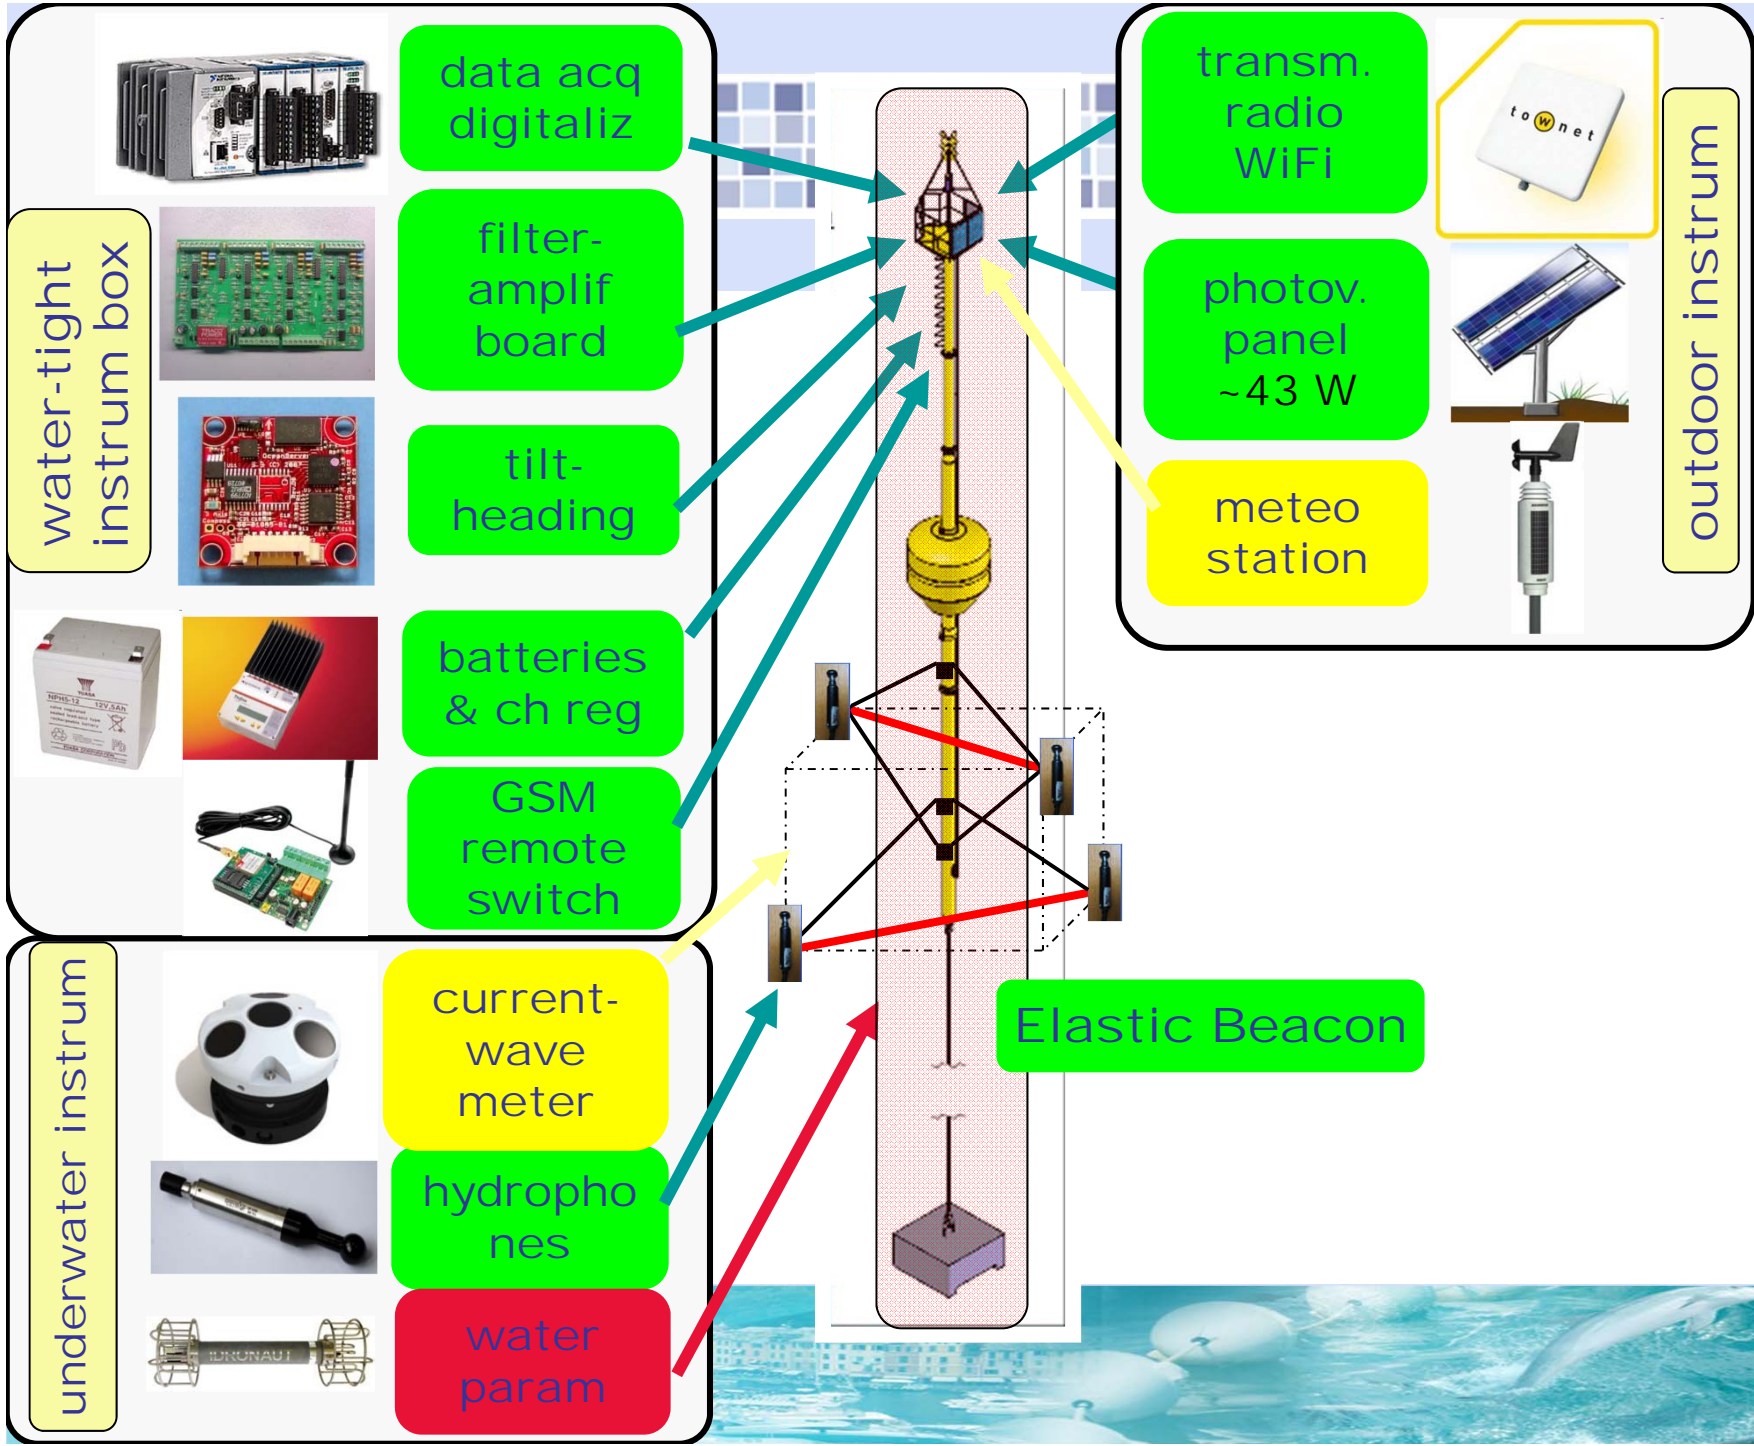

© Rosso M. DIBIO - UNIGE

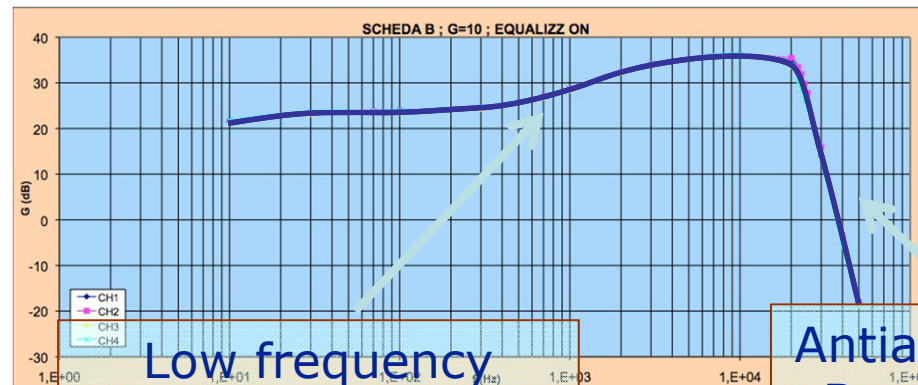

# Hydrophone properties

- ➔ GP0280 by COLMAR
- ➔ Working band: 5 – 90.000 Hz
- ➔ Sensitivity differential output: -165 dB re 1V/ $\mu$ Pa @5 kHz
- ➔ Directivity: spherical, omnidirectional
- ➔ Max working depth: 1000 m
- ➔ Gain @5 kHz: 36 dB (differential output)
- ➔ Input acoustic equivalent noise: 34 dB re 1 $\mu$ Pa/ $\sqrt$ Hz @5 kHz

# Acquisition System

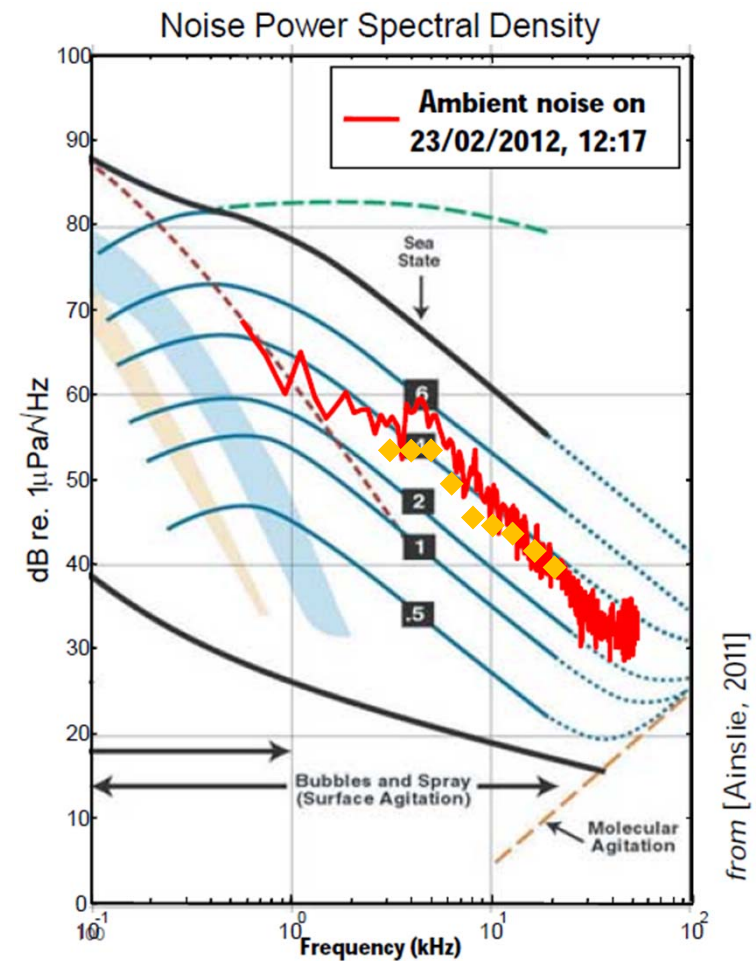

4-channel  
16 bit ADC  
Single clock  
Up to 100 kS/s

# Performances

- ➔ Hydrophones absolutely calibrated
  - Ambient noise (Wenz curve)
  - Measurement with calibrated hydrophone shows noise higher than theoretically expected
  - Our system provides similar results
- ➔ Up-time 89%

# On-line analysis

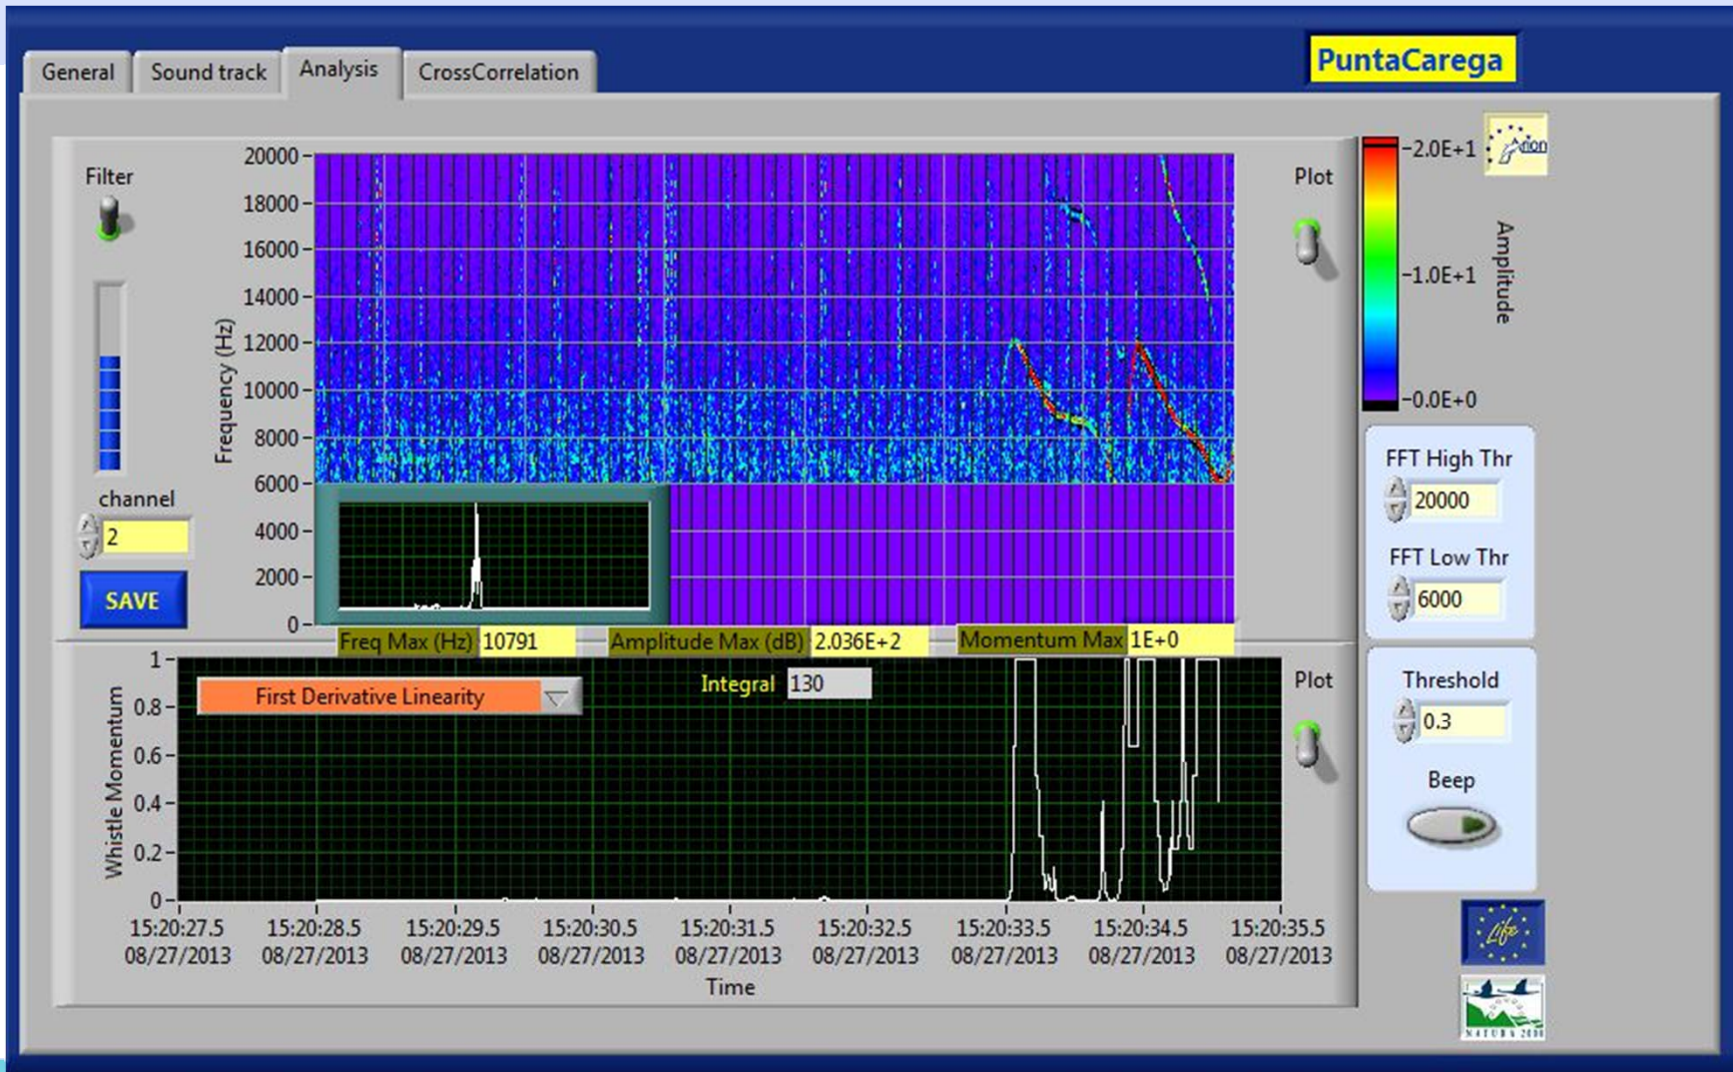

- ➔ Whistle identification – Zimmer algorithm
- ➔ *Noise reduction – boats mis-identification (in progress)*
- ➔ Sound heading calculation
- ➔ *Sound source localization (in progress)*
- ➔ *Boat tracking (in progress)*

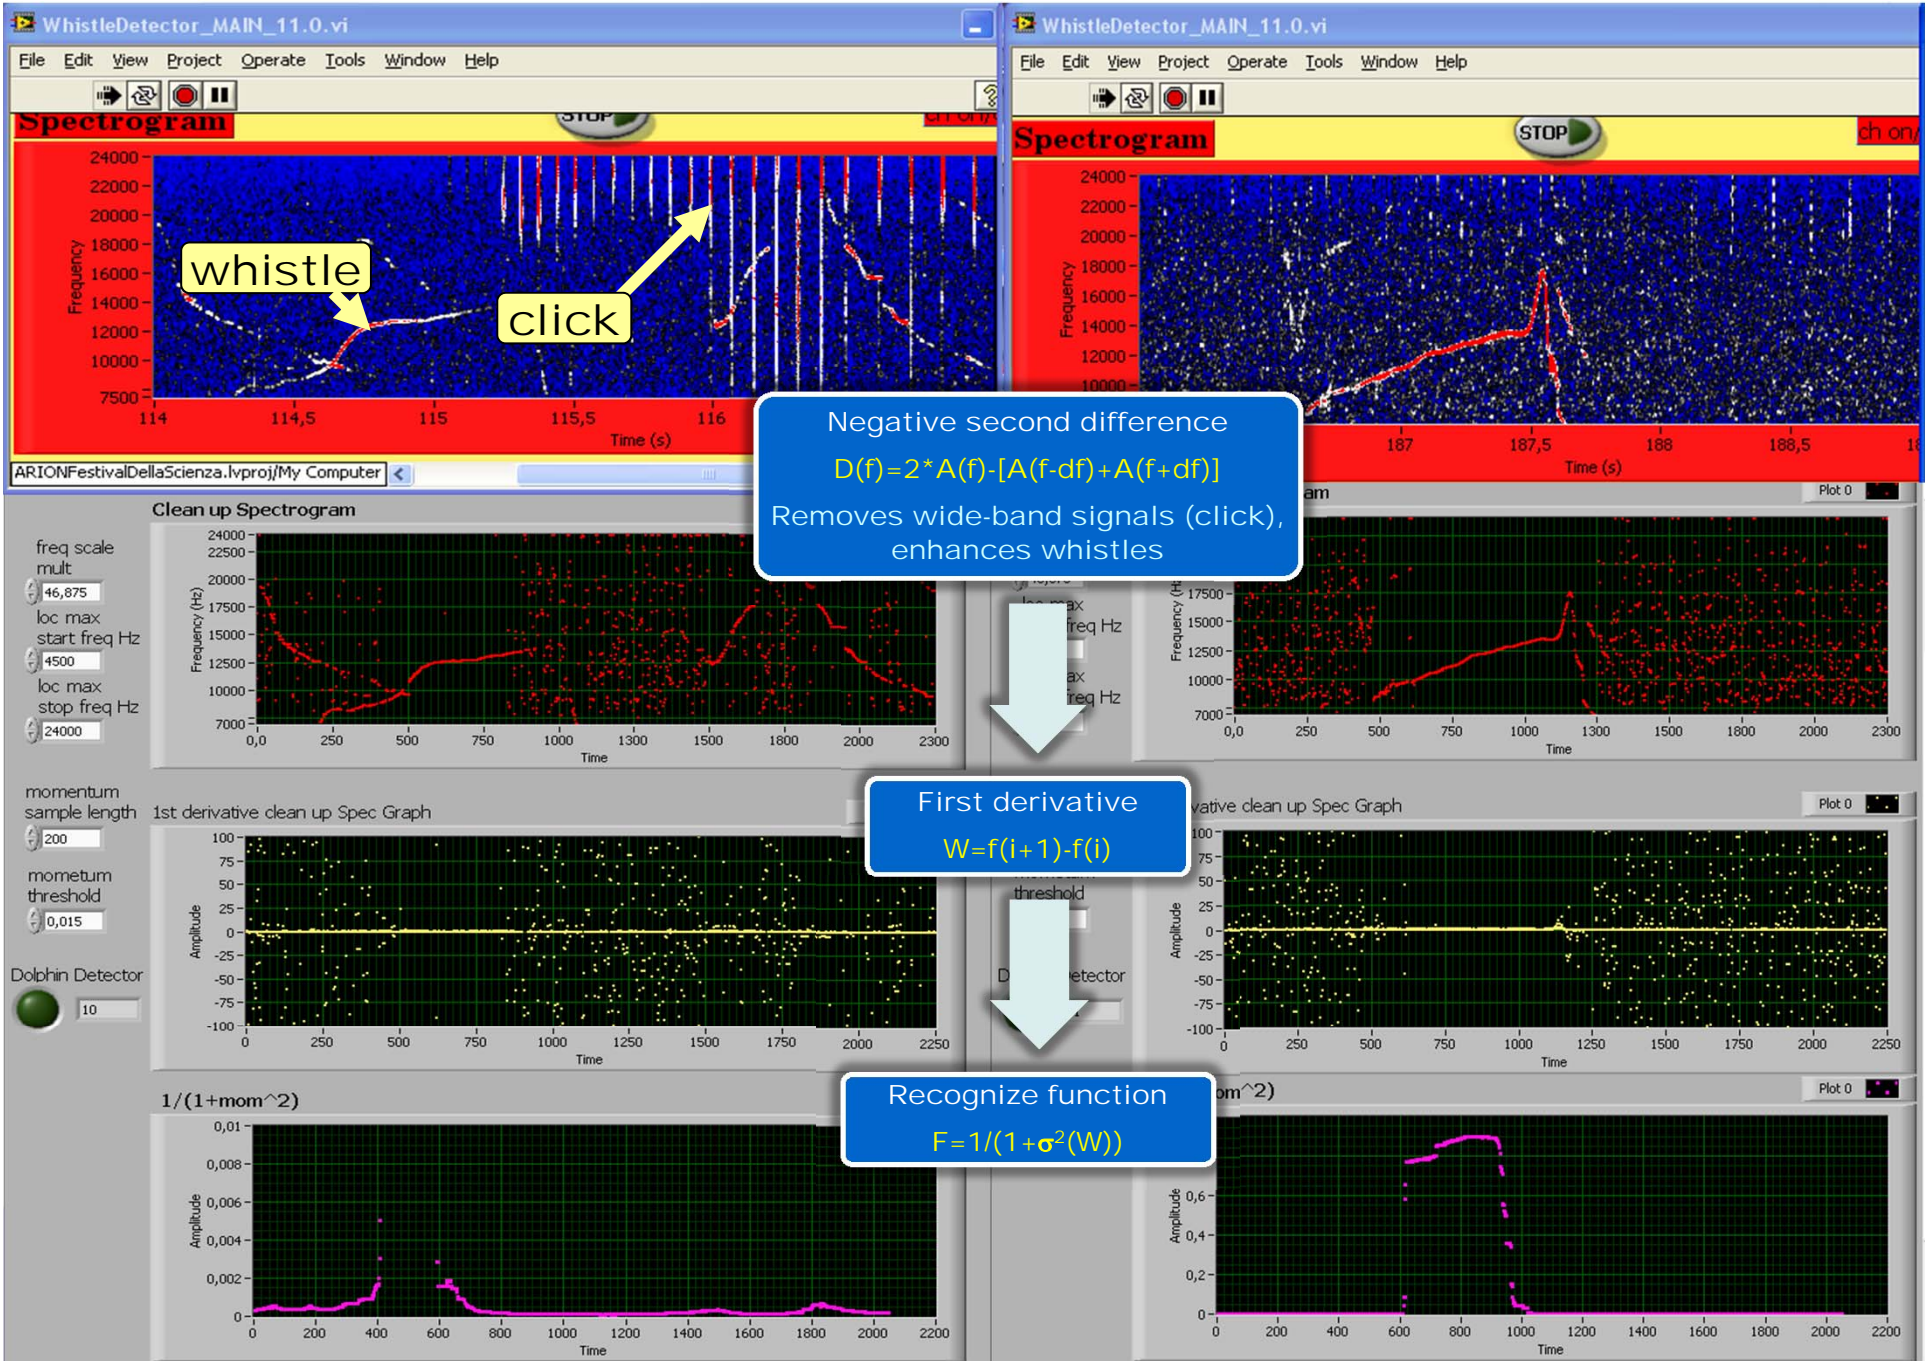

# WHISTLE IDENTIFICATION

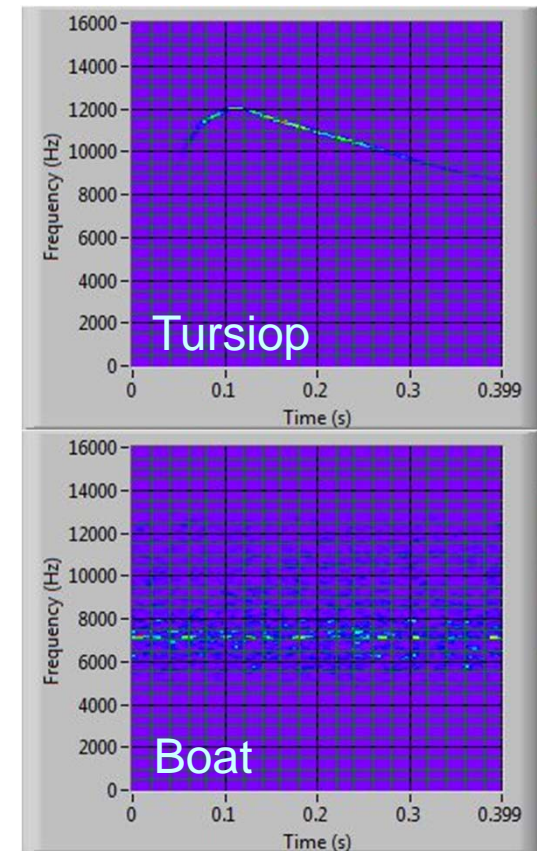

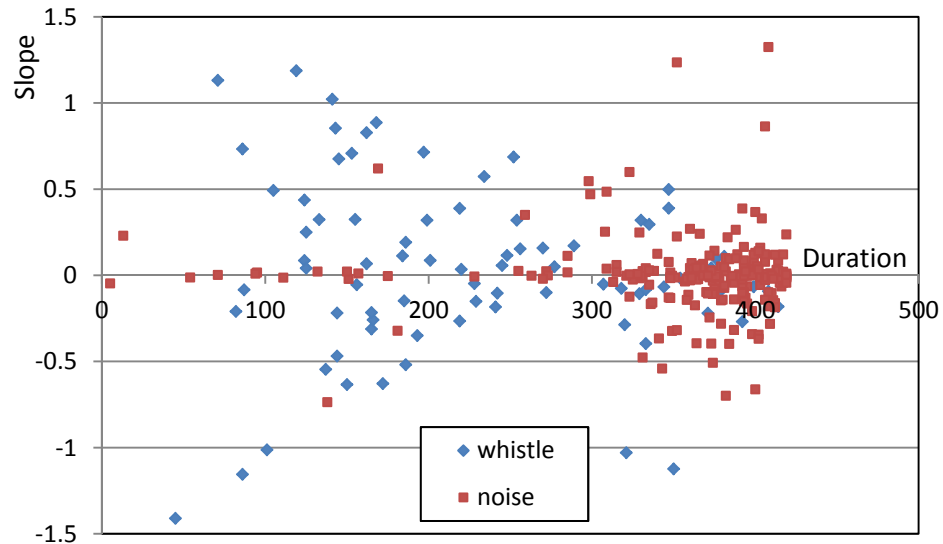

# Noise reduction

- The algorithm is not sufficient
- Boats mimic the bottlenose dolphin signal
- Check on duration and slope – in progress

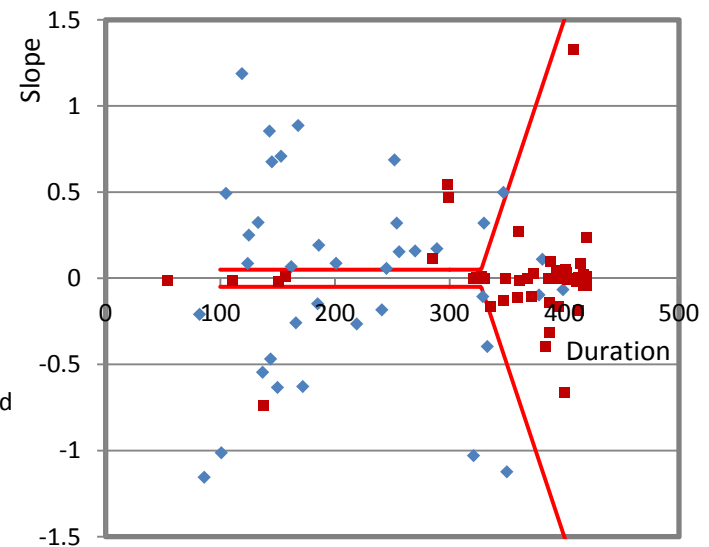

→ Clear correlation between signal duration and slope

- >90% efficiency
- <5% contamination

◆ Reconstructed  
■ Noise  
— Upper cut  
— Lower cut

# SOUND HEADING CALCULATION

$$h_2(t) = h_0(t - \Delta T)$$

$$R_{02}(\tau) = R_{00}(\tau - \Delta T)$$

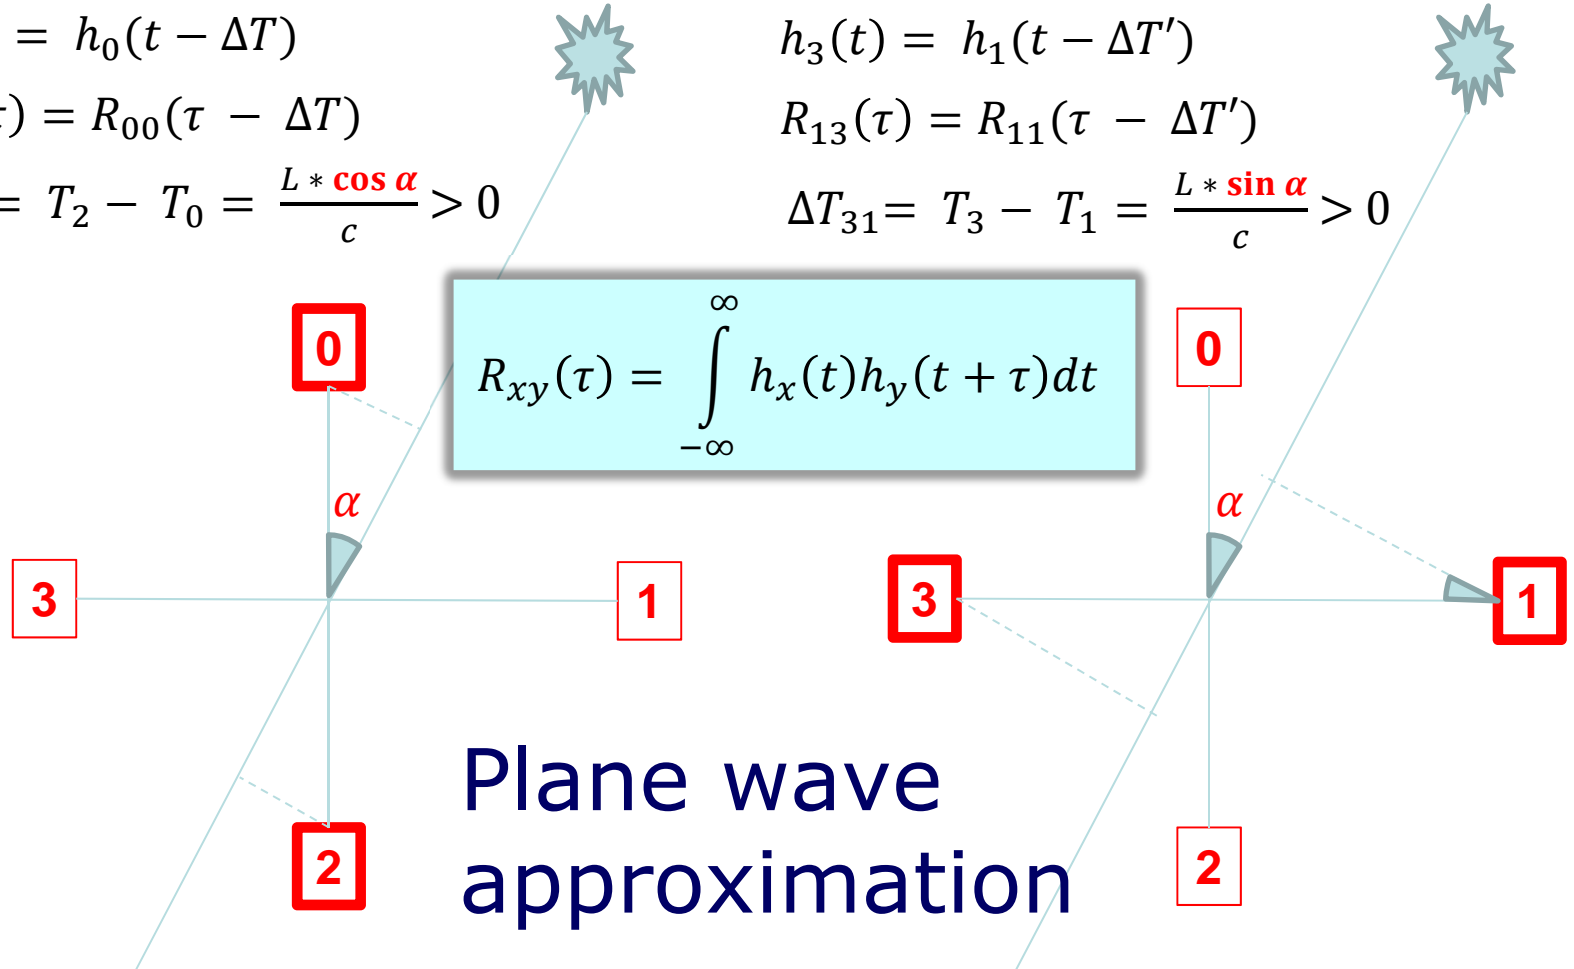

$$\Delta T_{20} = T_2 - T_0 = \frac{L * \cos \alpha}{c} > 0$$

$$h_3(t) = h_1(t - \Delta T')$$

$$R_{13}(\tau) = R_{11}(\tau - \Delta T')$$

$$\Delta T_{31} = T_3 - T_1 = \frac{L * \sin \alpha}{c} > 0$$

$$R_{xy}(\tau) = \int_{-\infty}^{\infty} h_x(t)h_y(t + \tau)dt$$

# Angular resolution

- ➔ Maximum acceptable compatibility between cross-correlations set to  $\pm 2 \cdot 10^{-4}$  s
- ➔ It corresponds to an average angular resolution of  $1^\circ$

# SOUND SOURCE LOCALIZATION

# Sound Source

- Frequency range: 5 kHz – 20 kHz
- Duration:  $\sim 1$  s
- Source level (**SL**): 160 dB re 1  $\mu$ Pa@1 m

## → Assuming Passive Sonar Equation:

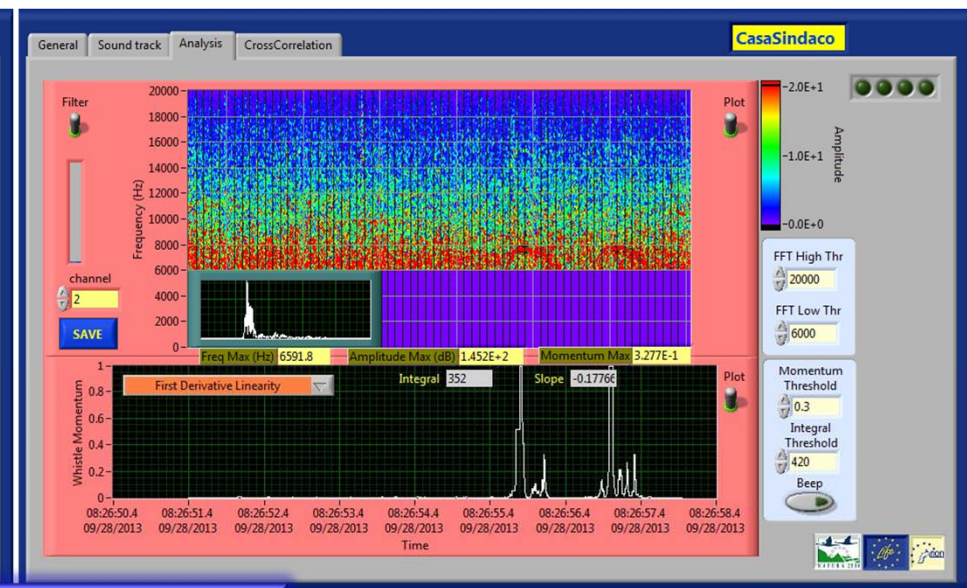

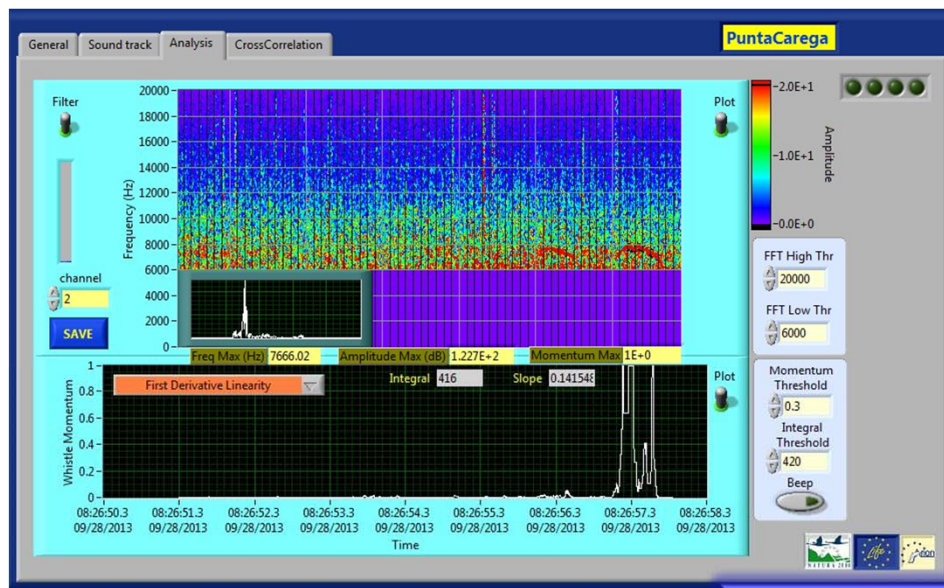

- Average noise Level **NL** from Wenz curve for the Sea state
- Noise is distributed over a Band Width **BW=40 dB**
- Transmission Loss (spherical propagation including spreading and attenuation losses)  
 $TL=20 \cdot \log(R) + C \cdot R$
- Detection Threshold **DT=5 dB**

$$\rightarrow L_{S/N} = SL - TL - NL - BW \geq DT$$

## → Expected maximum detection range

- @Sea State = 0  $D_0 = 6.3$  km
- @Sea State = 4  $D_0 = 1.4$  km

First observed whistle  
in coincidence

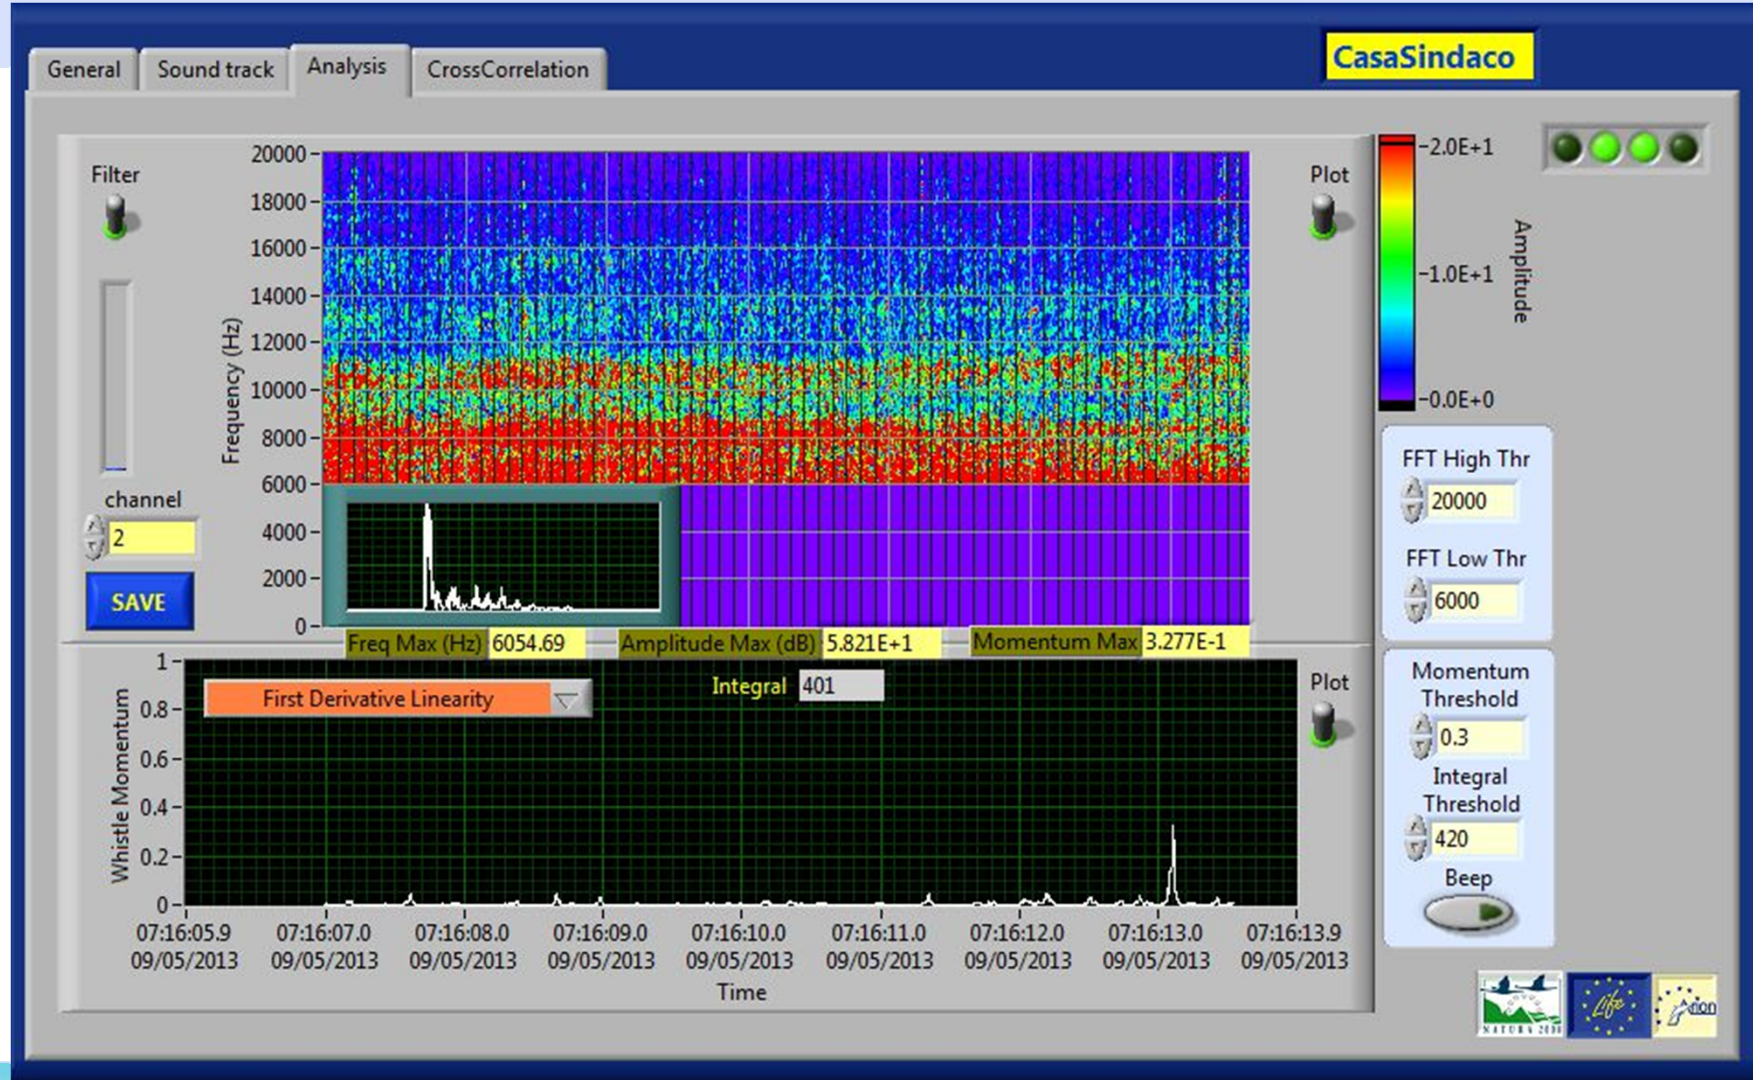

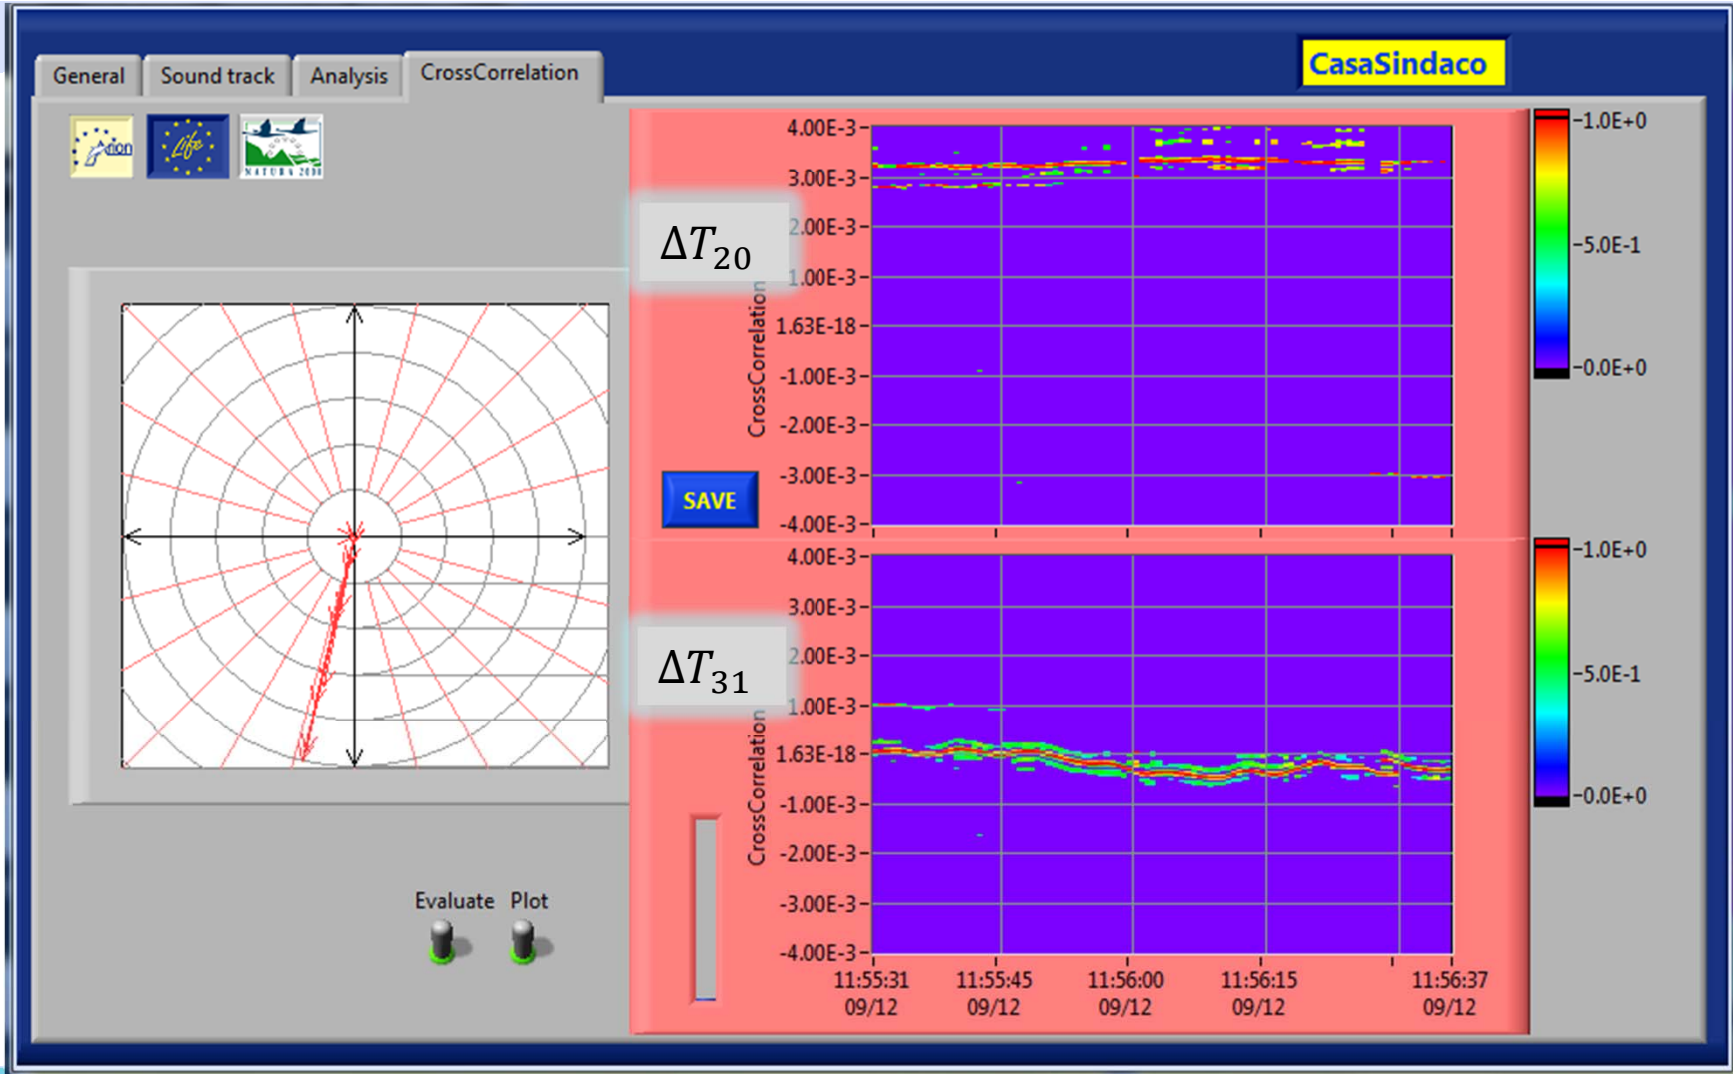

# BOAT TRACKING

- ➔ On-line boat heading tracking already implemented and working
- ➔ Boat identification and route tracking in progress

# BOTTLENOSE DOLPHINS OBSERVATION

## → Monthly and hourly observation

- Constant presence in the area (june affected by maintenance downtime)
- Preferred hours with lower boat traffic

N° Positive days

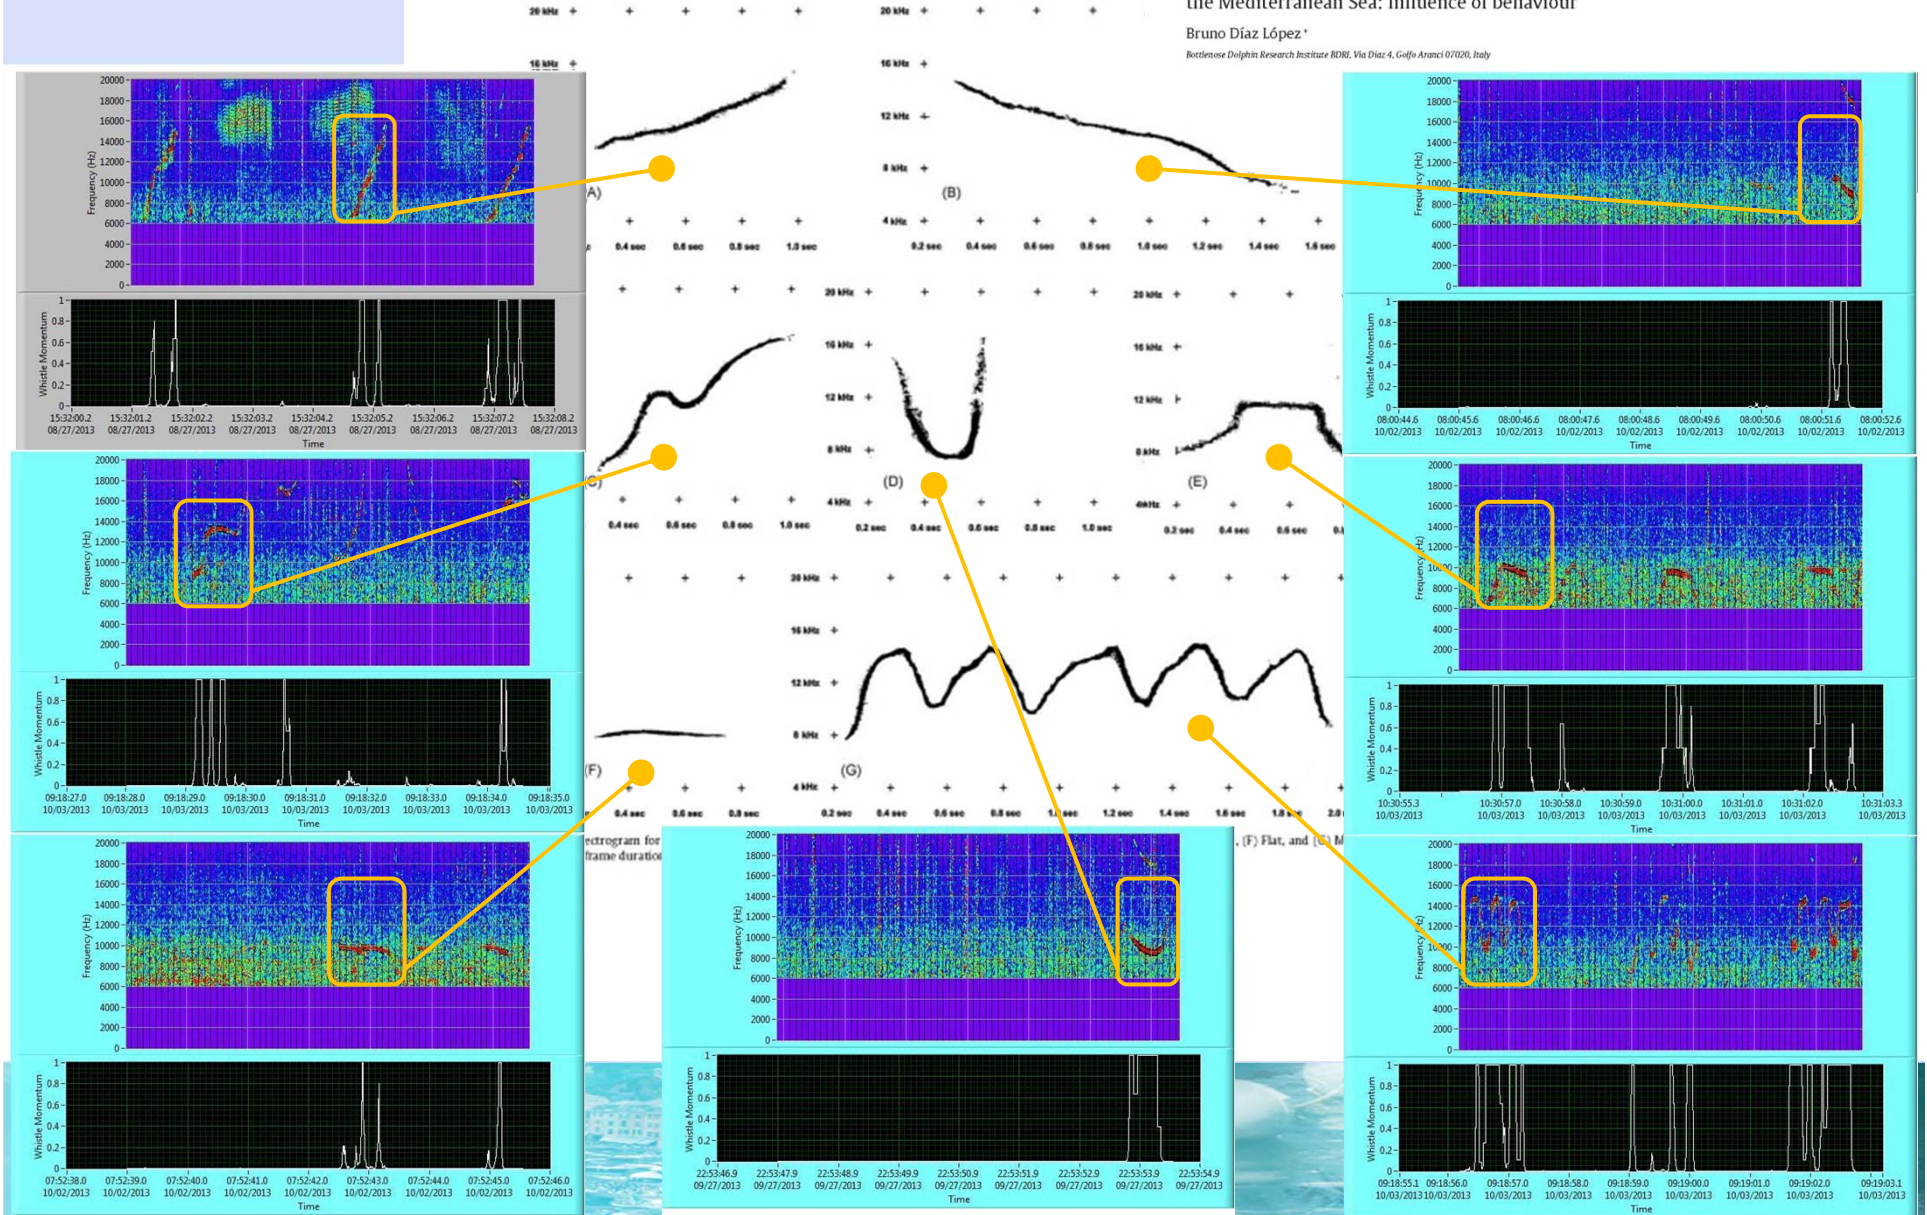

Original Investigation

Whistle characteristics in free-ranging bottlenose dolphins (*Tursiops truncatus*) in the Mediterranean Sea: Influence of behaviour

Bruno Díaz López\*

Bottlenose Dolphin Research Institute BDRI, Via Diaz 4, Golfo Aranci 07020, Italy

B. Díaz López / Mammalian Biology 76 (2011) 180–189

→ Observed several additional signals not common in the Mediterranean Sea

# Networks - present and future

## ➔ ARION

- is hosting a regional meteo-marine station (it is the second in Liguria)
- is entering in the LTER network
- is willing to share data with the marine environment scientific community

# Summary

- ➔ ARION is operating since June 2013
- ➔ Identification of bottlenose dolphins whistles with high efficiency
- ➔ Localization of sound sources in progress
- ➔ Tracking of boats in progress
