

The MEG experiment: recent result and upgrade

- Theoretical motivations
 - $\mu \rightarrow e \gamma$ decay probe of physics beyond standard model
 - comparison with other cLFV experiments and LHC
- Experiment overview
 - Signal and background
 - The detector
- Latest result
 - Improvements in data analysis
 - Result
- The upgrade
 - Design and R&D
 - Perspectives

- **cLFV forbidden** in the **Standard Model** with **vanishing neutrino masses**
- **extremely suppressed** in the SM extension with **neutrino oscillation**
 - example: $BR(\mu \rightarrow e \gamma) \approx 10^{-50}$ **not measurable** by any experiment

$$\Gamma(\mu \rightarrow e \gamma) \approx \underbrace{\frac{G_F^2 m_\mu^5}{192 \pi^3}}_{\mu - \text{decay}} \underbrace{\left(\frac{\alpha}{2\pi}\right)}_{\gamma - \text{vertex}} \underbrace{\sin^2 2\theta \sin^2 \left(\frac{1.27 \Delta m^2}{M_W^2}\right)}_{\nu - \text{oscillation}}$$

$$\approx \frac{G_F^2 m_\mu^5}{192 \pi^3} \frac{3\alpha}{32\pi} \left(\frac{\Delta m_{23}^2 s_{13} c_{13} s_{23}}{M_W^2}\right)^2$$

➡ $\mu \rightarrow e \gamma$ as a **clean probe** of **new physics** beyond the Standard Model

- **Huge enhancement** in several **beyond** the **SM** in particular in **Supersymmetric and Grand Unification Theories**
 - $B(\mu \rightarrow e \gamma) \approx (10^{-14} \div 10^{-12})$ experimentally **accessible!!**
 - New physics **discovery** or **tight limits** on their parameters

Several **cLFV** processes sensitive to **New Physics**

complementary processes to **define** the **nature** of NP

cLFV in τ and μ

Effective lagrangian: Λ energy scale, κ coupling to 4 fermions diagram

MEG collaboration
~60 physicists from 12 institutes from 5 countries

Why PSI?

- . The **most powerful continuous** machine in the world
- . Proton energy **590 MeV**
- . Power **1.2 MW**
- . Nominal operational current **2.4 mA**
- . **μ beam** up to **$10^8 \mu/\text{sec}$** , more than needed

Signal and background

Signal

$E_\gamma = 52.8 \text{ MeV}$
 $E_{e^+} = 52.8 \text{ MeV}$
 $\Theta_{e\gamma} = 180^\circ$
 $T_{e\gamma} = 0 \text{ s}$

Radiative Muon Decay

$E_\gamma < 52.8 \text{ MeV}$
 $E_{e^+} < 52.8 \text{ MeV}$
 $\Theta_{e\gamma} < 180^\circ$
 $T_{e\gamma} = 0 \text{ s}$

Accidental

$E_\gamma < 52.8 \text{ MeV}$
 $E_{e^+} < 52.8 \text{ MeV}$
 $\Theta_{e\gamma} < 180^\circ$
 $T_{e\gamma} \Rightarrow \text{flat}$

Accidental bkg is dominant and determined by **beam rate** and **resolutions**

$$B_{acc} \propto R_\mu \Delta E_e \Delta E_\gamma^2 \Delta \Theta_{e\gamma}^2 \Delta t_{e\gamma}$$

$$B_{RMD} \approx 0.1 \cdot B_{acc}$$

Exp./Lab	Year	$\Delta E_e/E_e$ (%)	$\Delta E_\gamma/E_\gamma$ (%)	$\Delta t_{e\gamma}$ (ns)	$\Delta \theta_{e\gamma}$ (mrad)	Stop rate (s^{-1})	Duty cyc.(%)	BR (90% CL)
SIN	1977	8.7	9.3	1.4	-	5×10^5	100	3.6×10^{-9}
TRIUMF	1977	10	8.7	6.7	-	2×10^5	100	1×10^{-9}
LANL	1979	8.8	8	1.9	37	2.4×10^5	6.4	1.7×10^{-10}
Crystal Box	1986	8	8	1.3	87	4×10^5	(6..9)	4.9×10^{-11}
MEGA	1999	1.2	4.5	1.6	17	2.5×10^8	(6..7)	1.2×10^{-11}
MEG	2008 - x	1	4.5	0.15	19	3×10^7	100	5×10^{-13}

MEG keywords:

- 1) **thin** → “low” energy
 - 2) **fast** → high rate → intensity frontier
 - 3) **stable** → precision measurement → background rejection
- . **μ beam stopped** on a 205 μ m polyethylene target (1)
 - . **non uniform** solenoidal **magnetic** field (2)

(Dated: March 4, 2013)

The analysis of a combined dataset, totaling 3.6×10^{14} stopped muons on target, in the search for the lepton flavour violating decay $\mu^+ \rightarrow e^+ \gamma$ is presented. The data collected by the MEG experiment at the Paul Scherrer Institut show no excess of events compared to background expectations and yield a new upper limit on the branching ratio of this decay of 5.7×10^{-13} (90% confidence level). This represents a four times more stringent limit than the previous world best limit set by MEG.

SUSY-GUT

3. < Multiple scattering

MEG^{UP} at a glance

MEG

Upgraded
MEG

- PSI $\pi E5$ beam line
 - $> 10^8 \mu^+/\text{sec}$
- **Surface** ($p=28 \text{ MeV}/c$) **muon beam**
 - **residual range** $\sim 120 \text{ mg}/\text{cm}^2$
 - **thinner target** $140\mu\text{m}$ [205] $\rightarrow$ placed at 15° [22°]
 - $7 \times 10^7 \mu^+/\text{sec}$, 8.1σ e/μ separation
 - $\sigma_x \sim \sigma_y = 9 \text{ mm}$

- **single volume, low mass, stereo drift chamber + multi tile scintillation timing counter** inside COBRA magnet

- *Drift chamber*

- **Single volume** gas detector
- **U-V stereo reconstruction** (8°) $\rightarrow$ hyperbolic DC
- **low mass** (90:10 He:iC₄H₁₀) $\rightarrow$ Low $X_0 < 1.7 \times 10^{-3}$ per track [similar to current value]
- **>80% transparency** towards **TC** [40 %]
- **Ultra-fast electronics** for cluster timing, ~ 1 GHz bandwidth

- *performance from MC*

- **> 40 hits/track** [10-16]
- single hit resolution **$\leq 120 \mu\text{m}$** [210]
- Momentum resolution **$\sim 150 \text{ keV}$** [~ 310]
- Angular resolution **$\sim 5-7 \text{ mrad}$** [9-10]

- **INFN takes the full responsibility of the construction of the new tracker**

Timing Counter

- **increased muon flux** → **reduce hit-rate and pile-up**
- $(3 \times 9 \times 0.5)$ cm³ plastic **scintillator tiles**, read by **MPPC**
- **improve timing resolution** by combining several tiles

The photon detector

- The γ -detector **almost met its design** requirements
 - **largest, best performant Xe detector to date**
- **800 liters LXe, 848 VUV PMTs**
 - **216 on the entrance face, 6.2 cm granularity**
- **Non-optimal** reconstruction of γ -rays that **convert close** to the detector **entrance face**
 - **worse energy and position resolution for shallow events**
- **Non-uniform** light transmission for events **close** to the **lateral surfaces**
 - **reduced acceptance at the edges**

γ -detector improvement

- Use the **same cryostat**, most **mechanics**, + **620 PMTs**
- Use of **SiPM** (MPPC) **12x12 mm²**
 - **~3500 sensors**
 - **+9% detector transparency** to 52.8 MeV γ -rays
 - **Better granularity** for **depth reconstruction/pile-up rejection**
 - **position reconstruction**
 - **timing**
- Difference **geometry** for the **lateral faces**
 - **+10% acceptance**

-

- **Chamber** behavior in MEG^{UP} **high rate environment**

- Under a **harsh environment** the DC is subject to **aging effects**

**Pisa
Lecce
Roma**

- **gain loss**
 - **worse energy resolution**
- **excessive chamber current**
- **self-sustained discharges**
- **high voltage instability**
- **wire corrosion, swelling, rupture**
- **Accelerate aging test**

- **Single hit resolution**

- **Light gas** (He:iC₄H₁₀)
- **low multiple scattering**
- **lower number of clusters**
- **large impact parameter fluctuations**
- **count/time individual clusters** on anode wire (cluster timing)

- **Realistic prototype** from the point of view of

- **field configuration**
- **decision on materials**

- Prototype feature

- **1 complete cell (20 cm length) + guard field**
- **Gold-plated tungsten wires**
 - **~4 μ m plating**
 - **sense wire 25 μ m, field+shape 80 μ m**
- **~1 kBq alpha-source at the center**
- **Assembled in clean room**

- Work done **@INFN Pisa**

- **1 prototype assembly in 2 working days**

Measuring configuration

- On scale

- **Aging** is measured as the **gain drop** as a function of the **collected charge**

$$R = -\frac{1}{G_0} \frac{dG}{dQ} \left(\frac{\%}{C/cm} \right)$$

- **Accelerated irradiation** (20x aging), **accelerated gas flow**
- The **current drop** is nicely fitted with an **exponential function** over > 10 days
 - Actualized **time constant = 945 days**
 - Gain drop **0.11%/day** on the central wire, **NOT** a serious **problem** for MEG^{UP}

- Measurements with **three Cu drift-tubes + 20 μ m W(Au) wires**
 - 200 μ m thin wall**
- For **vertical tracks**: $\frac{d_1 + d_3}{2} - d_2 = \pm \Delta$ and $\sigma_\Delta \equiv \sqrt{\frac{3}{2}} \sigma_d$
- Measurement done **@INFN Lecce**
 - various He:iC₄H₁₀ mixture (95:5 $\rightarrow$ 50:50)**
 - high bandwidth commercial amplifier (Phillips 775)**
 - use the arrival **time** of the **first cluster** + **x-t relation**
 - custom pre-amp prototype produced @INFN Lecce**

Three-tubes results

- Contains the **contribution** of **CR** muons **multiple scattering**

- When **MS removed** $\sigma < 120 \mu\text{m}$ already for **(15:85)**

Mixture (He:iC ₄ H ₁₀)	Resolution (μm)
5:95	330
10:90	160
15:85	140
20:80	135
25:75	120
50:50	110

- Large **prototype** built @INFN Roma

- **8x8 cells** (7x7 mm²)
- **50 cm** long wires
 - 80 μm W(Au) field wires
 - 25 μm W(Au) sense wires
- **No stereo angles**
- **custom pre-amp** (INFN Lecce)

- **Silicon cosmic ray telescope** assembled @INFN Pisa as a **section facility**

- **BaBar SVT spare, new electronics** designed for **supply and read out**
- support from “servizio alte tecnologie” and “servizio progettazione elettronica”
- **20 μm resolution** on **straight tracks**
- **DUT in a sandwich** within **4 layers of Si detectors**

Scintillators for TRG
Si layers
DC under test

- **Preliminary resolution** measurements with three-tubes are **very promising**
- **To be confirmed** with **intensive** measurement **campaign** with the **silicon telescope** to test reconstruction/cluster timing (chronological order)
 - *Roma prototype*
 - *Lecce three-tubes in the telescope*
 - *Pisa new prototype in configuration with stereo wires*
 - *Pisa and Lecce full scale prototype (mechanics and read out)*
 - last one maybe **not only telescope** but **beam...**

500μm offset

Track fit: same MEG algorithm

End plate geometry:
flat $\rightarrow$ **>90%**
transparency to TC
(76% with conical one)
work ongoing...

- **Several** prototype **tiles** built to test
 - **different scintillators** (BC422, BC418, BC420)
 - **different wrapping** material/techniques (Al Mylar, Teflon, M3 reflector tape)
 - **different tiles dimension** to optimize
 - **resolution** vs **efficiency** vs **number** of **channels** vs ...
 - **different sensors** (Hamamatsu, Advacid, Ketek)
 - **time resolution** and **temperature** dependence
 - **Different pre-amplifiers**
- R&D @PSI by **INFN Genova** and **INFN Pavia + Tokyo University**
 - **Thermalized chamber** for test @PSI
 - **Beam tests @Frascati** this summer

Tail time resolution better than 60ps

- Development of **UV-sensitive MPPC** in **collaboration** with **Hamamatsu photonics**

- ~**18% Photon Detection Efficiency measured**
- R&D ongoing for **read-out of multiple channels** with
 - realistic cable configuration**
 - noisy environment**
 - vacuum feed-through tests with many signals**

- Detect the **positron emerging** from the **target**
 - array of **250 μ m scintillating fibers** read out by **SiPM**
 - weak signal from $e^+ \rightarrow$ R&D on fiber polishing, wrapping and coupling with sensors
- **Decay point** $\rightarrow$ e^+ **momentum** and **angular** resolution improvement
- **Independent** measurement of the **beam shape** and **intensity** at the **COBRA center**
- R&D @**PSI** by **PSI** and **INFN Rome**

$$\sigma_p < 100 \text{ keV}$$

$$\sigma_\phi < 5 \text{ mrad}$$

Target/ Spectrometer	thickness (μ m)/ angle (deg)	σ_p (keV)	σ_ϕ (mrad)	σ_θ (mrad)	comment
Passive/old	205/ 20.5	320	11.7	9.8	measured
Passive/new	205/ 20.5	110	6.3	5.3	simulated
Passive/new	140/ 15	110	5.3	4.8	simulated
Active/new	250/ 20.5	90	4.7	5.1	simulated

Expected sensitivity

PDF parameters	Present MEG	Upgrade scenario
$\sigma_{E_{e^+}}$ (keV)	380	110
$e^+ \sigma_\theta$ (mrad)	9	5
$e^+ \sigma_\phi$ (mrad)	11	5
$e^+ \sigma_z / \sigma_y(\text{core})$ (mm)	2.0/1.0	1.2/0.7
$\frac{\sigma_{E_\gamma}}{E_\gamma}$ (%) $w > 2$ cm	1.6	1.0
γ position at LXe $\sigma_{(u,v)} - \sigma_w$ (mm)	4	2
γ - e^+ timing (ps)	120	80
Efficiency (%)		
trigger	≈ 99	≈ 99
γ reconstruction	60	60
e^+ reconstruction	40	95
event selection	80	85

MEG^{UP}

MEG^{UP}
competitor in a
large phase
space region
with other
projects as
mu2e,
COMET, $\mu \rightarrow eee$
that will follow

- **Physics case** of cLFV in $\mu \rightarrow e \gamma$ channel
- **Last MEG result**
 - **$BR < 5.7 \cdot 10^{-13}$** (sensitivity 7.7×10^{-13})
 - **Expected MEG final sensitivity $\sim 5 \times 10^{-13}$ (statistics doubled w.r.t. this seminar)**
- **From MEG $\rightarrow$ MEG^{UP}**
 - **upgrade** in a relative **short** amount of **time**, make **best use** of the **present technology** available
 - aiming at a sensitivity $\sim 5 \times 10^{-14}$
 - **R&D on new/refurbished sub-detectors**
- The **upgrade schedule** is **well defined** and up to now **on schedule**

Thanks for you
attention

PAUL SCHERRER INSTITUT

NP **indirect** search via cLFV is sensible to **higher energy scale w.r.t. to direct** search at LHC

MEG allowed
by **last**
result
(2.4×10^{-12})

LHC upper
bound in
sensitivity

- Non uniform field: positron emitted almost perpendicular w.r.t beam axis swapped away rapidly
- bending radius almost independent w.r.t. emission angle

Drift chambers

- 16 ultra thin modules
 - 0.0003 X_0 per module
 - two staggers planes with 9 wires each
 - cathode foils for longitudinal information

Timing counter

- Two identical sectors of 15 scintillation bars read by fine mesh PMTa
- Transverse scintillation fibers read by APDs for longitudinal hit reconstruction

- 900 liters of LXe detector with 846 PMTs to collect scintillation light
- Large LY and fast response (4, 22 and 45 ns)
- LXe purification system in gaseous and liquid phase to remove impurities

- Trigger algorithms implemented on FPGA: fast, efficient and flexible to experimental needs
- Use of DRS waveform digitizer: optimum timing and energy reconstruction and pile up rejection
- DAQ efficiency ≈ 1 for the bulk of the statistics

No excess over expected background is **observed** in data set

Projection of fitted likelihood function (2009-2011 all combined)

Consistency check

- Compatibility between old and new analysis: 31%
- Probability to observe UL equal or lower than observed: 24%

Effect on UL (change in ΔNLL)

- 1% uncertainty on upper limit value

Center of $\theta_{e\gamma}$ and $\phi_{e\gamma}$	0.18
Positron correlations	0.11
E_γ scale	0.07
E_e bias	0.06
$t_{e\gamma}$ signal shape	0.06
$t_{e\gamma}$ center	0.05
Normalization	0.04
E_γ signal shape	0.03
E_γ BG shape	0.03
Positron angle resolutions ($\theta_e, \phi_e, z_e, y_e$)	0.03
γ angle resolution ($u_\gamma, v_\gamma, w_\gamma$)	0.03
E_e BG shape	0.01
E_e signal shape	0.01
Angle BG shape	0.00
Total	0.25

- Necessary to take into account the **specific ionization inside the detector**
 - **31.5 kHz/cm² on the innermost wire @ $7 \times 10^7 \mu/\text{sec}$**
 - **6 nA/cm @ 10^5 gain**, for 90:10 He:iC₄H₁₀
 - **0.32 C/cm on wire integrated in 3 years** of DAQ (7 mm cell)
 - **New DC at center 17.6 cm [19.3 cm in present config]**

Cluster Counting/Timing in pillole

$$t_0 = t_{last} - t_{max}$$

gives the trigger time

$$b_f = \int_{t_0}^{t_{first}} v(t) dt$$

first approx. of impact parameter b

$$(c/2)^2 = r^2 - b_f^2$$

length of chord

$$N_{cl} = c / (\lambda(\beta\gamma) \times \sin\theta)$$

expected number of cluster

$$N_{ele} = k \times N_{cl}$$

expected number of electrons

$$\{t_i\} \text{ and } \{A_i\}, i=1, N_{ele}$$

ordered sequence of electron drift times and amplitudes

$$P(i,j), i=1, N_{ele}, j=1, N_{cl}$$

probability i -th ele. $\in$ to j -th cl.

$$D_i^{N_{cl}}(x) = \frac{N_{cl}!}{(N_{cl}-i)! (i-1)!} (1-x)^{N_{cl}-i} x^{i-1}$$

probability density function of ionization along track
