Conclusions

Electric-magnetic duality is a fascinating symmetry.

Originally considered in the context of electromagnetism, it also plays a key role in extended supergravity models, where the duality group (acting on the vector fields and the scalars) is enlarged to $U(n)$ or $Sp(2n, \mathbb{R})$.

Conclusions

Electric-magnetic duality is a fascinating symmetry.

Originally considered in the context of electromagnetism, it also plays a key role in extended supergravity models, where the duality group (acting on the vector fields and the scalars) is enlarged to $U(n)$ or $Sp(2n, \mathbb{R})$.

In these contexts, duality is a symmetry not only of the equations of motion,

but also of the action (contrary to common belief).

Gravitational electric-magnetic duality (acting on the graviton) is also very intriguing. It rotates for instance the Schwarzschild mass into the Taub-NUT parameter N .

Conclusions

Electric-magnetic duality is a fascinating symmetry.

Originally considered in the context of electromagnetism, it also plays a key role in extended supergravity models, where the duality group (acting on the vector fields and the scalars) is enlarged to $U(n)$ or $Sp(2n, \mathbb{R})$.

In these contexts, duality is a symmetry not only of the equations of motion,

but also of the action (contrary to common belief).

Gravitational electric-magnetic duality (acting on the graviton) is also very intriguing. It rotates for instance the Schwarzschild mass into the Taub-NUT parameter N .

Gravitational duality is also thought to be relevant to the so-called problem of “hidden symmetries”.

Twisted
self-duality for
(linearized)
Gravity

Duality invariance
and spacetime
covariance

Conclusions

One crucial feature of these algebras is that they treat democratically all fields and their duals.

Whenever a (dynamical) p -form gauge field appears, its dual $D - p - 2$ -form gauge field also appears.

Similarly, the graviton and its dual, described by a field with Young symmetry

simultaneously appear.

Understanding gravitational duality is thus important in this context.

Introduction

Electromagnetism in $D = 4$

Gravitational duality in $D = 4$ (linearized gravity)

Twisted self-duality for p -forms

Twisted self-duality for (linearized) Gravity

Duality invariance and spacetime covariance

Conclusions

Since the dynamical variables that are varied in the action principle are the components A_μ of the vector potential, one needs to express the duality transformations in terms of A_μ , with

$$F_{\mu\nu} = \partial_\mu A_\nu - \partial_\nu A_\mu$$

(so that $\mathbf{B} = \nabla \times \mathbf{A}$).

Gravitational duality in $D = 4$ (linearized gravity)

Twisted self-duality for p -forms

Twisted self-duality for (linearized) Gravity

Duality invariance and spacetime covariance

Conclusions

The proof is elementary.

Once A_μ is introduced, $dF = 0$ is an identity. But $dF' = 0$ does not hold off-shell (unless α is a multiple of π but then F and its dual are not mixed), where F' is the new field strength $\cos \alpha F - \sin \alpha *F$ after duality rotation. Hence there is no A' such that $F' = dA'$.

Duality transformations of the potential - The problem

Gravitational electric-magnetic duality

Marc Henneaux

Introduction

Electromagnetism in $D = 4$

Gravitational duality in $D = 4$ (linearized gravity)

Twisted self-duality for p -forms

Twisted self-duality for (linearized) Gravity

Duality invariance and spacetime covariance

Conclusions

The proof is elementary.

Once A_μ is introduced, $dF = 0$ is an identity. But $dF' = 0$ does not hold off-shell (unless α is a multiple of π but then F and its dual are not mixed), where F' is the new field strength $\cos \alpha F - \sin \alpha *F$ after duality rotation. Hence there is no A' such that $F' = dA'$.

It follows from this theorem that **it is meaningless to ask whether the Maxwell action $S[A_\mu]$ is invariant under the above duality transformations of the field strengths since there is no variation of A_μ that yields these variations.**

Duality transformations of the potential - The problem

Conclusions

The proof is elementary.

Once A_μ is introduced, $dF = 0$ is an identity. But $dF' = 0$ does not hold off-shell (unless α is a multiple of π but then F and its dual are not mixed), where F' is the new field strength $\cos \alpha F - \sin \alpha *F$ after duality rotation. Hence there is no A' such that $F' = dA'$.

It follows from this theorem that **it is meaningless to ask whether the Maxwell action $S[A_\mu]$ is invariant under the above duality transformations of the field strengths since there is no variation of A_μ that yields these variations.**

In the same way, it is meaningless to ask whether the Maxwell action is invariant under hyperbolic rotations (and conclude that it is, yielding an apparent contradiction with the non-invariance of the equations of motion), because the same argument indicates that there is no variation of the vector potential that gives the hyperbolic rotations off-shell for the field strength.

Gravity

Duality invariance
and spacetime
covariance

Conclusions

Duality invariance of the action is manifest if one goes to the first-order form and introduces a second vector-potential by solving Gauss' constraint $\nabla \cdot \mathbf{E} = 0$.

If, besides the standard "magnetic" vector potential defined through,

$$\vec{B} \equiv \vec{B}_1 = \vec{\nabla} \times \vec{A}_1,$$

one introduces an additional vector potential \vec{A}_2 through,

$$\vec{E} \equiv \vec{B}_2 = \vec{\nabla} \times \vec{A}_2,$$

one may rewrite the standard Maxwell action in terms of the two potentials A^a as

$$S = \frac{1}{2} \int dx^0 d^3x \left(\epsilon_{ab} \vec{B}^a \cdot \dot{\vec{A}}^b - \delta_{ab} \vec{B}^a \cdot \vec{B}^b \right).$$

Here, ϵ_{ab} is given by $\epsilon_{ab} = -\epsilon_{ba}$, $\epsilon_{12} = +1$.

Conclusions

The Riemann tensor

$$R_{\lambda\mu\rho\sigma} = -\frac{1}{2} (\partial_\lambda \partial_\rho h_{\mu\sigma} - \partial_\mu \partial_\rho h_{\lambda\sigma} - \partial_\lambda \partial_\sigma h_{\mu\rho} + \partial_\mu \partial_\sigma h_{\lambda\rho})$$

fulfills the identity

$$R_{\lambda[\mu\rho\sigma]} = 0.$$

The Einstein equations are $R_{\mu\nu} = 0$.

This implies that the dual Riemann tensor

$$*R_{\lambda\mu\rho\sigma} = \frac{1}{2} \epsilon_{\lambda\mu\alpha\beta} R^{\alpha\beta}{}_{\rho\sigma}$$

Conclusions

- The Maxwell action

$$S[A_{\lambda_1 \dots \lambda_p}] = \int d^D x \left(-\frac{1}{2(p+1)!} F_{\lambda_1 \dots \lambda_{p+1}} F^{\lambda_1 \dots \lambda_{p+1}} \right),$$

with $F = dA$, gives the equations of motion

$$d^* F = 0.$$

Conclusions

- The Maxwell action

$$S[A_{\lambda_1 \dots \lambda_p}] = \int d^D x \left(-\frac{1}{2(p+1)!} F_{\lambda_1 \dots \lambda_{p+1}} F^{\lambda_1 \dots \lambda_{p+1}} \right),$$

with $F = dA$, gives the equations of motion

$$d^*F = 0.$$

- On the other hand, it follows from the definition of F that

$$dF = 0.$$

- The general solution to the equation of motion is $^*F = dB$ for some $(D-p-2)$ -form B . One calls the original form A the “electric potential” and the form B the “magnetic potential”.

Gravity

Duality invariance
and spacetime
covariance

Conclusions

- Conversely, assume that one has a p -form A and a $(D - p - 2)$ -form B , the curvatures $F = dA$ and $H = dB$ of which are dual to one another,

$$*F = H, \quad (-1)^{(p+1)(D-1)-1} *H = F,$$

then A fulfills the Maxwell equations.

- In matrix form, one can rewrite the equations as

$$\mathcal{F} = \mathcal{S} * \mathcal{F},$$

where

$$\mathcal{F} = \begin{pmatrix} F \\ H \end{pmatrix}, \quad \mathcal{S} = \begin{pmatrix} 0 & (-1)^{(p+1)(D-1)-1} \\ 1 & 0 \end{pmatrix}.$$

One refers to these equations as the twisted self-dual formulation of Maxwell's equations because \mathcal{S} introduces a "twist".

Twisted
self-duality for
(linearized)
Gravity

Duality invariance
and spacetime
covariance

Conclusions

The “twisted self-duality conditions”, which express that E is the dual of R (we drop indices)

$$R = - *E, \quad E = *R,$$

or, in matrix notations,

$$\mathfrak{R} = \mathcal{S} * \mathfrak{R},$$

with

$$\mathfrak{R} = \begin{pmatrix} R \\ E \end{pmatrix}, \quad \mathcal{S} = \begin{pmatrix} 0 & -1 \\ 1 & 0 \end{pmatrix},$$

(linearized)
Gravity

Duality invariance
and spacetime
covariance

Conclusions

- This is because, as we have seen, the cyclic identity for E (respectively, for R) implies that the Ricci tensor of $h_{\alpha\beta}$ (respectively, of $T_{\alpha\beta\gamma}$) vanishes.
- The above equations are called twisted self-duality conditions for linearized gravity because if one views the curvature \mathfrak{R} as a single object, then these conditions express that this object is self-dual up to a twist, given by the matrix \mathcal{S} . The twisted self-duality equations put the graviton and its dual on an identical footing.

- For p -forms, non-minimal couplings (as in supergravity) can be introduced without problem.
- For gravity, however, only the linearized theory has been dealt with so far. Can one go beyond the linear level?
- Positive indications : Taub-NUT, Geroch group/ Ehlers group upon dimensional reduction, cosmological billiards.
- The manifestly duality symmetric actions will most likely exhibit some sort of non-locality.
- Other questions : Magnetic sources, asymptotic symmetries.
- Much work remains to be done...

Gravitational electric-magnetic duality

Marc Henneaux

Introduction

Electromagnetism
in $D = 4$

Gravitational
duality in $D = 4$
(linearized
gravity)

Twisted
self-duality for
 p -forms

Twisted
self-duality for
(linearized)
Gravity

Duality invariance
and spacetime
covariance

Conclusions

THANK YOU!
