

The GAMMA-400 mission

Valter Bonvicini

INFN Trieste, Italy

On behalf of the GAMMA-400 Collaboration

VULCANO Workshop, 18-24 May 2014

Outline

- Origin and evolution of the project
- The apparatus
 - The converter/tracker
 - The calorimeter
- Physics with GAMMA-400
 - Photons
 - Electrons
 - Nuclei
- Conclusions

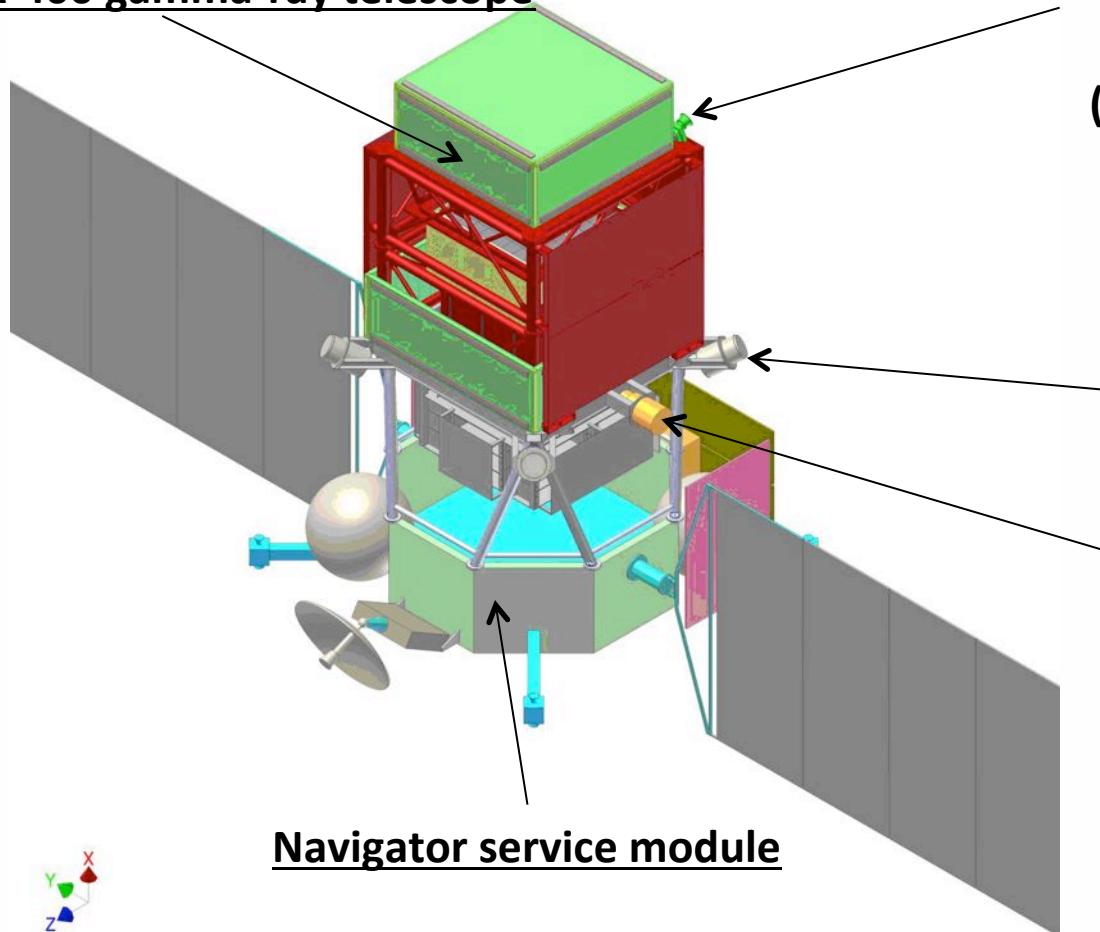

The GAMMA-400 project

- Mission is approved by ROSCOSMOS (launch currently scheduled by 2020)
- GAMMA-400:
 - Scientific payload mass: 4100 kg
 - Power budget: 2000 W
 - Telemetry downlink capability: 100 GB/day
 - Lifetime: > 7 years
 - Orbit (initial parameters): apogee 300000 km, perigee 500 km, orb. period 7 days, inclination 51.8 °
 - GAMMA-400 will be installed onboard the platform “Navigator” manufactured by Lavochkin

GAMMA-400 SCIENTIFIC COMPLEX ON THE NAVIGATOR SERVICE MODULE

GAMMA-400 gamma-ray telescope

Star sensors (2) with accuracy of $\approx 5''$

(Space Research Institute)
Gamma-ray burst monitor “Konus-FG” (6)
(Ioffe Physical Technical Institute, St. Petersburg)

4 direction detectors on telescopic booms

2 spectrometric detectors

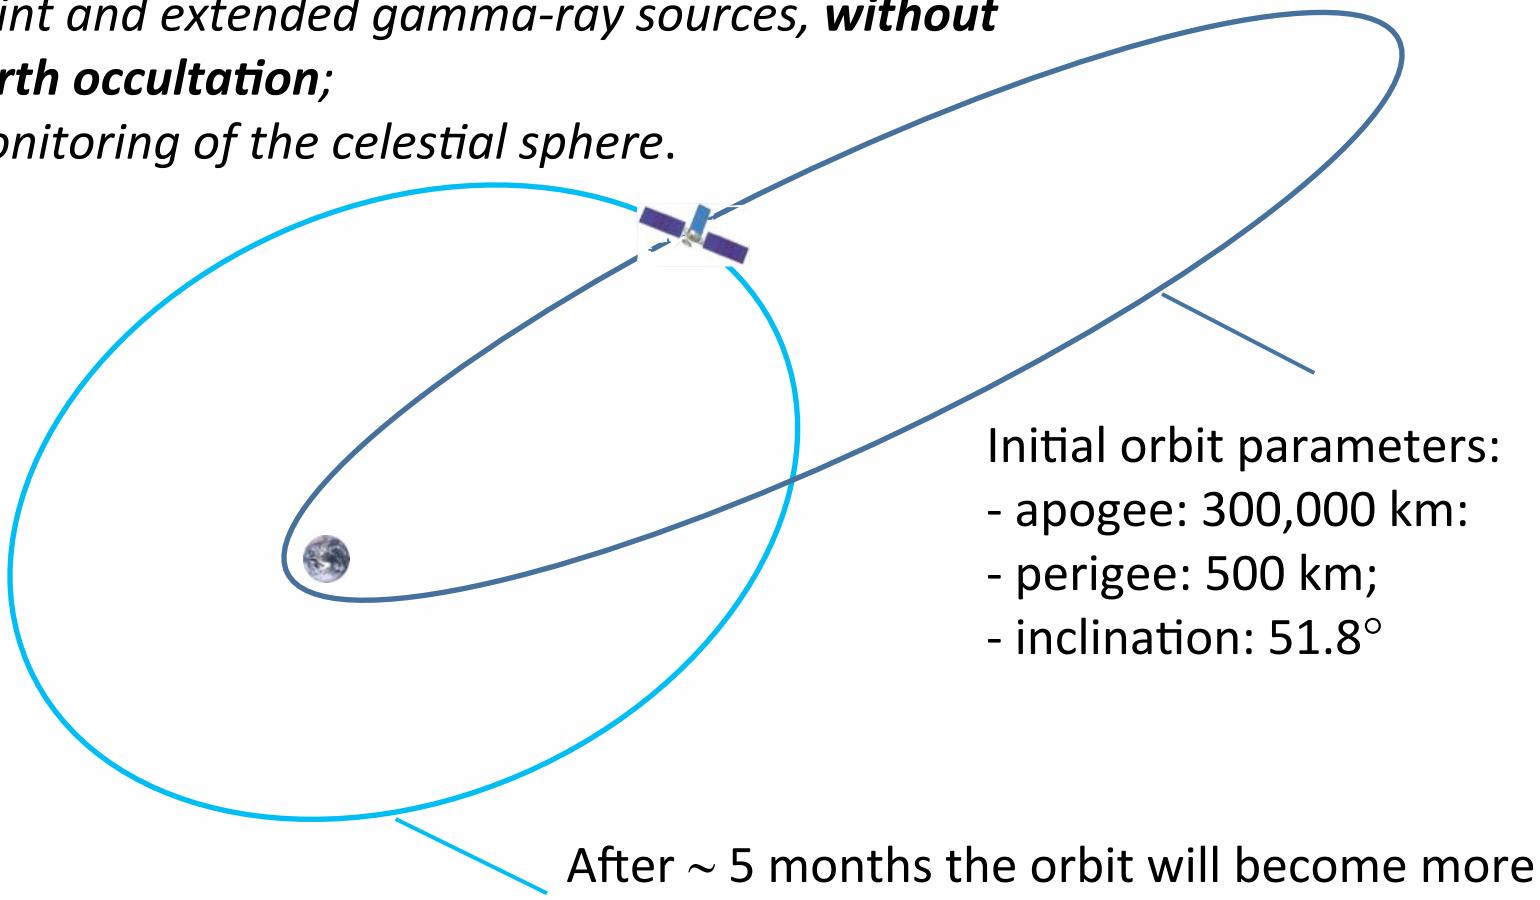

Magnetometer (2)
(Ukraine, Lviv)
on telescopic boom

Navigator service module

ORBIT EVOLUTION AND OBSERVATION MODES

Observation modes:

- *continuous long-duration (~100 days) observation of specific regions of celestial sphere, including point and extended gamma-ray sources, without Earth occultation;*
- *monitoring of the celestial sphere.*

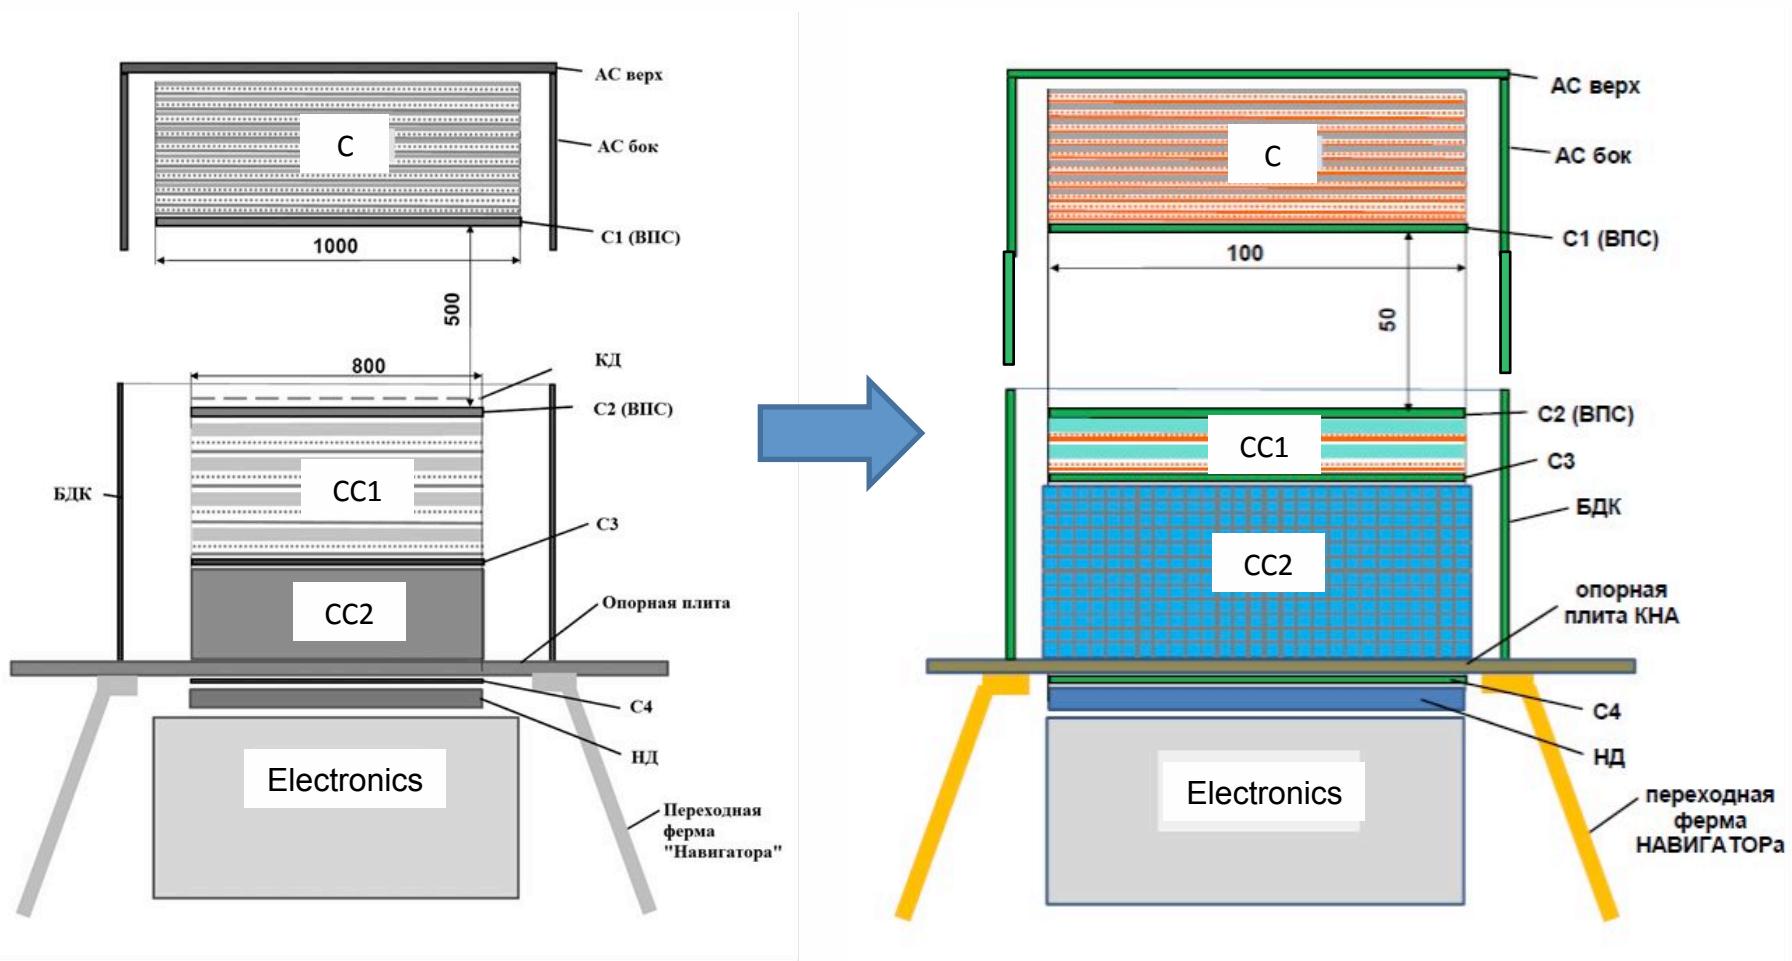

GAMMA-400

- Original Russian design focused on:
 - High Energy Gamma-rays (~ 10 GeV – 3 TeV)
 - High energy electrons (e^+ and e^-) up to TeV
- Scientific objectives (from Russian proposal):
 - “To study the nature and features of weakly interacting massive particles, from which the Dark Matter consists”
 - “To study the nature and features of variable gamma-ray activity of astrophysical objects, from stars to galactic clusters”
 - “To study the mechanisms of generation, acceleration, propagation and interaction of cosmic rays in galactic and intergalactic spaces”

Improvements in the GAMMA-400 design and performance

- During the last years, the collaboration between Italian and Russian groups has resulted in a new version of the apparatus. Guideline:
 - to develop a jointly defined **dual instrument** that, taking into account the currently available financial resources, optimizes the scientific performance and improves them with respect to the original version: this new version **has been agreed upon by both (Russian and Italian) sides during a collaboration meeting held in Moscow in February 2013.**

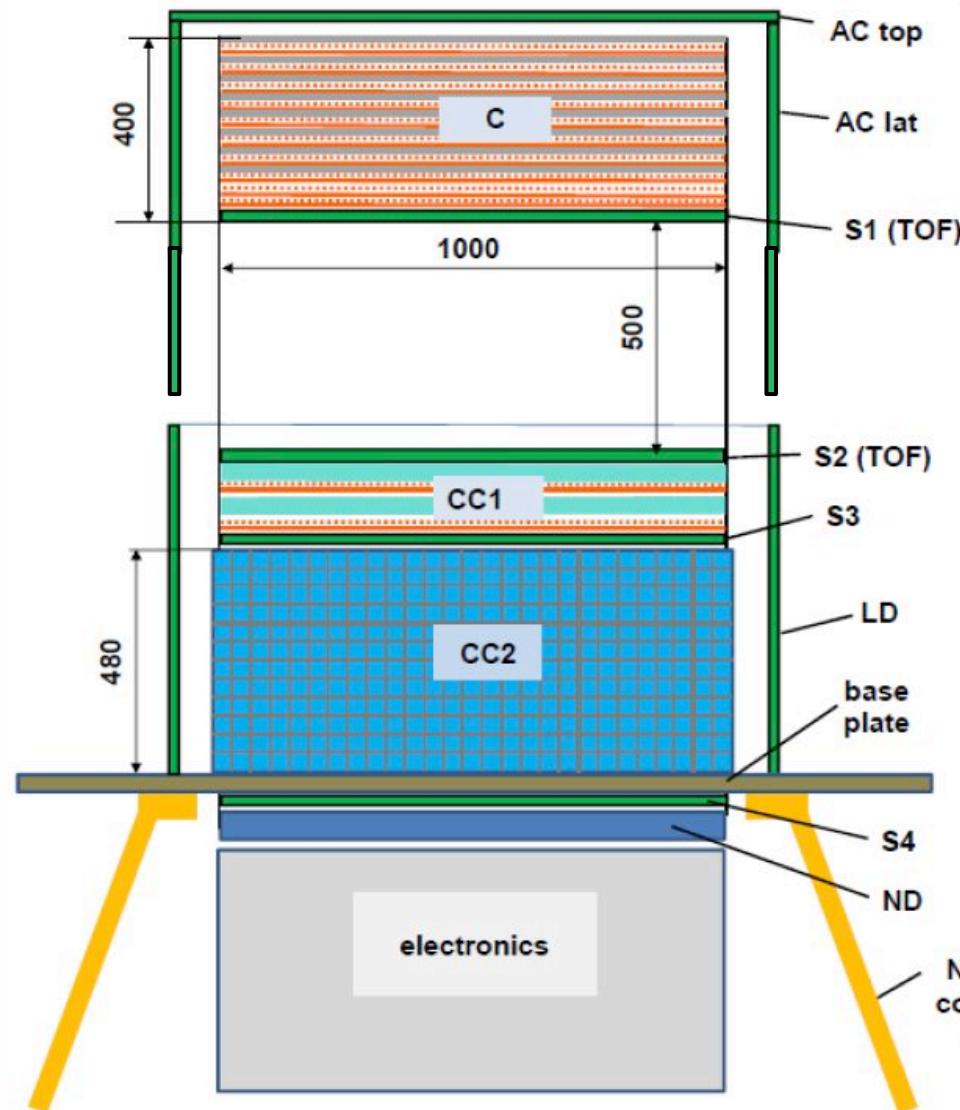

GAMMA-400 evolution

Original Russian proposal (2011)

Jointly agreed Russian-Italian proposal (2013)

The GAMMA-400 apparatus

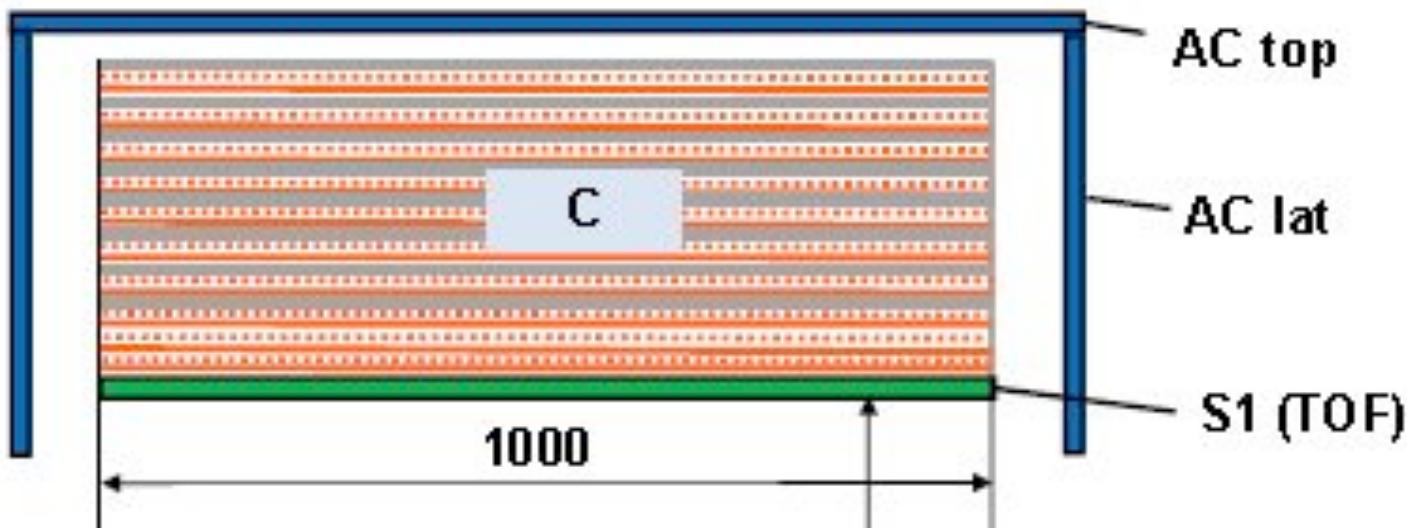

B2 over B1 improvements:

- Introduction of a highly segmented homogeneous calorimeter with CsI cubes
⇒ improved energy resolution, extended GF with lateral particle impingement, nuclei capability
- Increase of the planar dimensions of the calorimeter (from 80 cm x 80 cm to 100 cm x 100 cm) ⇒ larger A_{eff}
- Si strip detector pitch of the 2 CC1 layers decreased from 0.5 mm to 0.08 mm

GAMMA-400 characteristics:

- a dual instrument for photons (100 MeV ÷ 1 TeV) and cosmic rays (electrons \sim 10 TeV and high energy cosmic-ray nuclei, p and He spectra at the “knee” ($10^{14} - 10^{15}$ eV);
- State of the art Si-W converter/tracker with analogue read-out;
- 3-D, deep, homogeneous calorimeter with excellent resolution and large acceptance.

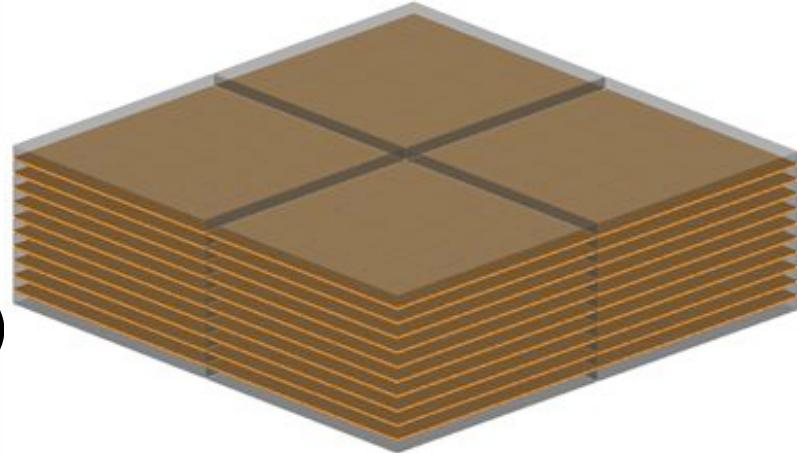

Converter/Tracker

- 10 x-y layers (20 views):
 - 8 layers W $0.08X_0$ + 8 planes Si (x,y)
 - 2 layers of Si (x,y), no W

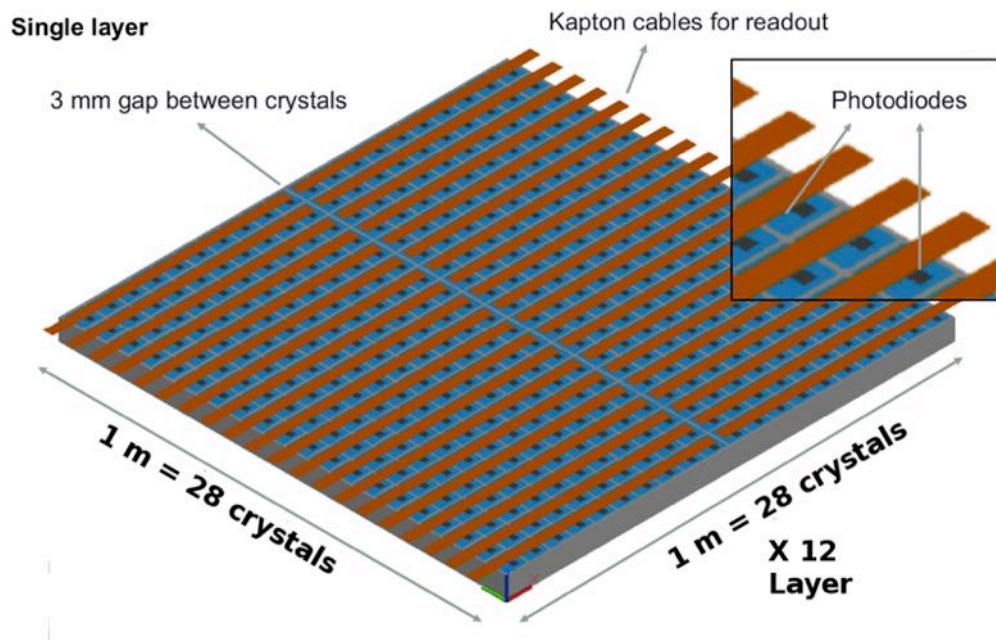

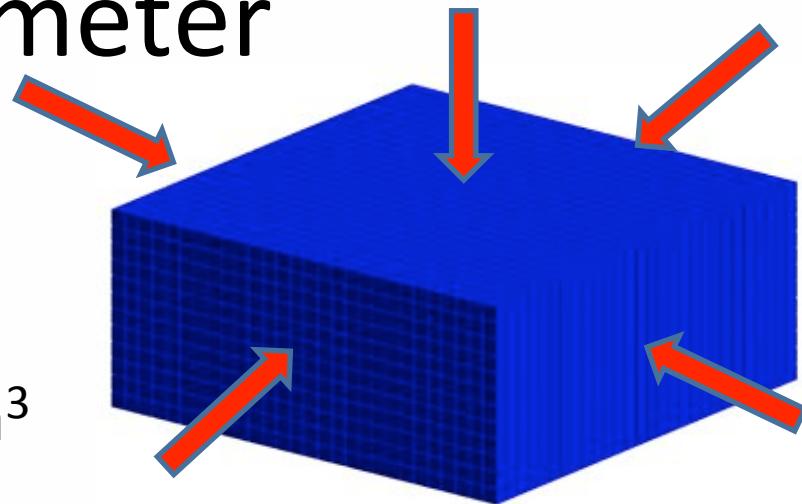

Converter/Tracker

- Homogeneous Si-W Tracker
- 4 towers ($\sim 50 \text{ cm} \times 50 \text{ cm}$ each);
- 8 W/Si-x/Si-y planes + 2 Si-x/Si-y planes (no W)
- Thickness of each plane $0.1 X_0$
- Each sensor $\sim 9.7 \text{ cm} \times 9.7 \text{ cm}$ from 6" wafers;
- Sensors arranged in ladders (5 detectors/ladder), 1 ladder $\sim 50 \text{ cm}$;
- Implant pitch $80 \mu\text{m}$ (fine segmentation)
- Read-out pitch $240 \mu\text{m}$ (capacitive charge division, one strip every 3 is read-out), 384 read-out strips/ladder;
- 2000 silicon detectors;
- 153600 readout channels, 2400 front-end ASICs (64 channels/ASIC)
- Power consumption (FE only): $\sim 80 \text{ W}$

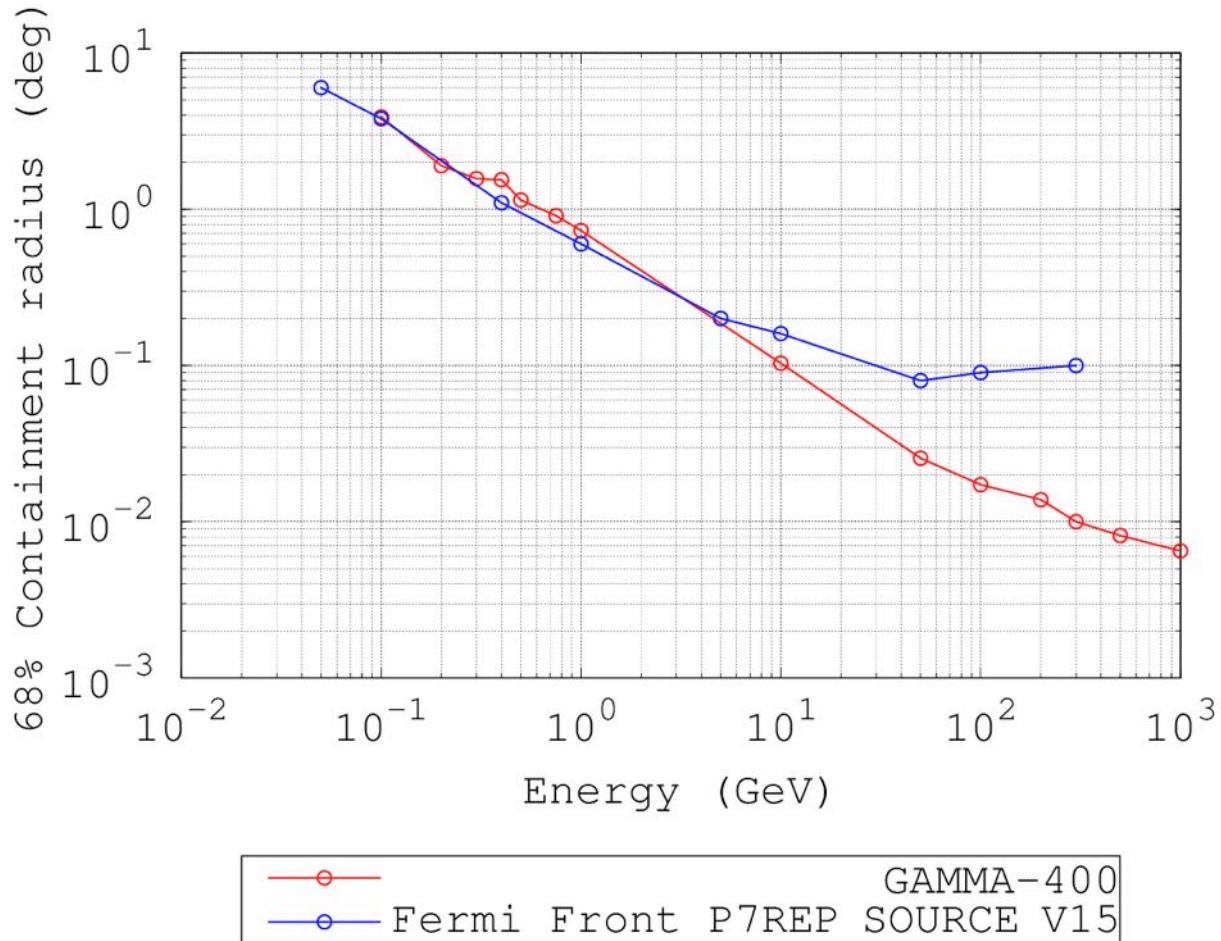

CC2 Calorimeter

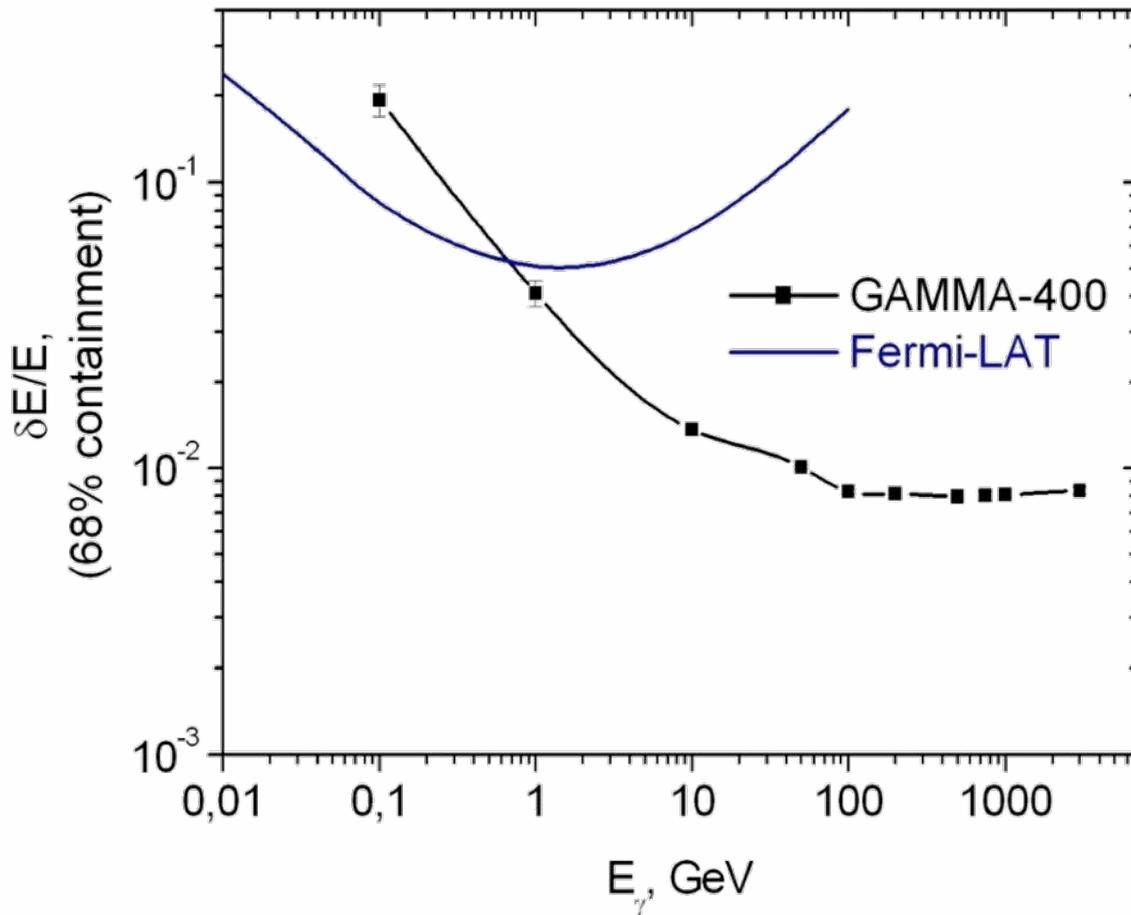

- $28 \times 28 \times 12 \text{ CsI(Tl) cubes}$
- $L_{\text{cubes}} = 3.6 \text{ cm}$
- CC2 dimensions: $1 \times 1 \times 0.47 \text{ m}^3$
- X_0 : $54.6 \times 54.6 \times 23.4$
- λ_l : $2.5 \times 2.5 \times 1.1$
- Mass = 1980 kg
- Planar GF: $9.5 \text{ m}^2\text{sr}$
- $\text{GF}_{\text{eff, el.}}^{0.1-1 \text{ TeV}} \sim 3.4 \text{ m}^2\text{sr}$
- $\text{GF}_{\text{eff, prot.}}^{1 \text{ TeV}} \sim 3.9 \text{ m}^2\text{sr}$

Angular resolution

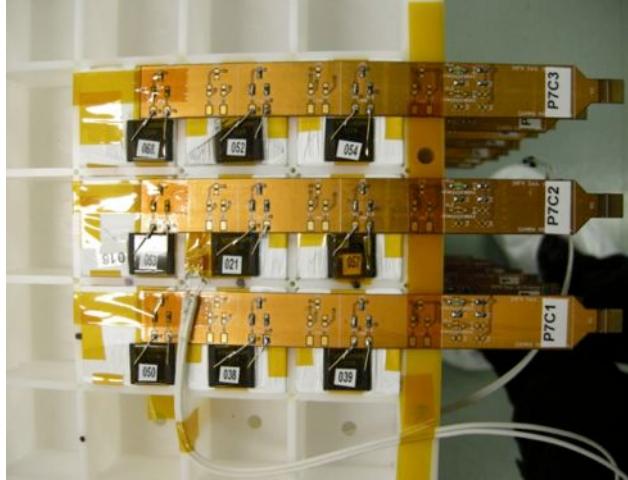

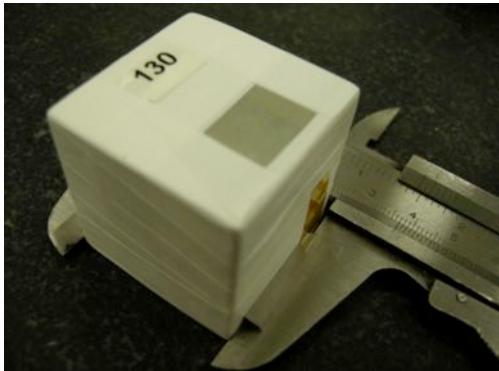

Energy resolution for γ

Calorimeter prototype

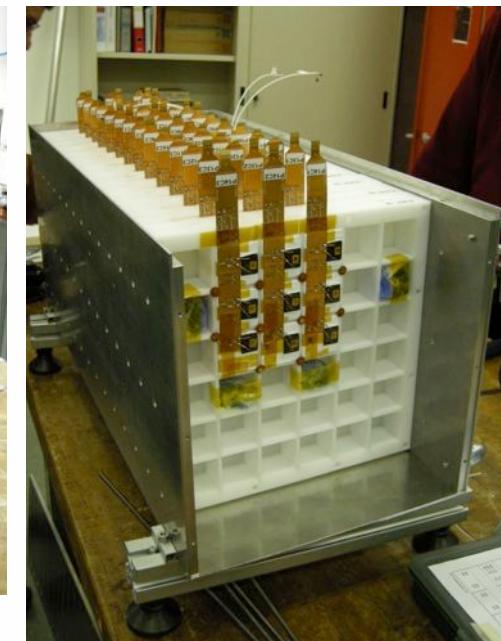

- 14 Layers
- 9 crystals in each layer
(crystals $3.6 \times 3.6 \times 3.6 \text{ cm}^3$)
- 126 Crystals in total
- 126 Photodiodes
- 50.4 cm of CsI(Tl)
- $27 X_0$, $1.44 \lambda_l$
- Photodiodes read-out by 9 CASIS1.2A
16-channel ASICs)

Mechanics:
INFN Pisa

Front-end electronics:
INFN Trieste

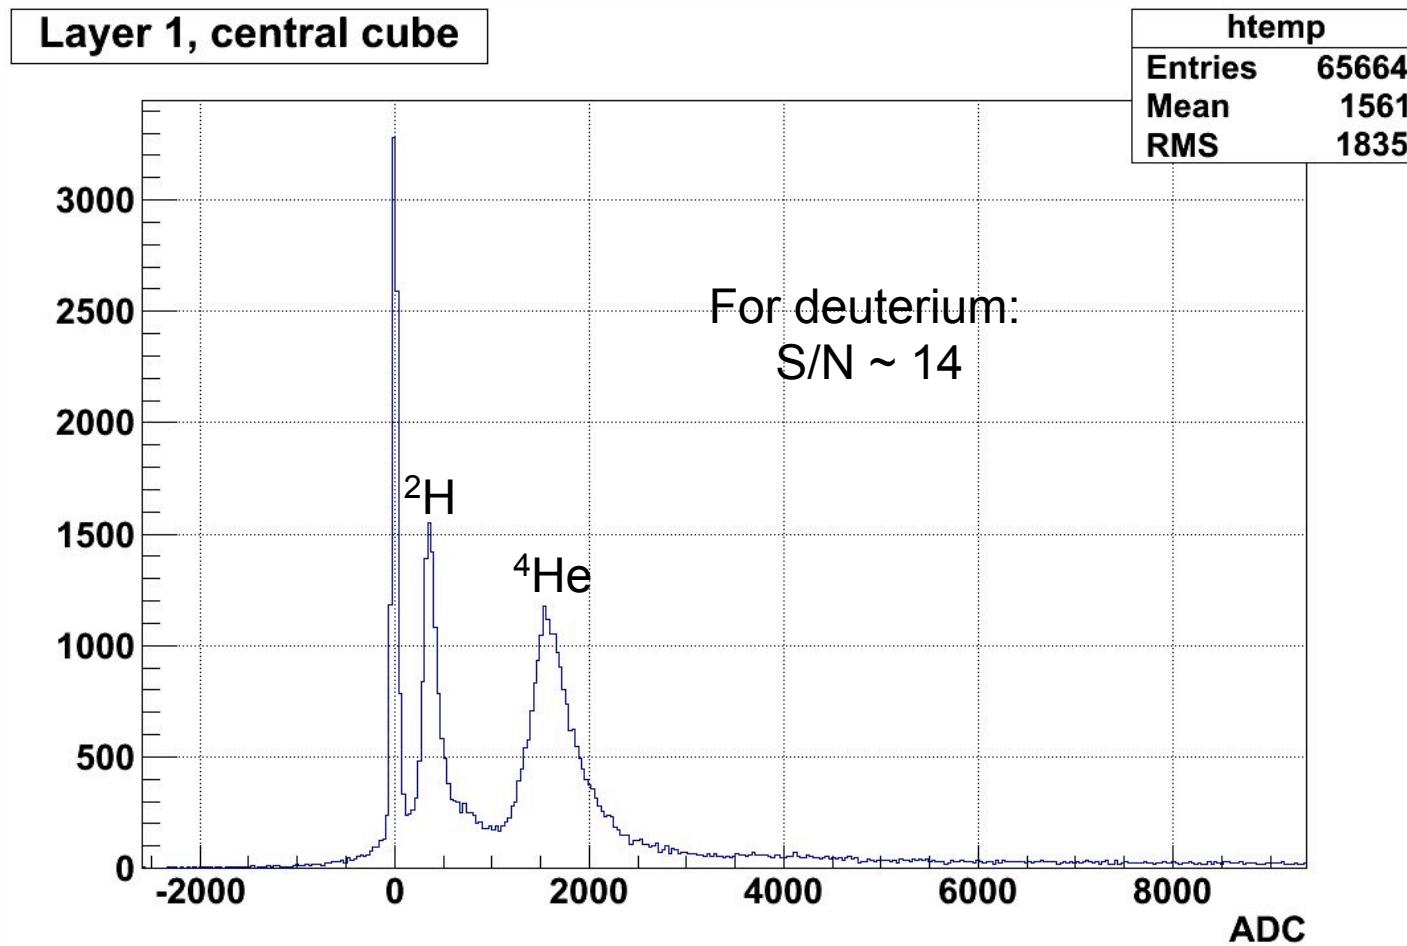

Crystals, photodiodes,
DAQ, assembly:
INFN Florence

Physics with GAMMA-400

- GAMMA-400 is focused on the detection of the three main component of cosmic radiation:
 - **γ -rays from 100 MeV up to TeV energies**, to be studied with substantial improvements concerning the angular resolution at high energies and the continuous exposure to sources without Earth occultation
 - **electrons/positrons up to ~ 10 TeV**, to be measured with much improved sensitivity compared with current space, balloon-borne, and ground measurements
 - **cosmic-ray nuclei up to the "knee"**, whose spectrum and composition is to be studied with unprecedented detail up to \sim few PeV/nucleon

Photons

- Detection of possible Dark Matter signal
 - Gamma-ray lines
 - Satellites
 - Dwarf Spheroidal Galaxies
 - Galactic Center
- Measurement of the high-energy γ -ray spectrum
 - SNR
 - Pulsars and PWN
 - Massive star clusters
 - AGN
 - GRB

Increasing the energy resolution

The γ -ray differential energy results for a 135 GeV right-handed neutrino dark matter candidate.

L. Bergström, Phys. Rev. D 86 (2012) 103514, arXiv:1208.6082

Electrons can tell us about local GCR sources

- High energy electrons have a high energy loss rate $\propto E^2$
 - Lifetime of $\sim 10^5$ years for > 1 TeV electrons
- Transport of GCR through interstellar space is a diffusive process
 - Implies that source of high energy electrons are < 1 kpc away

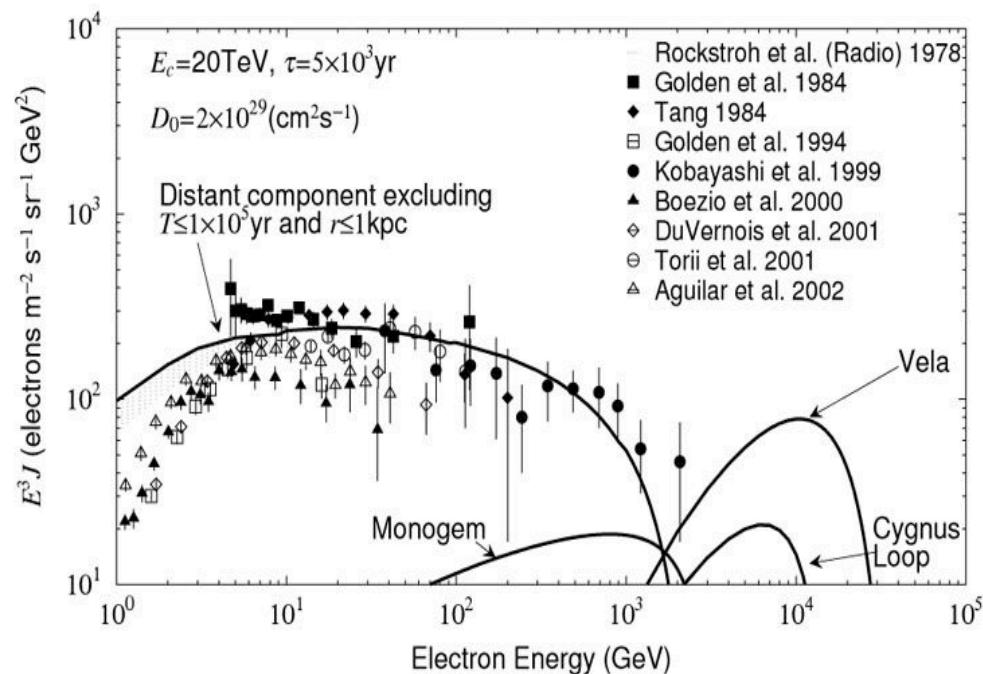

Only a handful of SNR meet the lifetime & distance criteria

Kobayashi et al., ApJ 601 (2004) 340-351:
calculations show structure in electron spectrum at high energy

V. Bonvicini - 2

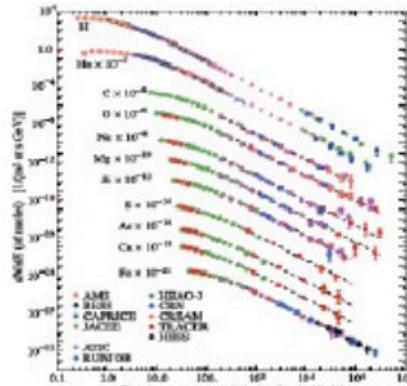

Electron Spectrum

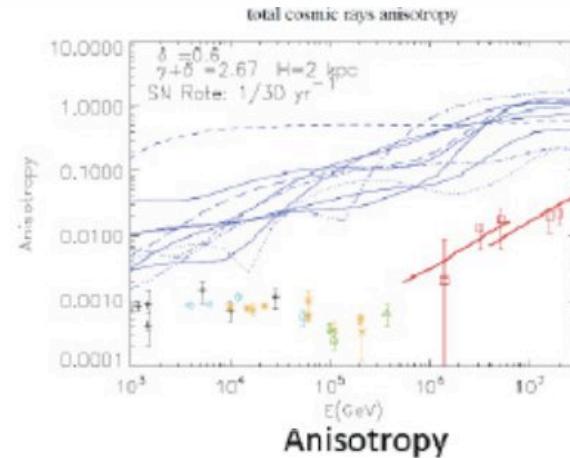

Nuclei

Energy spectrum shape

Composition

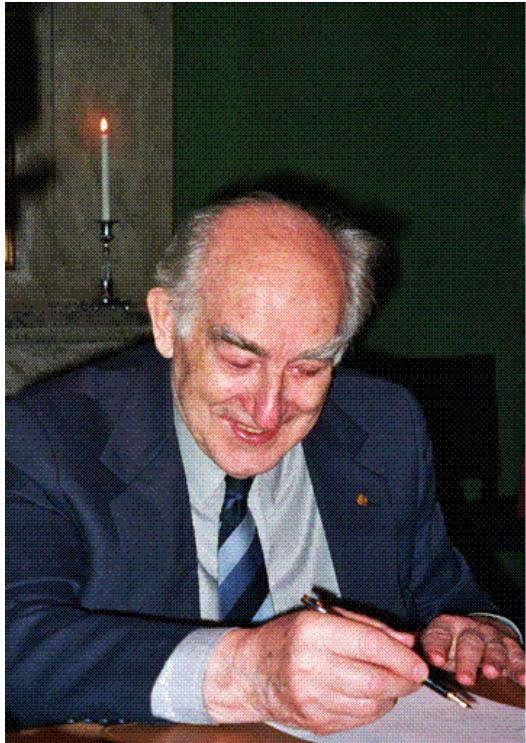

Anisotropy

- Study the acceleration mechanism (or mechanisms)
 - Study the limit of the acceleration phenomena
 - Understand the kind of sources in the Galaxy
 - Answer the question: is there the same mechanism (or source) for different nuclei?
 - Study the distribution of the sources
 - Study the propagation process in the Galaxy

Conclusions

- The GAMMA-400 mission represents a unique opportunity to perform **simultaneous measurements of photons, electrons and nuclei** with unprecedented accuracy.
- GAMMA-400 will provide in-depth investigations on some of the most challenging physics items, such as:
 - DM search in γ and high-energy electron spectra
 - CR origin, production and acceleration to the highest energies
 - Flux and elemental composition of nuclei at the knee
- Synergy with ground-based Cerenkov arrays (CTA) and other wavelength instruments.

Vitaly Ginzburg (1916-2009)

Lidiya Kurnosova (1918-2006)

“At the end of the last century, Nobel laureate academician Vitaly Ginzburg (LPI) and professor Lidiya Kurnosova (LPI) proposed the GAMMA-400 project in Russia to search for indirect signals of dark matter particles by studying the gamma-ray sky. Within the framework of this project, which has become international, the precision gamma-ray telescope GAMMA-400 has been designed”.

γ -ray lines in diffuse radiation : Perspectives for GAMMA-400

Back-on-envelope estimate:

Sensitivity to the γ -ray line (flux) in the diffuse radiation can be expressed in simplified form as: $I_\gamma = \frac{n_\sigma}{0.68} \sqrt{\frac{2F_{bck}\eta E_\gamma}{GT}}$

where n is a number of σ , F_{bck} is a (diffuse) background, ηE_γ is an energy bin width, which depends on η (energy resolution), G is a geometric factor, T is an observation time

Comparison of Fermi LAT and GAMMA-400 sensitivity:

- ηE_γ for GAMMA-400 is 10X less than that for Fermi LAT at $E > 100$ GeV,
- G for GAMMA-400 is ~ 0.5 of that for Fermi LAT,
- the sensitivity for GAMMA-400 for the same observation time is expected to be ~ 2 better than for Fermi LAT.

γ -ray line from source : Perspectives for GAMMA-400

Assumption: the line is a δ -function in energy spectrum

Confidence estimate: Confidence of the line detection can be taken similarly to the confidence in detection of point source (probability for the background to fluctuate to create a “feature”)

$$C = \frac{N_{sig}}{\sqrt{N_{bkg}}}$$

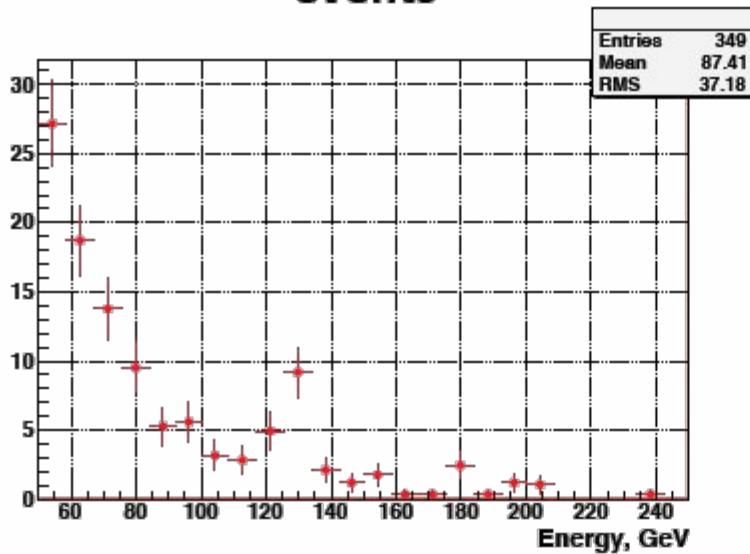

where N_{sig} is a number of events from the “line” (source), and N_{bkg} is a number of background (diffuse) events

With 10X better PSF for Gamma-400:

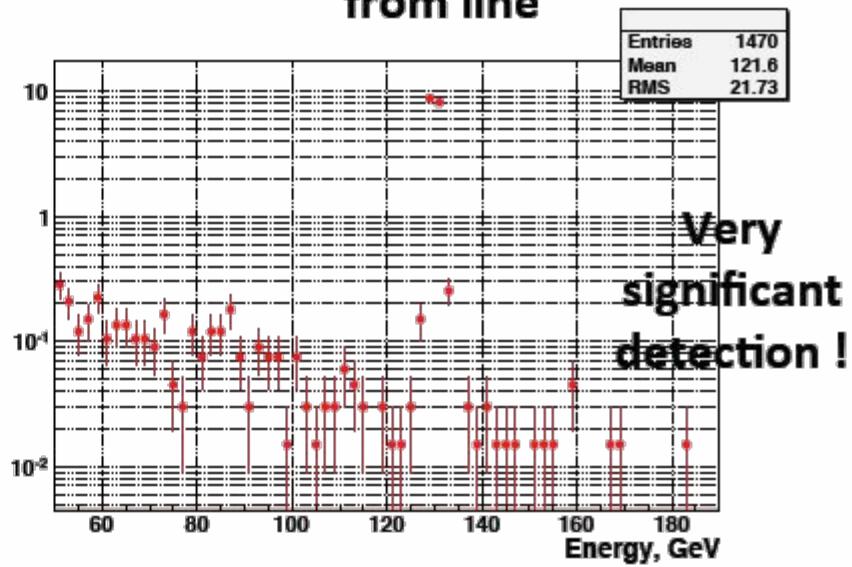

- N_{bkg} can be 100X less,
- detection confidence C will be ~5X larger, assuming twice less events from the “line” N_{sig} detected (due to smaller A_{eff})
- **All this works only for the point source!**

Increasing the energy resolution

LAT-like instrument, 300 events

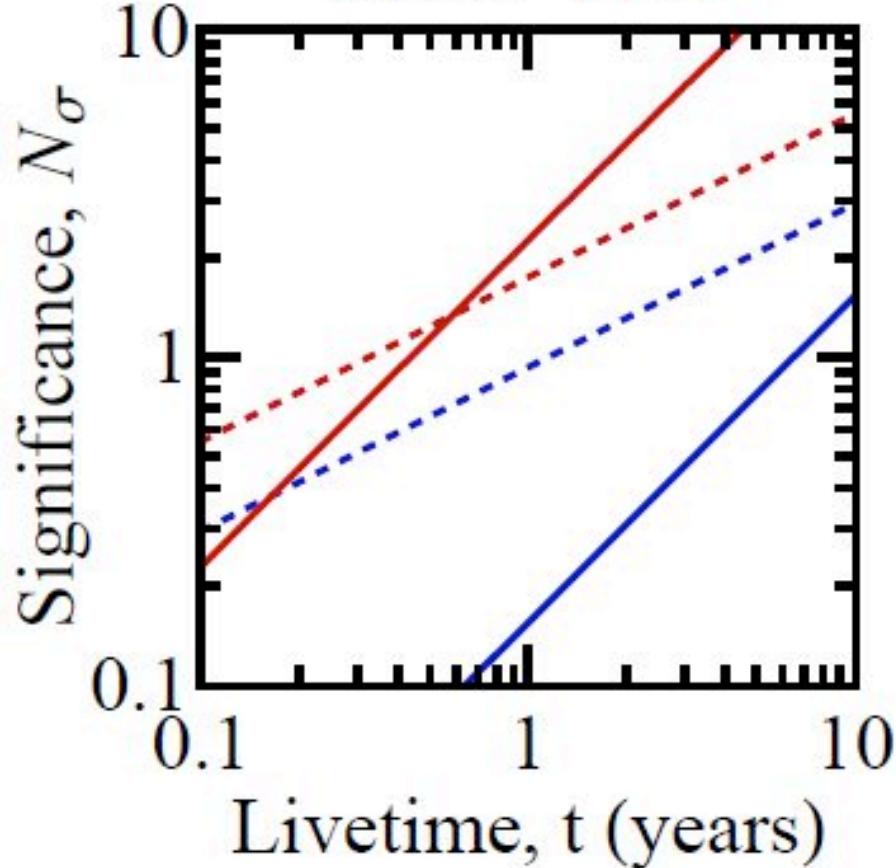

**Gamma-400, 10X better dE/E, 10X better PSF
(100X less background), same # of events
from line**

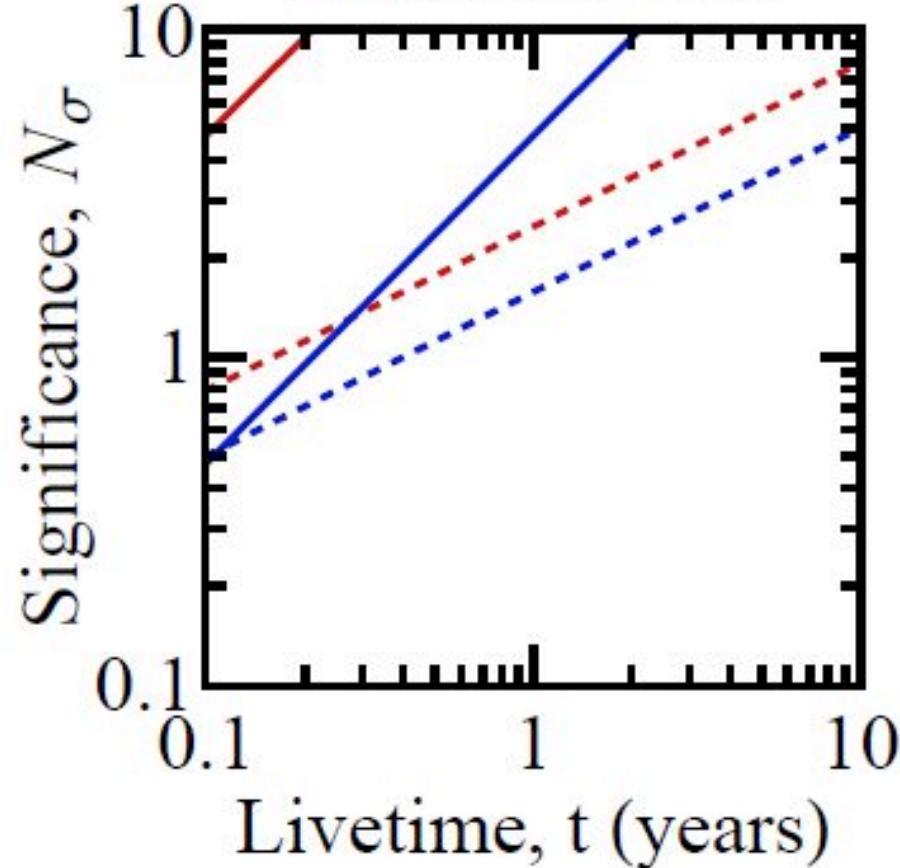

Alexander Moiseev Aspen 2013 Closing in
on Dark Matter

Increasing the angular and energy resolution

Fermi-LAT

GAMMA-400

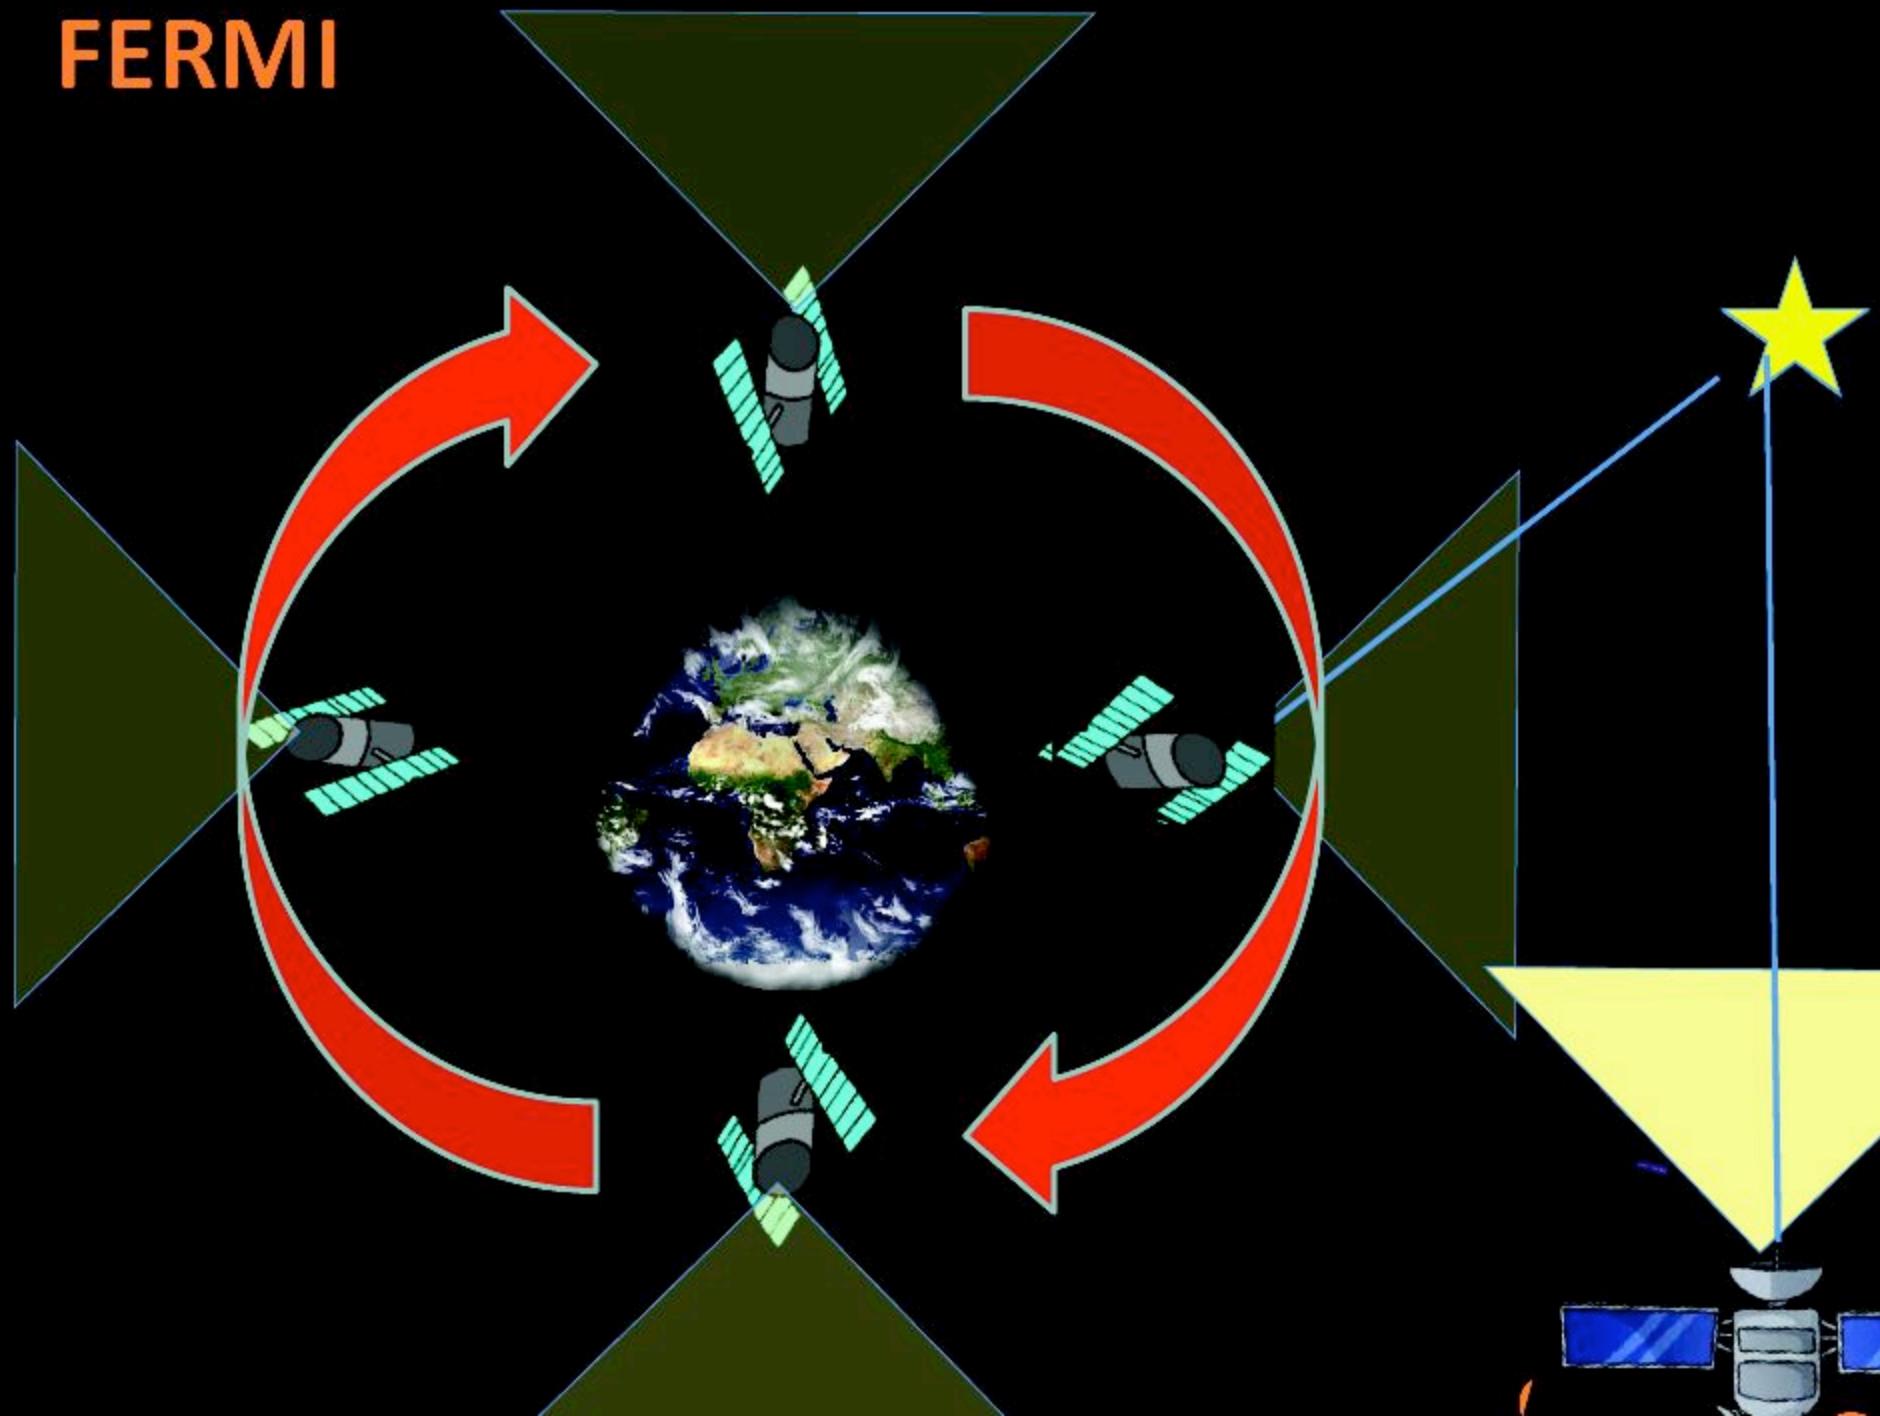

The expected significance of 135 GeV line in the flux spectrum (dashed lines) or the fluctuation angular power spectrum (solid lines) analysis of the diffuse γ -ray background with the Fermi-LAT or GAMMA-400 experiments.

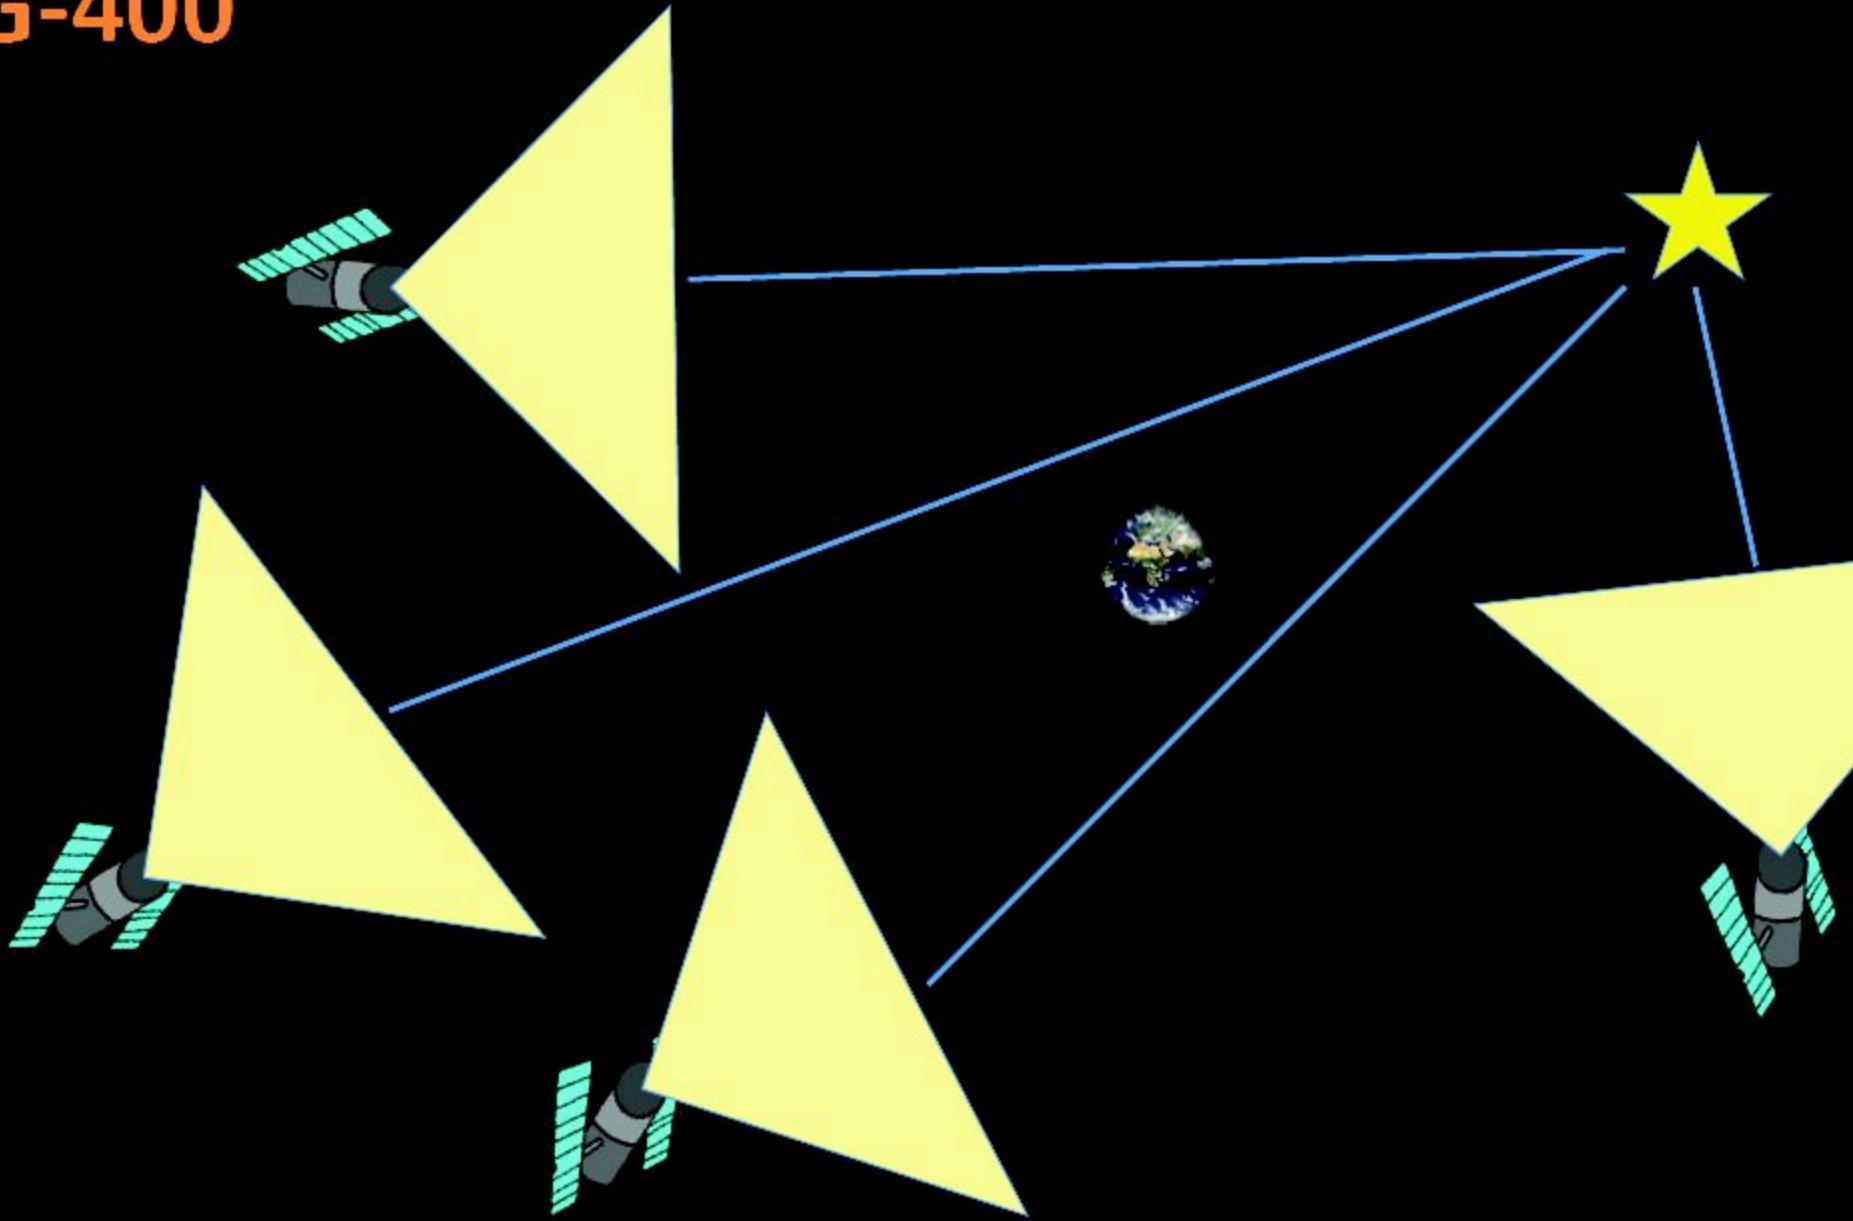

Galactic Center

- Expected to be the strongest source of γ -rays from DM annihilation. “EGRET GeV excess” has been in the center of DM discussion for years, until it was closed by Fermi LAT results
- Intense background from unresolved sources remains the main problem, assuming that the part of background created by CR interactions with the matter, is much better known and can be accounted for
- Potential perspectives for GAMMA-400: having >10 times better angular resolution at high energy, faint sources in dense GC area can be localized and their radiation can be removed as a background, and better model of diffuse radiation can be built. Concern: smaller effective area can make this analysis more difficult and not efficient

FERMI

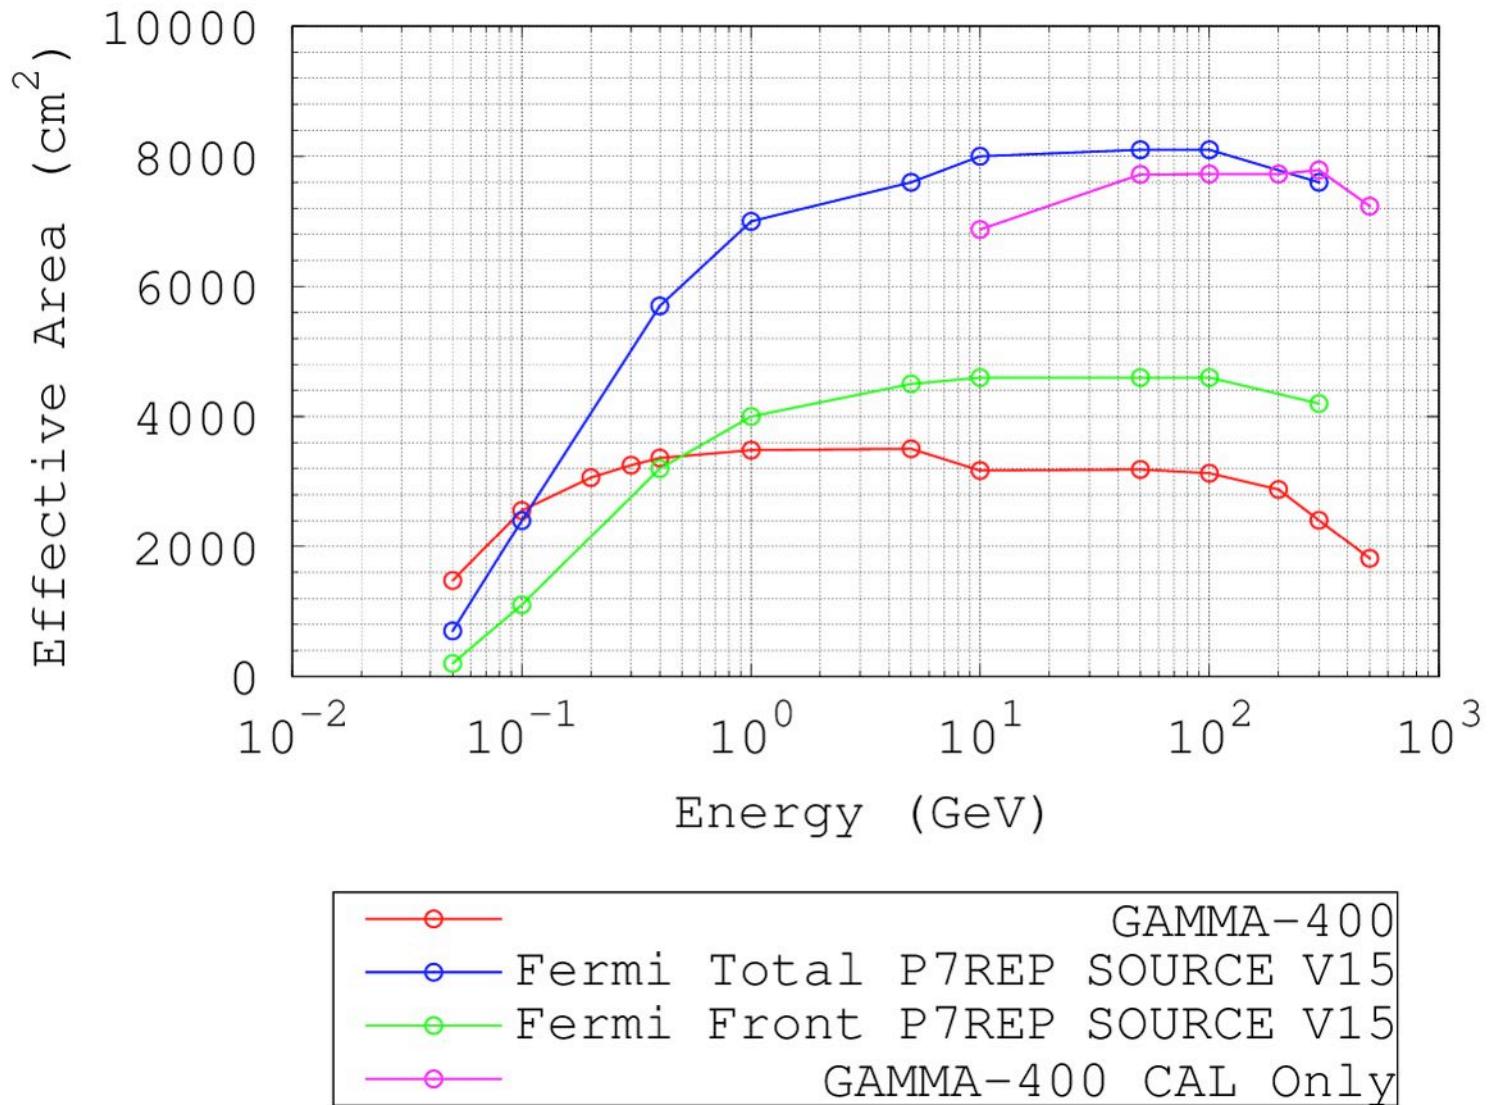

G-400

Comparison of the main parameters for GAMMA-400 and Fermi-LAT

	Fermi-LAT	GAMMA-400
Orbit	circular, 565 km	1. Elliptical, 500-300,000 km 2. Semi-circular, 200,000 km
Energy range	20 MeV - 300 GeV	100 MeV – 3 TeV
Effective area ($E_\gamma > 1$ GeV)	~ 8000 cm ² (Fermi total) ~ 4300 cm ² (Fermi front)	~ 3800 cm ²
Coordinate detectors	Digital Si strips (pitch 0.23 mm)	Analog Si strips (pitch 0.08 mm)
Angular resolution ($E_\gamma \geq 100$ GeV)	~ 0.1°	~ 0.01°
Calorimeter - thickness	CsI ~ $8.5X_0$	CsI(Tl)+Si strips ~ $25X_0$
Energy resolution ($E_\gamma \geq 100$ GeV)	~ 10%	~ 1%
Proton rejection coefficient	~ 10^4	~ 10^5
Mass	2800 kg	4100 kg
Downlink capability	15 GB/day	100 GB/day

COMPARISON OF BASIC PARAMETERS OF OPERATED, EXISTING, AND PLANNED SPACE-BASED AND GROUND- BASED INSTRUMENTS

	SPACE-BASED INSTRUMENTS					GROUND-BASED GAMMA-RAY FACILITIES			
	EGRET	AGILE	Fermi-LAT	CALET	GAMMA-400	H.E.S.S.-II	MAGIC	VERITAS	CTA
