

**Specific questions to the Technical Advisory Committee of the SPES project (TAC1, 22-23 January 2014)**

1. Is the line between the Target-Ion-Source system and ALPI as RNB Accelerator, including mass separation stages, beam cooling, charge breeding and the RFQ, properly designed? Please consider that, in a first operational phase, the High Resolution Mass Spectrometer and the Beam Cooler might not be available (possibly subject to later funding).
2. Does the preparation of the new cyclotron building and infrastructures take into account all necessary items and important issues?
3. Please assess in particular the activity done in 2013 and the corresponding spending profile, as well as the activity and budget plan for 2014.
