$\mathcal{N} = 2$ theories and the BPS bound

BPS Quivers
and $\mathcal{N} = 2$
superconformal
theories

Simone
Giacomelli

Introduction

Quivers and
4d/2d corre-
spondence

A class of
SCFT's with
ADE flavor
symmetry

Conclusion

The infrared effective action of an $\mathcal{N} = 2$ theory is a $U(1)^r$ gauge theory. It can be written in terms of a single function \mathcal{F} (prepotential), encoded in an algebraic curve. [N. Seiberg, E. Witten '94.](#)

The states of the theory have electric and magnetic charges and flavor quantum numbers

$$(e_i, m_i, s_j) \equiv \gamma \in \Gamma^{2r+f}; \quad i = 1, \dots, r \quad j = 1, \dots, f = \text{rank}(G_F)$$

$$\langle \gamma_1, \gamma_2 \rangle = \sum_i (e_i^1 m_i^2 - m_i^1 e_i^2) \in \mathbb{Z} \quad \text{Dirac quantization condition}$$

All the states satisfy the **BPS bound**:

$$M_\gamma \geq |Z(\gamma)|; \quad Z(\gamma_1 + \gamma_2) = Z(\gamma_1) + Z(\gamma_2).$$

States saturating the bound are called BPS and preserve 4 supercharges.

BPS quivers

BPS Quivers
and $\mathcal{N} = 2$
superconformal
theories

Simone
Giacomelli

Introduction

Quivers and
4d/2d corre-
spondence

A class of
SCFT's with
ADE flavor
symmetry

Conclusion

Quiver property: The BPS spectrum has finitely many generators

$$\gamma = \pm \sum_{i=1}^N n_i \gamma_i \quad \forall \gamma \in \mathcal{H}_{BPS}; \quad n_i \in \mathbb{N}.$$

The BPS quiver of the theory is an oriented graph:

- One node for each generator γ_i .
- $\langle \gamma_j, \gamma_i \rangle$ arrows from node i to node j .

$$(0,1) \textcircled{1} \Longrightarrow \textcircled{2} (2,-1)$$

BPS states and quiver representations

BPS Quivers
and $\mathcal{N} = 2$
superconformal
theories

Simone
Giacomelli

Introduction

Quivers and
4d/2d corre-
spondence

A class of
SCFT's with
ADE flavor
symmetry

Conclusion

In a vacuum bifundamentals are constant and reduce to linear maps $B_{ij}^a : \mathbb{C}^{n_i} \rightarrow \mathbb{C}^{n_j}$. We recover a **quiver representation!**

Subrepresentation $S (= \sum_i k_i \gamma_i)$: collection of subspaces \mathbb{C}^{k_i} and maps b_{ij}^a s.t. all diagrams commute

$$\begin{array}{ccc} \mathbb{C}^{n_i} & \xrightarrow{B_{ij}^a} & \mathbb{C}^{n_j} \\ \uparrow & & \uparrow \\ \mathbb{C}^{k_i} & \xrightarrow{b_{ij}^a} & \mathbb{C}^{k_j} \end{array}$$

The representation γ is **stable** if

$$\arg Z(S) < \arg Z(\gamma) \quad \text{for all subrepresentations.}$$

Equivalent to D-term constraints coming from FI terms.

The 4d/2d correspondence

BPS Quivers
and $\mathcal{N} = 2$
superconformal
theories

Simone
Giacomelli

Introduction

Quivers and
4d/2d corre-
spondence

A class of
SCFT's with
ADE flavor
symmetry

Conclusion

Let us consider Type IIB string theory on $\mathbb{R}^4 \times CY_3$, where CY_3 is an hypersurface singularity in \mathbb{C}^4 ($f(x_1, x_2, x_3, x_4) = 0$).

The LG theory with superpotential f **encodes the quiver**:

- Vanishing 3-cycles \iff Vacua of the 2d theory.
- Intersection number of vanishing cycles \iff Number of solitons between the vacua.

4d/2d correspondence (Cecotti, Neitzke, Vafa '10)

For every $\mathcal{N} = 2$ theory with the quiver property, there is a $\mathcal{N} = (2, 2)$ 2d theory (with $\hat{c} < 2$) such that $B = S^t - S$ ($B_{ij} = \langle \gamma_j, \gamma_i \rangle$ and $S = tt^*$ Stokes matrix).

If $f(X_i, Y_a) = f_1(X_i) + f_2(Y_a)$ the 2d theory is the sum of two LG models with superpotential f_1 and f_2 . The Stokes matrix is $S = S_1 \otimes S_2$.

Two simple examples

- For $SU(2)$ SYM (setting $\Lambda = 1$) Klemm, Lerche, Mayr, Vafa, Warner '96.

$$f(x, y, w, v) = e^w + e^{-w} + x^2 + y^2 + v^2.$$

The superpotential is then $\mathcal{W} = e^X + e^{-X}$. This is the \mathbb{CP}^1 σ -model

- For $SU(N)$ SYM:

$$f(x, y, w, z) = e^w + e^{-w} + x^N + y^2 + z^2$$

$D_p(G)$ models and their BPS quivers

BPS Quivers
and $\mathcal{N} = 2$
superconformal
theories

Simone
Giacomelli

Introduction

Quivers and
4d/2d corre-
spondence

A class of
SCFT's with
ADE flavor
symmetry

Conclusion

Consider the local Calaby-Yau geometry (with $G = ADE$)

$$f_{p,G} = e^{pw} + \mathcal{W}_G(x, y) + v^2 + e^{-w} = 0 \quad \left(\Omega = \frac{dx \wedge dy \wedge dv}{\partial_w f_{p,G}} \right)$$

Describes G SYM coupled to a matter sector ($D_p(G)$).

$D_p(G)$ is superconformal and has (at least) G flavor symmetry.

Scaling dimensions and R-symmetry

BPS Quivers
and $\mathcal{N} = 2$
superconformal
theories

Simone
Giacomelli

Introduction

Quivers and
4d/2d corre-
spondence

A class of
SCFT's with
ADE flavor
symmetry

Conclusion

$$f_{p,G} = z^p + v^2 + \mathcal{W}_G(x, y) + \sum_{ijk} u_{ijk} z^i x^j y^k \quad (z = e^w).$$

From the 2d perspective $f_{p,G}$ has dimension one.

From the 4d perspective Ω has dimension one

$$D_{2d}(\Omega) = D_{2d} \left(\frac{dx dy dv}{z \partial_z f_{p,G}} \right) = D_{2d}(x) + D_{2d}(y) - \frac{1}{2} = \frac{1}{h(G)}.$$

$$D_{4d}(u_{ijk}) = h(G) D_{2d}(u_{ijk}).$$

The same relation holds between 2d and 4d R-charges:

$$R_{4d}(u_{ijk}) = h(G) R_{2d}(u_{ijk}).$$

superconformal
theories

Simone
Giacomelli

Introduction

Quivers and
4d/2d corre-
spondence

A class of
SCFT's with
ADE flavor
symmetry

Conclusion

- The quiver is a powerful tool to study the BPS spectrum of $\mathcal{N} = 2$ theories. We can determine it studying quiver stable representations.
- The 4d/2d correspondence allows to determine the quiver for $\mathcal{N} = 2$ theories with a string theory realization.
- The study of 4d theories can be related, via the 4d/2d correspondence, to problems in 2d field theories. This allows to study problems in 4d theories using 2d techniques and viceversa (e.g. classification of 2d theories with $\hat{c} = 1$).

- The quiver is a powerful tool to study the BPS spectrum of $\mathcal{N} = 2$ theories. We can determine it studying quiver stable representations.
- The 4d/2d correspondence allows to determine the quiver for $\mathcal{N} = 2$ theories with a string theory realization.
- The study of 4d theories can be related, via the 4d/2d correspondence, to problems in 2d field theories. This allows to study problems in 4d theories using 2d techniques and viceversa (e.g. classification of 2d theories with $\hat{c} = 1$).
