## pp Elastic Scattering at LHC Energies

*Friday, 12 September 2014 16:10 (20 minutes)*

Using a unified analytic representation for the elastic scattering amplitudes of pp scattering for all energies, the behavior of observables at the LHC energies in the range 2.76 - 14 TeV is discussed. Similarly to the case of 7 TeV data, the

proposed amplitudes give excellent description of the preliminary data at 8 TeV. We discuss the energy dependence of the observables, with predictions for the experiments at 2.76, 13 and 14 TeV and investigate asymptotic properties of pp collisions.
