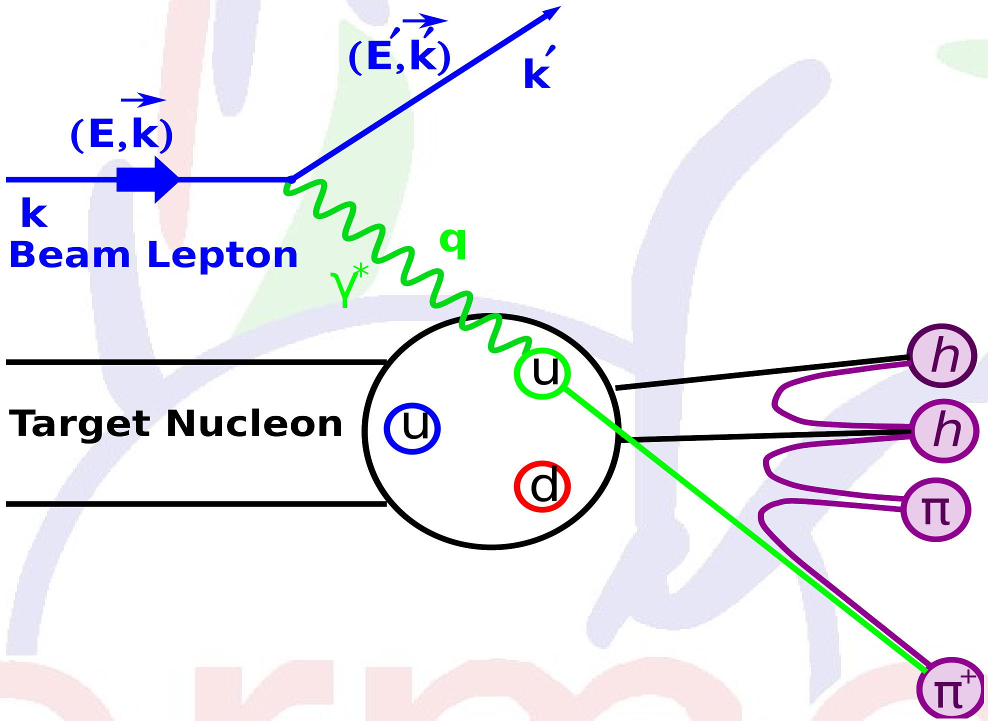
Semi-Inclusive Deep-Inelastic Scattering

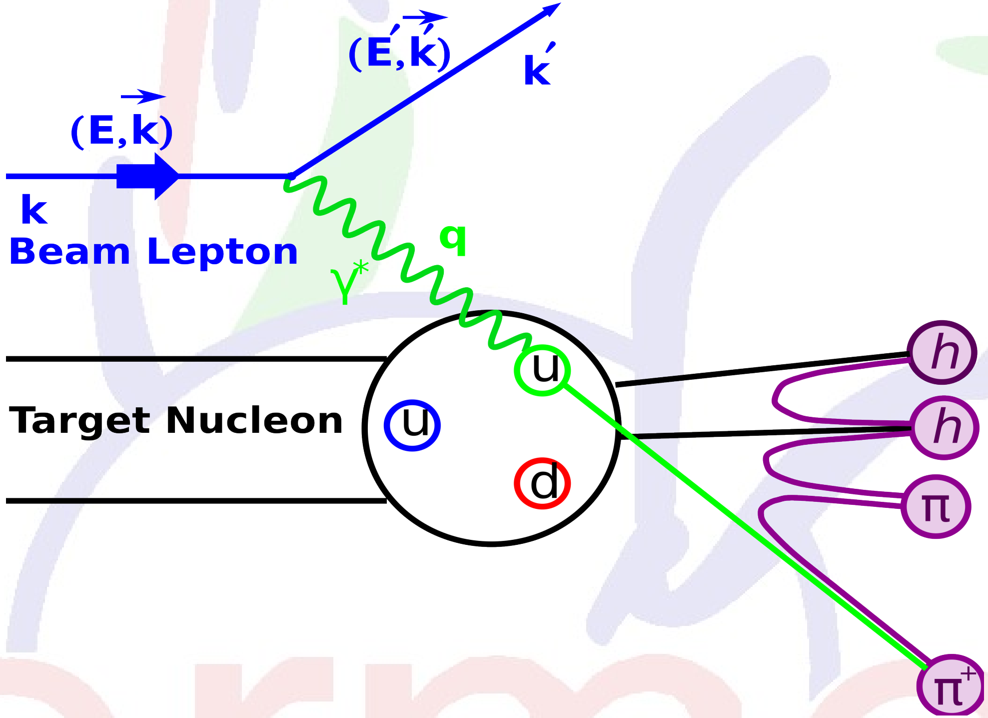


Semi-Inclusive Deep-Inelastic Scattering

$$Q^2 = -(k - k')^2$$

$$\nu = E - E'$$

$$W^2 = (P + q)^2$$



$$x_B = \frac{Q^2}{2 \cdot M_N \cdot \nu}$$

$$z = E_h / \nu$$

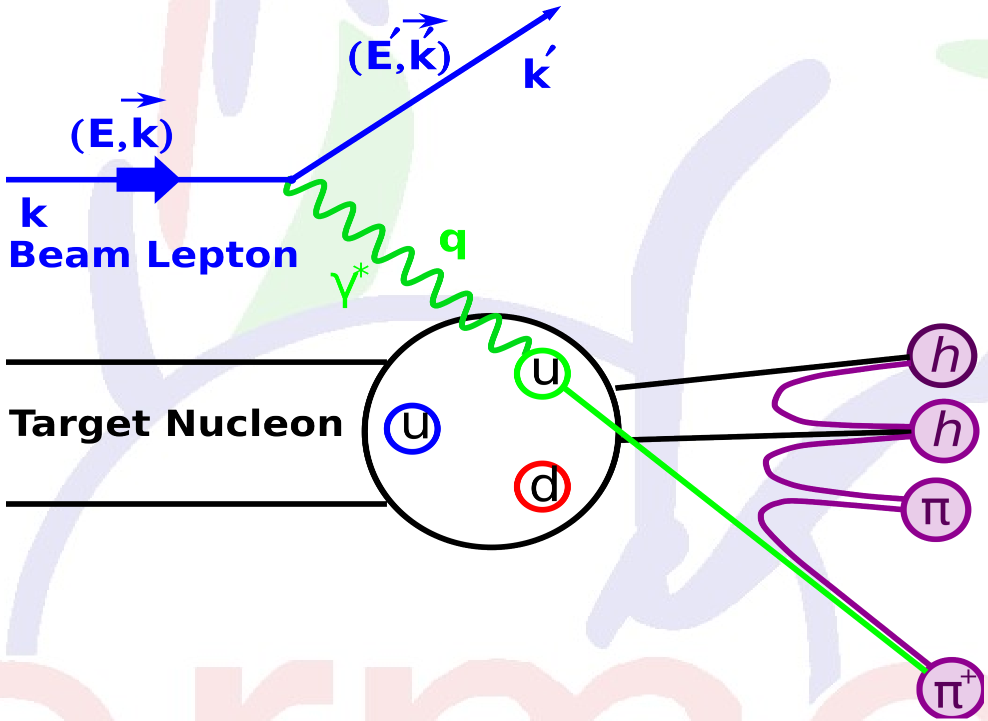
$$P_{h\perp} = \frac{|\vec{P}_h \times \vec{q}|}{|\vec{q}|}$$

Semi-Inclusive Deep-Inelastic Scattering

$Q^2 = -(k - k')^2$

$\nu = E - E'$

$W^2 = (P + q)^2$



$x_B = \frac{Q^2}{2 \cdot M_N \cdot \nu}$

$z = E_h / \nu$

$P_{h\perp} = \frac{|\vec{P}_h \times \vec{q}|}{|\vec{q}|}$

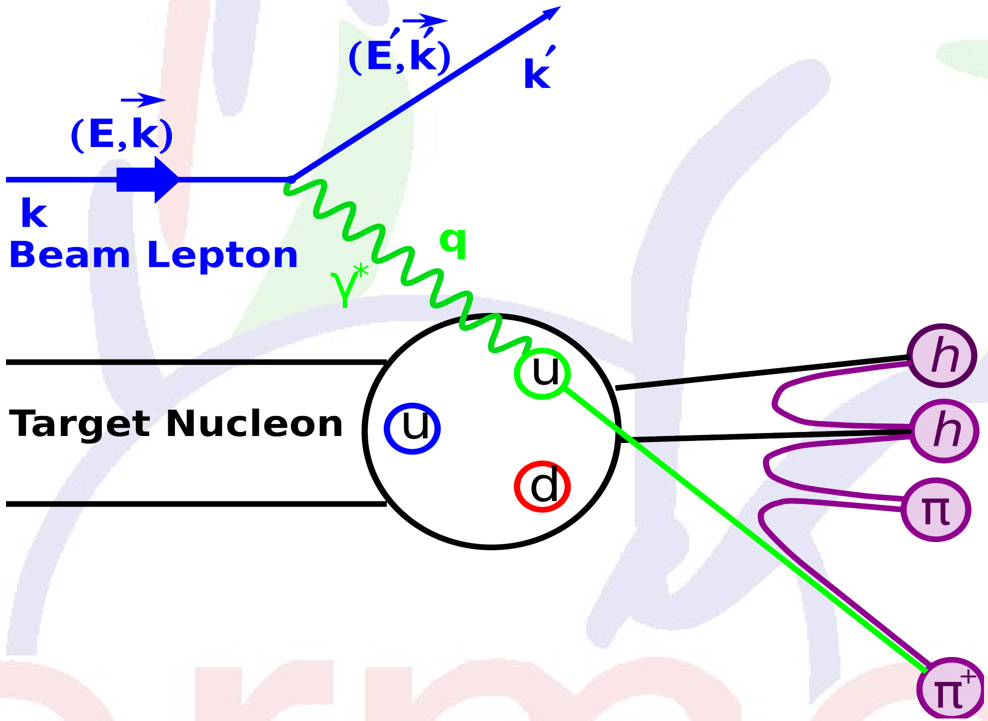
TMD factorization at leading order in $(k_\perp / Q)$, $P_{h\perp} \simeq k_\perp \ll Q$

Semi-Inclusive Deep-Inelastic Scattering

$Q^2 = -(k - k')^2$

$\nu = E - E'$

$W^2 = (P + q)^2$



$x_B = \frac{Q^2}{2 \cdot M_N \cdot \nu}$

$z = E_h / \nu$

$P_{h\perp} = \frac{|\vec{P}_h \times \vec{q}|}{|\vec{q}|}$

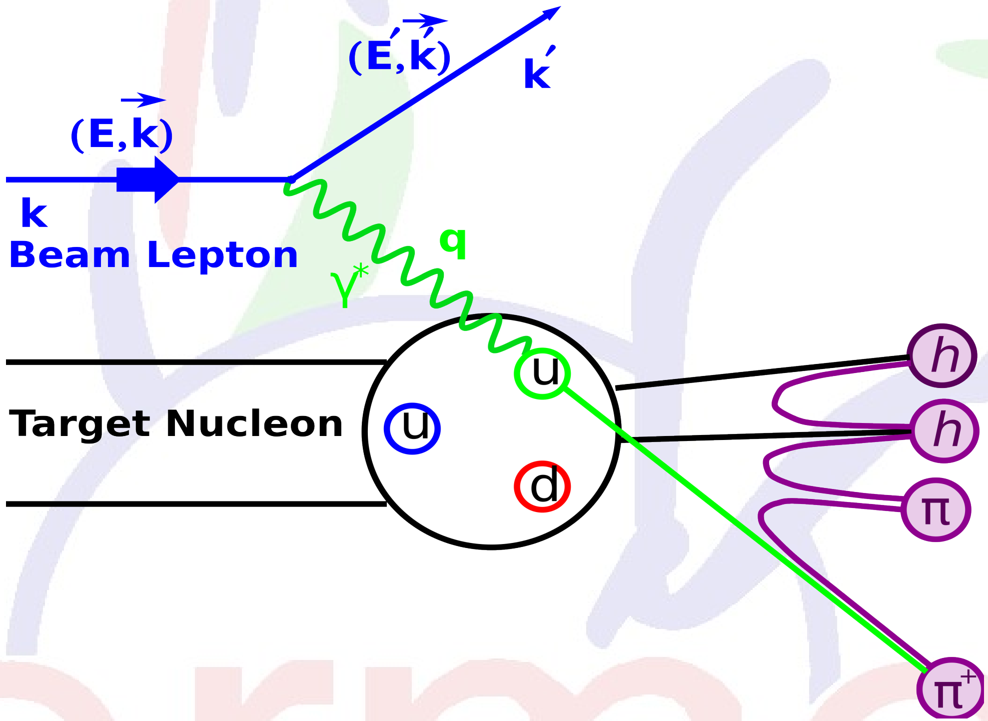
$$\sigma_{eN \to ehX} \sim \sum_q e_q^2 f_q(x_B, Q^2, k_\perp^2)\, \sigma^{eq \to eq} D_q^h(z, Q^2, p_\perp^2)$$

Semi-Inclusive Deep-Inelastic Scattering

$$Q^2 = -(k - k')^2$$

$$\nu = E - E'$$

$$W^2 = (P + q)^2$$



$$x_B = \frac{Q^2}{2 \cdot M_N \cdot \nu}$$

$$z = E_h / \nu$$

$$P_{h\perp} = \frac{|\vec{P}_h \times \vec{q}|}{|\vec{q}|}$$

$$\sigma_{eN \to ehX} \sim \sum_q e_q^2 \, f_q(x_B, Q^2, k_\perp^2) \, \sigma^{eq \to eq} \, D_q^h(z, Q^2, p_\perp^2)$$

TMD-PDF TMD-FF

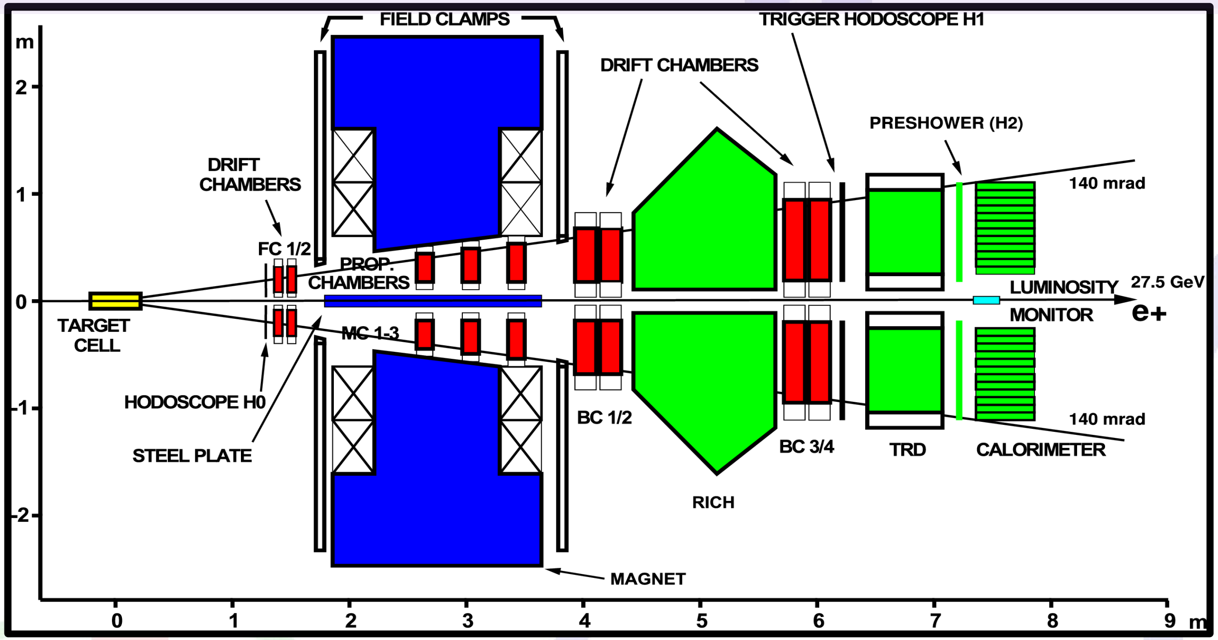
Experimental observable

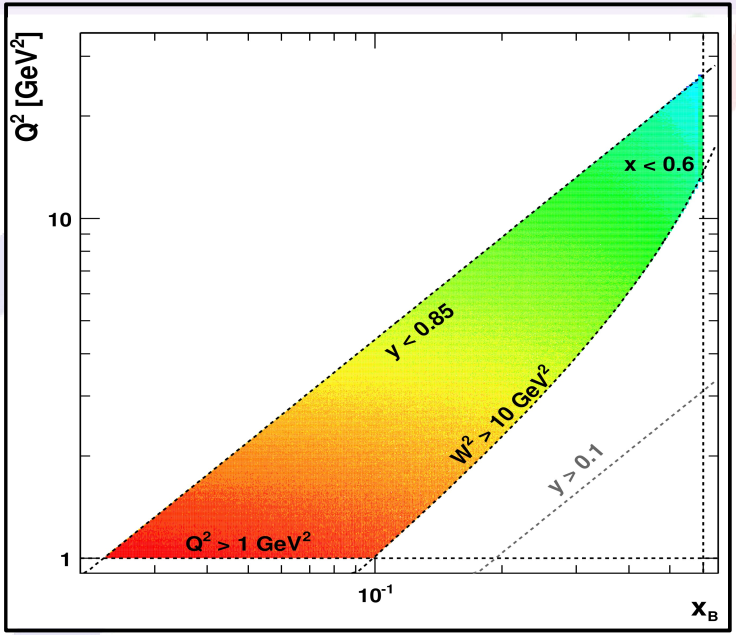
SIDIS hadron yields

$$M^h(x_B, Q^2, z, P_{h\perp}, \phi_h) = \frac{N^h(x_B, Q^2, z, P_{h\perp}, \phi_h)}{N^e(x_B, Q^2)}$$

DIS event yields

Experiment





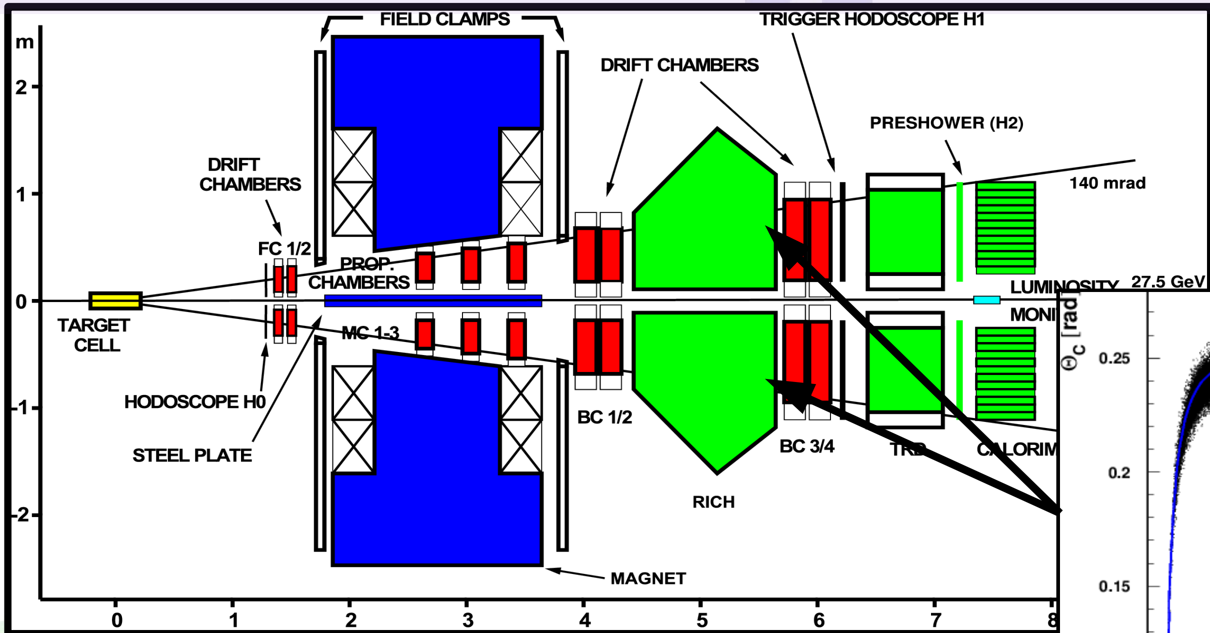
Beam : e^-/e^+ 27.6 GeV

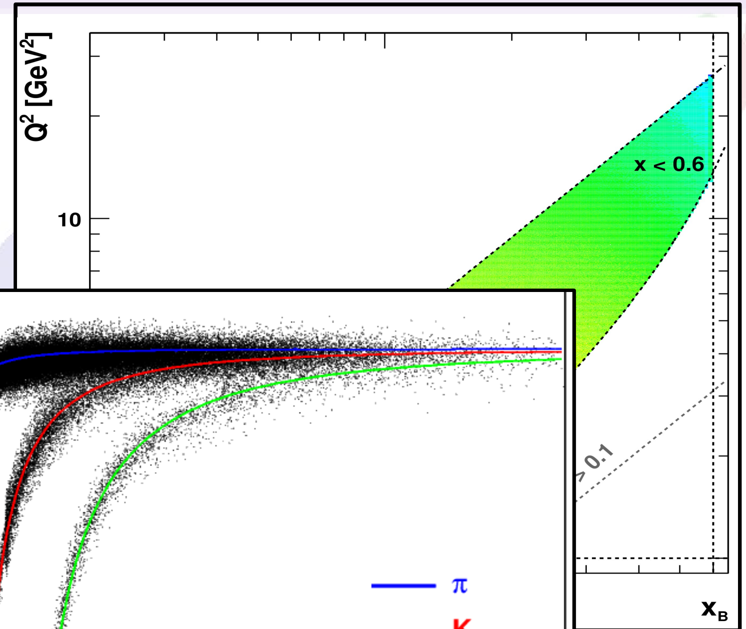
Target : H/D pure gaseous

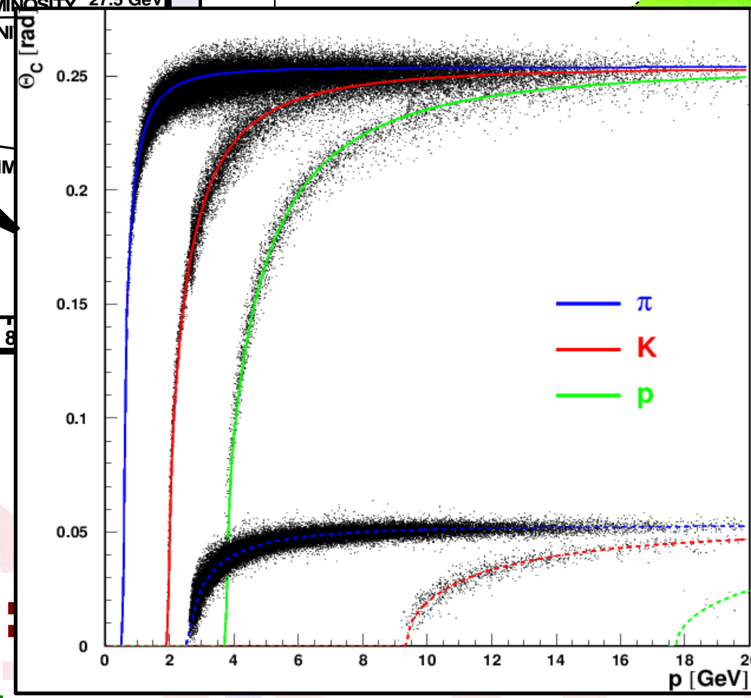
Good momentum resolution : $\frac{\delta p}{p} < 2\,\%$

Excellent particle identification

Experiment







Beam : e^-/e^+ 27.6 GeV

Target : H/D pure gaseous

Good momentum resolution :

Excellent particle identification

Data selection

DIS regime

- $Q^2 > 1$ GeV ^{2}
- $W^2 > 10$ GeV ^{2}
- $0.1 < \nu/E_{beam} < 0.85$

SIDIS selection

- 2 GeV < p < 15 GeV
- 0.2 < z < 0.8
- $x_F > 0.2$

DIS event yields

Experimental observable

SIDIS hadron yields

$$M^h(x_B, Q^2, z, P_{h\perp}, \phi_h) = \frac{N^h(x_B, Q^2, z, P_{h\perp}, \phi_h)}{N^e(x_B, Q^2)}$$

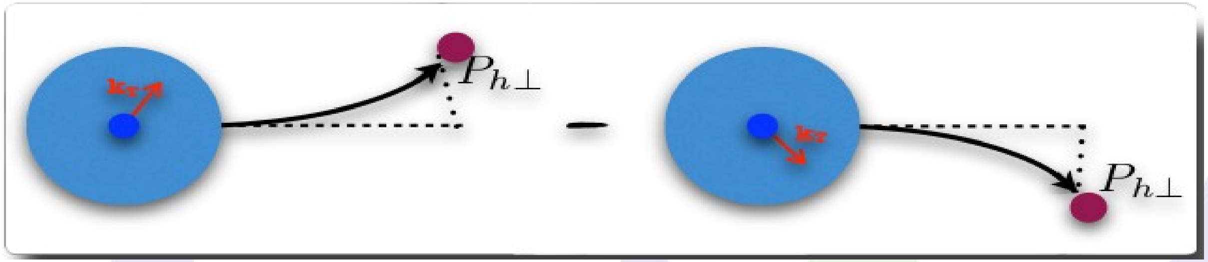
TMDs via ϕ_h

DIS event yields

Azimuthal modulations



Cahn effect

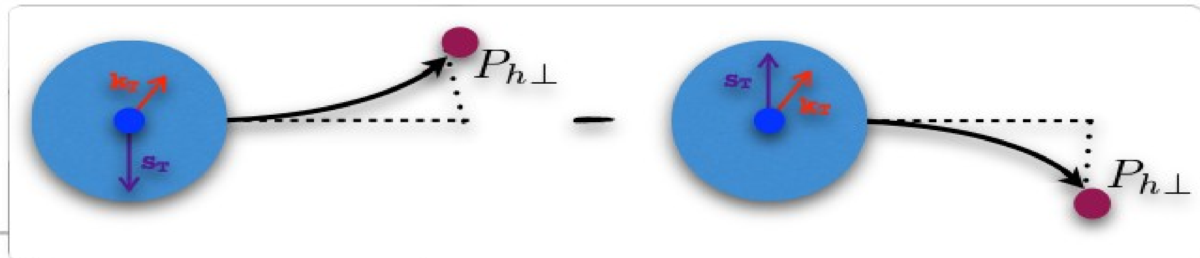
kinematic effect caused by quark intrinsic transverse momentum.

$\left(\cos\phi_h\right)$

R.N. Cahn, Phys. Lett. B78, (1978)

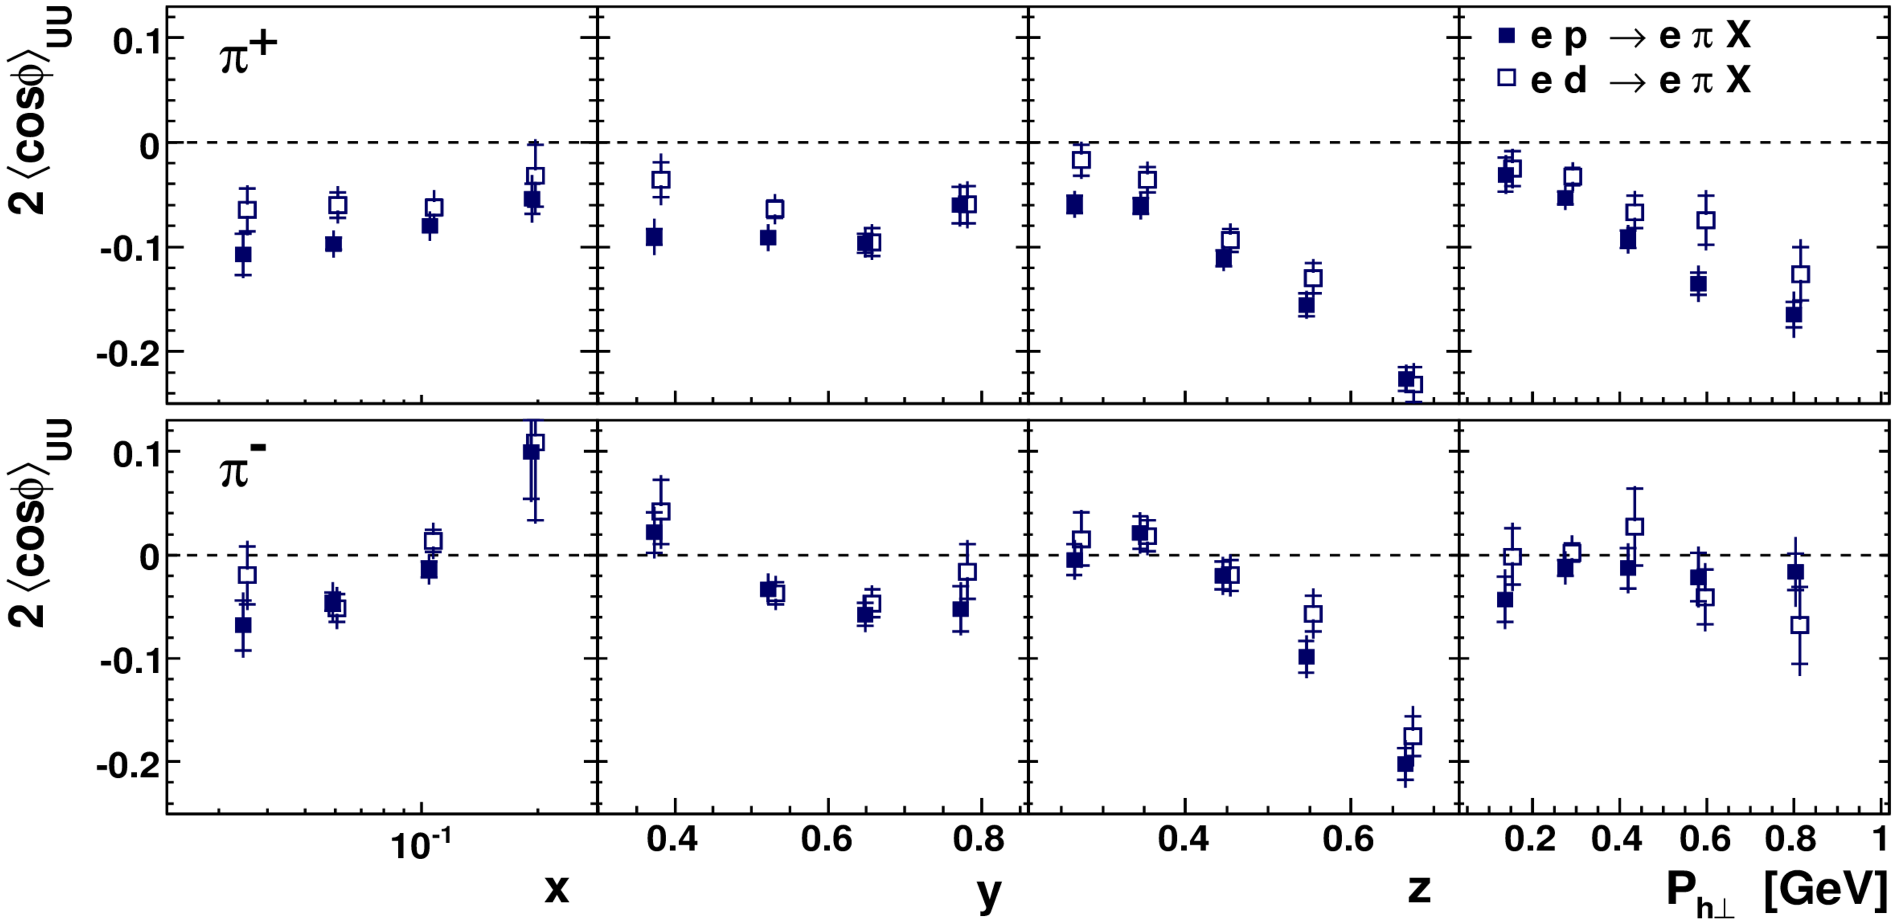
Boer-Mulders effect

correlation between quark transverse momentum and quark transverse spin.



$\left(\cos 2\phi_h\right)$

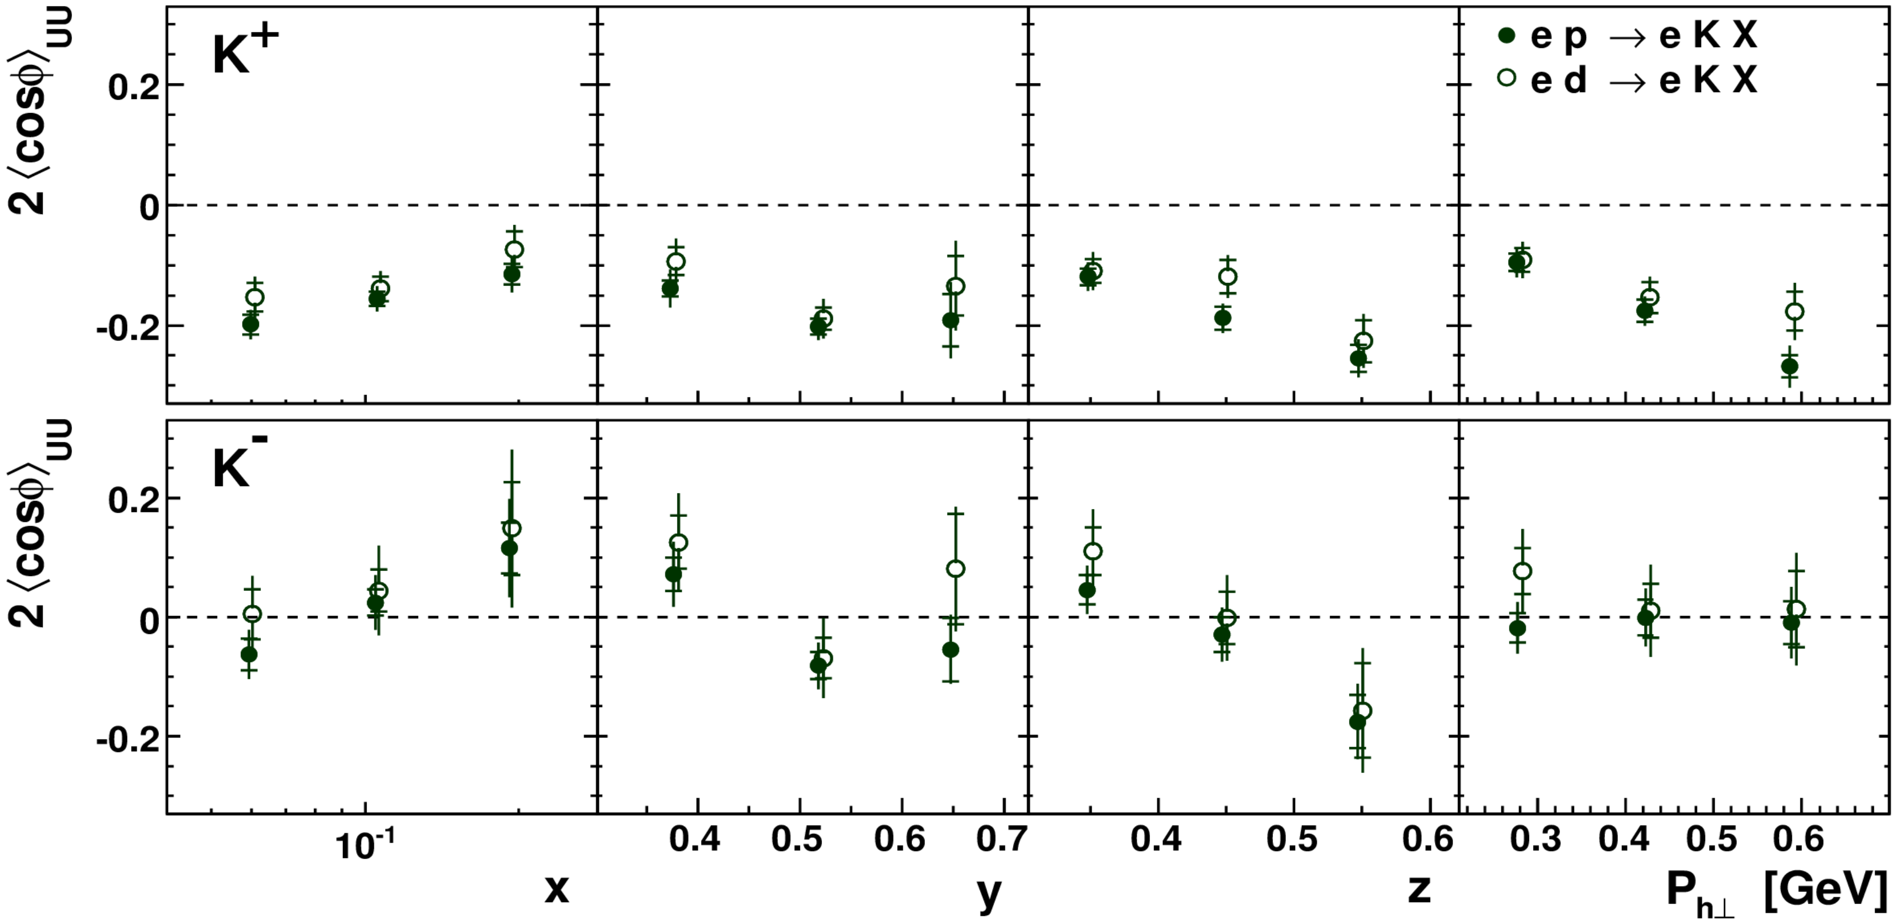
D. Boer and P.J. Mulders, Phys. Rev. D57, (1998)



Both π^+ and π^- have negative asymmetry amplitudes.

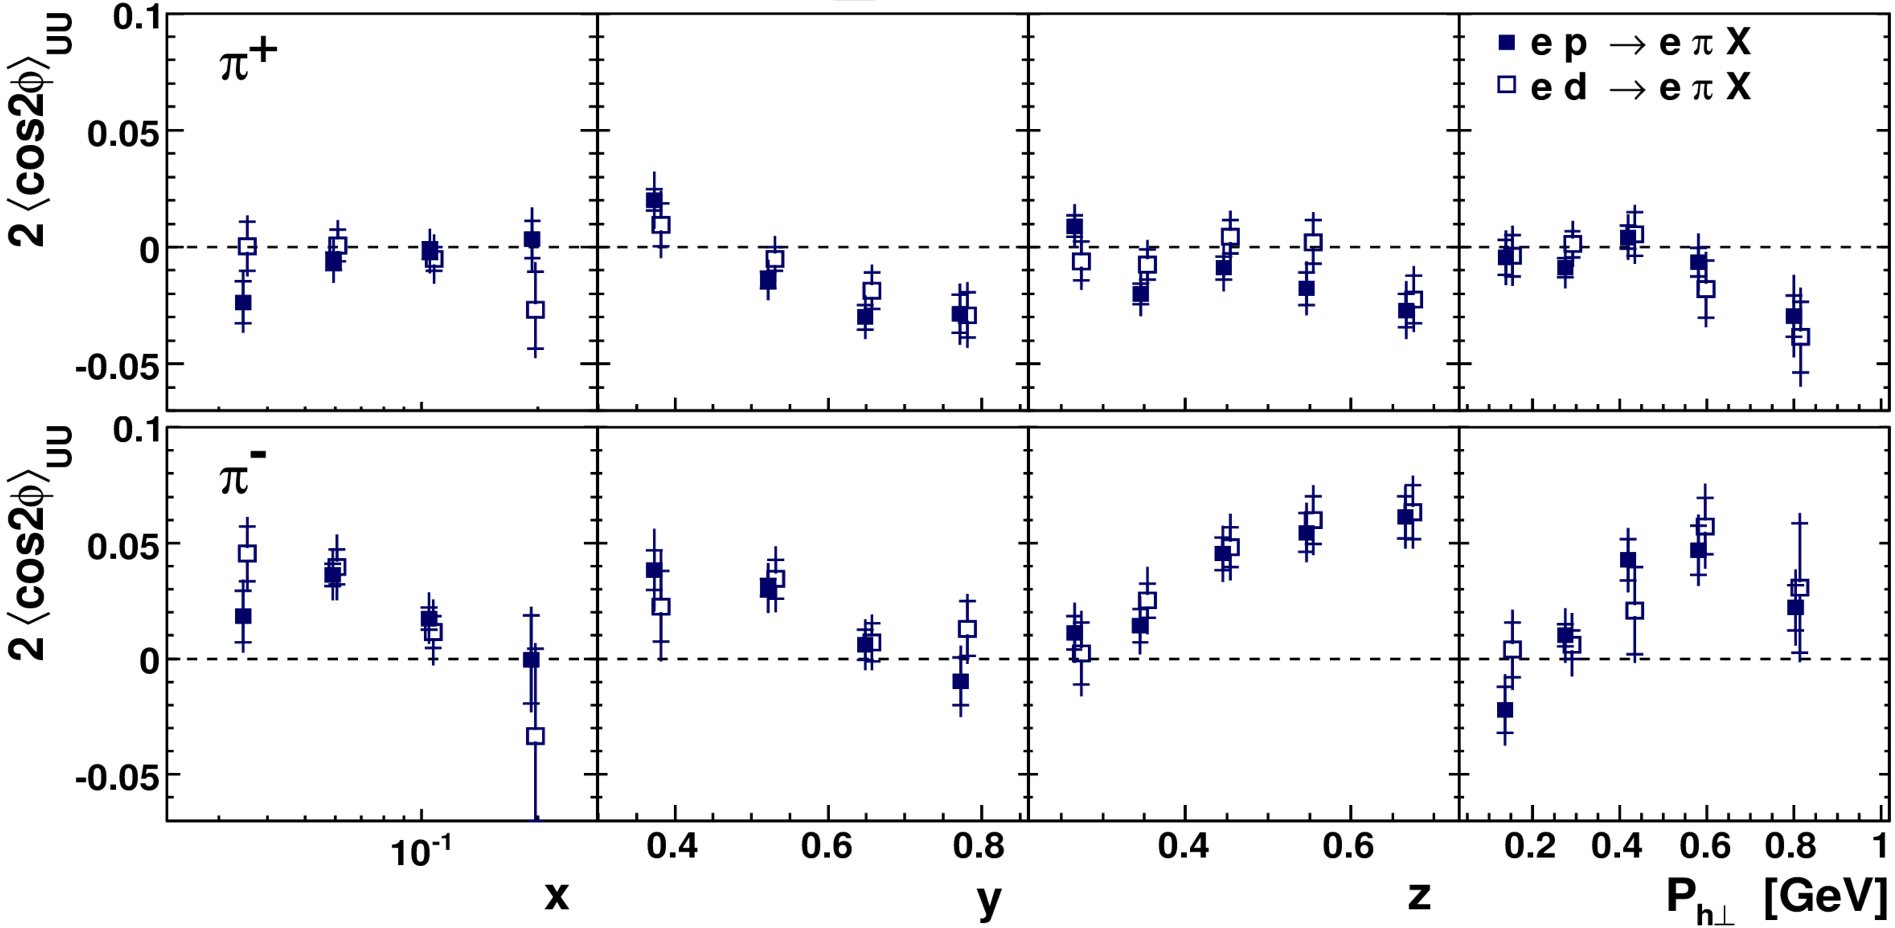
The magnitude of π^+ asymmetry amplitude is smaller on deuterium than on hydrogen target.

For both particles the asymmetry amplitude is the largest in magnitude at high z.



Large negative amplitudes for positively charged kaons.

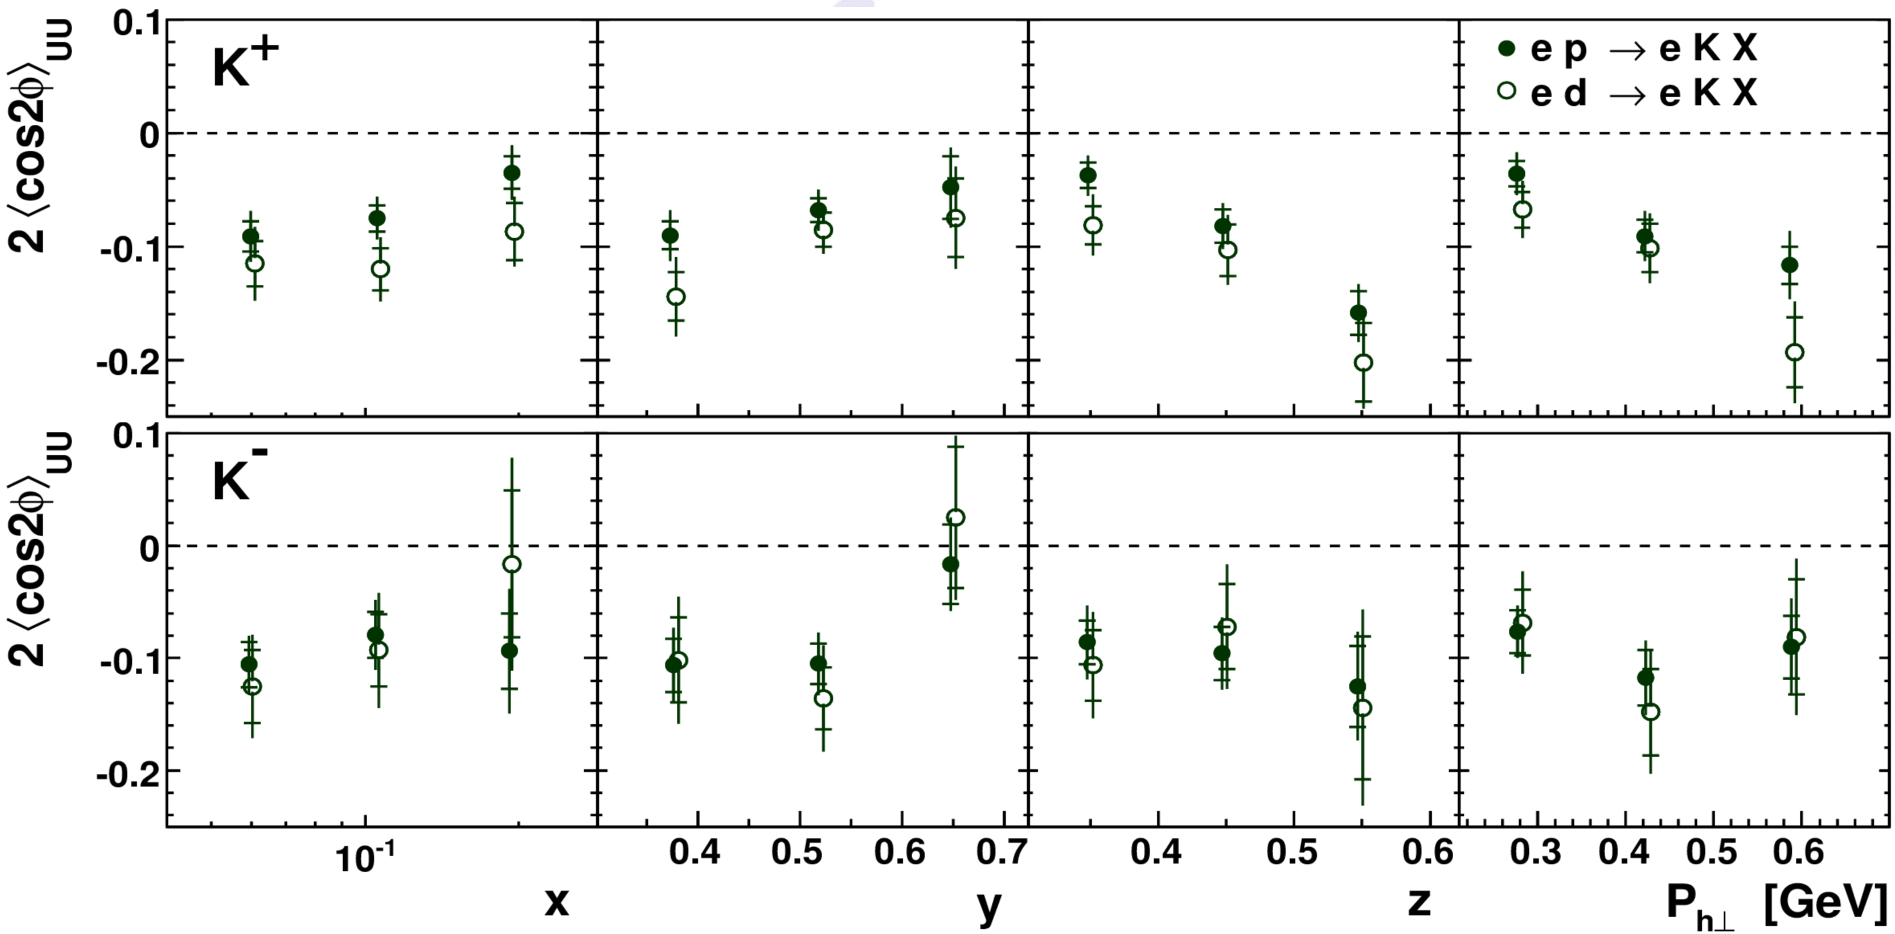
Similar results for hydrogen and deuterium targets.



The amplitudes for oppositely charged pions have the opposite signs.

π^+ and π^- asymmetry amplitudes have different magnitudes.

Similar results for hydrogen and deuterium targets.



The asymmetry amplitudes have negative sign for both K^+ and K^-.

Both kaons have large asymmetry amplitudes in magnitude.

Similar results for hydrogen and deuterium targets.

Summary

- High statistical data set for positively/negatively charged pion and kaon multiplicities on proton and deuteron.
- The extracted multiplicities integrated over hadron transverse momentum give an access to collinear fragmentation functions.
- The azimuthal modulations of produced hadrons indicate the presence of non-vanishing intrinsic transverse momentum of quarks inside an unpolarized nucleon.
- Dependence of multiplicities on hadron transverse momentum provides constraints on transverse momentum dependent distribution and fragmentation functions.
- A_{LU} results are coming soon!
